UFOs, FLYING SAUCERS AND MKULTRA MIND CONTROL

FOREWORD

I remember Jim Keith writing this book. At the time, he was also working on an article for the coming issue of *Steamshovel Press*. Jim contributed regularly to the magazine and stayed in phone contact for research help and to chat conspiracy. He mentioned that he was trying to summarize all of his current thinking in a single themed manuscript.

The original *Saucers of the Illuminati*, in fact, may have been Jim Keith's last contribution to the zine world. The original book had an 8x10 format, spiral bound and resembled more a magazine than a book. Then, many people who knew Keith at all knew him primarily through his small-circulation "fan" magazines (although it is hard to conceive of a conspiracy/UFO cover up "fan"), *Dharma Combat* being the most well known but certainly not the only example. Zines were the happening means of the parapolitical underground in those pre-internet days and Keith served as the super-celebrity of that scene, broadcasting his charm and humor through self-published photocopied wonders, but also writing letters and doing commentary for similar zines produced by others.

Going through my stack of Keith masterworks recently, I discovered *Notes From The Hangar #1* from the early 1990s. In it, Keith published the rant of one Jason Bishop III, making declarations about humans working side-side with aliens in Dulce, New Mexico. Today it has become quite a familiar story, but at the time it was lore that had yet to reach the pinnacle of its currency in UFO circles. In fact, it was still part of what I see as a "barium meal" of UFO disinformation perpetrated by Air Force intelligence agents partly to drive a man named Paul Bennewitz insane.¡ In *Notes In The Hangar*, Jim presented the rant without edit and included several pages of critical response, declaring that he didn't necessarily believe any of it, but he believed in the importance of having it all discussed.

In *Saucers of the Illuminati*, Keith summarized his understanding of that history in a chapter entitled "MJ-12". That chapter remains one of the most concise and complete reviews of that important episode in the history of the ufological subculture,™ but at the same time comprises only a portion of what this book has to say. From there *Saucers* expands upon Keith's notions about the arcane and occult forces behind human history.

It was a point of view that developed over time, actually re-doing *Saucers* in 1998 in actual book form and now which resonates as a defining echo of the weirdness of the post-9/11 world, years after Keith has gone on to his reward.£ As the book cover attests, "as the 21st century approaches, many people suspect that something earth shattering is about to happen..."

On the phone back then with Keith explaining the over-arching view he felt he had captured in this new manuscript, I asked him if he thought he could really find a wider audience for the perspective. Wasn't it a bit obscure for the average reader?

We both had televisions on in the back ground as we spoke, both watching *CBS News*. As Dan Rather segued to the commercial, the newly redesigned CBS logo graphic appeared in the upper left corner of the screen. It was the CBS eye neatly pressed within a pyramid. As I looked in surprise at how much it looked like the backside of a dollar bill, Keith asked, "What was that you were saying about obscure?"

¡. Thanks to Peter Dale Scott for this concept. It refers to planted disinformation used by intelligence agents in order to track the blow-back. In the Bennewitz case, this meant various Area 51 stories that emerged as part of the UFO circuit presentations of people like John Lear and Bill Cooper, and had peripheral players such as super-spook Gorden Novel and JFK researcher Lars Hansson.

™. The first book-length treatment of the topic, *The Bennewitz Papers*, written by one of Keith's compadres, Greg Bishop, author of the *Wake Up Down There* anthology, is now pending publication.

£. Keith and I wrote *The Octopus: Secret Government and the Death of Danny Casolaro*, which became a hard-to-find cult classic. It currently enjoys a new edition, with one of three new chapters dealing with Jim Keith's unusual death. Among the many strange dimensions of Keith's passing discussed therein was the appearance of *clostridium* bacteria in the kind of knee surgery that led to his early death. Keith had noted years ago the presence of *clostridium* bacteria in the late 1970s cattle mutilations of New Mexico. *Clostridium* also killed our mutual good friend Ron Bonds, who published the first book edition of *Saucers*.

Kenn Thomas publishes *Steamshovel Press*. POB 210553, St. Louis, MO 63121. Samples issue: $7; four issue subscription, $25. Checks payable to "Kenn Thomas," not *Steamshovel Press*."

The Great Seal of the United States of America featuring what some believe to be the symbol of the Illuminati.

Adam Weishaupt, founder of the Bavarian Illuminati.

Introduction

In 1993 a miniscule two hundred copy photocopied "researcher's edition" of my book *Saucers of the Illuminati* was rushed into print, upon my urging, by IllumiNet Press. My purpose for authorizing this informal edition was to get into print certain interesting connections that I had made between occult philosophy, the lore of UFOs, and the totalitarian New World Order - ideas that I had discussed at length with other researchers and that were already twinkling into being in a firmament of articles by some of those worthies. I was a little... paranoid is not the word I seek... concerned that by the time a proper paperback edition of *Saucers* was ushered into being, that I might be accused of plagiarizing myself.

As it turned out, my worry was largely unfounded, and little of what I wrote about in '93 has been grappled with, understood, or even mentioned in the conspiracy or UFO press, much less by the *New York Times*. I take this to be positive proof that I was on the right track.

Actually, my sense is that the ideas in *Saucers* tend to jump disciplines from political conspiracy, to UFOs, to the occult, in an attempt to synthesize the information in each. The researchers in those varied disciplines almost never have any truck with and so are confounded by their adjoining truckstops in arcane research. The Left Hand Path doesn't know what the Vast Right Wing Conspiracy is doing, you might say. But these topics are, at the deepest levels, intertwined and clarify the notions of the others.

Another matter: the ideas in *Saucers of the Illuminati* are dangerous, not to mention extremely weird, and stray very close to Things You Are Not Supposed to Think. In fact, in current polite--read mind controlled--society you are not even supposed to think

that there are things that you are not supposed to think... Do you follow?

Since the lightning appearance and disappearance of the researcher's edition of *Saucers* in 1993 copies have been completely unavailable, aside from a pirate edition that was rumored to have been put into print. That unavailability created a few misunderstandings about the book. Some speculated in print and on the Internet that the book was too incendiary, too Politically Incorrect, and that it went so quickly out of print because it was suppressed by the CIA or the Men in Black or somesuch. Those things have been known to happen in the annals of conspiracy research, of course, but not in this case. Simply, when I might have been expanding the text of *Saucers* to a length more appropriate for a paperback, I was doing lots of other things: writing nine other books, chasing the wolf of velvet fortune, things like that.

But I finally got around to the revision in 1998. Now here is the bells and whistles version of *Saucers*, with a lot of material not included in the book's original incarnation. Since the first appearance of the book, a great deal in the text has been clarified, and the revised work reflects new theories, new understandings obtained, and an arsenal of new smoking guns. Also included in this edition is the text of "UFOs at the Edge of Reality," a lecture delivered in Atlanta, Georgia in 1995.

I admit it. *Saucers of the Illuminati* is my strangest and most controversial work. That fact has been underlined by the largely uncomprehending and sometimes hostile reviews given to the first edition. The book may also be the most true that I have written.

Hold on to your brains. Maybe the world is ready for this stuff now.

1

A Process of Decoding

Regardless of our experience or research, we seem no closer to finding an answer to the puzzle of the UFOs. These strange craft and their equally strange occupants behave in a manner that seems to contradict physics and logic, appearing and disappearing seemingly at will, dropping curious objects and artifacts (including potatoes and pancakes), mutilating cattle, abducting people and leaving cryptic messages embedded in the brains of their awe-stricken contactees. These activities, these odd messages seem only to compound our confusion as to whom these interlopers on "our" cosmic turf are and what their motives might be.

While many saucer contactees or the variegated cults that have risen around them characterize the visitors they have confronted as angelic "Space Brothers" or advanced elder beings intent on warning humanity away from nuclear proliferation or other humanly-fostered evils, other indications as to the motives of these strangelings in silver ski suits are not so positive. Many individuals claim to have been abducted against their will by aliens in UFOs, and they have reported every kind of bizarre and grisly experience, ranging from mystical enlightenment, to the transmission of apocalyptic messages that they must deliver to mankind, even the implantation of tiny electronic brain devices apparently used for mind control or monitoring, perhaps in the same fashion that earthly ranchers now monitor cattle with under-the-skin electronic implants. Something very strange indeed is going on.

Analyzing the conflicting signals that we have received about the nature of these visitors, it is almost as if we are purposely being misled and befuddled by these mysterious agents, purposely being deceived about the motives behind these visitations, and perhaps even directed in some mysterious transformative operation of which we are not aware.

My own interest in the matter of UFOs is rather personal. Although I have been intensely interested in UFOs and the paranormal since my childhood in the early 1950s, it was not until 1972, in the Los Angeles, California suburb of Upland, that I experienced my own first contact--maybe. I came gradually awake in the middle of the night to find an archetypal grey alien staring in my face from a distance of about one foot. I leaped out of bed and raced into the living room. When I returned to my bedroom, the visitor was nowhere to be found.

I really didn't know what to think about what had happened. Was the experience an hallucination at the edge between dreaming and wakefulness? Was it an actual encounter with an alien presence? Was it a cross-dimensional experience that defied the boundaries of dream and reality? I have never been prone to this sort of nightmare, and have not experienced anything comparable in the intervening twenty-five years.

But there was nothing solid to grasp onto about the event, and so I shunted it into the category of maybe. I more or less forgot about the incident until I read Whitley Streiber's bestselling book *Communion* many years later, and one of the accounts in that book tipped the scale toward categorizing the event as being reality, rather than as a nightmare. In Streiber's book it was noted--coinciding with unnerving accuracy with my own apparent encounter--that the color and skin texture of the alien skin was not grey, but rather a deep blue grey, and that it had the shiny almost wet-seeming texture of

plasticine. Here was a coherence with another's alien experience that challenged--fractured--coincidence.

So, while I am perfectly aware of the fact that the U.S. military and others have experimented since at least the early 1950s with aerial craft that fit the description of UFOs, while I also know that the UFO experience has been hoaxed, including by American intelligence agencies and by UFO buffs, and that UFOs and abduction experiences may sometimes be a ruse to conceal mind control operations as described in a number of my books, I also leave the latch string out for other more "alien" interpretations of at least a percentage of UFO events.

One intriguing possibility is that the incident in Upland was one of beamed electronic mind control of the sort I have described in a number of my books. The house where the incident took place was a large hippie/radical commune where any number of anti-Establishment pipedreams were hatched. The strange motley of activists in Technicolor dream coats that came and went from the place at all hours no doubt drew the attention of those who monitor such things.

And so it occurred to me: Was I zapped electronically with the image of an alien? Was it just a byproduct of the chromatic chromosomes so prevalent at the time? I will probably never know. What I do know is that there are depths to the UFO enigma that are not plumbed by most researchers in the field, Horatio.

John Keel, for one, is a pioneering researcher who has been able to peer beyond the simplistic "space beings from another galaxy" device that is the primary stock-in-trade of UFO journalism. Of these strange visitors Keel has said:

> Many flying saucers seem to be nothing more than a disguise for some hidden phenomenon. They are like Trojan horses descending into our forests and farm fields, promising salvation and offering us the splendor of some great super civilization in the sky. While the

> statuesque long-haired "Venusians" have been chatting benignly with isolated traveling salesmen and farm wives, a multitude of shimmering lights and metallic disks have been silently busying themselves in the forests of Canada, the outback country of Australia, and the swamps of Michigan.

Other researchers have proclaimed that the motives of the visitors may not be altogether benign. It was the famous UFO researcher Jacques Vallee who coined the term "Messengers of Deception" and he has speculated of the UFOs:

> They are physical objects, the product of a technology, but they are also something else: the tools of a major cultural change. I think UFOs are perpetrating a deception by presenting their so-called occupants as being messengers from outer space, and I suspect there are groups of people on Earth exploiting this deception.

Speaking of the experiences of abductees in *Messengers of Deception*, Vallee surmises:

> It is more likely that they have taken a non-physical trip, controlled and guided by a system that acts on human consciousness (the Soviets use the term "psychotronic" to designate such devices), rather than one that is purely physical. The symbols it uses are engineered to have certain effects.

Vallee also reports, "I believe there is a very real UFO problem. I have also come to believe that it is being manipulated for political ends. And the data suggest that the manipulators may be human beings with a plan for social control."

I concur.

The evidence that I present in this book suggests that our vision has been purposely obscured by what we have been led to believe about the UFO experience, and it is probably not directly being done by insectoid extraterrestrials. Aside from the genuine

activity of hoaxers and disinformation agents, at least some of them factually connected to government, there seem to be certain elements of the UFO "message" that appear to be purposely designed to deceive. It appears that it was intended that we should be deluded from the very beginning, and it also appears that there is a definite method to the UFO madness.

To my mind the most sensible, yet least voiced explanation is that some UFO encounters are being staged for an ultimate--and ulterior--purpose. Is it within the realm of possibility that there is a group working behind the scenes to convince us that we are being invaded by space aliens?

In order to understand at least a portion of UFO sightings and their purpose, we need to work on decoding what amounts to their curious "language"--a language pieced together from the strange events and messages of hundreds and thousands of encounters, composed of word and symbol and deed apparently bearing meanings beyond the obvious. We must peer below the surface, the apparency, and furthermore, we must view these strange craft and their occupants in a different manner, in a manner that is perhaps not so different than the "open eyes" that secret societies attribute to their metaphysical initiates.

2

The Human Factor

If you were to assimilate the information contained in a large quantity of current books, motion pictures, and television presentations on the subject of UFOs and UFO abductions, I believe that you would be likely--by weight of the evidence presented--to come to one of three conclusions. That,

(A) we are being invaded by aliens from outer space, or

(B) that a high percentage of the human race is crazy and suffering from hallucinations of little green men or worse, or

(C) you would take an "agnostic" approach undecided on one of the first two possibilities.

I will not discount either of the first two possibilities as being the ultimate explanation of what is going on, however I consider it highly unlikely that you would even suspect, based upon information that is generally available, what I consider to be the most likely origin of this phenomenon. My investigations have shown me that UFO sightings (or at least a significant percentage of same) in all probability are the product of an entirely different *praxis* or control process than either alien invasion or hallucination, and that the parties responsible for the phenomenon have, so far as I can determine, never been named as such.

In preparation for the reality shift that I intend this book to entail, I would like to cite a few instances of UFO abductions that do not entirely fit into the media template as to what these encounters are like. In this fashion I hope to shatter the generalized

and predictable nature of what are usually put forth as "characteristic" UFO encounters. This will perhaps open the door for new interpretations.

Bruce Smith probably still regrets having chosen to attend a lecture by Budd Hopkins, reputed expert on alien abduction (who, oddly, never entertains the human quotient in his writings), in New Jersey in 1991. The lecture profoundly affected Mr. Smith (as abduction accounts have affected many others) to the point where he packed up his belongings into his trailer home and headed west. Perhaps Smith felt that New Jersey did not have the requisite privacy that encounters with ufonauts usually require.

Camping in Tesuque, New Mlexico, Smith woke up in the middle of the night, sensing that he was being visited by someone. Suddenly his ankles were grabbed by a pair of hands and, while woozily drifting in and out of consciousness, he saw a hazy creature looming in front of him... and, oddly enough, wearing glasses and a white, button-down shirt, the kind that his father had worn, according to Smith.

So far, so bad. Smith was dragged away from his tent and campsite but, still semi-conscious and able to partially grasp what was going on, he was able to see that it wasn't toward the expected glowing saucercraft that he was being carried.

Smith maintains that he was manhandled into a large, dark blue van, with markings identifying it as belonging to the U.S. Navy. After traveling for an hour in the back of the van over winding New Mexico roads, Smith maintains that the van stopped and he was levitated out the back door, and was then carried into a huge building that he believes was a portion of the Los Alamos nuclear laboratory.

Once inside the building, Smith was placed on an examination table while a big-headed "alien" examined him and "gouged" at his

eyes with a scalpel. Smith went unconscious again and woke up back at the campsite that he had been abducted from.

These terrifying experiences were uncovered several months later while Smith was under hypnotherapy. Smith concluded from the memories that welled forth under hypnotism that he had been abducted many times in the past, but this seems to have been the only time that it happened in collusion with the U.S. Navy.

One is tempted with this account to believe the stories that we hear of government/alien collaboration in abduction and hideous medical experiments--the sort of stories that John Lear and Bill Cooper used to make hay with on late night talk radio, and which still have some currency with the more excitable end of the UFO hobbyist community--but that is not the only possible explanation for the events that Smith says he endured.

The dark blue van is the obvious sticking point in this abductee's tale. Why, pray tell, would space aliens be driving around in vans in order to abduct people? Mysterious vans of this sort are also reported to have been prevalent during a UFO flap in Montana, with "Smithsonian Institute" emblazoned on the side. Researchers contacting the Institute found that they didn't know anything about the vehicles.

In John Keel's *The Mothman Prophecies*, he describes a similar modus operandi taking place in rural Virginia, at the height of the UFO flap of 1973:

> People up in the back hills had been seeing mysterious unmarked panel trucks which sometimes parked for hours in remote spots. There seemed to be several of these trucks in the area and the rumor was that they belonged to the air force. Men in neat coveralls were seen monkeying with telephone and power lines but no one questioned them...

It is perhaps a gauge of the quality of much UFO research that it is considered a serious possibility that these vans sometimes reported in conjunction with abductions and cattle mutilations (or alternately, the black helicopters that often show up around cattle mutilations) are disguised, shape-morphing extraterrestrial craft.

Strange, but if aliens are involved in all of this--and I have grave doubts that they are--instead of vans, wouldn't the more commonly described Star Trek-like "teleporter beams" as depicted in *Fire From the Sky* be more their speed, much more convenient, and less liable to be discovered? More to the point, when driving vans, would little grey aliens be able to see above the steering wheel?

Perhaps the answer is that the beings driving these vehicles aren't alien at all, or at least not quite so alien as we have been led to think. There is no shortage of available accounts of human beings being unaccountably connected to UFOs in the annals of this research, and "close encounters of the human kind" often take place without any accompanying extraterrestrial-appearing characters being involved in the incidents at all. Statistics compiled by James M. McCampbell in the book *Ufology* show, surprisingly, that over one third of "close encounters of the third kind" that are reported involve contact with UFO occupants who are apparently human.

John Keel is the source of another anecdote:

> One family of seven people swore they had seen a circular object land near a wooded area on Long Island. They stopped their car to watch and were astonished when they saw two figures, normal-human-sized beings, exit through a door in the object as a large black car crossed the field and stopped nearby. The two beings got into the car and it drove off. The object took off quickly and disappeared into the night sky.

Another UFO encounter involved two highly credible women, Betty Cash and Vickie Landrum, and Landrum's young grandson, Colby. The trio were motoring near Dayton, Texas in 1980 when they noticed an unusual moving light in the sky above them. They pulled the car over to the side of the road, and the light approached, hovering at approximately 135 feet in altitude and only a few hundred feet away, until it was so close that it was blinding in intensity. By that time the witnesses were able to perceive that they were viewing some kind of huge aerial craft.

Betty Cash, the driver, got out of the car in order to better view what they could now see was a huge, diamond-shaped craft. Flames shot out of the base of the UFO, and a roaring sound engulfed them. Betty Cash returned to the car, where she found the door handle hot to the touch. The strange aircraft slowly moved away. Then the observers saw the approach of twenty-three large, twin-rotor helicopters (apparently Army Chinooks), that looked as if they were escorting the UFO at a distance of about three-quarters of a mile.

After returning home all three of the witnesses of the strange craft had come down with what was apparently radiation poisoning. Betty Cash, the woman who had exited the car for a better look, suffered the worst case, with headache, loss of hair, eyes swollen shut, and sores on her skin, causing her to be hospitalized for six weeks. Since the incident Cash has also contracted cancer that she attributes to the incident. The other two witnesses suffered lesser degrees of eye inflammation and "radiation burns."

When contacted by Cash and Landrum, the Army responded in typical cover-up fashion. Despite the reports of other witnesses that Army helicopters had been in the area at the time of the UFO sighting, they issued a denial of having taken part in the maneuvers. An independent UFO investigator found a blackened area on the road in the vicinity where the witnesses had observed the UFO and

the choppers. Within a few days an unidentified road crew hurried to the location, dug up the portion of the road, and replaced it.

What these and similar accounts seem to say is that UFOs and encounters of the third kind are not always an entirely alien affair, that tabloid television may not have all the answers, and that humans may be involved to some unknown extent in many of these incidents--perhaps in some unknown plan of directed transformation that they are trying to implement. Few, very few, contemporary researchers have made this connection, most of them instead opting for the more-easily-graspable notion that the ufonauts are visitors from nearby star systems. There, leave it at that, they seem to say. What else could they be?

There are exceptions in the research community, however. Some prominent investigators such as Jacques Vallee, Martin Cannon, Alex Constantine, and John Judge seem to have entirely abandoned the idea that UFOs are extraterrestrial phenomena, although any alternate hypotheses are rarely hinted at in the mass media. Bogeymen "Greys" from outer space make better press it seems, and there are other reasons.

For the general public, I suspect the possibility that UFOs are controlled in some fashion by humans, for some conspiratorial purpose, is unthinkable. Why? The answer is simple. The public is the victim of a massive propaganda assault where you would be least likely to expect one. There is an almost total media blackout about the possibility that UFOs are anything other than extraterrestrial phenomena.

When humans are mentioned in relation to UFOs it is always in the context of some eldritch and vast science fictional conspiracy that includes government/alien collaboration and secret treaties, underground bases, and macabre scenarios of human-alien vat clonings. The monolith of this unlikely scenario is sustained upon a foundation of no hard evidence whatsoever; odd, since it apparently

involves hundreds of thousands of human participants scuttling in the dark underbelly of terrestrial politics and selling out the human race for a place in the sun after the coming alien takeover of Earth.

An additional filter on the truth is that the whole subject of the existence of secret, conspiratorial groups manipulating politics from behind the scenes is treated as a big joke by the media, and as the province of crackpots, as can be readily deduced from the treatment accorded to Oliver Stone's motion picture *JFK*. Six months prior to the release of the film, there was a huge media campaign to discredit the production, along with the whole notion of a conspiracy being involved in the John F. Kennedy assassination. Certainly there is abundant evidence showing that it is almost impossible that Lee Harvey Oswald was the sole individual responsible for the murder of Kennedy, and that the large number of inconsistencies in the government story suggest that a conspiracy is at least possible. But that evidence, so it seems, is irrelevant. There are no political conspiracies, and that's that, chump.

Likewise, against the preponderance of evidence, almost the entirety of UFO literature (including motion pictures and television) assumes that the solution to the enigma of the saucers is, in a sense, already known to us. It is taken for granted that we already know that extraterrestrials from other planets pilot these super-science craft. Perhaps, after all, it serves someone's purpose for the public to believe this way. Perhaps it assists the transformation I have spoken of, a transformation that is taking place all around us.

3

The Mind Manipulators

To understand the motives that might prompt humans to organize such a massive deception, a mass mind-twisting of this scope, I believe that we should look outside the literature of UFOs, consulting the history of other recent and verifiable mass manipulations and deceptions. If we are attempting to unravel the secret of the most perplexing mystery of this century, we should acknowledge that certain segments of mankind, in order to accomplish their power-hungry plans, have often been happy to pull a veil over the eyes of (if not put out the eyes of) their fellows who inhabit this earth.

Since the middle of this century (and very probably before that) the intelligence agencies of the United States, as well as other countries, have been involved in covert programs intended to modify beliefs and behavior--to control the minds of the population of the world. The rubric "National Security" is employed by these manipulators as a catch-all shield to veil the illegal (and definitely immoral) activities of intelligence agencies involved in a welter of Orwellian mindbending programs such as ARTICHOKE, MKULTRA, and MKDELTA.

Although intelligence agency brainwashing is only very rarely spoken of in the mass media, this does not reflect on its prevalence or on the magnitude of its ambitions, which have involved thousands of programs and billions of dollars of funding into research on mind alteration and the control of often unwitting victims. Many volumes (although few published by major

publishing houses) have been filled with horrendous accounts of brainwashing, electroshock, psychosurgery, drug experimentation, and the experimental injection of hostile bacteria and viruses, all performed by "our" employees, the U.S. military and intelligence agencies.

Walter Bowart in the classic expose *Operation Mind Control* characterizes the purpose of intelligence agencies as being

> ...to take human beings, both citizens of the United States and citizens of friendly and unfriendly nations, and transform them into unthinking, subconsciously programmed "zombies," motivated without their knowledge and against their wills to perform in a variety of ways in which they would not otherwise willingly perform. This is accomplished through the use of various techniques called by various names, including brainwashing, thought reform, behavior modification, hypnosis, and conditioned reflex therapy.

A survey of some of the gothic monuments in the landscape of mind control research include:

The advent of television in the late 1940s has provided a potent mind drug administered to the vast majority of the population. Providing a substitution for actual human life in the modulating and hypnotic electronic flicker of the television tube, studies have been conducted showing that television actually induces a trance state that, with years of watching, becomes permanent. Television is, without a doubt, the most potent societal soporific in the mind control arsenal.

Susan Bryce, writing in *Nexus*, aptly describes what takes place during television watching:

> There is so much information coming at viewers over a short time, that they sit lethargically staring blankly at the screen. This is precisely what you are supposed to do. In this lethargic mode, when people are almost snoozing, more is taken in subconsciously by the

> mind. Have you ever wondered why people fall asleep in front of the TV? Viewers become passive recipients, on the treadmill of mindless consumerism, routed endlessly from one shopping center to another, buying, buying, buying. Mass programmed shoppers. Becoming absorbed in the pursuit of media popularized roles or fashions, in the vain hope of becoming loved, respected, rich, socially popular or sexually desirable. Sheep who venerate compulsive neurotic behavior as normal, desirable human contact.

Madness Network News chronicles that:

> Between 1953-1967, the CIA paid Ewen Cameron over $18,000 to test LSD, Thorazine, and sensory deprivation on mental patients. Dr. Carl Pfeiffer was paid $25,000 a year by the CIA to drug prisoners with LSD. Dr. Harris Isbell drugged prisoners with LSD for 11 years under CIA auspices. Dr. Louis Jolyon West of UCLA, Dr. Sidney Malitz, Dr. James B. Cattell, Dr. Amadeo Marrazzi, Dr. Paul Hoch, and many other psychiatrists were also on the CIA payroll.

Robert Heath at Tulane University in 1955 was employed by the U.S. Army to combine the administering of LSD with implanted brain electrodes on psychiatric victims.

Between 1952-57 Dr. Paul Hoch at the New York Psychiatric Institute was funded to the tune of $200,000 by the Army, to research mind control by drugging on humans.

Nineteen fifty-six saw the CIA authorizing the use of Bulbocapnine and other drugs on state penitentiary inmates. Bulbocapnine was deemed to be especially useful in inducing catatonic states in which brainwashing and implanting of information or commands could be performed.

In 1961 Dr. W. Fry and Dr. R. Meyers conducted experimentation involving the use of focused ultrasonics to create brain lesions, while in 1963, Dr. Peter Lindstrom at the University of Pittsburgh used sonic beams in the focused destruction of brain

tissue--a technique said to have been evolved to replace pre-frontal lobotomies.

One prime notable in mind control is Dr. Jose Delgado who, beginning in the 1950s and funded by Naval Intelligence and the Air Force, among others, crafted the first radio controlled brain implants, what he termed "stimoceivers."

Delgado described the capability of these early, crude stimoceivers in the following terms:

> It is already possible to induce a large variety of responses, from motor effects to emotional reactions and intellectual manifestations, by direct electrical stimulation of the brain. Also, several investigators have learned to identify patterns of electrical activity (which a computer could also recognize) localized in specific areas of the brain and related to determined phenomena such as perception of smells or visual perception of edges and movements. We are advancing rapidly in the pattern recognition of electrical correlates of behavior and in the methodology for two-way radio communication between brains and computers...
>
> The individual is defenseless against direct manipulation of the brain because he is deprived of his most intimate mechanisms of biological reactivity. In experiments, electrical stimulation of appropriate intensity always prevailed over free will; and, for example, flexion of the hand evoked by stimulation of the motor cortex cannot be voluntarily avoided. Destruction of the frontal lobes produced changes in effectiveness which are beyond any personal control.

Delgado's stated purpose in the invention of the stimoceiver was the "master control of human behavior," although after a popular treatment of the subject in his book *Physical Control of the Mind* was released, research into the area of direct electrical stimulation of the brain was rarely referred to again.

In the mid-70s, Dr. Louis Jolyon West, director of the Neuropsychiatric Institute at UCLA, suggested a centralized "violence reduction center" to be created at an abandoned missile

base in California, a concept that was greeted with approval by then-Governor Ronald Reagan. West reported in a secret memo that one purpose of the center would be the implementation of brain surgery techniques: "...now by implanting tiny electrodes deep within the brain... [it] is even possible to record bioelectrical changes in the brain of freely moving subjects, through the use of remote monitoring techniques."

At the same time that the military and intelligence agencies were drugging, implanting, and sawing up the brains of their experimental subjects, the nation at large was being stupefied by massive drugging promoted by the so-called medical profession and the media as the answer to their cares.

Peter Schrag in *Mind Control* records that, "by 1975 American physicians were writing 240 million pharmacy prescriptions annually for psychotropic medication for people who were not hospitalized--roughly one for every man, woman and child in the country--enough pills all told to sustain a $1.5 billion industry and to keep every American fully medicated for a month." Since that time the prevalence of pharmaceutical drugging in this country has only increased.

During the 1960s a shift seems to have taken place in emphasis in mind control projects. The U.S. military commissioned a number of experimental projects delving into the use of electromagnetic frequencies for controlling and altering the behavior of subjects. Between 1965 and 1970, Project Pandora researched the effects of low intensity microwaves on the health and psychology of humans. This was at the same time that the American embassy in Moscow was being irradiated by microwaves by the Russians, causing numerous harmful physiological effects in the employees there.

Studying Soviet literature on microwaves for the CIA, Milton Zarat determined, "they believe that the electromagnetic field induced by the microwave environment affects the cell membrane,

and this results in an increase of excitability or an increase in the level of excitation of nerve cells. With repeated or continued exposure, the increased excitability leads to a state of exhaustion of the cells of the cerebral cortex."

Eldon Byrd of the Naval Surface Weapons, Office of Non-Lethal Weapons, engaged in research into anti-personnel electronics, described the effects of electromagnetic radiation on the offspring of animals. He spoke of "a drastic degradation of intelligence later in life... couldn't learn easy tasks... indicating a very definite and irreversible damage to the central nervous system of the fetus." Byrd also described experiments in which, "At a certain frequency and power intensity, they could make the animal purr, lay down and roll over."

Even more startling brain control possibilities were researched. A 1976 DIA report suggests that "Sounds and possibly even words which appear to be originating intercranially can be induced by signal modulations at very low power densities."

Anna Keel, in *Full Disclosure* magazine, discusses one such experiment:

> Dr. Sharp, a Pandora [Project] researcher at Walter Reed Army Institute of Research, some of whose work was so secret that the couldn't tell his boss, conducted an experiment in which the human brain has received a message carried to it by microwave transmission. Sharp was able to record spoken words that were modulated on a microwave carrier frequency by an "audiogram," an analog of the words' sound vibrations, and carried into his head in a chamber where he sat.

Dr. James Lin of Wayne State University in his book *Microwave Auditory Effects and Applications* discussed the Sharp experiment and remarked that, "The capability of communicating directly with humans by pulsed microwaves is obviously not limited to the field of therapeutic medicine."

Anna Keel writes:

> What is frightening is that words, transmitted via low density microwaves or radio frequencies, or by other covert methods, might be used to create influenoe. For instance, according to a 1984 U.S. House of Representatives report, a large number of stores throughout the country use high frequency transmitted words (above the range of human hearing) to discourage shoplifting. Stealing is reported to be reduced by as much as 80% in some cases. Surely, the CIA and military haven't overlooked such useful technology.

Keel also remarks:

> Another indication that the government entertained notions of behavior control through use of fields and sound, is a 1974 research proposal by J.F. Schapitz. To test his theory, his plan was to record EEG correlates induced by various drugs, and then to modulate these biological frequencies on a microwave carrier. Could the same behavioral states be produced by imposing these brain wave frequencies on human subjects? His plan went further and included inducing hypnotic states and using words modulated on a microwave carrier frequency to attempt to covertly condition subjects to perform various acts. The plan as released (through the Freedom of Information Act) seems less part of a careful recipe for influence than Adey's and other DOD scientists' work, and may have been released to mislead by lending an "information beam" science fiction like quality to the work.

In an upcoming chapter we will examine the possible use of an "information beam" employed in a highly science fictional manner.

A 1993 issue of the *Tactical Technology* newsletter reported on the then-current state of Soviet mind control technology:

> While visiting Russia in November 1991, Morris [Janet Morris, research director of the U.S. Global Strategy Council, a think tank located in Washington D.C., founded by Ray Cline, previously a deputy director of the CIA] and other members of a team sent to investigate

Russian technologies for commercial development were invited to a demonstration of mind control technology. A volunteer from the U.S. team sat down in front of a computer screen as innocuous words flashed across the screen. The volunteer was only required to tell which words he liked and which words he disliked. At the end of the demonstration the Russian staff started revealing the sensitive, innermost thoughts of the volunteer - none of which had been previously discussed.

The recorded message was mixed with what appeared to be white noise or static, so when played back it became indecipherable. Since there were no more volunteers in the U.S. group, the Russians volunteered to go upstairs and let the Americans choose a mental patient for demonstration. The Americans declined the offer.

The Russians told Morris of a demonstration in which a group of workers were outside the hospital working on the grounds. The staff sent an acoustic psycho-correction message via their machine to the workers telling them to put down their tools, knock on the door of the hospital and ask if there was anything else they could do. The workers did exactly that, the Russians said.

The Russians admitted to using this technology for special operations team selection and performance enhancement and to aid their Olympic athletes and an Antarctic exploration team. Unlike lie detectors, this machine can determine when the truth is spoken, according to Morris.

Being an infrasound, very low frequency-type transmission, the acoustic psycho-correction message is transmitted via bone conduction. This means that earplugs will not restrict the message. An entire body protection system would be required to stop reception. The message, according to the Russians, bypasses the conscious level and is acted upon almost immediately. They also say that the messages are acted upon with exposure times of under one minute.

Morris envisions this technology will be miniaturized into a handheld device. Presently the International Healthline Corp. of Richmond, Va., is planning to bring a Russian team of specialists to the U.S. in the near future to further demonstrate the capability...

Trilateral Commission kingpin Zbigniew Brzezinski has nicely summed up the mindset of the brain tinkers in these government-sponsored programs, in between gloating over the wonders of the coming New World Order in his book *Between Two Ages: America's Role in the Technotronic Era*:

> In the technocratic society [that Brzezinski sees as the New Order of society coming into ascendance after Marxism] the trend would seem to be towards the aggregation of the individual support of millions of uncoordinated citizens, easily within the reach of magnetic and attractive personalities effectively exploiting the latest communication techniques to manipulate emotions and control reason.

Could Zbig have been any more straightforward in talking about mind control?

We do know that authoritarian (and often covert) control of society continues unabated, the techniques becoming more finely honed as experimental subjects are utilized by the thousands and then discarded. The populace has been drugged, shocked, irradiated, made ill, manipulated, and even killed in the efforts of the military and intelligence agencies and their psychiatric dupes to devise the most effective and invisible manacles for the containment of members of our "democracy."

Is there any suggestion that this sort of mind programming might have been expanded to incorporate UFO incidents and the public's belief in UFOs to assist in their bamboozling? Whatever the answer, I believe that there is little doubt that such UFO incidents could be simulated in this fashion.

What additional capabilities than those described above, and the perhaps added usage of hallucinogens and hypnosis, along with various "extraterrestrial" stage props, would be required in order to convince an abductee that he had been waylaid by a flying saucer, rather than a dark blue van? I am not suggesting that this is the

entirety of the answer to the UFO riddle--but might not mind control experimentation of this sort, conducted with UFO space trappings, comprise a statistically significant part, and might not hoaxing, unusual natural phenomena, and the tendency for many UFO buffs to be extremely gullible account for most of the rest?

Ufologist Otto Binder has said, "At any rate, it would seem that the expanding series of saucer sightings in waves, from 1964 to date, is all building up to a crescendo, as if the saucer men are conditioning earth people in seeing saucers, and gradually forcing even the most recalcitrant scientists and government authorities to realize the sightings are not figments of imagination, but real."

The recent huge, triangular UFO seen by thousands of residents over Arizona is exactly the sort of sighting that cannot be ignored. But why would extraterrestrials have to be, or be interested in, conditioning humans to believe in their existence?

4

Infiltration

Although the forces that appear to dominate UFO research seem to prefer that everyone maintain a "Goshwow! Aliens are among us!" approach that beyond disinformational purposes also serves in marketing to the slack-jawed yokels with underbites, there seem to be certain forces afoot today other than just grey aliens. Although thus far we are only able to evaluate circumstantial evidence of UFOs being connected to human occupants (rather than aliens) and the military, there are a number of accounts of the military attempting to infiltrate public UFO research organizations, apparently in an attempt to monitor and disinform the field, and to delude the public at large on the subject of UFOs. On a number of occasions the UFO field has been infiltrated by military intelligence personnel, and well-known UFO "researchers," possibly even the majority of the prominent ones, have loyalties that seem not to reside with the UFO research community or with the truth.

In the early 1950s H. Marshall Caldwell, then acting as Assistant Director for Scientific Intelligence for the CIA, penned the following memo to CIA Director Walter Smith. Caldwell wrote:

> With world-wide sightings reported, it was found that, up to the time of the investigation, there had been in the Soviet press no report or comment, even satirical, on flying saucers, though Gromyko had made one humorous mention of the subject. With a State-controlled press, this could result only from an official policy decision. The question, therefore, arises as to whether or not these sightings:
>
> (1) could be controlled

(2) could be predicted, and

(3) could be used from a psychological warfare point of view either offensively or defensively.

The public concerns with the phenomena, which is reflected both in the United States press and in the pressure of inquiry upon the Air Force, indicates that a fair proportion of our population is mentally conditioned to the acceptance of the incredible. In this fact lies the potential for the touching-off of mass hysteria and panic... A study should be instituted to determine what, if any utilization could be made of these phenomena by United States psychological warfare planners...

In the book *Clear Intent*, authors Fawcett and Greenwood detail the destruction of the early civilian UFO investigative group, the National Investigations Committee on Aerial Phenomena (NICAP), by government intelligence agents. They cite the involvement in the group of Nicholas de Rochefort, member of the Psychological Warfare Staff of the CIA, Vice Admiral Roscoe Hillenkoetter, a director of the CIA, and Bernard J.0. Carvalho, another apparent CIA asset.

They describe the removal of Donald Keyhoe as NICAP's director in 1969, and point to the actions of chairman of the board Col. Joseph Bryan, former chief of the CIA's Psychological Warfare Staff as being instrumental in Keyhoe's ouster. They also note that John Acuff, the head of the Society of Photographic Scientists and Engineers--connected to Defense Department intelligence units and the CIA--was the man who replaced Keyhoe. Acuff seems to have defanged NICAP, as far as the government was concerned, turning it into a sightings collection group without a trace of its earlier governmentally-critical policy, an approach that eventually drove the organization out of business. Acuff was replaced by Alan Hall, retired from the CIA, with the group eventually being dissolved.

Further investigation of government manipulation of UFO researchers must include a mention of William Moore, the co-author of *The Philadelphia Experiment* and *The Roswell Incident*, as well

as editor, until recently, of *Far Out* magazine, published by Larry Flynt of *Hustler* fame. Moore, who continues to be a medium weight popstar of the UFO research field, for reasons which remain unclear to me admitted at the 1989 MUFON Symposium that he had functioned as an agent for members of the U.S. military, reporting on at least one UFO group and involved individuals in exchange for "leaked," allegedly secret government documents about UFOs. To me this is astounding. The only reason I can imagine that Moore might betray his own activities in this way is that he feared that someone else was going to "out" him as working with the government, and he was attempting damage control by his "voluntary" admission.

Other information on Moore involves the matter of UFO researcher Paul Bennewitz. Bennewitz, a self-employed electronics expert, believed that he had discovered alien technology in action at Kirtland Air Force Base in New Mexico, and contacted the military in an attempt to alert them. Bennewitz was apparently fed a series of documents outlining military collaboration with the aliens and other matters that are currently the stock-in-trade of the "Aliens are among us and polluting our vital bodily fluids!" end of the UFO research spectrum.

According to Moore, "[Bennewitz] was the subject of considerable interest on the part of not one, but several government agencies, and [I discovered] they were actively trying to defuse him by pumping as much disinformation through him as he could possibly absorb..."

Moore admits that he knew that Bennewitz was being disinformed by the government--with evidence suggesting that Special Agent Richard Doty was at least partially responsible--but according to his own admission he took no action to disabuse Bennewitz of the lies that, Moore says, were gradually driving him crazy. Bennewitz got to the point where he believed that aliens were

invading his house and poisoning him. He gradually broke down from the disinformational (and perhaps other) attacks, until he was put into a psychiatric hospital.

Sergeant Richard Doty, one of Moore's contacts who was involved in the Bennewitz matter, was a special agent with the Air Force Office of Special Investigations at Kirtland Air Force Base in Albuquerque, New Mexico. During the course of his employment with AFOSI he invited Linda Moulton Howe--a well-known investigator of cattle mutilations who oddly never seems to bring up the government connection--to visit him at Kirtland. Once Howe had arrived at the Air Force base, Doty showed her alleged secret documents that seemed to reveal information on crashed alien vehicles and their occupants.

According to Howe:

> These pages... contained a summary of this government's retrieval of crashed disks and alien bodies, including a live alien from a crash near Roswell in 1949. The paper said that this extraterrestrial had been taken to Los Alamos National Laboratory, where it had been kept until it died of unknown causes on June 18, 1952. Then the paper summarized some of the information that had been learned from this distinctly alien life form about our planet and its civilization's involvement with this planet. One of the paragraphs said, "All questions and mysteries about the evolution of Homo Sapiens on this planet have been answered, and this project is closed," ...Further, it stated in the paper that these gray extraterrestrials had been personally involved in the genetic manipulation of already evolving primates on this planet, suggesting that Cro-Magnon was the result of genetic manipulation by the gray extraterrestrials.

Another meeting was arranged between Captain Robert Collins, Howe, and John Lear, the UFO "expert" and former employee of the CIA. Lear is the man who has done more than anyone including Bill Cooper to convince the public that aliens are

among us, living in huge underground bases, and collaborating with the government to put us all in the vat-prepared soup. Collins furnished Lear and Howe with more alleged secret documents on the aliens, and mentioned to her that he had worked with William Moore for years.

It also is within the sphere of William Moore's influence that the bogus MJ-12 paper, a faked 1947 presidential "briefing document" on crashed saucers, surfaced.

5

MJ-12

In mid-1987, when UFO buffs first got the MJ-12 document in their hands, many of them thought that they were fondling the Holy Grail of UFO research. This photo reproduction of an eight-page alleged government document is purported to be a preliminary briefing on UFOs for President-elect Eisenhower, released on November 18, 1952 (also officially the first day of the formation of the CIA).

The MJ-12 document was allegedly used to brief Eisenhower by Rear Admiral Roscoe H. Hillenkoetter, said to be a member of Majestic-12, a top secret research team composed of scientists and military men empowered to investigate UFOs. The MJ-12 document claims that in July, 1947, an alien disk craft crashed in Roswell, New Mexico, and that a second craft crashed on the Texas-Mexico border in 1950.

From where did this historic and apparently earth-shaking MJ-12 document originate? In December, 1984, a roll of undeveloped 35mm black and white film was received in the mail in Burbank, California, by Jaime Shandera, a television producer. Shandera has said that the package was postmarked at Albuquerque, New Mexico. The roll of film was developed by Shandera and William Moore, who found photo images of the pages of the MJ-12 document.

The first publication of a portion of the MJ-12 document appeared in the *London Observer* newspaper, on May 31, 1987. A small portion of the document was printed in an article by Martin

Bailey, titled "Close Encounters of an Alien Kind--And Now if You've Read Enough About the Election, Here's News from Another World." The article was reprinted in many American newspapers in the weeks that followed.

According to British UFO researcher Timothy Good, he was the first to publish the complete MJ-12 document, in his book *Above Top Secret*, in May, 1987. Where did Good get his copy? He stated, "I received the document from a CIA source in March of 1987." When queried as to whether the CIA source had anything to do with William Moore, Good responded, "I am sure. Oh, absolutely."

The document was published and re-published in magazines, analyzed, touted as extraterrestrial gospel, decried as a hoax. But it captivated the imaginations of many UFO researchers, and injected life into an ailing UFO research field to a degree that had not been seen since the halcyon days of the 1960s.

For those UFO buffs who are interested in objective evaluation the fact that no original copy of the MJ-12 document is available is only one of the difficulties in proving or disproving its validity. Because of this fact, no evaluation of the authenticity of signatures, paper, or ink can be made.

The document also is suspiciously similar to a description of the one that was shown to Linda Moulton Howe at Kirtland Air Force Base, if a more refined version.

Other details suggest that the document is a hoax. The dating format is a mixed civilian and military style, as for instance in the date, "18, November, 1952." The military format would be 18 November, 1952," lacking the added comma. Single digit dates also have an added zero inserted before them in the MJ-12 document, a practice that did not come into use in the military until the 1970s. As pointed out by debunker Philip J. Klass, in available examples of Hillenkoetter letters and memoranda, the conventional military date format is used.

Also, according to Klass, a Los Angeles document examiner has determined that the typewriter used to type the MJ-12 document was not available before 1963.

Researcher Kevin Randle points out another significant discrepancy in the MJ-12 document: "The document is constructed as a briefing paper for President-elect Eisenhower, suggesting that Eisenhower had no knowledge of the Roswell crash. The problem is that Eisenhower, as the Army Chief of Staff in July 1947, would have been completely aware of the Roswell crash."

The MJ-12 report does not resemble in style or substance anything else that I have seen originating from the government, and I have examined hundreds of government documents originating from the same period, many of them dealing with UFOs. The document is also not written in typical "bureaucratese," that elusive jargon so valued in government circles.

The main problem with the MJ-12 document for me, however, is that it solves too much, wrapping up too many of the loose ends of the contemporary UFO controversy, and "proving" exactly what most UFO buffs "already know." Little new information is offered on the alleged saucer crashes themselves, which is rather odd given the fact that this constitutes our first clear look inside the "Cosmic Watergate" so toured by Moore, Stanton Friedman, and others. If this in fact is a briefing provided to Eisenhower, then it is a comic book briefing that would have raised far more questions in the President-elect's mind than it answered. The loose ends that are wrapped up in the document also neatly intersect with the specific stated beliefs and investigative involvement of the men most closely associated with the report: Shandera, Moore, Friedman.

After the publication of the MJ-12 briefing documents, another unsigned document was allegedly discovered in the National Archives, dated July 14, 1954. This is a purported memo to General Nathan Twining, Air Force Chief of Staff, from Robert Cutler,

Eisenhower's Special Assistant for National Security. This document states, "The President has decided that the MJ-12 SSP briefing should take place during the already scheduled White House meeting of July 16, rather than following it as previously intended." The alleged memo was unsigned, with Cutler's name and title typed at the page bottom. Advocates of the authenticity of the original MJ-12 pages claim that the Cutler memo provides proof positive that the document--and the alleged secret MJ-12 consulting group--was real, while detractors suggest that the memo is just another fake.

The authenticity of the Cutler memo, this supposed confirmation, is doubtful. Advocate Stanton Friedman insists that the memo is real because "it was in a classified box in a classified vault," but this only points up Friedman's willingness to overlook the obvious in his anxiety to verify the MJ-12 document. What would have stopped someone from carrying the Cutler memo in with them when examining the supposedly secure box?

Jo Ann Williamson, Chief of the Military Reference Branch, has indicated that "this particular document poses problems" in a number of ways. Williamson points out that it is not typed on government letterhead and does not have a watermark; it does not have a top secret registration number; it is the single document with a notation about MJ-12 in the folder in which it was found; the marking TOP SECRET RESTRICTED INFORMATION attached to it was not used until many years after the Eisenhower administration; and Robert Cutler was traveling in Europe and North Africa on the day the memo was supposedly issued.

Other significant factors, possibly the most significant in the evaluation of the authenticity of the MJ-12 documents and the Cutler memo are the associations of their recipient and primary disseminators. Jaime Shandera, who reportedly received the film containing images of the MJ-12 document, had in 1980 been involved in pre-production for a fictional movie about UFOs with

Stanton Friedman and William Moore. Some rash souls have suggested that the production of the MJ-12 document may have been their next fictional foray. Shandera had also "been working closely with Bill Moore and myself on the Roswell crash," according to Friedman.

Shandera and Moore had both been in contact with Richard Doty, who was at the time of the MJ-12 document's release working for the Air Force Office of Special Investigations. Doty was trained in disinformation and psychological warfare, and allegedly a self-admitted member of a disinformation group. According to published reports, Moore has stated that Doty reported to a Pentagon official named Hennessey, reportedly chief of security for the Stealth project. It is impossible to gauge Doty's actual connections, since portions of his service records are censored, although while stationed at Linsay Air Force Base in West Germany, according to Klass:

> Doty was charged with falsifying official documents and telling falsehoods to his commanding officer. A formal investigation confirmed these charges and Doty was "decertified" as a special agent [with the] Air Force Office of Special Investigations and returned to Kirtland AFB in late 1986. Doty spent his last two years before retirement in food services management.

Doty was allegedly involved in an earlier UFO hoax regarding a sighting near Kirtland Air Force Base in 1980. An anonymous letter, purporting to be from an airman and indicating that the same information had been submitted to the Office of Special Investigations, was sent to a UFO organization. According to researcher Robert Hastings, "careful analysis of the anonymous letter reveals that it was almost certainly typed on the same typewriter used by Doty..."

According to Dr. Bruce Maccabee of the Fund for UFO Research, Doty also confessed to William Moore that he been involved in another hoaxed UFO incident, called the Ellsworth case, and that he had forged documents and submitted them to researchers as authentic.

Was Doty or the OSI the source of the MJ-12 documents? Did he forge them? No conclusive proof exists.

But the plot continues to thicken. Researcher Lee Graham has reportedly said that William Moore had contacted him "in an intelligence capacity" and that he worked for the government in releasing sensitive UFO information. According to Graham, Moore had flashed a Defense Investigation Service badge, although Stanton Friedman in his 1996 MJ-12 apologia titled Top *Secret/Majic* puts a different spin on the event. Friedman says, "As a joke, Bill once pulled out a MUFON identification card, flashed it at Lee, and indicated that he was working for the government. Lee bought it." This sidesteps the issue of this alleged impersonation of a government official, as well as Graham's memory of a government badge, not a MUFON card. Friedman carefully sidesteps these matters in his defense of a person who has otherwise admitted to collaborating with agents of the government!

Another issue that Friedman does not approach in *Top Secret/ Majic* is Moore's association with men claiming to be Air Force intelligence. Although I was not present at the 1989 MUFON Conference at which William Moore spoke, Jacques Vallee was, and offered the following description:

> In a confused and embarrassing presentation before the MUFON Conference, Bill Moore indeed confessed that he had willingly allowed himself to be used by various people claiming to act on behalf of Air Force Intelligence and that he had knowingly disseminated disinformation, although he has never been "on the payroll." This is a

> mere play on words, of course. Not being on the payroll does not mean that he was not paid in cash or through other means...
>
> Moore gave a weak excuse for his actions, claiming that he had acted in a heroic private effort to infiltrate and ultimately expose the operation.

Does Friedman avoid bringing up these matters because they provide additional evidence that the MJ-12 document is a hoax, or simply because he is Moore's friend? It is impossible to know, although Friedman's recent career as a "UFO expert" has been largely based on protesting too much about the discrepancies in MJ-12.

Although the MJ-12 document has not been conclusively proven to be a fake, the weight of evidence suggests that this is the case. More significantly, to be given serious consideration, in order to be factored in as valid data into any real evaluation of the nature of UFOs, it must be proven to be real, and this certainly has not taken place.

In a sense, it doesn't matter if the MJ-12 document or the Cutler memo are proven to be counterfeit, since the majority of UFO true believers will continue to believe what they want, despite any facts to the contrary. My experience is that a significant portion of the UFO hobbyist community use their obsession as a form of excitement, for the feeling of being "in the know," and as a substitute for a life. Deep down, they hope that we are being invaded by evil aliens!

That aside, it is obvious that the government is attempting to defuse UFO investigations by overwhelming them with incendiary disinformation and by having informants report on the activities of groups and individuals. This is no longer the matter of conjecture that has buzzed among UFO researchers since the earliest days of these investigations. Now there is more than enough proof to show that this is the case.

Providing more support for the idea that UFO abductions may have more to do with humans than aliens, we do know that the American government, at least, is in possession of top secret aircraft of a radically different type than orthodox aircraft, and that these may include saucer craft. Certainly there is much evidence to show that advanced disk craft designs confiscated from the Germans after World War II may have been put into production.

It is only in recent years that the existence of this kind of aircraft has been able to be fairly easily verified by observation outside the military installation known as Area 51 in Nevada. Before this sort of testing moved on to other regions, large crowds would gather outside this military preserve for UFO watching parties. There, on many nights (Wednesday was said to be the most active night for the flights), one was able to observe strange aircraft doing aerial maneuvers that would have been impossible for the unclassified aircraft of which we are aware. But that does not make these craft extraterrestrial, nor does it make them extraterrestrial/human technological hybrids. It does make it obvious, however, that the people who maintain that this is the case, without a shred of hard evidence, are blithering idiots.

The relatively common occurrence of garden variety humans being seen in the vicinity of, entering and leaving, and sometimes piloting UFOs may be another significant clue as to the meaning and origin of these craft. Many operations which are said to take place inside the saucers and performed by "alien" beings are in fact carbon copies of the kind of operations performed on the restraining tables of psychiatrists in the employ of the CIA and other military and intelligence agencies--right down to the reports of tiny electronic brain implants inserted through the nose, the standard insertion technique for both brain control shrinks (as exemplified by Dr. Jose Delgado, the originator of the technique) and, so we are told, the grey aliens.

6

A Symbolic Odyssey

It has been established, I think, that there are aspects of the UFO mystery that owe more to the activities of humans than extraterrestrials. But my purpose is not simply to show that humans forces of some sort--perhaps the CIA--are hoaxing the populace into believing that the aliens are here and pose a threat to the well-being of mankind. I am hoping to provide a look into the purpose behind the hoaxing.

There are strange clues that need to be examined in detail; these involve a tangled web of symbolism in the UFO mythos that, fortunately, resolves into a single meaning: Trust me on this. As I cite each reference in this symbolic odyssey, I will try to distill the relevant images that will assist in forming a conclusion.

In the incredible account "My Life Depends On You!", which has circulated widely in the underground press, Martti Koski describes the experience of literally going mad. In 1975 he began to be plagued by unwanted voices that he believed were being broadcast from the hotel room above him. Assuming that he was experiencing a neurotic bout he put up with the voices until, in the late summer of 1979, his mental torture escalated. Now Koski found that he was losing control of his bodily functions, and that his senses were being scrambled. His heartbeat became erratic to the point that he entered the University of Alberta Hospital in Edmonton, Canada.

Once checked into the hospital, the voice in his head identified itself, claiming to be a spokesman for the Royal Canadian Mounted Police, and telling Koski that he had been chosen to be a spy. The

voice dubbed Koski the "Microwave Man." Koski claims that while in the hospital bizarre experiments were performed on him by the doctors while, in the meantime, interior voices were telling him to perform acts like stealing shirts and engaging in covert sales of cigarettes to other patients.

After leaving the hospital, Koski attempted to escape the barrage of voices by traveling to his native Finland, but to no avail. The voices did not let up.

After eighteen years of psychic attack, Koski has, to a degree, learned to live with it. In Finland he works with other individuals who claim that they have been victims of government mind control experimentation, some of them being able to back up their claims with x-rays that seem to show tiny mushroom-shaped brain implants.

Koski's plight may be interpreted in at least two ways. He may be simply crazy, and the voices may be entirely the product of his own mind. The lucidness of his written account of his ordeal, however, argues against this possibility. He may also be correct in his conclusions. He may be mind controlled by, as he suspects, the RCMP. Certainly there is a huge body of literature detailing the activities of government intelligence operations on civilians, and there is proof that brain implants in fact actually are performed, including numerous x-ray photos of tiny, otherwise unexplainable brain implants. It is also interesting that the most infamous of doctors working in the CIA MKULTRA mind control experiments of the 1950s was Dr. Ewen Cameron, his horrendous experimentation performed at his gothic Ravenscrag facility in Montreal, Canada.

But there is an additional strange element to the Koski story that may provide a piece to the puzzle that we are researching. After Koski returned to Finland, the voices he was hearing began to tell him a different story. Now they told him that they weren't RCMP, at

all. They were beings from the "Dog Star," Sirius. So Koski is being mind-manipulated by extraterrestrials?

There are further symbolic linkages on this speculative trail that may or may not lead to the stars. At the beginning of this century, contact with the Sirius star system was claimed by the occultist Lucien-Francois Jean-Maine who, through the famous occultist Papus, learned the rituals of the Ordo Templi Orientis lodge, founded by Aleister Crowley, and formed his own group in his native Haiti. Jean-Maine is said to have in 1922 combined the OTO rituals with voodoo practices to form the Cult of the Black Snake in Haiti. He also claimed to be in contact with a disembodied being or voodoo loa named Lam, an entity who OTO Grand Master Kenneth Grant said was one of the Great Old Ones, an elder as well as eldritch god nigh-identical with those portrayed by the American horror writer H.P. Lovecraft in the 1920s and 30s.

Lam, according to Grant, has the task of uniting the current that emanates from the Andromeda galaxy with the current that flows from Sirius. Grant believed that a dimensional portal exists in the Andromeda galaxy, and through this portal will enter the Old Ones, demonic entities intent on returning Earth to their dominion and having humanity for breakfast.

Prior to Jean-Maine's contact with Lam, the famous occultist and founder of the OTO Aleister Crowley reported that he had summoned the same entity through one of his own "magickal" workings. Crowley also penned a drawing of Lam, reprinted in Kenneth Grant's *The Magical Revival*, adding another strange dimension to the now inter-dimensional puzzle.

Crowley portrays the entity Lam as a prototypical big-headed "Gray," i.e. as the picture of modern popular conceptions about what a UFO alien is supposed to look like. Crowley, relates Grant, also "unequivocally identifies his Holy Guardian Angel with Sothis

(Sirius), or Set-Isis." The obvious connection here is the significance of Sirius, although the Ordo Templi Orientis lodge, Crowley, and Lam also have their own special relevance.

Evaluating this mish-mash of occultism, who would imagine that the telepathic transmissions from Sirius might have something to do with military intelligence? Occult investigator James Shelby Downard, in his wonderful "Sorcery, Sex, Assassination, and the Science of Symbolism" (published in my *Secret and Suppressed* anthology) researches the existence of a Sirius-worship cult that he believes exists at the highest levels of the CIA! He cites as one of their ritual locations the telescope viewing room of the Palomar Observatory in California. There, he says, the adepts of the Sirius-military intelligence cult enact rituals in the telescopically-focused light of the Dog Star, in imitation of the Egyptian priesthood, astral rays bathing the viewing chamber and the participants when the telescope is aimed Sirius-ward.

Utter madness? Tell that to Colonel Michael Aquino of U.S. military intelligence, the admitted head of the satanic Temple of Set, a deity identified in occultism with Sirius. Aquino makes no bones about the fact that he is the head of his offshoot of Anton LaVey's Church of Satan, known to draw many of its leaders from military circles. Again, we see the strange conjunction of Sirius, occultism, and military intelligence.

Another occultist and "spirit channeler," championing the cause of Sirius, the Dog Star, in the 1950s and 60s, was well-known ufologist George Hunt Williamson (the penname for Michel d'Obrenovic). Williamson authored the classic UFO book *Other Tongues--Other Flesh*, an extended treatise on the beneficence of the ufonauts from Sirius, who supposedly provided mankind with civilization in the far distant past.

Williamson treats this theme at length again in his book *Secret Places of the Lion*, extolling the "Goodly Company," the "Star

People," the "Children of Light," who "migrated to earth"--the "dark star"--"planet of sorrows"--about eighteen million years ago and have worked ceaselessly and tirelessly in their gigantic task of acting as the Creator's mentors to a backward, fallen race.

Williamson claimed that he had met these benevolent "space friends," and was in fact a member of the group of witnesses who claimed to have seen George Adamski contact a saucer craft and an alien being in the California desert. The alien warned him about the evil influence of the beings from Orion.

Williamson also rhapsodizes at length, but in a somewhat circumspect fashion, on the seemingly-unrelated theme of Solomon's Temple and the reappearance of the Messiah, hinting at certain "secrets" relating to same. Although it may seem quite a digression, Williamson's treatment of the Messiah theme provides the solution as to his own and to others' "secret" orientation in ufology.

Drawing upon a selection of quotes from his book, Williamson maintains that:

> Throughout the entire history of the earth, the "Goodly Company" or the multitude of "Christ Souls" have incarnated in a group...
>
> Pharoah was addressed as "The King, the Ra, the Sun." This signified his position as leader of the "Goodly Company" of star born beings dedicated to the salvation of a planet!...
>
> A special hereditary order of men was now created to keep a semblance of Aton (One God) worship amongst the Israelites; although the Greater Light could not be theirs because they were not yet ready for it, a less spiritual worship was set up, based on pagan ritualism, that nevertheless was symbolic in its sacrifices, ceremonies, vestments, etc...
>
> The promise of an Eternal King, to arise out of David's Family, was repeated over and over again: to David, to Solomon, and again and again...

> There are references to the breaking of the bread and drinking of the wine as a symbol of "the sacred repast." The wine represents the "Holy Vine of David" and the bread "the life and knowledge of God." Those "Children of the Greater Light" who are descendants of the "Holy Vine of David" serve, through the "sacred repast," "the life and knowledge of God!! God made a covenant with David of an eternal dynasty."...
>
> David and Bathsheba prepared the way for the coming of the Master or the Fulfillment in Israel...
>
> When Solomon ascended the throne of his father, he consecrated his life to the erection of a temple to God and a palace for the kings of Israel. David's faithful friend, Hiram, King of Tyre, hearing that a son of David sat upon the throne of Israel, sent messages of congratulation and offers of assistance to the new ruler...
>
> Now we are entering the "twilight of the gods," when the final destruction of the Old Age will take place and man and the gods will be regenerated and reunited! Man will have revealed unto him a true vision of his eternal heritage--that earthly things may show him the nature of his spirit!

So sayeth George Hunt Williamson. But what do the Temple of Solomon, Hiram, King of Tyre, the "Holy Vine of David," the ancient manipulation of Earthlings by space aliens, and the coming "Fulfillment in Israel" have to do with Sirius, the Dog Star? A surprisingly large amount, it turns out.

A more recent version of essentially the same Sirius scenario is provided by the UFO contactee Oscar Magocsi.

After contact with the extraterrestrials, Magocsi believes that he has a mission to impart the wisdom of the "Psycheans," members of the "Interdimensional Federation of Free Worlds," whose base of operations is located near Arcturus. Magocsi reports that humanity migrated from the Pleiades thousands of years ago, and that we (and the Interdimensional Federation) are at war against evil forces from Draconis. These Dark Forces, Magocsi maintains, rely on human allies--the Illuminati secret society--whose mission is to assist in

enslaving mankind through a long term disinformation operation intended to portray them as forces of good hailing from the Orion nebula. There are, Magocsi claims, actual good guys from Orion--he dubs this faction the Lords of Light--but the Illuminati are a different bunch altogether. Magocsi also maintains that a particular area of positive influence is Sirius, the intelligences there supposedly beaming telepathic transmissions intended to counteract the bad vibes of the Dark Forces.

7

Increase of Resolution

A few additional notes need to be added to this mystic cacophony before a conclusion can be drawn about Sirius, the Temple of Solomon, and the nature of UFOs.

A remarkable UFO group was contacted by Jacques Vallee in Paris, France. The group is called the Order of Melchizadek, and it uses the Star of David for its emblem, and for its program espouses a one world government and the doing away with money and religion--except for the UFO-oriented sort of religion, I would imagine. The Order is cabalistic in its mystical practices, the Qabalah being an ancient form of Jewish mystical cosmology, a philosophy also employed by other occult groups such as the OTO and the Freemasons. Vallee notes the curious number of organizations that the head of the French Order of Melchizadek fronts, including the Front for Christian Liberation, Jesus People Europe, Jesus Revolution, the Charismatic Christian, the Christian Socialist Party, and Jew and Arab movements. Here relevant cross-currents include cabalism, the Order of Melchizadek, and the Star of David. Throw in one world government and the abolition of money and religion for good measure.

Another French UFO group that Vallee investigated should be stirred into the melange. The Frenchman Claude Vorilhon was taking a pleasant hike in the mountains one day--so he relates--when he saw a UFO hovering nearby, the craft bearing a Star of David with a swastika inside the emblem. A glowing childlike figure stepped forth from the craft. The child conversed with Vorilhon,

bestowing a new name on him, "Rael," and informing the man that the reason he had been chosen to be contacted was because France was the birthplace of earthly democracy during the French Revolution. The being entrusted Vorilhon with the mission of building an embassy in which the aliens, which Vorilhon calls the Elohim, from the biblical reference, could meet with dignitaries of Earth, with the stated task of spreading "Peace, Love and Fraternity."

Vorilhon was informed that humans had been created by the Elohim, godlike space travelers who were also skilled in the arts of DNA alteration and cloning. Vorilhon was now to assist the Elohim in preparing mankind for the final age of Revelation. Vorilhon, now going by the name Rael, insists to his numerous followers that "A world government and a new monetary system must be created. A single language will serve to unify the planet."

He and his followers now sport the Star of David/swastika that he observed on the side of the UFO, and practice a form of "sensual meditation" that may be similar to kundalini yoga as practiced by the OTO and other groups.

Of the Rael cult, Jacques Vallee observes:

> The most remarkable facts about Rael-Vorhilon are that he has acquired a large number of disciples--including thousands of followers in French Canada--and that the cult seems to have sources of income beyond the donations from his flock, leading some to speculate that the Raelian movement... like Jim Jones' People's Temple, may have attracted the attention of social engineers motivated by the observation and management of such belief systems.

An additional case, that of Betty Andreasson, should serve to link this twisted chain of incidents.

Andreasson's abduction was the subject of a book by Raymond Fowler, titled *The Andreasson Affair*. Although her case has been

discussed at great length in the UFO-related press, and has been the subject of a number of television segments, no one has satisfactorily explained the extremely strange nature of the events she experienced, ones that are quite different from typical UFO abduction events, as least as they are usually presented.

Taking place in 1967, the events of Betty Andreasson's abduction were later brought out through the use of hypnosis. Andreasson recalled being kidnapped from her home and spirited away into what appeared to be a spacecraft. She was transported to an unknown location and then taken through a series of underground passageways that she believed were part of a city. Arriving at an underground chamber, Andreasson experienced, in a manner that she describes as highly painful as well as emotional, a kind of mythic psychodrama enacted before her which may not have been different from the kind of mystical dramatizations enacted in ancient Mystery Religions and other mystic cults.

She saw a huge bird, that she estimated to be fifteen feet in height, resembling an eagle but with a more elongated neck. The creature was apparently alive, but as Andreasson watched it, it began to transform. It began to glow with a light and heat that was so intense as to cause her pain. When the heat and light had diminished the bird was gone and she was gazing on a pile of flickering embers.

As Andreasson stared at the embers she saw a worm wriggling in the ash. "Now, looks like a worm," she described it during her hypnosis, "a big fat worm. It just looks like a big fat worm--a big gray worm just lying there."

Also during the experience, Andreasson was told by her abductors, "We are going to measure you for light... You have not completely understood the word that you have. You are not completely filled with light."

She said, "I believe I am filled with the light! I believe--I believe that I'm filled with the light!"

Andreasson also recalled that, "They called my name, and repeated it again in a louder voice. I said, 'No, I don't understand what this is all about, why I'm even here.'

"And they--whatever it was--said 'I have chosen you.'

"'For what have you chosen me?'

"'I have chosen you to show the world.'

"'Are you God?' Andreasson asked, 'Are you the Lord God?'

"'I shall show you as your time goes by.'"

The following text is part of an interview with Betty Andreasson, conducted by Raymond Fowler:

> FOWLER: Have they [the UFOs] anything to do with what we call the second coming of Christ?
> ANDREASSON: They definitely do.
> FOWLER: When is this going to occur?
> ANDREASSON: It is not for them to tell you.
> FOWLER: Do they know?
> ANDREASSON: They know the Master is getting ready, and very close.

Since we are ranging cosmically far afield in our search for connections, it should be noted that Eye in the Triangle emblems have been seen on some UFOs and the uniforms of their occupants, that Men in Black sometimes wear the same emblem and speak of themselves as being members of the "Nation of the Third Eye," and that in recent years a significant percentage among 2,000 UFO sighting reports in Belgium describe triangular craft with lights at each point of the triangle, and another light in the center of the triangle. This may be the same gigantic aircraft seen over Phoenix, Arizona in 1997--again, the Phoenix!--a craft identified as being a

UFO in the news media, but conforming to descriptions of top secret aircraft currently being produced by the military.

To reiterate the elements I have been stirring together in this and the preceding chapter: the "Dog Star," Sirius--the "Lords of Light" and various other references relating to light--the Eye in the Triangle--the Illuminati--Set--Isis--the Temple of Solomon, the Star of David, and God's reported covenant with Israel--the Qabalah--and the Phoenix. All of these symbols convey a single Earthly origin.

Is it surprising to note that these are the symbols and catchphrases of a secret society that has existed since--conservatively--at least the 1700s, and which draws upon mythology that began with the Egyptians, if not earlier. That society is the Illuminati, whose most visible proponents currently are the Freemasons, a secretive fraternal order with many members among the ranks of prominent world leaders, politicians, intelligence and military, and with conclaves located in virtually all towns of any size in America. Although the vast majority of Freemasons know very little of such arcane imagery and purposes, the information is there to be perused in their books and in the performance of their mystical initiatory rites.

Albert Pike, the head of the Scottish Rite of Freemasonry in the 1800s, announced that, "Sirius still glitters in our Lodges as the Blazing Star *(l'Etoile Flamboyante)*." He also spilled the symbolic beans when he said that Sirius was interchangeable with the Eye in the Triangle, the Mother Goddess Isis, and the pentagram beloved of many a mystical sect.

One of the secrets, perhaps the core secret of the Illuminati and of their related societies (including the Freemasons and the Priory of Sion secret society as revealed and simultaneously concealed in Baigent, Lincoln, and Leigh's seminal *Holy Blood, Holy Grail*) is

that the overall goal of this secret society is the rebuilding of the destroyed Temple of Solomon in Jerusalem.

The secret within the secret is that this is the purpose of the New World Order (another Illuminati conception), namely the enthronement of a new Messiah from the genetic line purported to descend from King David (and Jesus, thus fulfilling the ambitions of both Jews and Christians) who will rule over the world in feudal fashion and supposedly usher in a new era of transcendent wonderfulness.

Gibberish? The Freemason Pike said in the 1800s: "Behold our object, the end, the result, of the great speculations--of antiquity; the ultimate annihilation of evil, and restoration of Man to his first estate, by a Redeemer, a Masayah, a Christos, the incarnate Word, Reason, or Power of Deity." When Freemasons tell you that the group is all about performing good works and driving around in funny little cars on the fourth of July, don't believe them. They have a metaphysical agenda, although only those initiated at the highest levels are aware of it.

This agenda is exactly what George Hunt Willamson is getting at when he talks about the "Holy Vine of [King] David": a physical bloodline of individuals descended from the alleged marriage of Jesus and Mary Magdalene, and from King David. This scenario is also a key to the battle plan of the New World Order (whose agenda seems to go back, in this instance, to at least the time of the Knights Templar).

So UFO celebrity George Hunt Williamson had it, and so the varied branches of the Illuminati have it, although in highly cryptic fashion. If it is thought that Williamson is merely echoing biblical themes and in fact had no secret Masonic orientation woven into his writings on UFO contact, we should listen further to his words:

"Solomon," Williamson says, "was a great artist; he designed most of the burnishings for his Temple of God. He was an alchemist,

and manufactured by alchemical means the gold used in his Temple. The transmutation of base metals into gold was accomplished by 'vibrations.' Alchemy was more than a speculative art--it was also an operative art!" Similar, perhaps, to the speculative and operative lodges of Freemasonry?

The Andreasson encounter reiterates a number of secret society symbols, including its familiar 'light' motif, but centers around the explicitly Masonic symbolism of the death and rebirth of the phoenix. In the informative book *The New World Order*, Ralph Epperson asserts, "The phoenix bird symbolizes a rebirth, not only of an individual inside the Masonic religion but also of a new civilization arising out of the ashes of the ruined one."

And this appears to be the plan of the Illuminati.

In recent years the highest levels of political manipulation have been directed toward fulfilling the biblical prophecy and Freemasonic philosophic cornerstone of rebuilding the Temple of Solomon in Jerusalem on the site of the Dome of the Rock, a Muslim holy place, and placing a World King of Davidic bloodline on its throne. There have been several attempts by terrorists linked to high level Israeli intelligence to blow up the Dome of the Rock, the reported site of Solomon's Temple, an event which is rightly seen as a certain motive for the launching of a holy war between the Jews and Arabs.

Making it even more likely that the Dome of the Rock will be destroyed, and the Temple of Solomon rebuilt is that a red heifer has been born in Israel--supposedly the first red heifer since the destruction of the Second Temple by the Romans in A.D. 70. The ashes of a red heifer were traditionally used for purification before approaching the Holy Temple. Some Muslims are concerned that the birth of the red heifer will be seen as the signal for the destruction of the Dome of the Rock.

"The potential harm from this heifer is far greater than the destructive properties of a regular terrorist bomb," David Landau wrote in the Israeli newspaper *Ha'aretz*.

As far as the possibility that the recapturing of the reported site of Solomon's Temple will set off war, and possibly nuclear war in the Middle East, not many Jewish or fundamentalist Christian sects--or even Freemasons--are likely to be much worried about this possibility. Millions of dollars have in fact been channeled into the terrorist organizations from Christians in the United States in their fanaticism and belief that the rebuilding of Solomon's Temple will set off the advent of the Messiah, which conveniently also carries all the earmarks needed for it to parallel the second coming of Christ.

And the manipulation continues...

8

Philip K. Dick and the Illuminati

The most revelatory account I have I come across of a possible contact with an alien intelligence is the book *VALIS* by Philip K. Dick. Aspects of the book that seem to be little understood are symbols that point to an encounter of some sort with what we can accurately term the Illuminati. Again, the messages in *VALIS* are coded, and the meanings encoded are Freemasonic, comprising in fact a relatively exhaustive recapitulation of Freemasonic lore and agenda.

VALIS is a semi-fictionalized account of "Horselover Fat," Dick's alter ego (the name formulated from a word derivation of his name), and Dick's meeting with what he takes to be God, or at least a God, via the medium of a pink beam of light. Dick dubs this god VALIS (a Vast Active Living Intelligence System).

Dick's vision came about when, in March of 1974, and suffering from two impacted wisdom teeth, he waited in his apartment in Anaheim, California for a prescribed plain killed from a local pharmacy. When the delivery person from the pharmacy arrived at the door it was a young woman wearing a golden fish-emblem necklace. Dick reflects that:

> For some reason I was hypnotized by the gleaming golden fish; I forgot my pain, forgot the medication, forgot why the girl was there. I Just kept staring at the fish sign.
>
> "What does that mean?" I asked her.

> The girl touched the glimmering golden fish with her hand and said, "This is a sign worn by the early Christians." She then gave me the package of medication.
>
> In that instant, as I stared at the gleaming fish sign and heard her words, I suddenly experienced what I later learned is called anamnesis--a Greek word meaning, literally, "loss of forgetfulness." I remembered who I was and where I was. In an instant, in the twinkling of an eye, it all came back to me. And not only could I remember it but I could see it. The girl was a secret Christian and so was I. We lived in fear of detection by the Romans. We had to communicate in cryptic signs. She had just told me all this, and it was true.

This sudden influx of knowledge had been caused by a pink beam of light that had shot out of the necklace the girl was wearing, the beam apparently penetrating directly into Dick's head and imparting a vast array of information, including the knowledge of several languages that he had not previously understood. Aside from feeling a sort of hyper-rationality, Dick sensed that he had been taken over by a superior mind that had memories dating back in excess of two thousand years.

Later Dick was to hear troubling, grotesque messages coming out of his radio telling him to die, and would have an all-night display of graphic inner vision similar to thousands of abstract paintings seen in rapid succession projected upon the mind's eye. He also experienced a superimposition of the features of ancient Rome onto those of the California landscape in the 1970s, and formed the conviction that the present world was locked in what he termed a "Black Iron Prison," a state of spiritual (and probably physical) entrapment.

From these experiences and others Dick evolved a complex body of speculation, from which he drew a trio of books that included *VALIS* and a lengthy *Exegesis* consisting of several thousand pages of handwritten notes speculating on the nature of his contact with what he determined to be God.

The outcome of Dick's experiences with VALIS was not altogether benign. After the encounter (and a breakup with his wife) Dick attempted to kill himself, ending up in a mental ward instead.

What Dick believed to be the source of his contact is particularly interesting:

> "Where did the plasmate [VALIS] originally come from?"
> After a pause Fat said, "From another star system."
> "You wish to identify that star system?"
> "Sirius," Fat said.

In *VALIS* Dick relates the fairly widely-known information on the African Dogon tribe and their startling and unexplainable exact astronomical knowledge about the Sirius star system (as described in *The Sirius Mystery* by Robert G.K. Temple--possibly a pseudonym?). The Dogon, Dick says, "got their cosmogony and cosmology directly from the three-eyed invaders who visited long ago. The three-eyed invaders are mute and deaf and telepathic, could not breathe our atmosphere, had the elongated misshapen skull of Ikhnaton and emanated from a planet in the star-system Sirius. Although they had no hands, but had instead, pincer claws such as a crab has, they were great builders."

Dick has Horselover Fat dreaming of these three-eyed creatures: "They manifested themselves as cyborg entities: wrapped up in glass bubbles staggering under masses of technological gear... Soviet technicians could be seen, hurrying to repair malfunctions of the sophisticated technological communications apparatus enclosing the three-eyed people." I will have more to say about the Dogon later in this text.

Dick also believed that, "Our world is still secretly ruled by the hidden race descended from Ikhnaton, and his knowledge is the information of the Macro-Mind itself... From Ikhnaton this knowledge passed to Moses, and from Moses to Elijah, the

Immortal Man, who became Christ. But underneath all the names there is only one Immortal Man, and we are that man."

"Real Time ceased in 70 C.E.," Dick asserted, "with the fall of the Temple at Jerusalem [i.e. the Temple of Solomon]. It began again in 1974. The intervening period was a perfect spurious interpolation aping the creation of the Mind. 'The Empire never ended,' but In 1974 a cypher was sent out as a signal that the Age of Iron was over; the cypher consisted of two words: KING FELIX, which refers to the Happy (or Rightful) King.

"The two-word cypher signal KING FELIX was not intended for human beings but for the descendants of Ikhnaton, the three-eyed race which, in secret, exists with us."

Dick believed that, "The person referred to by the two-word cypher KING FELIX is the fifth Savior who... VALIS had said, was either already born or would soon be."

Out of the VALIS communications, "Fat deduced that he had a mission, that the plasmate's invasion of him represented its intention to employ him for its benign purposes."

Of Ikhnaton's three-eyed kin, Dick alter-ego Fat observes, "My God... These are the original builders...," to which another character replies, "We have never stopped... We still build. We built this world, this space-time matrix." This is reminiscent of the terms with which the Freemasons refer to themselves in such tomes as Pike's *Morals and Dogma*. There is no mistaking the connection for anyone with the slightest familiarity with Masonic lore.

And VALIS, we learn, employs the same mystical communication system as the Masons: "All its verbal information is stored as Cabala." The Qabalah (alternative spelling, Cabala) is an ancient form of mysticism that pervades Freemasonry, top of pyramid to base.

Dick describes the method by which VALIS initiates secretly communicate with each other: "During a handshake, a motion with

one finger of two intersecting arcs: swift expression of the fish symbol, which no one beyond the two persons involved could discern." The connection with the secret handshake of the Freemasons is obvious.

In *Exegesis,* Dick amplified on his beliefs:

> For the first time I have inferential evidence that a genuine secret fraternity of authentic Xtians exists, & has affected history... & possess supernatural powers & Immortality, due to direct links back to Christ--so they are the true hidden church. The two historic interventions which I am sure of collate: the secret fraternity fights the Empire (Rome in all its manifestations) & promotes the evolution of man to higher levels by inner & outer regeneration. The 16th, 17th century Illuminati are connected with this secret brotherhood...

Whether the godlike VALIS was involved at all, what was communicated to Dick seems to be approximately what the Freemasons and their brethren want us to believe about their mission: that theirs is an ancient tradition resting on an immortal bloodline that comes from the star system of Sirius, and that fulfillment of their plans (including the rebuilding of the Temple of Solomon, and the enthronement of a World King (their secret agenda hidden in their convoluted inner circle cant) is the only salvation for this soon-to-be One World.

Dick seems to believe that VALIS took the form of a satellite, firing electronic beams of information down upon the Earth. Or perhaps crop circles? He has one of his characters say, "The satellite had control of them from the get-go. It could make them see what it wanted them to see... The satellite has occluded them, all of them. The whole fucking United States."

There are other indications that the actual VALIS that Dick contacted may have come from another source than Sirius. "In Fat's

[i.e. Dick's] opinion, his apartment had been saturated with high levels of radiation of some kind."

He theorized that, "the Rosicrucians [the philosophic precursors to the Masons] were telepathically beaming pictures at him, probably boosted by micro-relay systems of an advanced order; but then, when Kandinsky paintings began to harass him, he recalled that the main art museum at Leningrad specialized in just such nonobjective moderns, an he decided that the Soviets were attempting telepathically to contact him."

Later Dick theoretically pinpointed the transmissions as originating from the schemes of a crippled rock musician named Mini: "He visited the Soviet Union one time; he said he wanted to see certain experiments they were conducting with microwave information transfer over long distances."

Fat himself comes to believe within the pages of *VALIS* that, "All that was involved from the start... was advanced laser technology. Mini found a way to transmit information by laser beam, using human brains as transducers without the need for an electronic interface. The Russians can do the same thing. Microwaves can be used as well. In March 1974 I must have intercepted one of Mini's transmissions by accident; it irradiated me."

Actually, I doubt that Dick felt the source of his infernal "enlightenment"--that happened to him in real life, in much the same fashion as it was depicted in the partially fiction *VALIS*, as shown by his statements in his Exegesis--was a rock musician. It happens that information beam experiments of exactly the type that Dick speculated on were at about that time being conducted by both the CIA and the KGB.

CIA Director Richard Helms described research taking place in the 1960s into "sophisticated approaches to the 'coding' of information for transmittal to population targets in the 'battle for the

minds of men'" as well as "an approach integrating biological, social and physical-mathematical research in attempts... to control behavior." He described "use of modern information theory, automata theory, and feedback concepts... for a technology for controlling behavior... using information inputs as causative agents."

Anna Keel, in *Full Disclosure* magazine, writes:

> Due to [the CIA's] Project Pandora, it is now known that applied biological (and other) frequencies can also be used as direct "information inputs" (e.g. of feeling or emotion) and to reinforce brain rhythms associated with conditioning and information processing. One way to get such a signal into a human may be through use of a high frequency carrier frequency. Results of research into information processing, unconscious processes, decision making, memory processes and evoked brain potentials would likely be exploited or integrated in an interdisciplinary system.
>
> For difficult subscribers... there are substances that have psychological or psychobiological effects ranging from subtle through devastating, and that cause increased susceptibility to conditioning. Some of these substances are similar to ones which are recognized by neurotoxicologists or behavioral toxicologists as occupational hazards; some are variations of substances used experimentally in laboratories to produce selective damage in certain neuronal tracts. Many substances needn't be injected or orally ingested, as they may be inhaled or applied with "skin transferal agents," i.e. chemicals like the popular industrial solvent dimethylsulphoxide (DMSO), which can, in fact, enhance the applied substance's effect. For instance, some compounds cause damage that produces increased sensitivity to stimulus, distraction (or flooding of thought associations), and enhance susceptibility to influence i.e., a state where automatic parallel information processing, which usually takes place outside of awareness, and interferes with conscious or more intentional limited channel processing. While causing acute mental symptoms wouldn't be the goal in groups, producing mild distraction, an ego weakened blurring between the sense of "I" and "you," would enhance some kinds of conditioning and promote suggestibility; then, perhaps transmitted "thought

> associations," "the voice of God," "lucky advice" or whatever, can more easily get through and have an effect... Convenient to the agencies involved in covert influence, is that among primary symptoms of schizophrenia or mental illness are ideas that one is being influenced by "transmissions" (e.g. radio frequencies), "voices" or even telepathy; unless complaints about covert psychological weapons are well organized, they would tend to be discounted as indicative of mental imbalance.

Another approach that may have been used is the transmission of "key concepts" to matters that the subject is already conversant in, creating a realignment of the subject's sense of reality by the injection of just a few bits of information, images, or sentences. In Dick's case this might have involved accessing his study of religious symbolism and history. A fast acting hallucinogen and a beamed transmission of religious concepts might have made him very susceptible to the idea that, due to an unexplainable event of "gnosis" he had tapped into the secrets of reality.

Dick describes a message broadcast "Out over the airwaves by one of the largest TV stations in the world, NBC's Los Angeles outlet, reaching many thousands of children with this split-second information which would be processed by the right hemispheres of their brains; received and storied and perhaps decoded, below the threshold of consciousness where many things lay slumbering and stored." He terms the message the KING FELIX cypher, and reports that, "The United States Army cryptographers studied it but couldn't discern who it was intended for or what it meant."

Dick describes the way in which the message was broadcast:

> On the screen the words FOOD KING appeared--and then they cut instantly, rushing their film along as fast as possible so as to squeeze in as many commercial messages as possible; what came next was a Felix the Cat cartoon... One moment FOOD KING appeared on the screen and then almost instantly the words--also in huge letters--

> FELIX THE CAT. There it had been, the juxtaposed cypher, and in the proper order: KING FELIX.

I don't know whether the KING FELIX cypher or the Food King/Felix the Cat messages were actually broadcast (other than in *VALIS*, that is), but discounting the possibility out-of-hand would be unwise. Certainly similar messages have been sent over the airwaves, such as the Eye in the Triangle station break presented by CBS during 1992. A perfectly clear representation of the Eye in the Triangle was shown, quickly metamorphosizing into abstract patterns. Curious as to whether I was projecting my own fixations, I polled an audience of about a hundred people from the podium at a UFO convention; the majority of them had also noticed the depiction.

Another television subliminal was the image of the Statue of Liberty projected between the film frames of an ALF cartoon, as reported in *TV Guide*. Surely that image must have been slipped into the programming by some overzealous right wing patriot skulking in the CBS editing room. So one would tend to believe, but check out what conspiracy theorist and Freemasonic expert Norma Cox has to say in her *Secrets* newsletter on the subject of Lady Liberty:

> [This] is the statue of the Moon Goddess, Diana... This Queen of Heaven is also the Queen of Democracy... Diana's right arm holds a great torch (symbolizing the sun) high in the air. The left arm (right and left symbolic of male and female), grasps a tablet which bears the date of the Declaration of Independence. A crown with huge spikes, like sun rays, rests on her head (the crown covertly represents our satellite, the Moon)... Note the similarity between Juno, holding aloft a sword and Diana, whose statue, symbolizing Freedom, Equality and Worldwide Brotherhood, stands in New York harbor. Worshipped as Juno Lucina, the Bringer of Light, Illuminism's adoration of this Moon goddess ranks only slightly below that of the god of the Sun who, in the case of Juno, is Jupiter (Zeus), her husband.

I have been following examples of the injection of occult symbolism via other conduits; one of these, amazingly, impossibly, is Camel cigarette advertising. Although the media has been hip to the idea that the cigarette company is specifically targeting young people with their cartoon "Joe the Camel" cigarette campaign, no one that I know of has spotted the fact that the Camel ads are riddled with subliminal imagery, including occultist subliminal content. It begins with the Camel image itself, the camel being a symbol of Isis according to Aleister Crowley. Other images I have noted in these ads are the obviously phallic snout of Joe the Camel (this representation has been noted by other, including mainstream writers), the phallus being a seminal occultist obsession; a tiny representation of a man with erect phallus on the cigarette package's front; and a sprinkling of other important occult symbols such as the rose, the moon, the ocean, the eye in the triangle, and the pyramid, all Isis or Illuminati symbols, prominently featured for no apparent reason in Camel advertising. There is even a depiction in one ad of Joe the Camel as George Washington; is it possible that Robert Anton Wilson and Robert Shea were on to something in their *Illuminatus!* trilogy, when they suggested that George Washington was impersonated by Adam Weishaupt, after the suppression of the Bavarian Illuminati, and that this is the significance of this ad? Nah.

But to return to Philip K. Dick... Ultimately the VALIS enigma is difficult to interpret with any absolute sense of certainty about what took place that day in March of 1974. It shines with points of illumination whose meaning remains elusive against the explanations of prosaic reality. What we do know is that, for whatever reason, in whatever fashion, Philip Dick had almost the entire Illuminist/Freemasonic mythos fired into his forebrain, and that he struggled with those images, trying to make sense of their symbolism, for the short period of time that remained in his life. Either he was force-fed a massive injection of Freemasonic

mythology via electronic beam (as he believed), or in a moment of dreadful illumination--or perhaps hallucinogenic receptivity--Philip K. Dick saw the truth of the world.

9

The Sirius Connection

The Freemasons tell a very curious story about the origin of their order and of civilization. They believe, in a mythology with roots dating back to the time of the Sumerians, that civilization on Earth (not to mention the secret occult doctrine) was established by divine visitors from the star system Sirius, which they symbolically equate with the Egyptian god triunity of Isis, Osiris, and Horus. In the Sumerian mythology they are explicit in stating that these extraterrestrial visitors, who they term Oannes, were fish-like in form. Isis, it may be observed in Egyptian representations, wears a fish headdress. The home system of these alien visitors, the star Sirius, was of such significance to the Egyptians that they based their calendar and the alignment of their temples on the star's rising times.

Harry Lebelson in an essay titled "The Search for Ancient Astronauts" reports the following of the fish-like extraterrestrials:

> The Oannes were described as teachers who gave the people insight into letters, the sciences and art. Referring to cuneiform and pictographic records compiled several thousand years before his time, [the scholar] Berossus describes how the Oannes taught the people to found temples and codify laws; they taught the principles of geometrical knowledge and 'everything to humanize mankindt,' as Berossus put it.

Here is the theme of extraterrestrials visiting Earth thousands of years ago and civilizing it, along with the information that these

visitors specifically imparted information on building ("The Builders") and geometrics, orientations central to Freemasonic lore and symbolism.

We do know that, for whatever reason, there was a sudden quantum leap in civilization that took place virtually simultaneously in Sumeria and Egypt. According to Professor W.B. Emery in Archaic Egypt:

> At a period approximately 3400 years before Christ, a great change took place in Egypt, and the country passed rapidly from a state of advanced Neolithic culture with a complex tribal character to two well-organized monarchies, one comprising the Delta area and the other the Nile valley proper. At the same time the art of writing appears, monumental architecture and the arts and crafts developed to an astonishing degree, and all the evidence points to the existence of a well-organized and even luxurious civilization. All this was achieved within a comparatively short period of time, for there appears to be little or no background to these fundamental developments in writing and architecture.

And the reason for this remarkable increase in human knowledge is known to us, although not admitted. Although the truth has not filtered into the hallowed studios of the 6:00 News, it is not in question as to whether mankind has come into contact with an extraterrestrial culture. We have. There is complete confirmation of the legend of the Oannes, which has been obtained in the 20th century. Proof of that contact resides in the secret cosmological traditions of the Dogon tribe of Africa.

The traditions of the Dogon have been transmitted in oral fashion for centuries, and may comprise the most pure offshoot of the secret tradition that underpins the religious beliefs of diverse religions and secret societies - including the Illuminati. Their tradition clarifies the secret agenda of the major occult and religious

traditions of this planet. And that pure transmission from the Dogon speaks of, verifies and conclusively proves extraterrestrial contact.

The secret tradition of the Dogon is centered upon the star Sirius, but more significantly, upon its smaller companion Sirius B. The problem is that Sirius B is totally invisible to the naked eye, and was only discovered through the use of a powerful telescope in the 20th century. It might have only been a lucky guess that the Dogon attributed an orbiting companion to Sirius, if only they hadn't made so many more "lucky guesses" that prove their scientific knowledge of the star system:

--They know that Saturn has a ring around it, although it is impossible to determine this fact without the aid of a telescope.

--They are aware that the planets in this solar system orbit around the sun, and that the solar system is contained in the Milky Way.

--The Dogon say that Earth's moon "is dry and dead like dry dead blood."

--They are aware of four moons of Jupiter.

--They know that the Earth turns on its axis.

--They also know, most significantly, that the orbital period of Sirius B around Sirius A is fifty years; again, a fact impossible to determine without a modern telescope.

Where did they obtain this information? They say that they were taught it by intelligent amphibious beings called the Nommo--the term used in both a singular and plural form--who came from Sirius thousands of years ago in a circular, spinning ark. Their tradition is a precise correlation with the Sumerian tradition of the Oannes. The Dogon call the Nommo "the Shaper of the world"--note the similarity to Phil Dick's concept of "the Builders."

The Dogon have a number of interesting things to say about Sirius and the Nommo. During Dogon ceremonies the Sirius system is portrayed on a checkered blanket, recalling the tessellated or

checkerboard pattern that the Freemasons favor for their floors: is this a reference to Sirius?

The Bozo tribe, cousins to the Dogon, call Sirius the "Eye Star," a concept hearkening to the Eye in the Triangle and to the Egyptian glyph for Isis' consort Osiris. It is noteworthy that the Bozo say that Sirius A is "seated." Isis is depicted in Egyptian hieroglyphics with a symbol of a seat or throne.

Remarkably, there is another religious tradition on which the lore of the Dogon may cast a penetrating light. The Dogon refer to mankind as Ogo, the imperfect, the outcast. They say that the Ogo were rebellious and were unfinished as a creation. In order to make up for the rebellious--sinful--nature of the Ogo, one of the Nommo, named O Nommo, "Nommo of the Pond," was sacrificially crucified on a tree to atone for our imperfect nature, died, and will return in an ark with the ancestors of men.

According to Robert K.G. Temple in *The Sirius Mystery*:

> The name Nommo comes from a Dogon word linked to the root nomo, "to make one drink." It is said: "The Nommo divided his body among men to feed them; that is why it is also said that as the universe 'had drunk of his body' the Nommo also made men drink. He also gave all his life principles to human beings." He was crucified on a kilena tree which also died and was resurrected.

The helical rising of Sirius was key in Egyptian--as well as Dogon--religious ceremonies. The Dogon also portray the helical rising of Sirius as a cross with a flower-like sun in its center, an image very reminiscent of the flowering cross of the Rosicrucians and their successor groups like the Freemasons and the Ordo Templi Orientis.

It may be speculated that the fish symbol of the secret soiety that Philip K. Dick felt had contacted him may have derived from the Oannes/Nommo connection. The fish symbol, stood on its head,

also portrays a representation of the fertility cult of Isis, and it is even possible that the Christian fish symbol is similarly derived, since it may be argued that Christianity is at core a Mystery Religion of Osiris-Sun God worship, transmogrified by claims of an historical uniqueness that it specifically does not possess.

As Aleister Crowley wrote in *The Book of Thoth*:

> In this card [Death, a Tarot card] the symbol of the fish is paramount; the fish (il pesce, as they call him in Naples and many other places) and the serpent [symbolizing the Messiah] are the two principal objects of worship in cults which taught the doctrines of resurrection or re-incarnation. Thus we have Oannes and Dagon, fish gods, in western Asia; in many other parts of the world are similar cults. Even in Christianity, Christ was represented as a fish. The Greek word IXThUS, "which means fish, and very aptly symbolizes Christ," as Browing reminds one, was supposed to be a notariqon, the initials of a sentence meaning "Jesus Christ Son of God, Saviour." Nor is it an accident that St. Peter was a fisherman. The Gospels, too, are full of miracles involving fish, and the fish is sacred to Mercury, because of its cold-bloodedness, its swiftness and its brilliance. There is moreover the sexual symbolism.

Michael A. Hoffman II in *Secret Societies and Psychological Warfare* observes the following of the star Sirius, that it is, "regarded in the highest occult circles as analogous to the 'hidden god of the cosmos'... The emblem of the All-Seeing Eye above the unfinished pyramid is the representation of the eye of Sirius, of its omniscient surveillance."

An investigation of the beliefs of Freemasonry (and, incidentally, of the other major religions both exo- and esoteric on this planet) shows that this "charitable fraternity" is merely an updated version of ages-old and archetypal Osiris/Isis Sun God/ Mother Goddess programming. This form of worship can be traced back to the literal beginning of recorded history, its mythology

anciently crystallizing into the Isis/Osiris Sun/Moon cultus of the Egyptian priesthood.

Osiris, it so happens, was one more divine visitor who is claimed to have civilized the backward and mud-rutting people of Earth with his teachings. From Egypt the deities of the Sun pantheon may have taken on different names (including Ra, Odin, Jehovah, and Jesus, with feminine counterparts including Diana, Mary, Ishtar, Rhea, Astarte, Cybele, and Ma), but the mode of worship and populace control was essentially the same.

The adepts of the Sun/Moon programming (of which Freemasonry is a major surviving branch) have always called themselves variations on the term "the Illuminati," the origin of the phrase betraying its source. Illuminati--Illumination--the adepts of the Sungod and his consort. When I state this derivation of the term there are no doubt many who will think I am distorting and oversimplifying this religio-occult progression--but I am not.

A quick and cursory sketch of the main branches of the Illuminati might go something like this, although I admit that others might offer a family tree somewhat different in its branchings. This is a secret society, remember, and what we know of the Illuminati has been obtained by accident (as when lightning struck down a member of the Bavarian Illuminati in the late 1700s, providing us with a cache of inner circle documents), or has been eked out through conjecture, inference, and interpretation of their double-talk code language.

In Isis/Osiris veneration, we can see the beginnings of the ritual trappings of the Mystery Religions that were to follow. One reason that the Greek and Roman Mystery Religions are mysterious is that little is known of what actually took place in their rites, celebrated primarily at night and in caves. We do know that Mystery Religions were the source of many of the practices that were taken up by later secret societies including the Freemasons, and that they

partook--practices varying somewhat from one Mystery group to the next--of secret ritual initiation involving dramatizations of the lives of the gods, the imbibing of psychedelic drugs such as magic mushrooms, sex orgies (with an emphasis on homosexuality), and at least in some instances, human sacrifice. The symbology of "light" pervades the Mystery Religions, adepts having been said to "have seen the light," "had their eyes opened," and so forth, all very appropriate to celebrants who enacted their rites in the dead of night in caves. Light = Illumination = Illuminati.

From the Mystery Religions, which were extremely influential upon the tenets of Christianity, came the philosophies of the Gnostics, composed of a number of secretive European sects, the most prominent perhaps being the highly secretive, perhaps even fictional, Priory of Sion.

Again, we know very little of what the actual practices of the early Gnostics were, but we do know that the Sun God/Mother Goddess orientation had in certain cases taken on a more philosophical bent, dealing with the eternal cosmic war between darkness and light. Again, the motif of "illumination" is represented. A recent translation of a document of the Cathars, perhaps the most prominent of the Gnostic groups, suggests that one of their secrets was that they were a straightforward Isis cult.

The Jewish/Gnostic mystical practice of the Qabalah, whose origin may have been about the time of Jesus or shortly after, was a primary influence on a number of secret society tributaries, including the Rosicrucians and the Knights Templar. Qabalism was also the singular greatest philosophical influence on the Freemasons, which in the mid-1700s evolved a return to an overt Sun God/ Mother Goddess mythology, along with an emphasis in their practices on the importance of the star Sirius. Freemasonry, aside from being an essentially Gnostic religion, has comprised since its inception a vastly important influence in world politics and in world

intelligence agencies, and may be the most active and far-reaching of the Illuminati fronts at the present time.

Freemasonry and the Rothschilds international banking group (the Rothschilds being from the beginning of their dynasty Freemasons) were the main influence on diamond magnate and Freemason Cecil Rhodes' Round Table secret society, formed around the turn of this century. Rhodes was the single most important Freemasonic spearhead into world political control. Currently we may note the Trilateral Commission (with their symbolic "666" triangular emblem and orientation), the Council on Foreign Relations, and the Bilderberger Society as being among the most influential organization on this planet; these sprung from the Round Table group.

While I am limited in space in this thumbnail sketch, it is very possible to trace the twistings and turnings of the Illuminist philosophy until we encounter the secret Freemasonic rituals of the elitist leaders of today, men like George Bush of the Skull and Bones German Illuminati offshoot, Henry Kissinger and Alexander Haig, alleged to be members of the Freemasonic P-2 group, and in all probability the (Cecil) Rhodes scholar, Trilateralist, and saxophone player from Little Rock, Arkansas, the highly symbolic Masonic location where the arch-Mason Albert Pike formulated his schemes.

Why were the Sun and Moon chosen by the Illuminati of ancient history as deities for the worship of their slaves and underlings? My guess is that it is a relatively arbitrary choice that reflects solar-lunar influence in a simple, understandable fashion, particularly as it might be understood in an agrarian society where these astral bodies are the obvious and all important influences in a people's day-to-day life. If the sun doesn't shed its beneficent rays on the Earth, then the crops don't grow.

There is an additional associative quality of the Sun God/ Mother Goddess programming that pertains to the human mother and father and accesses our unexamined and authoritarian-inlaid childhood programming, digging into deeply ingrained programming much in the same way that beer commercials on television access a different level of instinctuality, by being larded with sexual imagery.

As the cult of the Sun God and his consort first evolved, the Illuminati made it well known that they were the chosen representatives of these immortal deities--and did the people REALLY want to take a chance on not believing what they told them? The masses had better treat the Illuminati real nice, or they might have a word with the Sun God and his consort and have them bring a punishing plague of frogs.

"In the beginning," the Sun God and Moon Goddess were in absolute control, working in mysterious and usually sadistic ways that were only fully decipherable to their Illuminated envoys. A lot of people fell for this stuff, and they were probably given little tin badges that clearly identified them to the hold-out heretics whom they in turn tortured and murdered in order to assist them to "see the light."

In time (say about the time of the Chaldeans) the Illuminati started to believe some of their own programming and began to study the movement of the Sun and moon and their brother and sister stars and planets. This gave the Illuminati another leg up, via astronomy, in being able to predict coming occurrences like eclipses and comets. By the time astrology was formulated, the Illuminati had it all pretty well sewn up, with franchises in operation all over the planet.

Science began in a similar fashion as astrology--gasp! But the dominant belief modes of humanity have always been given names like "Science," which simply means "knowing." During the

sixteenth century when the noble Illuminati popularized this latest version of "knowing," they had lots of free time to dabble in astrology and alchemy (the forerunner of modern chemistry) and, for a change of pace, to participate in sex orgies in groups with names like the Hell Fire Club.

Since the Sun God (and his various relations, including sons and wives) were, after several thousands years of worship, beginning to fray around the edges in terms of believability, and a lot of commoners were beginning to grumble that this stuff was all made up, the Illuminati came up with a new and improved version of their mind control software that didn't depend upon the Sun God or Moon Goddess for ultimate authority. As the Sun/Moon cult lost some of its popularity, "Scientists" were quick to take up the slack. According to their propaganda, the physical laws of the universe were the ultimate causative factors, and naturally, those physical laws were only fathomable by the scientific (i.e. Illuminati) elite.

Now the Illuminati restored their waning dominance with their promotion of the arcane wisdom of bunsen burners, stupefying Mesmerism and electricity, and they no longer--at least at the present time--needed to draw their powers from mystical associations of the stars and planets. Their vision of the universe and society, as fostered by members of the British Royal Society and other Illuminati-conceived groupings, became the predominant worldview. The main tenet of their new religion, Science, was that whether you understood it or not, it was always Right. Not so different a creed than the programs that preceded it.

The British Royal Society of the late seventeenth century was the forerunner of much of the media manipulation that was to follow. After the re-tooling into "scientific" values was accomplished by the Illuminist masters, society (in the view of the Illuminati) needed to be conditioned for stability in a capitalist and non-religious format. The cogwheels had to be greased. This was

accomplished by the launching of non-religious, pro-scientific attitudes through the same media vehicles that influence us today: newspapers and books, with radio, motion pictures and television soon to follow.

And heretics against either Science or Religion have always been dealt with in summary fashion--sometimes possibly in dark blue vans by CIA technicians dressed to look like space aliens.

Now we are in an era--which we arbitrarily term "modern," but which seems to have no claim to that appellation--whose religion is a hybrid of both science and mysticism: this is the religion of the UFO and the New Age. It is a religion that performs the functions of all religion: it induces awe and susceptibility and confusion and guilt and restimulation of infantilism, and opens up the believer to intervention by the priesthood.

Attempting to crack the secret of the nature of this elusive beast, the UFO:

-- Isn't it odd that the U.S. military just happened to be working on disk craft back in the 1950s when the whole UFO flap started?

-- Isn't it odd that the mind control implants that are supposed to be inserted through the nostrils of UFO abductees just happen to conform exactly to the implants designed by Dr. Jose Delgado, the CIA mind control researcher?

-- Isn't it odd that several of the most prominent among "UFO researchers" have been members of military intelligence, men such as John Lear, "formerly" of the CIA?

-- And isn't it the oddest thing of all that the intelligence agencies of all countries crawl with Freemasons, and that the CIA just happens to have a reported faction of Mother Goddess cultism within its ranks?

Attempting to get a grip on this topic, why would "UFO" testing be done relatively "out in the open," on military reservations that can be fairly easily observed by a public notified of UFO flights

by "former" CIA men eager to spread the truth about the little grey men? Are the military authorities teasing us, as it were, with this open testing, along with all the other revelations of the secret order that underlies the normalized facade of our society and media?

When George Bush spoke repeatedly of the New World Order, is it likely that he would have simply forgotten the thousands of right wingers and conspiracy buffs who for years have used that phrase as the personification of world fascism, evil, and mind control? Or was something else going on, some other process or directed transformation?

When CBS broadcast an Eye in a Triangle in their station identification, could it possibly have been done by accident? Does this not hearken to the "cant" language, the mystical double-talk employed by Freemasons and other secret societies?

Michael Hoffman II has spoken about similar processes involving "revelation of method" or the purposeful giving away of arcane secrets of Freemasonry, which he dubs "the cryptocracy." He likens this to the activities of the alchemists:

> This is what simplistic researchers miss: the function of macabre arrogance thumbing its nose at us while we do nothing except spread the tale of their immunity and invincibility further. That is the game plan operant here.
>
> To the belief system of the modern man it sounds too crazy. Why would the perpetrators want their secrets revealed after the fact?... This question can only be definitively answered if one has an understanding of the zeitgeist which overseers in the cryptocracy have partly manufactured and partly tailored their own operations to coincide with. As I've pointed out, secrets like this were rarely revealed in the past because traditional people had not yet completed the alchemical processing (of mind control). To make such perverse, modern revelations to an unprocessed, healthy and vigorous population possessed of will, memory, adherence to their deepest inner intuition

> and intense interest in their own salvation, would not have been a good thing for the cryptocracy. It would have proven fatal to them.
>
> But to reveal these after-the-act secrets in our modern time, to a people who have no memory, no willpower and no interest in their own fate except in so far as it may serve as momentary titillation and entertainment actually strengthens the enslavement of such a people.

There is an occult/Freemasonic stratum in the command structure of media and world control. There is a long-term occult agenda in geopolitics that is just now coming to poisonous fruition.

10

Demons and Adepts

Secret societies such as the Freemasons have been linked throughout their history with the kind of otherworldly visitations that we associate with UFOs, having now conveniently pigeonholed the phenomenon into a "scientific" categorization that removes them from the relatively discredited earlier pigeonhole of being demonic. "These are highly evolved beings from the planet Xenon," we might be saying, "flying in craft that are thousands of years in advance of our own. You can't use a crucifix to scare these babies off."

Historically many occultists have claimed to channel alien beings that conform exactly to allegedly extraterrestrial visitors that are described today, although in the past this phenomenon was considered to be related to religion. Jacques Bergier, in *Extraterrestrial Visitations from Prehistoric Times to the Present* even credits the possibility that these entities actually exist, suggesting that the proliferation of alchemical, occult, and scientific knowledge that took place in the fifteenth and sixteenth century may have been due to contact with otherworldly beings by Illuminati such as Roger Bacon, Jerome Cardan, and Leonardo da Vinci. Is it possible that during the Middle Ages the Nommos made a return visit?

Bergier attributes the alien influx of knowledge to "Information Source X" and believes that:

> This knowledge was connected with alchemy but went beyond it... A knowledge that came from where? More or less directly from

> those Intelligences who are able to light and extinguish stars at will--an essentially rational knowledge, offered without request for payment and not requiring adherence to any religion--a knowledge that must have filtered over to [Jonathan] Swift, enabling him to predict the Martian moons.

Certainly, during the Middle Ages contact with angels and Men in Black and sundry demons (often dressed in "shining armor") was almost taken for granted by the populace, although I have the suspicion that it was probably in the interests of the clergy and secret mystical societies to play this material up and to weave legends around it. At that time the term "demon" did not always carry the satanic overtones that it does in this era, and the descriptions we have of the otherworldly beings from that time suggest that they were of two general descriptions.

There were the monstrous succubi and tormentors of humans that the clergy--including Catholic, Protestant, and Jewish--got a kick out of spooking their aptly-termed flocks with. There was also the category of entity said to have been in contact with the Illuminati of the day, and that group seems to have been more interested in imparting the advanced and arcane knowledge of alchemy and astrology and science than in forging diabolic pacts and wagering souls.

Note the difference: the clergy would be well-served by the imps of hellfire, while the Illuminati, affirming their possession of transcendent knowledge, would be served by contact with wise, unearthly spirits who didn't have anything to do with the bugaboos of mainstream religion. Not that I am absolutely positive that some of these "demons" may not have been real, but this dual orientation suggests that at least some of them were invented, just as some UFOs are invented.

Bergier quotes Jerome Cardan, who claimed to be in contact with demons: "Just as the intelligence of a man is greater than a dog's, in the same way that of a demon is greater than a man's."

Bergier also reports:

> During the Middle Ages, appearances of creatures with garments of light were most common. These messengers went to meet rabbis, with whom they held lengthy discussions on the cabala, the powers of gold, the knowledge and exploration of time, etc. They stated that they knew the guardians of the sky, but were not guardians themselves...
>
> There is no law against interpreting this radiance and the demons' shining garments in terms of our twentieth-century mythology, against imagining that the "double face" [displayed by many of the demons] is a space helmet, that the "luminous garment" is a force barrier producing luminous radiation through fluorescence or excitation...

While I don't know whether the Freemasons and their cohorts ever really contacted the sort of beings who we would now term "extraterrestrials," it may be that they did. Or it may only be that they only thought they did. Certain areas of human history--and the history of disinformation--elude easy answers. Yet I can't help reflecting on the fact that contact with extraterrestrial aliens might have been just as profitable a pursuit then for the occult adept--and the rank charlatan--as it is today.

11

Occult Espionage

Elizabethan scholar Francis Yates places John Dee, Illuminatus Extraordinaire, at the center of the formation of the Rosicrucian secret fraternity, this because of the references to *Ros Crus*, or the "Dew of Light" in his work. The Dew of Light is also a cabalistic image. Today we primarily know Dee as cabalist, alchemist, court astrologer to Queen Elizabeth, and ET channeler--at least one of whom who bore a close resemblance to a grey alien.

But Dee had another interesting side to his character that falls into the grey area between scholarly disciplines that few are willing to talk about. John Dee was one of the founders of what has come to be known as British Intelligence, which in its early days used alchemical ciphers of Dee's invention for passing secret messages. For what it is worth, Dee's code name was 007. As late as World War II, Himmler claimed that the Rosicrucians were a branch of British Intelligence, although my sense is that he may have gotten it backwards.

To this day, British Intelligence remains heavily Freemasonic in its membership. Peter Wright, the former assistant director of British M15, describes in his book *Spy Catcher* his initial vetting for a high-level position in the organization:

> "Just wanted to have a chat--a few personal details, that sort of thing," he [John Marriott, M15's personnel director at the time] said, giving me a distinctive Masonic handshake. I realized then why my father, who was also a Mason, had obliquely raised joining the brotherhood when I first discussed with him working for M15 fulltime.

I'm reminded of an odd instance when a journalist friend of mine was covering a survivalist/patriot convention for an American magazine. During the course of the convention, he met Bo Gritz, the right wing Liberty Lobby's Populist Party candidate for president of the U.S. in 1992, Vietnam war hero, and a prominent personality in the patriot movement. Shaking Gritz's hand, he says that he was rather surprised that he was given what he took to be a secret Masonic grip, and that Gritz looked at him in a somewhat sheepish fashion when he didn't return the grip. An interesting confluence of forces in play in the world these days...

Linking the Mother Goddess cult (of which Freemasonry is the most prevalent example that we know of) to intelligence agencies, the authors of *Dope, Inc.* give a highly interesting interpretation:

> The Cult of Isis was developed in ancient Egypt no later than the Third Dynasty of the Old Kingdom, approximately 2780 B.C. and represents one of the earliest formal articulations of the entropic and backward ideology of mother-worship. As known to the priesthood of the Temple of Isis--true believers themselves--the Isis cult formalizes the elements of a capability for social control, exploitation, and destruction of creative free will in subject populations. The elements include:
>
> Use of various schizophrenia-inducing drugs;
>
> Use of repetitive, heteronomic sounds in "music" to supplement the effect of psychotropic drugs, and to create a societal aesthetic that endorses and encourages the use of the drugs;
>
> Creation of synthetic cults based on the original reactionary Isis myth but specific to the psychological profile of the population which the priesthood has targeted for subversion;
>
> Enforcement of a political-economic model antagonistic to general human progress, and containing targeted populations within noncreative, manual slave-labor projects such as pyramid building.
>
> This combination of Pharaonic cult capabilities was taken as a model for further refinement in this century by the British Secret Intelligence Service's Tavistock Institute in London--an institution which launched

the "counterculture" in the United States and Europe, based on the very drugs, mescaline and hashish, the ancient priesthood had employed.

The occult underpinnings of the spy business should not be glossed over if we are attempting to understand historical world manipulation by secret societies, much less the real nature of UFO abductions. It may be interesting to note that many occultists channeling "alien" entities have had one foot in the occult camp, the other foot among spy agency contacts.

Aleister Crowley was a "magickal" adept who functioned as a spy for the British, and--opinions differ--perhaps simultaneously for the Germans. During his career as the world's foremost occultist of the time, Crowley claimed to be in contact with any number of alien beings, including gods of ancient Egypt, and to channel written material such as *The Book of the Law*, which he attributed to an extraterrestrial entity named Aiwass. As noted earlier in this text, he also claimed he had contacted an alien named Lam, which, from the drawing that Crowley made of the entity, looks almost exactly like the big-headed aliens so often involved in UFO abductions.

A 1923 U.S. military intelligence report reveals that Aleister Crowley, as well as another famous occultist, Rudolph Steiner, the founder of the Blavatsky-esque Anthroposophy, were being investigated as the leaders of a New York occult group allegedly involved in "subversive Bolshevik activities." The report, written by a Norman Armond, goes so far as to suggest that the Russian Revolution may have been controlled by occult networks. Armond states that Steiner and Crowley, through a holding company Steiner controlled, had been involved in an alliance with Lenin that had begun in 1909.

Aleister Crowley is reported--whether reliably or not, I do not know--to have initiated "psychedelic guru" Aldous Huxley into drugs. While this connection may lie somewhat afield of what we

are discussing, Huxley was the grandson of Thomas Huxley, a founder of the Rhodes Round Table, which was the base from which later well-known elitist control mechanisms such as the Trilateral Commission, the Council on Foreign Relations, and the Bilderbergers were launched.

Aldous Huxley was raised in the "Children of the Sun" (note the Sun orientation), a school for children of Round Tablers, and was tutored at Oxford by H.G. Wells who, during World War I, was the director of British foreign intelligence, and as the author of books like *The Open Conspiracy: Blue Prints for a World Revolution*, the most influential mouthpiece of the Rhodes/Illuminist New World Order.

During 1952 and 1953 secret meetings are reported to have taken place between CIA Director Allen Dulles, Ford Foundation Director Robert Hutchins, and Dr. Humphrey Osmond, Huxley's friend and personal physician. These meetings involved the funding by the Ford Foundation for a number of experimental research projects using LSD and mescaline. Also of interest is the statement of Captain Al Hubbard that LSD had been discovered, years prior to the date of its reported discovery, by a group led by the aforementioned Rudolph Steiner, seeking to discover a metaphysical "Peace Pill."

Huxley started a number of groups that, by furnishing LSD, mescaline, and settings for controlled trips, launched virtually all of the acid-occult missionaries of the 1960s, including Tim Leary, Ken Kesey, Richard Alpert (Baba Ram Dass), Gregory Bateson, and Alan Watts.

As poisonous as it may seem to a mostly-liberal audience, the LSD invasion of the world may have been a form of chemical warfare launched by British Intelligence (and their apparent masters), much in reflection of the kind of drug warfare that England had waged in the previous century during the Chinese

Opium War. Certainly LSD and a connected doctrine of occultism as furnished by men like Crowley and Huxley has paved the way for future interventions of the occult (and possibly ufological) kind, and for a possible alchemical transformation of which we are only beginning to be aware.

The espionage strategy of drug and occult philosophy-induced destruction of a culture is reminiscent of the process that Carl Raschke attributes to UFOs in "Ultraterrestrial Agents of Cultural Deconstruction" in *Cyber-biological Studies of the Imaginal Component in the UFO Contact Experience*. Raschke believes:

> UFOs serve as facilitators of what I label "cultural deconstruction,"... "Deconstruction" is contrasted with "destruction" inasmuch as the latter connotes a random and unconstrained act of demolition, whereas the former suggests an aim-governed and formative sequence of changes... The work of deconstruction is not sudden, but slow and inexorable. It is more akin to a sculptor chipping away at stone so that he can craft a figure than to an iconoclast who seeks by some *coup de main* to obliterate outworn impressions. So far as UFOs are concerned, the deconstructive movement works upon human culture as a whole, although it may also have devastating effects at times on individual lives.

Another "child of Crowley" was rocket scientist, Caltech founder, and California OTO head Jack Parsons. In Pasadena, California in January of 1946, Parsons, assisted by Church of Scientology founder L. Ron Hubbard (who later claimed he was working in Naval Intelligence at the time) participated in a "magickal" working intended to incarnate the demonic Whore of Babylon via Crowleyan sex rites. At about the same time that Parsons was trying to incarnate an extraterrestrial entity, he also claimed that he had met a Venusian in the desert of New Mexico--an interesting foreshadowing of the claims of later "contactees" such as George Adamski in the early 1950s.

Hubbard was later to abscond with Parson's girlfriend and his money, going on to form the Church of Scientology with its Freemasonry-like "grade chart" of spiritual processing and its cross emblem that is almost a duplicate of Crowley's *Book of Thoth* cross. Hubbard's son, Ron DeWolfe, says that Hubbard was something of an acolyte of Crowley, and after the death of the Beast 666, determined to take on his mantle.

Parsons was to die in June, 1952, in a chemical explosion that has often been suggested to have been a by-product of his cosmic tampering. That may or may not have been so. Before his death Parsons was interviewed by FBI agents and admitted that he had been illegally in possession of a number of classified documents relating to explosives taken from Hughes Aircraft Corporation, and that he had furnished them to the Israeli government. The question remains open as to who was responsible for Parson's death - infernal forces or Howard Hughes playing turnabout?

James Shelby Downard, in "The Call to Chaos" in *Apocalypse Culture* provides additional deep background on the intelligence agency-occult connection:

> Consider that the secret society which became the nucleus of the Office of Strategic Services - Central Intelligence Agency octopus was making biotelemetry implants in unsuspecting people as early as 1933. After the operations, the victims were kept drugged for a time and then were brainwashed (OSS-CIA is written that way because when the former became the latter, they changed the name but not the facts). I believe the implants were at first activated by touching the skin with a device similar to an electronic prod, but which actually was a symbolical phallus.
>
> The early implants were made to stimulate the pudenda nerve, when triggered, so that the sexually excited and amnesiac-drugged victims could be used in the sex circuses of the OSS-CIA secret order. Those victims were not infrequently operated on while anesthetized by morphine and scopolomine, which produce analgesia and amnesia

> (twilight sleep, to esotericists). They too were brainwashed after healing. This evil program, supposedly for the sake of national security, was oriented to the Cult of GAOTU [The Freemasonic god, the Great Architect of the Universe].

Downard also reports:

> Saturnalian orgies were and are performed with some representation of a deity... A woman I call the Great Whore performed in those rites some years ago, representing such deities as Artemis (Diana or Hecate), Aphrodite Porne (Dirty Venus), Bastet, Selket and the White Goddess described by Robert Graves in his famous book. I do believe that these sex circuses were part of a greater Call to Chaos working...

Is Mr. Downard projecting all of this? I am not entirely certain, but I do know that there are strong verifiable linkages between occultism, politics, and spycraft. One of the less-spoken-of aspects is their connection to homosexual and bisexual practices, long a mainstay of certain forms of ritual magick. With the risk of straying into Political Incorrectness (truth, as always, being a secondary concern of the arbiters of our national mindset), I will speak of such matters.

Jim Brandon in his excellent *The Rebirth of Pan* has commented on the attraction of UFOs, inexplicable Fortean events, and alien entities to sex activities of various sorts. It should be noted that homosexual orgies seem to have been an integral part of many Mystery Religion rituals, the precursor of many current secret societal practices, and that in primitive tribes homosexuals were often looked upon as partaking of divinity, and took on the role of shamans (read "channelers" in latter-day parlance). The Mystery Religions in addition utilized hallucinogenic drugs, Sun and Mother Goddess worship and human sacrifice--at least on occasion.

Aleister Crowley engaged in bisexual practices for some of his magickal workings, as did the cabal of "Apostles," a Cambridge University student group that was thoroughly infiltrated by the KGB and took over British intelligence in the 1930s, their influence said to have continued until the present day. One of the founders of the Apostles, which was termed by members as "the Higher Sodomy" and "a sort of gay Freemasonry," was Sidney Reilly, "Ace of Spies" as the media has it. Reilly was also part of the Rhodes Round Table group at 120 Broadway in New York that provided funding for the Bolshevik revolution. An index to Reilly's viewpoint is provided in a letter on bolshevism that he penned in 1925:

> I believe that... it [bolshevism] is bound by a process of evolution to conquer the world, as Christianity and the ideas of the French Revolution have done before it... and that nothing--least of all violent reactionary forces--can stem its ever-rising tide... the much decried and so little understood "Soviets" which are the outward expression of bolshevism as applied to practical government, are the nearest approach I know of, to a real democracy based upon true social justice and that they may be destined to lead the world to the highest ideal of statesmanship--Internationalism.

Pretty straight Round Table-One Worldism in Bolshevik guise.

From the ranks of the Apostles came such highly-placed British intelligence turncoats as Anthony Blunt, Donald Maclean, Kim Philby, and Guy Burgess. These men were KGB agents who infiltrated and controlled the highest levels of British--and in certain instances--American spycraft. In recent years Victor (Lord) Rothschild of the Rothschild banking family (which bankrolled Cecil Rhodes), a member of British intelligence during World War II, was fingered in the British Parliament as the most likely candidate for the highly-placed "Fifth Man" Soviet spy among his Apostle friends Blunt, Burgess, Philby, and Maclean. Although there

were calls for prosecution, Margaret Thatcher defended Rothschild and within months the case was closed.

The behind-the-scenes manipulation continues. Another homosexual cabal that allegedly included Knight of Malta, British intelligence agent, and Rhodes Round Table lawyer Louis Bloomfield, along with homosexuals Clay Shaw and David Ferrie, as described by "Torbitt" in his pivotal investigative document *Nomenclature of an Assassination Cabal*, is said to have been responsible--in an organizational sense--for the John F. Kennedy assassination.

There is a tangled web of Masonic symbolism that can be discerned in the events of the JFK assassination, beginning with the fact that the killing took place in the "Lone Star" (i.e. pentagram, Sirius) state. Remarkable research in this regard has been done by James Shelby Downard, demonstrating that the Kennedy assassination was manipulated for ritual purposes in an enactment of the ages-old "Killing of the King" fertility ritual, admittedly a radical theory but one backed up by a good deal of evidence.

As John Michell has said in *The Flying Saucer Vision*, "what we now suspect was in the past openly known. The 'gods' demand sacrifices, perfect specimens for their own scientific purposes. In the days when the nature of the gods was known, their desires studied, and the benefits they could bring enjoyed, sacrifices were left for them on the high places which they frequented. The relationship between the gods of mythology and the superior race from the sky, to whom the first sacrifices were made is a large subject which must soon be studied in detail."

In "The Call to Chaos" in *Apocalypse Culture*, Downard explains, "The third degree of 'Blue' (basic) Freemasonry, and more particularly the ninth degree of Scottish Rite work, embody symbolical assassination and death ritual; but in GAOTU [the Great

Architect of the Universe] operations they go in for the real McCoy: heavy snuff stuff."

The Kennedy assassination was performed at Dealey Plaza, the location of the first Masonic temple in Dallas. "Security" for the Kennedy motorcade was supplied by the New Orleans CIA office, with headquarters in a Masonic temple building. Dealey Plaza is located near the Trinity River, and Kennedy's motorcade headed for the Triple Underpass, both references symbolic of the Masonic triangle and number three fixation. In what may have been a symbolic dramatization of the Masonic Hiram Abif legend of assassination by three "unworthy craftsmen," after the Kennedy murder three "hoboes" were paraded in front of cameras by the Dallas police (one of the "hoboes" alleged to be E. Howard Hunt of the CIA), then the three were quickly released without record of their identity. In Masonic lore assassins travel in threes.

"Torbitt's" investigations persuasively show that the conspiracy to murder JFK was run from the top by Masonic Vice President Lyndon Johnson and 33rd degree Mason and homosexual J. Edgar Hoover, at the time playing dual roles in Washington as Director of the FBI and epically repulsive party girl, with Bloomfield (also very likely a Mason because of his affiliation with British intelligence) running a large network of conspirators and underlings in the killing of Kennedy. Mason Lyndon B. Johnson appointed Mason Earl Warren to head the Warren Commission for investigation of the assassination. Information was doled out to the commission by Mason Hoover and Mason and ex-CIA director Allen Dulles, while 33rd degree Mason Gerald Ford seems to have done everything he could to discount the possibility that the murder had been perpetrated by anyone but a "lone nut assassin."

One macabre possibility is that Lee Harvey Oswald may have received the same sort of brain implant as the alleged saucer abductees mentioned earlier. As detailed in *The Man Who Knew Too*

Much by Dick Russell, the Mexico City CIA station was, immediately prior to the Kennedy assassination, the location of certain mind control experiments intended to create a "sleeper killer," that is, an hypnotically-controlled assassin. Russell also repeats a "deadly rumor" that was published in the little-known *Were We Controlled?* by the pseudonymous "Lincoln Lawrence." Russell reports:

> Lawrence began his chronicle on March 30, 1961, when Oswald was admitted to the Third Clinical Hospital's Ear, Nose, and Throat division in Minsk [Russia]. He had been suffering "complaints about suppuration from the right ear and weakened in hearing," and the diagnosis called for an adenoid operation. Marina, whom he had recently met, came regularly to his bedside during his eleven-day stay in the hospital.
>
> "After he was placed under anesthesia," Lawrence wrote, "advanced technique was employed to implant a miniaturized radio receiver which would produce muscular reaction in his cerebral region." Thus, upon leaving the hospital, Oswald would "remain for the rest of his life--without his knowledge--a completely efficient human tool... subject to control!"
>
> The author went on to describe two devices implanted in Oswald's brain. One was R.H.I.C. (Radio-Hypnotic Intracerebral Control), "the ultra-sophisticated application of post-hypnotic suggestion triggered at will by radio transmission. It is a recurring hypnotic state, re-induced automatically at intervals by the same radio control"... On record in the National Archives is a government memo dated March 3, 1964, from CIA director McCone to Secret Service chief James Rowley, which makes a remarkably similar speculation. Following his surgery at the Minsk hospital, McCone wrote, Oswald might have been "chemically or electronically 'controlled'... a sleeper agent. Subject spent 11 days hospitalized for a 'minor ailment' which should have required no more than three days hospitalization at best"... But "Lincoln Lawrence" did not see Oswald ultimately as a pawn of the Soviets. Rather, he wrote that Oswald was later "high-jacked," or "maneuvered into the orbit of another group which trained and prepared

> him for work in the future when they (the second group) might have need for his 'special qualifications.' The second group then asserted control of Oswald upon his return to the United States in the summer of 1962..."

According to Lincoln Lawrence, Oswald was not the only manipulated cog in the wheel. Another was Jack Ruby, "placed under hypnosis... perhaps at a party or perhaps by some 'performer' who was pretending to offer a casual audition for the Carousel Club." The entertainer at Ruby's club the week of the assassination was, in fact, a hypnotist, William Crowe, whose stage name was Bill DeMar.

It is verifiable that Masons and their allied secret societies are hardwired into the control systems of government and intelligence agencies, comprising a level of unseen motive and hidden intention in agencies that have the power of life and death over the citizens of the United States and the world. They control the controllers, so to speak, and if there was a conspiracy and a cover-up in the John F. Kennedy assassination, then they were certainly in a position to accomplish them.

James Shelby Downard, again, has stated:

> But the ultimate purpose of that assassination was not political or economic but sorcerous; for the control of the dreaming mind and the marshaling of its forces is the omnipotent force in this entire scenario of lies, cruelty and degradation. Something died in the American people on November 22, 1963--call it idealism, innocence or the quest for moral excellence--it is this transformation of human beings which is the authentic reason and motive for the Kennedy murder.

And the transformation continues...

12

The Year of Light

The calendar of the Freemasons begins four thousand years prior to the Gregorian, at the time of a reported supernova that they commemorate as *Anno Lucis,* the Year of Light, and about the same time that a fantastic leap in civilization was accomplished in Sumeria and Egypt. Look at the cornerstone of any government building in your town and you will see that the Masonic date is included in the inscription, obvious proof that this dating is highly important to the Masons. But there were other, earlier commemorations to the supernova. Richard W. Noone, the author of a book titled *5/5/2000*, believes that the Great Pyramid at Giza was probably built as a monument to this striking astronomical event. He states:

> The Grand Gallery [of the pyramid], aimed like a giant telescope at a particular celestial body in the earth's southern sky--before its view of the heavens was blocked by the completion of the building--points to where radio astronomy bas just pinpointed the supernova (or giant stellar explosion) nearest to our solar system... The Great Pyramid's Grand Gallery is focused at this particular spot in the earth's southern sky.

Noone recalls that Dr. Anthony Hewish, 1974 Nobel Prize winner, while tracking astronomical anomalies in the heavens, "demonstrated that... strange rhythmic pulses were radio emissions from a star that had collapsed or blown itself up in the earth's southern sky some time around 4000 B.C."

At about the same time that Hewish's research was taking place, George Michanowsky, author of *The Once and Future Star*, was deciphering Sumerian tablets that caused him to come to the same conclusion. According to Noone's review of the events:

> The ancient Sumerian cuneiform table Michanowsky was deciphering described a giant star exploding within a triangle formed by the three stars Zeta Puppis, Gamma Velorum, and Lambda Velorum...
>
> Michanowsky continued deciphering the Sumerian star catalogue, containing observations going back for thousands of years. The remarkably accurate star catalogue now stated that the blazing star that had exploded within the triangle would again be seen by man in 6,000 years.

This means, interestingly enough, that the Sumerians set the date for the reappearance of the supernova in about the year 2000 A.D. Strong evidence, it seems to me, that the Freemasons probably see the turn of the next century as having a pivotal significance in their mythic history of the world. Taking into account what seem to be the secret purposes of the Freemasons and other allied secret societies, there are certainly many speculations that could be made about what the nature of that significance might entail.

If you are still in doubt that behind the whitebread facade of world politics there is an occult agenda, read the following quotes published in the *Rosicrucian Digest* in 1948, and drawn my attention in *The Patriot Report* of February 1998. According to an article titled "Requisites of Peace":

> --Nationalism is destined to become extinct.
> --The dissolution of nationalism does not mean advocating an equal distribution of the world's goods among all peoples. It does mean a pooling of resources and their common control by all the peoples for the whole of humanity.

--A one world is inevitable.
--If it does not come through an intelligent admission of the obsolescence of nationalism, then it will come through the most terrible war conceivable.
--Does all this seem to strike at the love of country? It will mean only the replacement of a limited love for a more expansive and expedient one - the love of the world.
--A unity of people, not of states, is required; if there is a merging of interests then there also must be a merging of political control - a central government.

The following quotes are from another article from the *Rosicrucian Digest* published in 1948, "War or Peace," penned by Gisbert Bossard:

--The eventual solution lies in a world federation... the world has progressed to the point of a United Nations.
--Unless certain deficiencies in the U.N. charter are eliminated, the United Nations organization cannot exercise effective world authority.
--Your help is needed in the final push for victory.
--The first Reform: Abolish the veto in matters of aggression.
--The second Reform: Control atomic energy and limit all other important weapons.
--The third Reform: Establish an effective but tyranny-proof world police force.
--Russia will achieve military equality with the U.S. through quota disarmament.
--The cooperation of Russia for the "One World" and a new and wonderful era for mankind is essential.

Aside from the dark catalog of covert manipulation that I have compiled in these pages, I will not delude you into thinking that I am certain that the Freemasons are planning on overthrowing the world system on or about the year 2000 A.D. I do not even know for certain whether this is the date planned for the final consolidation of governmental systems into the New World Order. All I know is that

the twists and turns of history are covered with the bloody fingerprints of Freemasons and members of allied secret societies who have intervened at key moments to turn the flow of history in hitherto unanticipated directions, and that everything points to the year 2000 as being an epic culmination in the mythology of these secret groups.

The Masonic architects of the French and Russian revolutions; the Masonic assassins of Archduke Ferdinand who touched off the bloody conflagration of World War I; the Masons who seem to have been responsible for the Jack the Ripper murders performed to stave off a deadly crisis in the Masonically-controlled British government; the Masons who controlled the investigation of and may have been responsible for the murder of John F. Kennedy; the host of Masonic controllers who lurked behind the gothic machinations of the CIA MKULTRA mind control programs; and the continued direction of international politics by Masons and their occultist brethren like P-2--all this makes it seem that the occult portents can now be seen as forecasting another intervention by the cabal.

Key to the creation of the New World Order is the economic and political unification of Europe. According to Cornelia R. Ferreira, writing in a monograph titled "The New Age Movement":

> The formula of the "United States of Europe" and of the "Universal Republic" (to be formed by Europe's merger with other world blocs) was first proclaimed by the Illuminati in 1793; has long been the slogan of the French lodges; was adopted in the 1920s by the Theosophists; and was discussed in American-German Masonic circles after World War II. Unelected European Commission president Jacques Delors, demonsrating the importance of European unity (and the totalitarian nature of the future world government), has threatened national leaders who do not unequivocally endorse it, hinting that Margaret Thatcher's opposition caused her downfall.

The attempted unification of Europe, directed (as revealed in *Holy Blood, Holy Grail*, by Baigent, Leigh, and Lincoln) by the Priory of Sion, a secret order that may in fact underpin, be connected to, or even be the Masonic order under a different name, may be a stage setting for something even more earthshaking than a united European state. At the same time that the European Commonwealth is being put in place piece by puzzle piece, there are additional and highly strange prefigurements coming into view, one of the most odd being the multiple-thousand sightings of Eye in the Triangle-configured UFOs seen in Belgium, the headquarters of the European Commonwealth, and, more recently, in Arizona, USA.

If one understands the claims made in *Holy Blood, Holy Grail* (and a study of Masonic texts such as Pike's *Morals and Dogma* or Hall's *The Secret Teachings of All Ages* will substantiate these claims), a person of the bloodline of King David, descended through Jesus and Mary Magdalene, is to be enthroned in a newly reconstructed Temple of Solomon in Jerusalem, ushering in the messianic New Age. This reenthronement of the Davidic line was apparently also the hidden mission of the Knights Templar, who are said to have been the group from which the Freemasons sprang in Scotland after the suppression of the Knights.

The family line from which the "Lion King" of the New World Order will arise may be the European royal von Hapsburgs, currently led by Otto Von Hapsburg, the son of the last empress of Austria, and a prominent member of the Bilderberger Society. The family crest of the von Hapsburgs is the double-headed eagle seen on Masonic regalia, and the family has been historically connected to the Illuminati in a number of ways. Maynard Solomon in his book *Beethoven* states that the composer's "Emperor Joseph Cantata," which characterizes Emperor Joseph von Hapsburg as a lightbringer and a foe of darkness, was commissioned by the Illuminati. The

commemoration may have been based on the Emperor's legalization of Freemasonry in Austria.

Another scion of the family, Archduke Johann von Hapsburg, in the late 1800s provided a huge gift of cash to a parish priest named Father Sauniere, which sum he used to build a temple to Mary Magdalene in France's Renne-le-Chateau. Mary Magdalene, alleged to have borne a child by Jesus--remember? Sauniere was also connected to the Hermetic Brotherhood of Light and the Priory of Sion.

According to J.R. Church, the author of *Guardians of the Grail*, "The Hapsburg dynasty which ruled the Holy Roman Empire since the 19th century, is the direct lineage of the Merovingian bloodline. The Habsburgs are reputed to be the family of the Holy Grail offspring of Mary Magdalene."

At this time the most probable candidate for the position of World King is Hapsburg's son, Karl, who is now thirty-five years old. Karl Von Hapsburg was probably smirking when he said, "The time for the [Hapsburg] dynasty lies in some happier tomorrow when a new Europe... will undergo a time of resurrection."

The Freemasons have always seen themselves as "the manipulators," "the builders," hence the name. One of the secret meanings of the Eye and the Pyramid (which, check a U.S. dollar bill, lacks a capstone, or a culmination, suggesting that it is unfinished) is a portrayal of this intervention in history, the guiding of events in what is cabalistically termed *tikkun,* or the "perfecting" of the universe--through disinformation, murder, seemingly whatever it takes.

The Freemasons seem to take positive delight in the deception they employ. In *Jack the Ripper: The Final Solution*, which implicates the Freemasons in highly believable fashion for the Ripper murders, author Stephen Knight describes the mindset:

> Freemasons applaud violence, terror and crime providing it is carried out in a crafty manner. One section of the [Masonic] notes says humor is all important and the most appalling crimes may be committed under its cloak. The one Ripper letter likely to have been genuine suggests that Jack the Ripper was going about his crimes in just this way, committing ghoulish murders with a Puckish sense of fun. If Masonic supremacy appears in jeopardy, it is reestablished by a show of strength, by crimes of violence, perpetrated to demonstrate... the far reaching power of Freemasonry to initiates the world over...

This is akin to the manipulation we are witnessing. Both Christians and Jews will see the coming World King as the fulfillment of their religious prophecies. What they will not see is a cool precision of cogwheels in motion in the program that enthrones him.

The date the Sumerians and apparently the Masons set for the reappearance of the supernova within the triangle of Zeta Puppis, Gamma Velorum, and Lambda Velorum is around the year 6000 A.L. (*Anno Lucis*) or 2000 A.D.

Who knows? It may even be that the Masons believe their own legends about Sirius, and expect the year 2000 to see the return of the Oannes, the Nommo, the beings from Sirius, those beings no doubt having plans for setting into motion another stage in the civilizing of humanity.

A possible strategy to take advantage of this event is only too obvious. If the Masons really are planning on setting a World King on the throne--and they are--it would be to their advantage to take into consideration millennial beliefs widely held by Christians about a Second Coming around the year 2000, while at the same time taking advantage of Jewish expectations about the Messiah and the rebuilding of the Temple of Solomon. They have even been subliminally introducing the youth of the world to the concept through the recent extremely popular animated feature produced by

Disney Studios: "The Lion King"--if you doubt the explicit rendering of the messianic legend into huggy and merchandisable animal format, then view this film another time.

At the same time that we see the building blocks being pressed into place for the coronation of a World King, we see other curious activities taking place. Pulitzer Prize-winning investigative reporter Tim Weiner, in *Blank Check,* observe that the largest "black" or hidden budget expenditure by the U.S. military and FEMA (the Federal Emergency Management Agency) is in the creation of huge underground bases of the same sort that are mentioned in the wilder of the government-alien collaboration scenarios. Those scenarios of grey aliens ruling underground roosts and preparing for an invasion to be launched from underground, may in fact be disinformation masking what is really taking place: the elite in the government creating a safe underground haven for themselves when the Global 2000 plan goes into place.

The event which may prompt the placing of the key piece in the *Novus Ordo Seculorum* pyramid, the missing capstone, the culmination of the Fool's journey of the Tarot, may well be the catastrophic collapse of the U.S. economic system. The collapse of the U.S. currency and the stock market, as prefigured by the recent crises in the Orient, may well be the straws that will break the American Phoenix's back.

On the other hand, there are those who say that the widespread computer flaw termed the "Millenium Bug" or "Y2K" may perform the same function. The Congressional Research Service describes the problem this way:

> Most computer systems in use today record dates in a format using a two digit number for the year; for example, 96 represents the year 1996. The two digit year field is very common among older systems, designed when memory storage was more expensive, but is also used in many systems built today. With this format, however, the

year 2000 is indistinguishable from 1900. The year data filed in computer programs performs various functions, such as calculating age, sorting information by date, or comparing multiple dates. Thus, when years beyond 1999 are entered under this format, computer systems will fail to operate properly.

Here are some newspaper quotes about the possible effect of the Millenium Bug:

> For some institutions... it will be too late. We could end up with a real catastrophe that could affect many people's lives around the globe... One industry expert has called the defect "the most devastating Virus ever to infect the world's business and information technology systems."
>
> --*Washington Post,* September 15, 1996

> The [IRS] is launching a massive effort to forestall a breakdown of the income tax system when the year 2000 arrives... If the agency cannot quickly revise millions of lines of obscure software code... it will throw the government's financial operations into chaos. Computers throughout government and private industry face the same problem... Experts say the federal government has been dangerously late in recognizing the problem.
>
> --*Los Angeles Times*, October 16, 1996

> The world of finance... is especially vulnerable... The absolute worst case is a global financial meltdown. Clearing and settlement of transactions could break down. Stocks held electronically could be wiped out. Interest might not be properly credited. Deposits or trades might not be credited to an account. The consequences may be catastrophic.
>
> --*Business Week,* August 12, 1996

This book, however, is not a treatise on the Millenium Bug, and so I will not go into all of the possible ramifications of a majority of the computers in the world suddenly being rendered

non-functional, but can you imagine the effects on this country--particularly in the inner city--if welfare and social security checks were not delivered for a few months?

Events of the sort mentioned above would leave the country, ripped apart by strife, ripe for elitist intervention. After push does come to shove, the small groups of survivalists and patriots hanging out in the woods of Oregon will provide little more than possibilities for further Establishment PR coups as these "murderous terrorists" are routed out.

There will be no resistance. Hungry, threatened people would be eager for any answer, especially if it was transmitted in "divine" fashion, and seemingly from the stars.

Regardless of whether there are any bigheaded grey aliens in the bleachers for the gala coronation, whether or not the occultists at the top are able to launch a fleet of UFO-style flying disks to perform synchronized aerobatics over the newly-rebuilt Temple in Jerusalem, wouldn't the appearance of a singularly impressive stellar display, a supernova flaring forth in the midst of a triangle composed of three stars, be a wonderfully impressive and awfully convenient harbinger of the Illuminati World King?

UFOs at the Edge of Reality

A lecture delivered in Atlanta, Georgia, November, 1995

What I intend to explore today are some of my thoughts and opinions about the nature of UFOs and aliens and reality, based upon an interest that goes back to about 1957. I'm going to focus on some material suggesting that UFOs and ETs walk a fine line between reality and thought (or awareness). This is not to suggest that this is an illusory experience, however. I don't believe that the UFO experience is illusory. I want to explore what you might call the edge of manifestation of this UFO phenomenon.

I'm not suggesting that UFOs and aliens are imaginary, nor will I pledge that they are always completely, materially, solidly "real." Actually, I think that their existence challenges the tightly-formulated definitions of reality and imagination, and points up the limitations of those definitions. It seems to me that UFOs sometimes happily cross these lines of demarcation, and defy the definitions. The way they do this gives us some clues to something else, to the nature of reality, what is really real and what is possible, in terms of the understanding and potential expansion of awareness.

Reality is an amorphous concept. My experience suggests that there is an in-between realm in this universe or omniverse where thought and matter meet, like one of those paradoxical graphics by the Dutch artist M.C. Escher, where thought and matter coalesce and partake of each other, where matter manifests from pure awareness, where reality takes form... and that the nurturing bed where matter, reality and, incidentally, where UFOs and ETs manifest, is what we might loosely call awareness, or the mind.

When I say "mind," I'm not limiting that to the purely physical conception, to the computer that resides behind your forehead, to the electrical activity sparking in your brain pan, or whatever, because

that is a rather limited and limiting conception. If we stick with that, we're not going to accomplish what I want, which is to provide a little more familiarity with this borderland reality, with the interface between thought and material solidity.

When I use the term "mind" I am talking about awareness in a generalized sense, in a theoretically absolute sense. My own belief is that awareness is not necessarily limited to an awareness resident in the body, in a meat body. You can believe anything you want, but anyone who has any experience with meditation, with hallucinogens, or with ritual magic is going to have a sense of what I'm suggesting.

Awareness, as far as I am concerned, and in my own experience, ultimately has no limitations whatsoever, beyond the limitations that it conceives for itself. Awareness is potentially a creator, and it can create freedoms and it can create limitations. Awareness, interestingly enough, creates its own conception of itself, which is what it then proceeds to be.

I just want you to try on the concept that awareness may not proceed from solid reality. In fact, I'm not certain that I could prove this to you unless you were willing to entertain this possibility and play around with it a little bit yourself. If you think that the possibilities that I have mentioned are absolutely impossible, then you are maintaining that the beliefs and knowledge of this insignificant tide pool of awareness, the planet Earth, determine the possibilities of the entire universe. This has a corollary that UFO aficionados are often vocally decrying; the absurdity of people who believe that life could only exist on one planet in this vast universe.

I'm also saying that awareness, very loosely defined, is senior to solid matter. It stands above solid matter. Awareness creates thought and belief and, ultimately I think is the creator of solid matter. Reality, I believe is defined and created from this immaterial plane of thought and mind. I think that you create the entirety of

your physical reference, and the only reason this isn't obvious to everyone is that one also creates the belief that one can't create or even influence physicality to the slightest degree with the mind.

I believe that you create your own reality entirely. In addition, you create yourself according to whatever template you choose, in whatever body you choose, on whatever planet you choose, based upon your belief structures.

It follows that if you create your own reality, if you change your beliefs about what you can and can't do, can and can't experience, can and can't see, then you can change your reality. You can restructure your own experience entirely, change your identity entirely, and experience anything whatsoever that you wish. This is perfectly true, at least in my own experience and belief structure.

Reality. The word is a semantic absurdity. Reality, according to my American Heritage dictionary, is "the quality or state of being actual or true." When you look up "actual" or "true" you find that defined as "Consistent with... reality." The definition goes in circles, and is never grounded in anything that is separate and verifiable.

The problem is that the concept of reality is indefinable, and the concept of something being "real" is dependent upon proving that something is "real," with a verifiable existence which is apart from some subjective belief or illusion. Something that can be nailed down using a disinterested measuring stick of comparison. Unfortunately or fortunately, so far as I know, it is impossible to do this with any aspect of reality or of thought. The reason for this can be exhibited by hauling forth the standard argument one encounters for the existence of something called "reality." I don't know how many times I've heard this one. You're talking to the guy at the party and presenting your crazy ideas about how reality isn't real, and the guy stands up and [bangs on the podium]. "See," he says, "This is real. This is solid. This is reality! Try and disprove that!"

The point is that knocking on something, feeling something, feeling the weight of something, does not prove its existence, because you are proving its existence with something that is essentially identical, that is, a solid hand is impacting with a solid podium. You have not removed yourself from the context of that existence and compared it with "reality."

It might as well be meaningless babble that takes place in a dream. You might as well be dreaming that you're banging your hand against a podium and hearing the rap in the dream. In fact, every time you do that, pound on the podium, you are dreaming in a sense, because solidity, solid reality, is not the basis of reality. You can dream that you're touching solidity, you can imagine it, and in fact, once you start working with this thing called imagination, once you regularly exercise your ability to dream up realities and all of the perceptions that are allied with them, you'll also be exercising your ability to mold and transform this one, that which you've considered to be your original reality. You'll theoretically be able to change your reality and everyone else's in any manner you wish. That might seem like a contradiction, but I don't think that it is: that you can change another person's reality. The reason it seems like a contradiction is that you are identifying your awareness with the limited definition of being fixated in a single physical body. You're really not stuck.

In my experience, there really is no "other" whose reality toes you're going to step on if you get a little too frisky with your awareness play, but it is one awareness inhabiting a multitude of bodies. At least until you change that conception, and that reality.

So the "truth" about "reality," bottom line, is that there ain't no such beast. Reality is only what we believe it to be. Reality is only a contingency of awareness. The fact that ten people or a thousand people believe the same thing, does not render the thing any more real in an absolute sense, but it does point out the structural

underpinning of the determinant of this shared illusion called reality, what causes it to manifest in the shapes and forms that it does; and that determinant, that reality-shaper is called "belief." What people believe down deep is what they consider to be reality, and also what they experience. Sometimes this can be different from what they say they believe.

The existence of UFOs can be voted down due to the relative rarity of the experience, and its sometimes insubstantial character. It's the same thing with people who study conspiracy politics. You look into this subject and it becomes quite apparent that the world is run on conspiratorial lines, Rockefeller, Rothschilds, regardless of what Rush says. But the conspiracy is outvoted by the pundits in the media who know better without actually having researched the subject, and so it's not true, it's not real.

What can be accomplished by playing around with belief systems? I think that potentially we can remove finally all barriers to perception, to creation, and theoretically come up with an unlimited awareness, capable of knowing anything, capable of doing anything, and one which is totally free of limiting definition. This naturally smacks of conceptions of godhood, but I'm not trying to get religious here. I'm saying that this is part of the spectrum of possibilities of awareness. Human beings are part of the spectrum of possible awareness manifestations; snails are another.

And in this latter portion of the 20th Century mankind has come up to having awareness characteristics, enough smarts where it is possible to attain states of awareness that were hitherto unimagined, at least by the majority of awareness points on the planet. Of course, this is a belief structure in itself that I am communicating; that we are on this planet, that we are human life forms, that we have certain awareness characteristics, that we inhabit bodies, that there is such a thing as time and human evolution.

Awareness is a fascinating thing and in my belief, if consciousness that has been localized on the planet Earth would finally begin to flow a little and be liberated from some of its former boundaries and self conceptions. Awareness just won't stay in a localized, fixated condition and position forever. That's its nature.

The human condition is an interesting thing. I thought about just what the human condition is, what a human body is, what this fleshly container for our awareness is, and I think I've had some insight on this. It occurred to me that a real reality, something that you know is true, is more satisfying to awareness than simply a dream or a work of art or a movie, let's say.

It's far more interesting to an awareness to be involved in something that is real, something unchangeable, something that cannot be denied, a true story, let's say. And that's what the human body is all about. It is the awareness creating itself solidly inside of the drama, the awareness play making itself a solid portion of the play so that the drama is real!

The awareness of death even creates itself within the illusion that when the reality creation ends, when the structuralization ends, the awareness ceases to exist. This doesn't actually seem to be the case. But the solid creation of the human body--pinch me so that I know I'm not dreaming--is based upon interest. So long as you are an omniscient awareness that exists outside of its creation, knowingly having created or creating that reality or game or whatever, it's not half as interesting. You know that your creation is an illusion, it's a game, a movie, it's pretend.

You, the awareness, know that it is a form of play that you're experiencing and that it really doesn't ultimately matter. But to pretend that it's real, true, that it's reality, to put yourself in the 3-D holographic picture and say that you had no hand in its creation and that the physical creation in fact was responsible for creating you, that you were born into it and had no hand in the creation of the

drama, now that makes for some real involvement, some real fun even if it's only of the tragicomic sort!

Ultimately, consciousness has to flow. It works like a rushing stream of events. No single, localized event ultimately has any meaning; only its localized meaning. It draws its meaning from the larger context. As we expand in terms of our own self conception, as we free ourselves from self-created barriers and limitations, you might say that we are refamiliarizing ourselves with the energy of the ocean of awareness, rather than fixating on the energy swirlings locked in the little tide pool, the tide pool of Homo Sapien's conception and delusion at the tail end of the 20th Century.

There seems to be a cover-up going on about the fact that awareness creates reality, is actually in charge of reality, and that awareness has the capability of creating a belief that something is solid and then perceiving it that way. Who's doing the cover-up? Well, scientists, I suppose, and the guys who don't believe in ESP and the paranormal, and of course if people believe this there wouldn't be any organized religion, so I guess the priests are covering this up, and maybe the societal structure, the elitists who don't want the commoners getting any delusions of grandeur that they can do anything they want and throw the bums out of the Federal Reserve or whatever...

There really is a reality monopolization going on and a continual indoctrination that is forever insisting on the limited nature of awareness. "I'm only human, it's human to err, you only go round once so grab all the gusto you can..." This is the tree of knowledge of good and evil that we're not supposed to pick from. Knowledge which, you might note, is proffered by the phallic serpent, Pandora's box (a cteic symbol), Tower of Babel (another phallic symbol), and the Frankenstein story where the moral is that you shouldn't muck about too much with reality because it's likely to bite you if you do.

The antidote to all this is the *Wizard of Oz,* written by the Freemason L. Frank Baum, where some upstart and her dog stop trembling for a moment and she gets up off her knees and sneaks away from the Scarecrow (Christianity, perhaps, with the crucified scarecrow?), the Tin Man (mechanistic science, perhaps?), and the Lion (animal impulses, perhaps), and Dorothy peers behind the emerald curtain (the green coloration perhaps signifying life, delving into the meaning behind this life). And then the deception becomes apparent.

Who, ultimately, is responsible for the cover-up of the centuries, the cover-up of the unlimited nature of consciousness? I would guess that it is awareness itself, the mass consciousness behind all of the mobile meat bodies, the mass consciousness itself which is covering up this possibility through its subservient minions like the priests and the scientists and the hack storytellers at NBC and so forth.

What would be the reason that mass consciousness, possibly the closest thing to God that we have pinpointed in this sector, has been covering up these cool abilities and transcendent possibilities? Possibly for fun. Possibly to create a game, because games have both freedoms and barriers resident in them, and this makes for interest because if you can do anything whatsoever then you create a completely non-challenging state. Superman, actually, would get pretty bored on Earth, because he wouldn't have any challenges. That's why the authors of the comic book had to invent Kryptonite, to give Superman a challenge with which to create a story.

Another reason for the enforcement of limited states and the cover-up of the real possibilities inherent in life is that there is a gradual unfoldment taking place in which this physical reality, bodies and so forth, is being evolved from non-existence or potential into a state of pure awareness. "God," let us say, taking part in a continual enlargement of its awareness and manifestation. Reality, I

am coming to believe, is based solely and entirely upon the belief structures that awareness holds. Change the underlying beliefs and you will change the perception of reality.

One of the time-honored methods of reality manipulation and creation is ritual magic. Ritual magic, at least according to the more intellectual magicians that I have come across, is simply the channeling of attention through ritual and symbology, concentrating attention in a certain direction so as to achieve a certain result. The channeling of thought so as to create a certain physical manifestation. Basically the imagining of something purely conceptual into reality. Ritual magic as reality creation.

I don't mean to defame any ritual magicians who are in the audience, but it's obvious that engaging in magic is giving some of your power away. It's based upon belief in the limitation of your own power, and that you have to access some higher conception or entity or universe energy channeling device like a symbol, or whatever. You have to go through certain incantations and steps and buff your body with lambs wool, or whatever. It's based upon the belief that you need a servo-mechanism to channel a higher power in order to manifest whatever you want in this world.

More to the point, I would think, would be to locate the limiting belief you have about your own power and ability, to deconstruct that belief by realizing that you created it in the first place, and then to manifest directly whatever it is you want without employing a go-between. Cut out the Baphometic middle man.

It's interesting to note the interplay of the psyche with the techniques of ritual magic and religion. Both religion and magic, these techniques of creating or influencing reality, can be seen to derive at least in part from a hierarchical vision of reality, to contain trappings in their rituals and literature if only subconsciously dramatizing a subjection to kingly and noble forces. A

totalitarianism of the spirit. In other words, I think that ritual magic and religion both have inherent in them the presumption of control by the nobility and a ministering court. If only in the hierarchies of angels. Or the *Wizard of Oz,* again. God as king, as above so below, regal robes, and the altar as the throne of the almighty. Jesus is coming - everybody look busy.

Actually, the study of reality creation and manipulation, in my opinion has been greatly furthered by the ritual magicians. In terms of the study of the creation and manipulation of realities, there is a succession of people who have contributed to this evolving field of study.

Certainly a lot of people contributed to this line of thought, but the most distilled transmission in this century, as far as I'm concerned, began this century with Aleister Crowley, who of course was also one of the first ET contactees with his channeling of the entity Lam. Several people have commented that Crowley's Lam bears a close resemblance to a grey alien.

Was Crowley a black magician? Did he engage in human sacrifice? I frankly don't know for certain, but with his synthesis of Eastern and Western magical and religious thinking, you can see that Crowley knew that these systems are basically symbolic interpretations overlaid on and hopefully accessing something more amorphous, and that this, not the symbolism itself, is where the power derives from.

I'll put it another way: I get the impression that Crowley knew that all of this stuff comes from unmanifest, non-symbolized awareness, and that there is a stepping down that takes place from pure awareness by which symbols and realities are created.

The next guy in line in this transmission might be Jack Parsons, head of the Pasadena, California chapter of the Ordo Templi Orientis in the 1940s, who I think if he didn't teach L. Ron Hubbard everything he knew, then he at least quickened Hubbard's

quest. Hubbard himself had lots of penetrating insights, although I would caution people about getting involved in his organization, which in my experience will siphon off all of your awareness and energy in the service of the Scientological cause. Hubbard also, although he came pretty close to copping to the fact that we create our own reality, also carefully hid that fact, because if you create your own reality you aren't quite so likely to subjugate yourself to "Source," which is what Hubbard termed himself.

Returning to the UFO/ET experience, from what I can tell, one of the things that makes it difficult to define and understand is that these are multifaceted phenomena, and there are a number of different origins for the experience. People assume that there is one explanation for UFOs/ETs, they latch on to the one they are most comfortable with, and they insist that one explanation explains all incidents and possibilities. I think that there are at least five different possible explanations for UFOs and ETs, in the following suggested categories:

(1) Encounters with aliens. People may have had encounters with extraterrestrial craft and their occupants, or with unexplained denizens of this world that seem to fit this definition; i.e. inner earth dwellers, or pixies or fairies, or whatever. Non-human encounters, let's say. This is an unproven possibility.

(2) Spiritual or non-material entities. This is the crossover dimension that I have been discussing, where reality slides in and out of thought and imagination and possibility and doesn't necessarily manifest as solidity or material reality.

(3) Government military operations involved with advanced craft and/or disinformation and/or psychological operations in which people are led to believe they have had encounters with aliens. I have the feeling that this is the source of some, although not all, of the more elaborate encounters over the last fifty years.

(4) The work of hoaxers.

(5) Misperception and delusion and fish stories.

So, depending on the incident, there are at least five possible evaluations and categories of experience. UFOs and ETs cannot be explained with only one explanation, and once you start compartmenting the experience this way, things become more understandable.

An example: As I recall, about two hundred years ago, the European scientific establishment declared that the panda bear was a myth. The rarity of encounters with panda bears made these men believe that the things didn't exist.

Now, can you imagine what the scene would have been like if the same forces had been at work on the "panda bear myth" as are at work in this century in relation to UFOs and ETs? Some guy in Leipzig would be running around in a fake panda suit, faking close encounters. The British military and the M15 intelligence agency would be doing advanced testing of fake, robotic pandas, and the CIA would be doing mind control experiments where guys were hypnotized and were convinced that they had a close encounter with a panda. The popular press would be full of this stuff. People would be dreaming of panda abductions. Disinformational panda manifestos and channelings from Panda Central at the center of the Earth or Saturn would be cranked out all over the place. We'd have faked panda autopsies. And the debunkers would be oh-so-seriously deriding the possibility that pandas could possibly exist. Like the UFO scene as it stands, things could get pretty confusing. Understanding the UFO experience has been confused by the propagation of hoax material, by the deluded and the true believers, and by the military trying to cover up its little schemes.

One proof of the unreality of reality is that so many totally unreal things that violate our conception of what is true continue to happen, regardless of how much government funding the materialists get. My own beliefs about UFOs and their inhabitants

are perhaps influenced by two close encounters that I have had this lifetime, which I'd like to describe to you.

I was talking about some LSD experiences to a friend back in the late 1960s, and I said something to the effect that the hallucinations I had were incredible while under the influence of the drug. My friend responded, "They're not hallucinations." That struck me as a profound insight at the time, and still does. LSD and other hallucinogenics do not so much cause hallucinations as they cause a relaxing of one's barriers to experience and then the whole strange world rushes in.

By the way, I'm not recommending LSD or other drugs, I personally stopped this line of inquiry before 1970. But... the time of this anecdote is 1968, and I was tripping on mescaline in the San Bernardino Mountains outside of Los Angeles. I wandered off from the group of people I was with and climbed to the bed of a pristine canyon, and perched on a boulder amidst a trickling creek. I relaxed in order to ponder the fate of the universe. And that was when I saw Her, or perhaps just felt Her with complete perceptual clarity. She didn't have a body, but my sense was that the stones, the water, the trees, the air... these things were Her flesh. It was, maybe, The Mother, the Mother Goddess who manifests this world... at least I thought so at the time.

This may have been the same entity who has been worshipped since ancient times via such vehicles as the Mystery Religions, perhaps the same being as seen in Virgin Mary manifestations, Isis, Astarte, the White Goddess... but I was awe-stricken with the sudden realization of what was what, and an amazement that I could have ever forgotten that the world was the flesh of the Mother, my Mother.

And that was when she noticed that I was sitting there, and I thought I perceived surprise. She vanished out of there at warp speed, and I was left assuming--what could I assume?--that I was

profane and undeserving of seeing Her and touching the hem of Her garment if she had been wearing one. Remember, she didn't have a body, but she was perfectly perceptible and understandable to me. So that was my first encounter with an uncommon being.

The second encounter was about four years later, in 1972. By this time I had knocked off the mescaline and LSD. Now, this was in the days before Whitley Streiber, and the media hadn't really latched on to grey aliens. But I woke up in the middle of the night in Los Angeles with one of these guys, the prototypical alien grey, staring me in the face, right up close. It terrified me, and I jumped out of bed and ran out of my bedroom into the living room. When I returned to the bedroom the visitor was gone.

I put this experience aside for twenty years, until I read the book *Communion,* which verified certain details of the experience, the primary one being the color and texture of the creature's skin... which was not grey, but blue grey, with the texture and reflective quality of clay... plasticine. That verification of detail was what made the needle swing over toward "close encounter" rather than "particularly vivid dream." I don't have those types of dreams. My nightmares don't feature aliens... and so now I am willing to accept that this might have been an actual encounter, one which may have taken place at the edge; at the edge of manifestation.

Regardless of the factuality or verifiability of these two encounters, I expect they did change my way of thinking about the UFO/alien phenomenon. These encounters violated all scientific laws and seemed instead to reside in something like a crossover state between fantasy and reality. Both of these entities simply vanished when confronted, and I began to feel that this might be the realm from which a good number of these encounters proceed.

A tangent that backs up this notion: it's interesting that a lot of ritual magicians have used sex as a tool for accessing different states of consciousness, for providing "oomph" to their workings.

Although I'm not a member of the Ordo Templi Orientis group, I have a copy of their Gnostic mass, and it's a straight sexual symbolization, dramatization. Crowley was very much into this, Kenneth Grant, Austin Osman Spare, the Templars, the Mystery Religions, tantric yoga, even some of the Christian adepts like Baron von Zinzendorf's Christian-Freemasonic group who got their kicks from rhapsodizing about the ecstasy of using Christ's side wound as an orifice for their penetration.

Sex can provide an access port into energies that are useful in manifesting other realities... This, as in the case with drugs, may have something to do with the relaxing of inhibitions to experience. Sometimes, though, things are manifested that are not desired. In the Hebrew Talmud masturbation is warned against because with each act are created incubi or succubi or disembodied entities which they refer to as Qlippoth. Certainly it's no secret that in a lot of UFO abduction cases the aliens make free with the abductees, even going so far as having sex with them.

I also want you to note that researchers have long connected poltergeist, "noisy ghost" phenomena with the presence of pubescent children, children phasing into sexual maturity. Certainly a lot of energies are aroused during this period, energies which apparently manifest Qlippoth-like entities and even impact with the physical environment and toss dishes around and so forth.

I wonder if there's a correlation between alien abduction and sexual frustration? I know a woman who had an alien encounter and impregnation, or thought that this had happened to her, and she dramatized all of the signs of pregnancy, including the enlargement of her stomach. She's a New Ager so she wouldn't have appreciated my down-to-earth suggestion that she get a sonogram and find out what's really going on. Anyway, the aliens apparently intervened at the last moment and spirited the alien half-breed away before birth. I

didn't question the woman closely enough to really have an informed opinion about what was going on--there are such things as what are termed hysterical pregnancies, and fathers sometimes dramatize the characteristics of pregnancy, you know--so I don't know the nature of what actually took place. But what I am pointing out is the sexual and birth connection to the UFO/ET experience.

Another matter of high curiosity is that ET abductions often contain elements which seem to be able to be traced to events which took place at the time of the abductee's birth. This was brought out by Alvin H. Lawson in a paper about what he calls the "Birth Memory Hypothesis." Lawson did a study of abductions in the 1970s and noted that in three hundred or so transcripts of persons who believed that they had been abducted by ufonauts, birth imagery was "abundant" in their descriptions of the events. These narratives linked "the fetus with the abductee, the placenta with the UFO, the cervical opening with UFO doorways and the umbilical cord with levitating light beams or pillars..."

Lawson commented that "most" abduction accounts are "dominated" by prenatal details. I know this sounds speculative and pretty wild, but Lawson did additional studies in which he compared abduction sequences with events which actually took place during the person' birth, and noted striking correlations. For instance, in the case of one woman who had a breech birth (rear end exiting first), she got aboard the UFO "by being vacuumed up a tunnel, through a small door, and into a tiny bubble-like room (like the amniotic sac), where she remained throughout her experience. She exited the UFO in a unique manner..."

Remember, this woman was a breech birth. "She 'sat down' over a trap door in the floor and sank to the ground. Another subject, a breech birth, who was born feet first, exited the UFO by walking backwards until she was outside. A forceps-aided... breech birth, she said that 'they' pushed on her head, slipping her outside; later she

said that during the examination 'they' moved her body to 'center' her."

Bud Hopkins says that he has regressed over 160 abductees whose narratives were loaded with reproductive imagery. Here the veil seems to have been pulled back a little, and we see the direct influence of the human psyche, at least in its sexual and birth aspects, directly influencing the UFO and ET experience, as if the psychic portion of the contactee is phasing into, shading into, shaping and influencing the reality of the contact, the actual circumstances. Might this be straight delusion? Sure, in many instances I'm certain that this is the case, but I don't think that we're talking delusion in all cases.

It's reminiscent of the anecdote where the shrink shows the woman a Rorschach test and she slaps him. I think it has more to do with the concept that Aldous Huxley talked about in *Doors of Perception,* that the mind functions, at least in part, as a reduction valve on experience, a tuner that limits the bandwidth of what is perceived, and puts perception into a manageable or understandable format, and perhaps even shapes the experience into what is dictated by the content of the awareness, particularly through its beliefs. I suggest that not only does awareness interpret what is perceived, UFOs and ETs and whatnot, but that it also creates these phenomena at both the mass consciousness and individual level.

Another suggestion that our experience of UFOs and ETs is influenced by our mindset is that a lot of these experiences portray far stranger motifs, ones which come from Freemasonry and the Mystery Religions and the New World Order.

The Frenchman Claude Vorilhon was taking a pleasant hike in the mountains one day, so he relates, when he saw a UFO hovering nearby, the craft bearing a Star of David with a swastika inside the emblem. A glowing childlike figure stepped forth from the craft. The child conversed with Vorhilon, bestowing a new name on him,

Rael, and informed the man that the reason he had been chosen to be contacted was because France was the birthplace of earthly democracy (i.e. during the French Revolution). The being entrusted Vorhilon with the mission of building an embassy in which the aliens, which Vorilhon calls the Elohim from the biblical reference, could meet with dignitaries of Earth, with the stated purpose of spreading "Peace, Love, Fraternity."

Vorilhon was informed that humans had been created by the Elohim, godlike space travelers who were also skilled in the arts of DNA alteration and cloning. Vorilhon was now to assist the Elohim in preparing mankind for the final age of Revelation. Vorilhon, having adopted the name "Rael," now insists to his numerous followers that "a world government and a new monetary system must be created. A single language will serve to unify the planet." He and his followers sport the Star of David/swastika emblem that he observed on the side of the UFO, and they practice a form of "sensual meditation" which may be similar to tantric yoga as practiced by the OTO and other ritual magicians.

Quite obvious to anyone with a conspiratorial bent who has studied the literature are the New World Order/Illuminati references within this UFO encounter and the mission that was imparted to Rael. The childlike alien might as well have been on a mission from George Bush.

Another case is that of Betty Andreasson. Taking place in 1967, the events of Adreasson's abduction were later brought out through the use of hypnosis. Andreasson recalled being kidnapped from her home and spirited into what appeared to be a spacecraft. She was transported to an unknown location and then taken through a series of underground passageways that she believed to be part of a city.

Arriving at an underground chamber, Andreasson experienced, in a manner which she describes as highly painful as well as emotional, a kind of mythic psychodrama enacted before her that

may or may not have been different from the kind of mystical dramatizations enacted in Mystery Religions and other mystic cults. She saw a huge bird, that she estimated be fifteen feet in height, which resembled an eagle but having a more elongated neck. The creature was apparently alive, but as Andreasson watched, it began to transform. It began to glow with a light and heat that was so intense it caused her pain.

When the heat and light vanished the bird was gone and she was gazing on flickering embers. As Andreasson stared at the embers she saw a worm wriggling in the ash.

"Now, looks like a worm," she described it in her hypnosis, "a big fat worm. It just looks like a big fat worm, a big grey worm just lying there."

Also during the experience, Andreasson was told by her abductors: "We are going to measure you for light... You have not completely understood the word that you have. You are not completely filled with light."

Andreasson said, "I believe that I'm filled with the light! I believe, I believe that I'm filled with the light!" Andreasson also recalled that, "They called my name, and repeated it again in a louder voice. I said, 'No, I don't understand what this is all about, why I'm even here.' And they, whatever it was, said that 'I have chosen you.'"

"'For what have you chosen me?'

"'I have chosen you to show the world.'

"Are you God?" Andreasson asked, "Are you the lord God?"

"I shall show you as your time goes by."

The following is part of an interview with Andreasson conducted by Raymond Fowler:

Fowler: Have they [the UFOs] anything to do with what we call the second coming of Christ?

Andreasson: They definitely do.

Fowler: When is this going to occur?

Andreasson: They know the Master is getting ready, and very close.

Since we are ranging cosmically far afield in our search for connections, it should be noted that Eye in the Triangle emblems have been seen on some UFO and the uniforms of their occupants, and that in recent years a significant percentage of two thousand UFO sighting reports in Belgium describe triangular craft with lights at each point of the triangle, and another light in the center of the triangle.

Anyway, the Lords of Light and various other references relating to light, the Star of David, the Phoenix, the Eye in the Triangle... All of these symbols convey a very earthly origin and are often seen in accounts of encounters and abductions. These are symbols from the mythology of the Freemasons and the Illuminati.

As I mentioned in my book *Saucers of the Illuminati,* incidents like these strongly suggest a Freemasonic/Mystery Religion/ Illuminati motivation and/or manipulation. Both American and British intelligence agencies are still much aligned to Freemasonic goals, and so this might point out an intelligence agency connection, say in terms of staged incidents, mind control, whatever. That's the argument that I make in *Saucers of the Illuminati,* but since then I've come to see that there are other possible explanations.

There is the possibility that, since Freemasons and their ilk are quite involved in ritualism and magic, that this might be a straight magical transmission evoking these UFO events and even influencing them from a non-physical standpoint. These events may be summoned by Illuminati ritual.

At the very least I would suggest that these symbols might have crept into the common subconscious coin, from which position

they are dramatized in reality. Again, I am not suggesting that incidents like these are examples of delusion, but that we may be looking at something quite different: that the content of the mind can influence and shape the manifestation of real events.

Another clue suggesting the UFO experience draws part of its meaning from the human experience or the subconscious or mass consciousness experience is that one can see that one of the major concerns of this era is, and should be, the interface of human consciousness with outer space. We have finally evolved tools, that is rockets and other modes of propulsion, for travel among the planets, and are getting to the point where the creation of a faster than light drive is possible. We can see this as conceivable, and something that mankind may accomplish in the near future.

We might conceive that humans or mass consciousness may be pondering upon these things, upon this position in time and the possibilities inherent in it. And these experiences with spacelings may in part depend upon and be flavored by this focus of attention, but also possibly because we have not objectified our experience of outer space yet, we have not solidified our beliefs and views, standardized our interpretation of the possibilities of this experience.

UFOs may wholly or partly constitute an "imagining into" future possibilities. Perhaps a testing out of realities that we are going to put on or manifest in the future. A trial run in a new pair of shoes. Maybe like the Rorschach test, space is relatively amorphous to us at this moment, in our present perception, a somewhat neutral oracle that we are reading meanings into, that we are beginning to play with.

I suspect, although since I have not conducted the experiment I cannot prove, that there are major correlations between the type of UFO/ET encounters one has and one's chronic emotional tone... i.e. anger, apathy, grief, whatever; one's obsessions, philosophy, and material circumstances, roughly gauged.

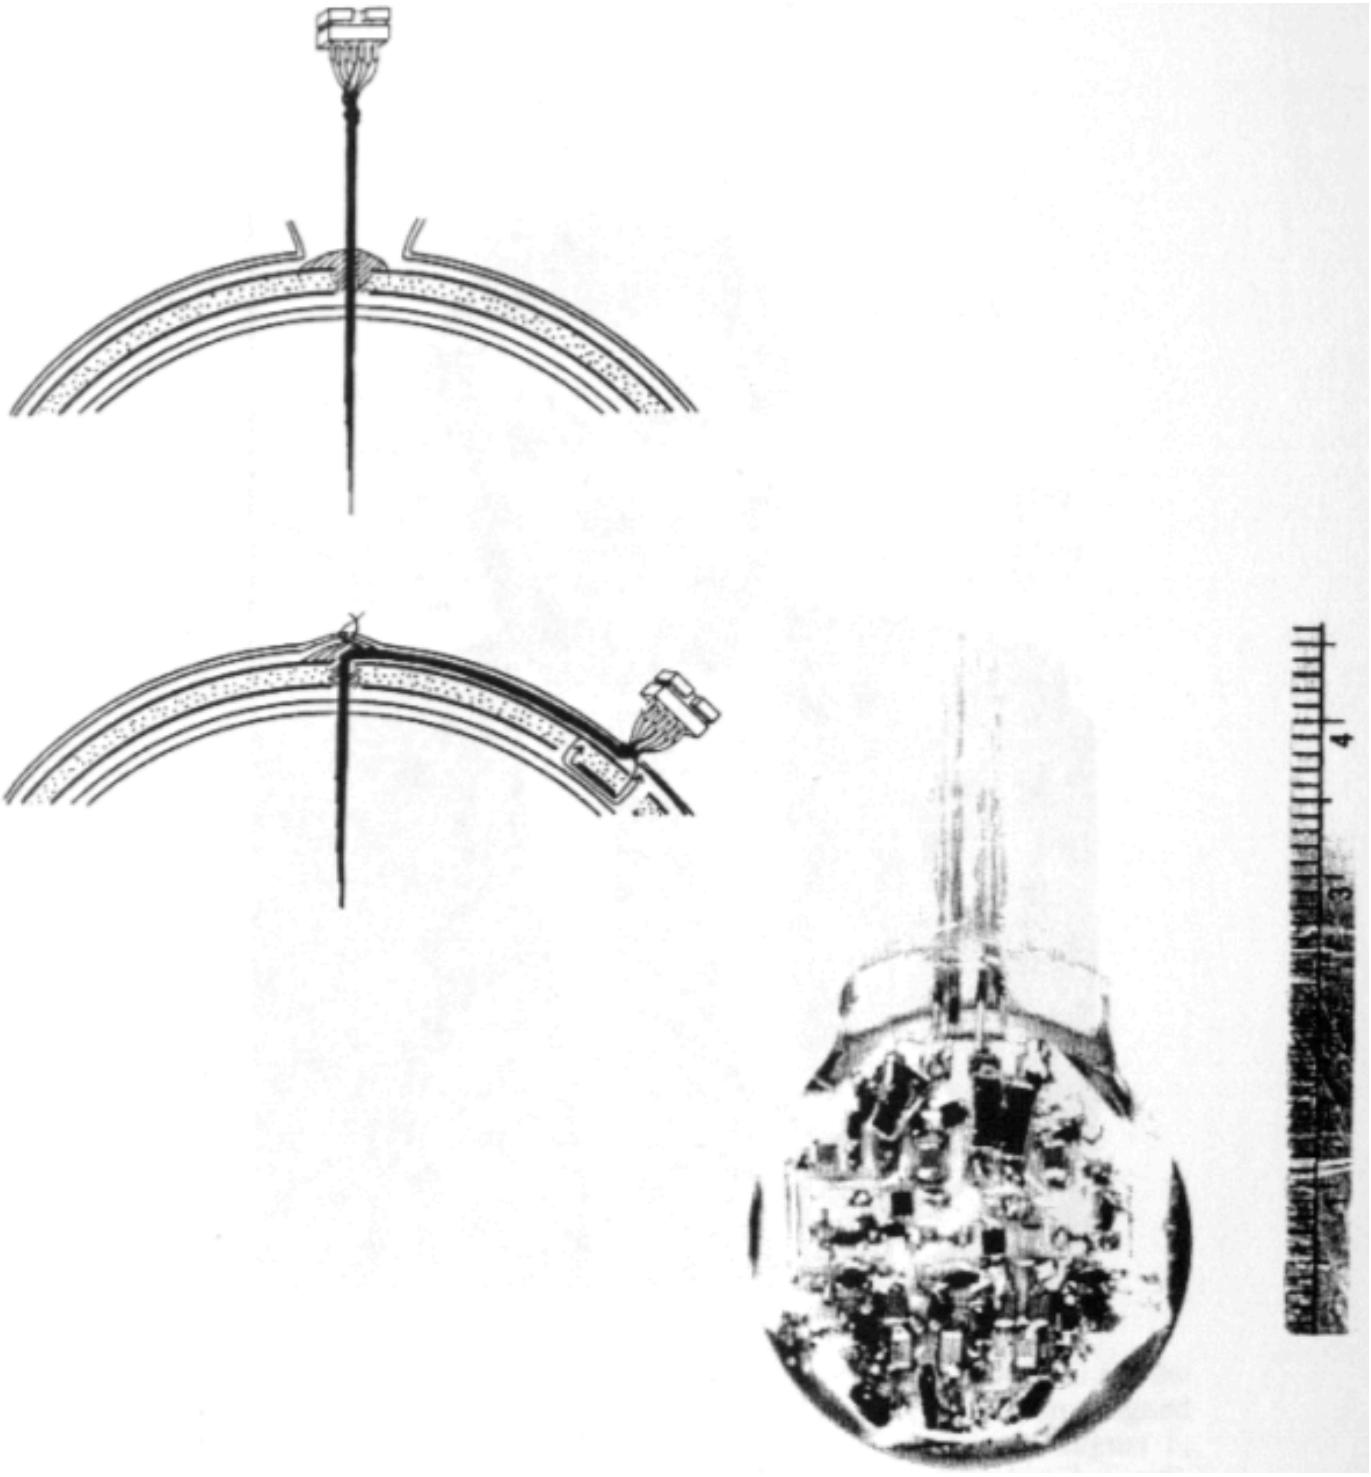
I have the feeling that a statistical analysis would show significant correlations between people who feel that they are victimized and abused by life and those who feel that they are victimized and abused by ETs. I have the feeling that people who have a generally airy-fairy New Agey view of life might tend to encounter benevolent space brothers who impart homilies about transcendence and golden eternity. Naturally, this would not correlate on a one-to-one basis, it wouldn't always be true, but I think that a decent statistical sampling would show that I am on to something here.

Again, I am not saying that these non-human contacts with humans are not sometimes real. I am saying that we tend to attract experiences that correlate with our mind and emotional sets, and that we ultimately create our own reality, including traffic jams, bad television shows, toothaches, trips to the corner grocery, being a human on the planet Earth, and having our mind blown by an ET encounter. I think that we are God playing at being human, until we realize the fact and decide to consciously play at something different.

Another clue to the UFO/ET experience is the alien face. It seems to be an interpretation and distillation of information that is too overwhelming to comprehend, and so the perception is simplified into a context that can be understood.

I have the suspicion that at least in some instances the ET experience is so big, so amorphous, so alien, that it is simplified in its comprehension, into the grey alien face. And why might I think that? Because the prototypical grey alien face is based upon the least information units that you can interpret and still come up with a face. It can be reduced to three dots in an inverted triangular shape, and given that as the basis of a face, the details can logically be filled in to form a tiny chin and a big head. It works aesthetically, in

the logic of the mind's eye. The triangular shape, the three dots in an inverted triangle, dictate the bulbous head as visual balance.



I am led to believe that perhaps the image is a distillation of an experience that is very amorphous but real, which offers a dearth of information--or perhaps too much information--to the contactee, and then the details are filled in by the mind. This is one function of the mind, to fill in the details. As a face, the grey alien is the ultimate in simplicity.

This is just conjecture, but is it possible that contactees and abductees in certain instances are confronted by something far more energy than entity, and that this energy field or nexus is channeled through the mind and interpreted based upon the least possible information units into the simplistic alien grey face?

You can see this in various oracular systems like the I Ching and the Tarot and runes and tea leaves and reading animal entrails and the Magic 8-Ball. These are purposeful destructurings of the field of information into random images, rendering the field itself amorphous and virtually meaningless, so that meaning can manifest, ready to deliver messages that are not otherwise available to the conscious mind. Like the William Burroughs Brion Gyson cut-up technique of literature. James Joyce must have seen this when he wrote his randomized *Finnegans Wake*...

John Lennon was pointing this out with his "I Am the Walrus" which is a randomized song text with recurring imagery of oneness and omniscient control by the Walrus, perhaps a bow to Lewis Carroll. This random fracturing of message is certainly the world of the abstract painter, like Jackson Pollock, and his swirling splatter canvases, which I find irresistible.

Ultimately I believe that there really is no universe, no "field" as it were, and no past and future. No time. I believe that we create the past to justify the present, and that we can create the past in any form we want. You create your own reality.

Implant technology pioneered by Dr. Jose Delgado.

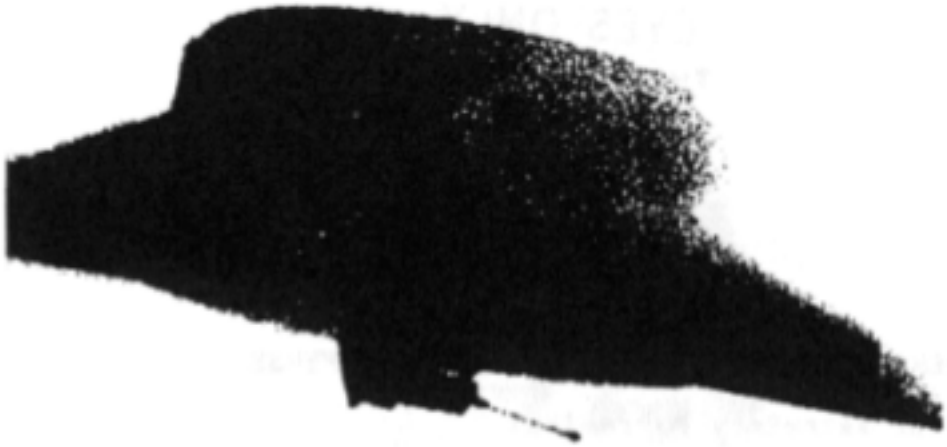
MEMORANDUM FOR THE SECRETARY OF DEFENSE

Dear Secretary Forrestal:



As per our recent conversation on this matter, you are hereby authorized to proceed with all due speed and caution upon your undertaking. Hereafter this matter shall be referred to only as Operation Majestic Twelve.

It continues to be my feeling that any future considerations relative to the ultimate disposition of this matter should rest solely with the Office of the President following appropriate discussions with yourself, Dr. Bush and the Director of Central Intelligence.

Harry Truman

TOP SECRET

Introduction

Before the modern era, there was so little codified knowledge in general circulation that a little extra private knowledge was a powerful thing, especially in the engineering trades. So it was common for tradesmen to band together in closed societies to keep their special power to themselves. In our time, however, no one can possibly know more than a fraction of all the codified knowledge, so power comes from distributing knowledge rather than hoarding it.

Science presents itself as a disinterested enterprise devoted to discovering how the universe unfolds. When scientists discovered that facts were marketable, however, the pursuit of truth and the power devolving from knowledge became organized into an industry. To earn a living, therefore, a scientist must accept a certain way of perceiving how the universe unfolds as reality, and be blind to alternative ways of unfolding. This is why radical and revolutionary discoveries are made so frequently by people working and playing outside the profession of their interest (would Albert Einstein have conceived the theory of relativity if he had not suffered an academic failure permitting him to make his calculations in his spare time while working in an unhurried office?) or by lifetime amateurs like Gregor Mendel (the first known discoverer of genetics), Stanford Ovshinsky (the high-school dropout who discovered amorphous transistors), and Immanuel Velikovsky (who defied union rules by picking up the materials of other trades).

From time to time a layman will make a naive observation of commonplace evidence disregarded by the professionals as too trivial to be worthy of their interest, not immediately profitable enough to justify investment, or politically dangerous to mention. Nevertheless, the simple facts must prevail over current beliefs. This book is the result of this kind of observation.

Each of these stories is the consequence of observations professional people are discouraged from making. All the

ideas, except the concepts of relativity, were worked out during shoptalk with skilled tradesmen in the course of everyday employment. The carpenter holds in his square the mathematics that was the glory of Greece. The boat designer is applying the principles of the most advanced calculus when he plots the curves of a hull. The electrician has fitted his leisure van with the electronic devices Q invents for James Bond. A tradesman possesses knowledge equivalent to professional scientists, and usually possesses somewhat greater skills because he not only has to be able to understand what the executives want, he also has to make these skills work. Most mechanics feel themselves to be at a disadvantage among professional people because they don't know that they possess equivalent knowledge. Because mechanics often do not learn to express themselves verbally in the manner recommended in the *Chicago University Manual of Style*, professional people do not recognize mechanics' learning, either.

Before a professional forum, amateurs—mechanics—look like idiots. Nevertheless, from time to time an amateur makes a naive and commonplace observation of such compelling importance that nothing else matters: Scientific belief must give way before a simple truth, however crudely presented.

This series of essays is the work of a lifetime amateur. These essays are presented as examples of this kind of momentous truth. Each is based on facts you can verify for yourself by making the same observations, and then proceeds to speculation. Each of these stories describes realities contradicting common sense and contradicting the local authorities on matters of science.

When published articles describing these observations brought response from university people, I was surprised to learn that the essential propositions in this book are in agreement with the most advanced thinkers of our time. These radicals are so far out of the common ball park that their very existence is unknown outside circles exchanging private papers. They are of the kind including Erwin Schrödinger, Louis de Broglie, and Nikola Tesla, names that are recognized today although the essence of their thinking remains mysterious. This

is not to say that they endorse everything written in these pages; they don't even agree completely with each other. I believe, however, that you will find the errors insignificant in detail compared to the general conception.

Most amazing of all is being informed that the visionary theorists scattered in isolated outposts beyond the pale of authorized science are not so isolated nor so visionary nor so theoretical as believed. There are also outposts manned by engineers working with less fantasy and more hardware to turn the facts disregarded by the universities into operational machinery.

Refusal to clothe the truth with fiction made it impossible to publish this material for ten years. When "The Crystal Planet" was first submitted, pyramid power made no sense to anyone except a few alchemists. Within the next five years, pyramids became the hottest property since the hula hoop. Less than five years ago, one editor, insisting that the public be given facts instead of fiction, was forced to leave his job. When the article, "How to Build a Flying Saucer" finally appeared in print, after two years of editorial hassles, two editions included waivers of responsibility in case the facts proved true! But the following year, that very article was selected at the MUFON (Mutual UFO Network) international conference in Mexico City for translation into Spanish and publication throughout Latin America. By the end of the seventies, these essays had found their way all around the world, passed from person to person through the mails, and had been reproduced by basement presses until they achieved the kind of circulation enjoyed by liberal Soviet poets. In time, a reply from a Soviet engineer researching radical means of locomotion found its way back through the postal grapevine of UFO freaks! It is a common joke that American antigravity research consists mainly of a budget assigned to the CIA to spy on what the Russians are doing; it seems that the Russians may be reading American science fiction to find out what can be done.

Most of these essays appeared initially as a series of articles in *Pursuit*, the quarterly subscription journal published by the Society for the Investigation of the Unexplained, with its present public service office at RFD 5, Gales Ferry, Con-

necticut 06335. Each article had to be cut to the editorial slot and still be self-contained. The geometric concepts developed with increasing comprehension and precision over the years.

To amend repetitions and contradictions and bring the material up to date, the articles have been rewritten for easier and more informative reading.

A hundred years ago, a speed of twenty-five miles per hour was legally prohibited in the belief that such terrific velocity would endanger life. Fifty years ago, engineers were certain man could not possibly reach the Moon because no rocket fuel exploded with sufficient velocity to escape the Earth's gravity. The limitation of combustion velocity was overcome by the concept of multiple-stage launchers. Neil Armstrong walked on the Moon without man's making a single new discovery. All that was necessary was to think differently about what was already known. The discoveries described in these essays are already in operation on the weapons proving grounds. One of these days an entire population is going to be annihilated like the citizens of Hiroshima, who did not realize there could be anything to fear from a lone aircraft on a beautiful August morning. Massive destruction seems to be the only way people will accept a revolutionary concept whose time is now.

So if anyone out there really wants to believe in flying saucers, he will ask, "How can we do this saucer thing?" You will see how easy it is when you want to solve the mystery; how easy it is once you accept an attitude of solving one problem at a time as you come to it! If you learn nothing else from this exercise, you will at least have had a lesson in how easy it is to construct, from the facts discarded by orthodoxy, a scientific theory no less tenable than the authorized version.

1.

MEGALITHIC ENGINEERING

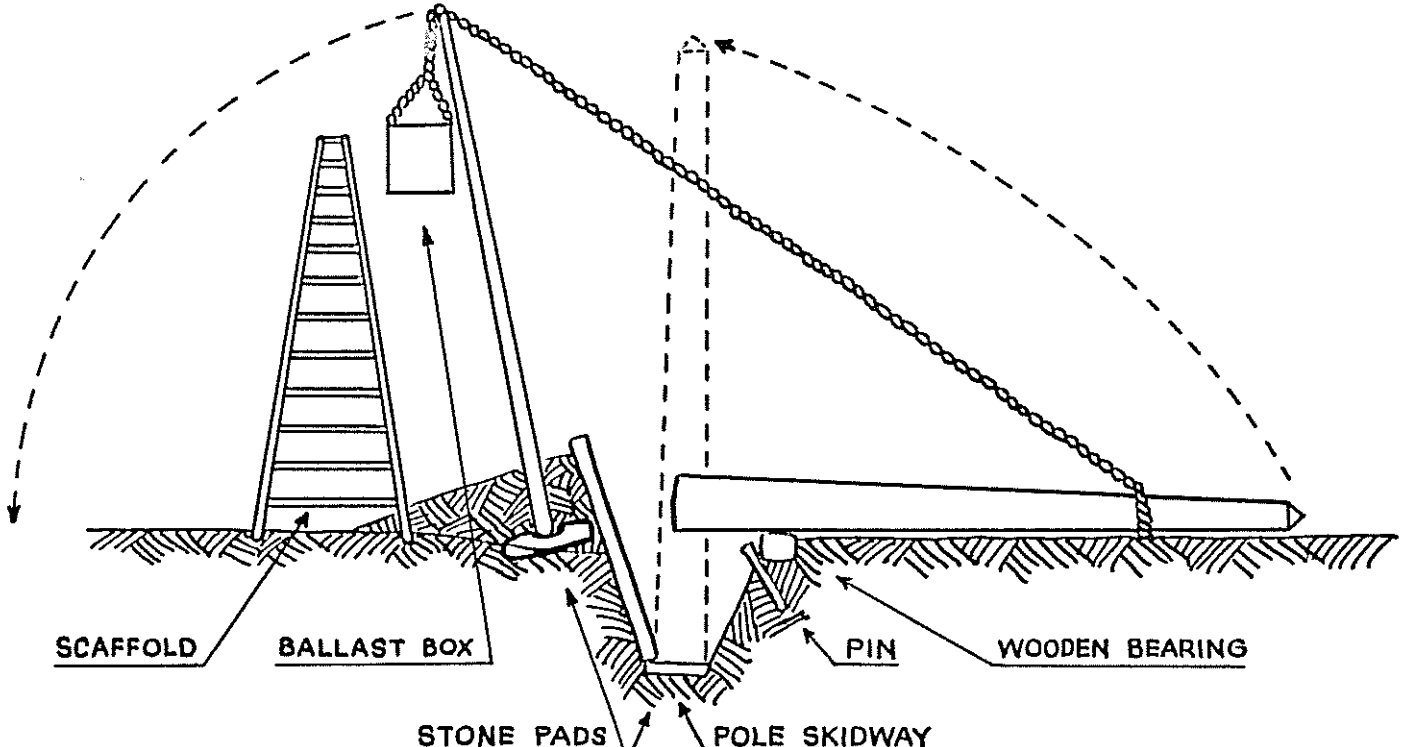
How to Build Stonehenge and the Pyramids with Bronze Age Technology

The most generally believed myth prevailing today is that the Earth is a colonial outpost of an extraterrestrial civilization. In recent prehistoric times, this civilization exercised its supersophisticated technology by quarrying inconveniently massive stones, transporting them for inconvenient distances over some of the world's most inconvenient terrain, and then piling them into temples on the scale of mountains—their way of getting their rocks off, so to speak. Whether or not you accept the scenario sold by Erich Von Daniken, scientists and engineers agree that the Great Pyramids of Egypt and other prehistoric megalithic monuments around the world are constructed on such a colossal magnitude that there's no way ordinary human beings could have done it. Even today, the monuments at Abu

Simbel had to be cut into pieces to move them a few hundred yards from the Nile waters rising behind the Aswan Dam because our heaviest machinery was not otherwise able to manage the task. A number of authors, professional archaeologists, and more or less talented amateurs have published calculations proving that the magnitude of the pyramids exceeds all the human resources known to be available for construction at the time.

When I address myself to the construction methods of the pyramid builders, I am forced to turn in my amateur card, since I worked for several years in heavy earth construction. My last employer handled the largest contracts undertaken in this part of the country at the time, and I was being trained to supervise construction of an industrial town site. Whenever I read a story about how the prehistoric megalithic monuments may have been erected, even though I cannot make an on-site job survey, I check all the measurements to see that they agree. Every carpenter who is given plans for three twelve-foot rooms on a thirty-six–foot foundation knows it can't be done. Architects frequently forget to allow for the thickness of the walls because they never have to do the job and because the contractor pays for errors.

If you take the trouble to calculate the volume of a megalith from the dimensions given by various writers, and multiply it by the average weight of stone (with a specific density three times water), you will find the most impressive magnitude of the prehistoric building industry is error in simple arithmetic. Even if we assume that the length and width of the megaliths are not multiplied by literary hype, they are reduced to human proportions by correct calculation. Although Stonehenge could have been built the way the British scientists staged it for television, it wouldn't have been. The operations are regarded as too dangerous by today's unionized workmen. The prehistoric laborers' workmens' compensation would never have approved the contract. Estimating the job as if my employer had been asked to bid on Stonehenge, I found that standard techniques known throughout the trade proved simple and economical. It is inconceivable for the prehistoric engineers to have done it in any other way. Megalithic construc-



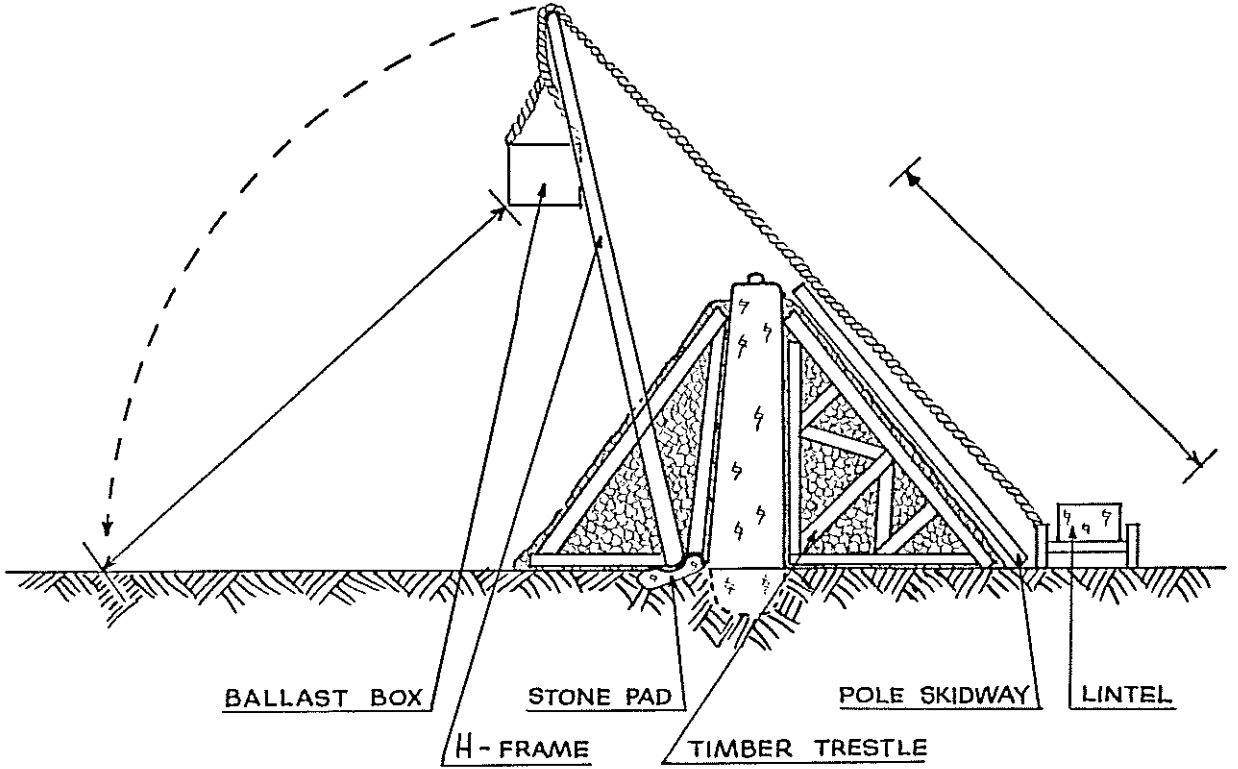
tion was the *usual* method of building public works the world over. In the Stone Age it had to be the most economical technique available, just as steel frame and reinforced concrete is today; and the methods had to be simple enough for gormless apprentices to follow with no more than the usual number of goofs. If scientists had asked tradesmen how megalithic monuments could be built, there never would have been any mystery.

The standard way to erect pylons would have made no scene for Charlton Heston in *The Ten Commandments*. The pylon is drawn to the site on a stoneboat; pallets have been traditional in the moving trades since prehistoric times. A thousand slaves driven by whips are not necessary, because a thirty-foot pylon with an average cross section of five square feet weighs less than fifteen tons. Three hundred slaves, or a dozen oxen, could handle it easily. Even if the ancients had unlimited slaves, they used beasts of burden because animals are more efficient; The primitive Eskimo knows enough to hitch a team of dogs to a sled.

In the socket prepared to receive the pylon, the bottom is laid with a slab of stone for a footing to prevent the pylon's shifting and toppling over in the course of time. The edges of the socket, where the base of the pylon overhangs, is buttressed with logs to resist the pressure of the stone when raised against it.

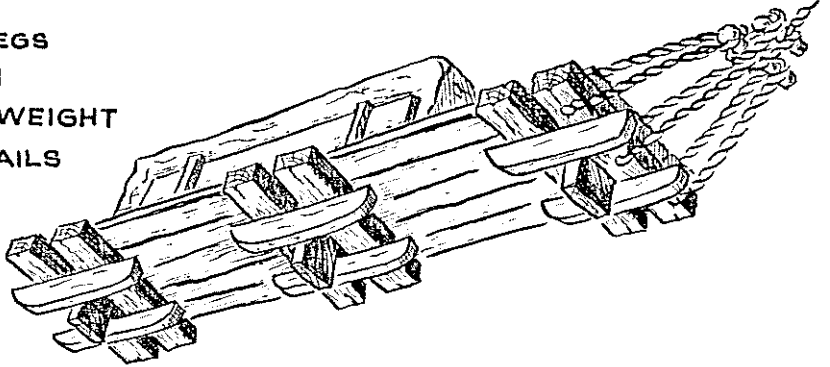
On the other side of the socket from the pylon, a pole A-frame is raised. A line is fastened to the top of the pylon, passed over the apex of the A-frame, and attached to an empty bucket suspended well above the ground. A scaffold is erected to the bucket so that a chain gang can pass ballast and fill it. When the weight of the ballast in the bucket is sufficient, the A-frame rotates on its legs as the bucket is lowered to the ground, drawing the pylon's base over the socket to the abutment, then raising the top of the pylon as the shaft rotates on the edge of the socket. When the pylon is practically erect, it plops into the socket. Voilà! No sweat. This is the probable method used to erect the posts for the massive triliths at Stonehenge.

Exceedingly massive lintels, such as found in the An-



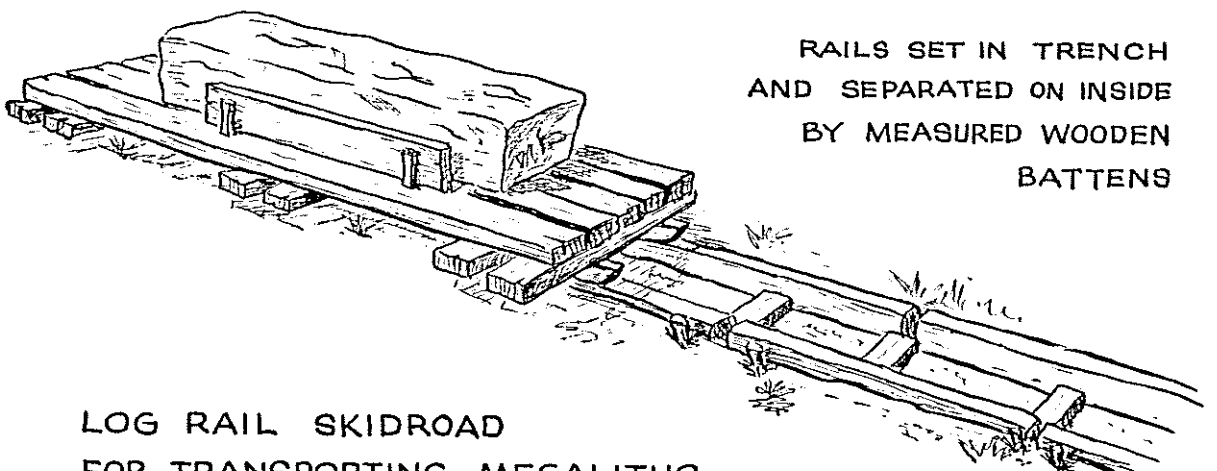
COUNTERWEIGHTED A-FRAME FOR RAISING OBELISK

dean ruins and at Stonehenge, were probably raised to the tops of the posts by a modification of the technique used to erect the posts. First the crew had to buttress the uprights with timbers and earthen fill. Barely a tenth of the posts at Stonehenge are held in their sockets; with so little lateral support on a foundation of broken and compressed rock, the horizontal movement of a lintel being moved over the tops of the posts would have pushed them over; this is a hardhat job. Gerald Hawkins, the decoder of Stonehenge, protests that the labor needed to provide all the posts with buttressing would have exceeded the effort of raising the lintels, but my platoon would be on unemployment insurance the day after they were hired if they didn't have a pair of posts buried for the arrival of the lintel in the morning.



To begin with, experienced workmen look for fill that's easy to shovel. Then they use the same fill for each arch in succession, merely having to fling it over. When the lintel is brought to the base of the buttress on its boat, an H-frame is raised on stone pads on the other side of the arch. Lines are fastened to the stoneboat and thrown over the legs of the H-frame. The weight of a ballast box suspended by the lines is what keeps the H-frame upright. A chain gang mounts a scaffold to fill the ballast box with stones. If the distance over which the box will fall is measured carefully to equal the distance the lintel must rise, the H-frame will slowly rotate on its bottom legs, drawing the lintel up the ramp on the buttress until it comes to a gentle stop right above the pins receiving it.

To skilled laborers who do this kind of work for a living, the only question is why the architects chose a quarry on the other side of the Bristol Channel. The construction specifications of Stonehenge call for about 100 five-ton monoliths to be hauled twenty-five miles overland with a few hundred feet of rise. A five-ton load is no big drag for a couple yoke of oxen. The present structure at Stonehenge is the third of its kind built at the same site. The earlier stones were smaller and probably more numerous. By the time a few dozen sledges had been dragged over the trail from the quarry, the grade would have been cleared, soft spots filled with rocks, and slopes cut down to a comfortable angle. You need only see a path worn



RAISING LINTEL WITH COUNTERWEIGHTED H-FRAME

RAILS SET IN TRENCH
AND SEPARATED ON INSIDE
BY MEASURED WOODEN
BATTENS

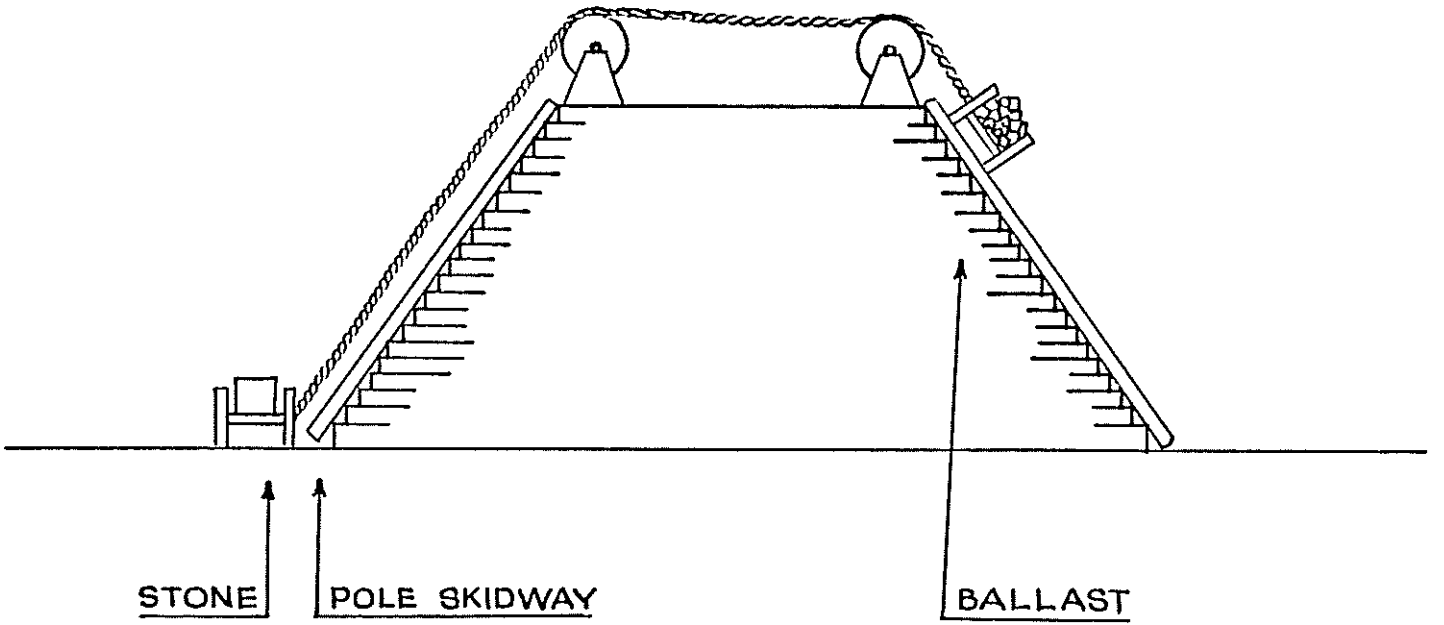
LOG RAIL SKIDROAD
FOR TRANSPORTING MEGALITHS

between farmhouse and outhouse to appreciate how quickly a repeated trail becomes a thoroughfare. To turn the grade into a proper railway, all that is needed is wooden poles laid along the right-of-way for the sledges to slide on. With some lubrication, properly cut skids will slide the stoneboats with less friction than the old Red River carts.

The smoothing of wooden rails for a skidway may seem more laborious than the dressing of the megaliths, but wood is ever so much easier to work. After one monument was completed, the roughly squared durable oak rails would be taken up and laid down for another construction elsewhere; the investment in transport machinery was thus amortized over many jobs. When the rails became crushed to the point where they could no longer bear the weight of sledges, the best sections—like worn-out railway ties—would be gleaned by poor folk for domestic structures, while the broken sections would be used for fuel.

Another shipment of about a hundred more blue stones had to be brought in from a quarry a few miles closer. To move these final megaliths, weighing from thirty to fifty tons, even twenty-mule teams would have sweated. To make the beasts sweat more heavily, between the quarry and the job site there is a low ridge to surmount. Archaeologists have sought the *easiest* grade over the ridge as the way the ancient Britons brought the megaliths to Stonehenge, which is why archaeologists cannot figure out how the monument was built. When there is a lot of altitude to gain in a short distance, however, experienced movers do not seek the easiest grade; they survey the range until they find the *steepest* cliff. Then they build a funicular railway, operated by counterweights, to raise the load as quickly as possible. (Travelers say that funicular transports on cliffsides are still used in England today.) Between the quarry and the job site there is a net loss of altitude, and once the cargo is raised to the summit of the dividing ridge, even fifty tons is no big sweat for teams of oxen to drag downhill.

Constructing the Great Pyramids was not a problem of engineering technique, but of logistics. The scale of the monu-



ments is so awesome that it is pure fantasy to estimate on the contract without knowing the resources available.

Logistics aside, the pyramidal design expedites its own construction. To begin with, the pyramid is its own ramp. To raise the building blocks to the working level, all that needs to be done is to lay a pole skidway against the sides. A line is fastened to the stoneboat at the base of the pyramid and passed over a pulley wheel at the top level. The line is then strung right across the top level, passed over another pulley wheel on the opposite side, and fastened to another stoneboat carrying an empty ballast box. This stoneboat is held by the line on another pole skidway laid against that side of the pyramid.

Second, the stepped slope of the pyramid also serves as its own scaffolding. A chain gang standing on the steps passes small stones from the bottom of the pyramid to the ballast box on the top of the slope. When the box is filled, it slides down the skidway, dragging the building block up the other side. When the traverse is completed, both stoneboats are emptied, each load is replaced with its opposite number, and the transport is repeated in the opposite direction.

The Great Pyramid has sides four hundred feet long, so a dozen counterweighted shuttles would be in operation continuously, bringing blocks to the masons faster than they could be laid. As the pyramid rises, the area of working level diminishes; but at the same time, the number of blocks needed to lay each course is reduced by a factor of the square of the shortening of the sides, so the construction rises faster as it goes.

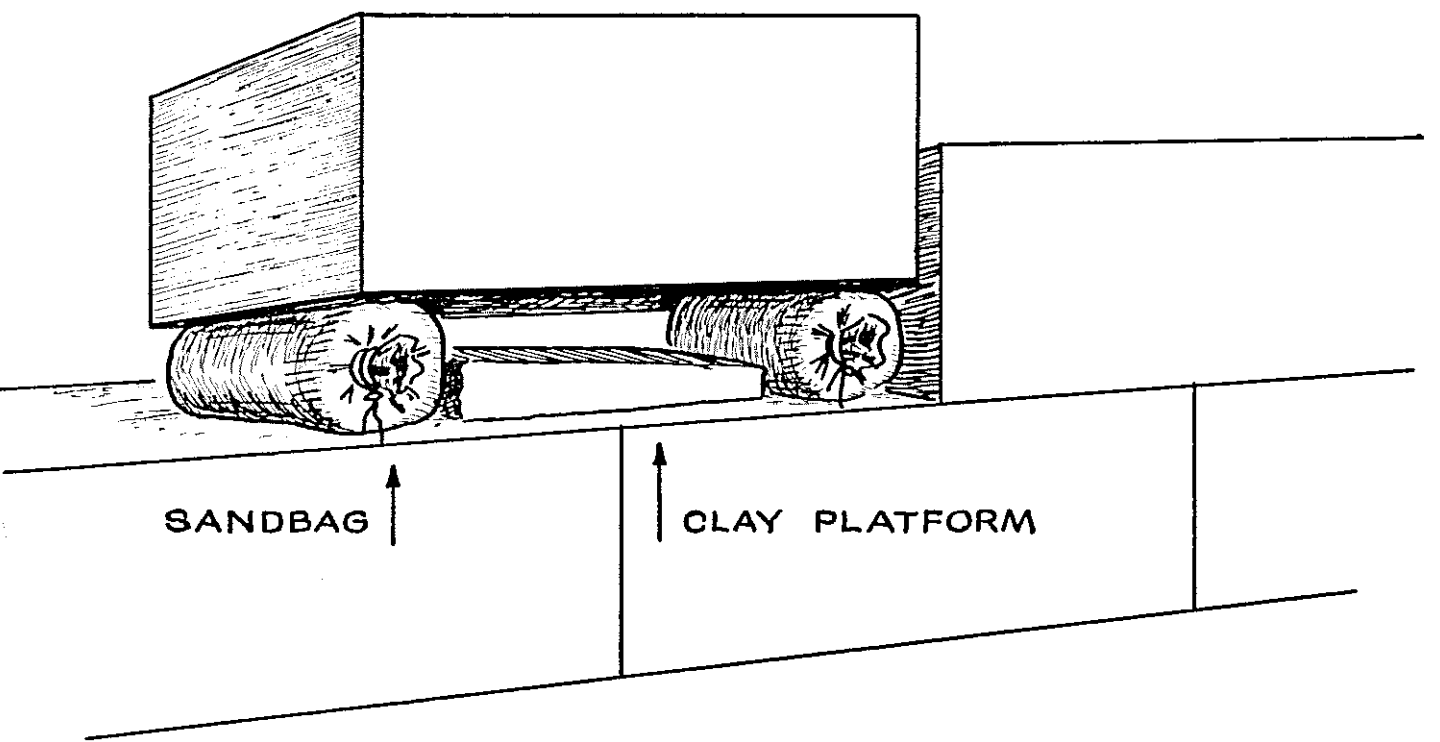
Dragging the pyramid blocks to working level up earthen ramps is one of several well publicized techniques worked out by scientists, including some professional engineers. Earthen ramps are plausible because they are feasible. But this pedestrian kind of engineering is never used by workmen in a competitive industry. An earthen ramp, besides requiring the moving of several times the amount of material involved in the pyramids themselves, won't stay put under long and heavy use. Earth flows under pressure, and the weight of

RAISING STONES TO THE TOP OF A PYRAMID
WITH COUNTERWEIGHTED PULLEYS

the ramps themselves would be sufficient to generate flow. The earthen slopes of railway grades are built on a trestle framework filled with rock to keep them stabilized. It is impossible to walk on fresh earthen fill, nor will fresh fill support several tons of rock and the slaves to haul it. A hard surface must be laid on the ramps to keep feet and load from sinking into it and tearing the ramp down about as fast as it can be rebuilt.

These problems are not insurmountable; all it takes is a lot more work. It is the cost-time-labor inefficiencies that make naive technology impractical. You must remember that pyramid building in ancient Egypt was a big industry, developed over thousands of years, and Egyptian businessmen practically invented accounting.

Critics object that there is no record of the Egyptians using wheels for industrial technology at the time the pyramids are believed to have been built. This is a specious argument when examined in historical context. The only reason we do not know how the pyramids were built is that there is no record to tell us. Without those missing records, we cannot know whether the Egyptians used wheels or not. We do not even know for certain that the people we call the Egyptians built the Great Pyramid in the first place. The only convincing evidence of the time of its construction is a cartouche painted on one of the interior stones signifying that the quarry supplied the order for Cheops.



When there is but one piece of evidence, we have to make of it what we can; we cannot deny its significance. But people in the construction business know that when a shipment of three million units is spot-labeled with the customer's order number, marking just one unit is not the practice; in a normal shipment of that amount, at least three thousand stones should be labeled. And why would a shipping label be left on the *interior* facing of a religious monument? The possibility should not be overlooked that the single scription of Cheops's cartouche may be an example of prehistoric graffiti. Until authenticated records are provided, it is not unreasonable to assume that engineers who developed mathematics at least as far as the Greeks, who designed a monument incorporating the ratios of the Earth, Sun, and Moon, who perfected astronomy to the

limit of the unaided eye, and who put a polished finish on a stone mountain with such precision that irregularities are practically undetectable without measurement by laser, probably also used the wheel.

Rather more puzzling is the absence of any record of the ancillary industries needed to support pyramid building. The manufacture of tool bits to cut stone must have employed as much manpower as the transport industry involved in moving monoliths by the ton. Construction men know that the replacement of lost tools is a serious expense for the company and crew. Yet not only is there no record of the means the prehistoric stonecutters used, but no tools have been found in the rubble left behind after construction. Neatness must have been rewarded beyond all other virtues in the ancient Egyptian construction industry; you need only consider the polished casing of the Pyramids to believe it.

Reporters compare the precise setting of the prehistoric megaliths with the casual tolerances of modern stonework and marvel. The only reason modern builders work to a tolerance of a quarter-inch is that there are no practical reasons to be more precise—and powerful economic reasons for not trying to be. (But if you ever visit a dry dock, you will see tonnages thousands of times more massive than the most stupendous works of the ancients set into position with a precision comparable to the Great Pyramid's; if a ship does not balance on its keel exactly where the blocks are set for it, it may topple over and put the dock out of business for several months until it is cut to pieces for removal like the monuments at Abu Simbel. Out of necessity, shipwrights developed techniques for placing hulls by hand because no machinery is big enough.) Given economic reason to be exacting, modern masons can equal the ancients. (The grinding of giant astronomical mirror lenses is a hand job.) In a tradesman's opinion, the only reason the prehistoric megaliths were dressed to tolerances within a millimeter (at least once in a while) is that the labor was economical to perform within the context of the masons' operations.

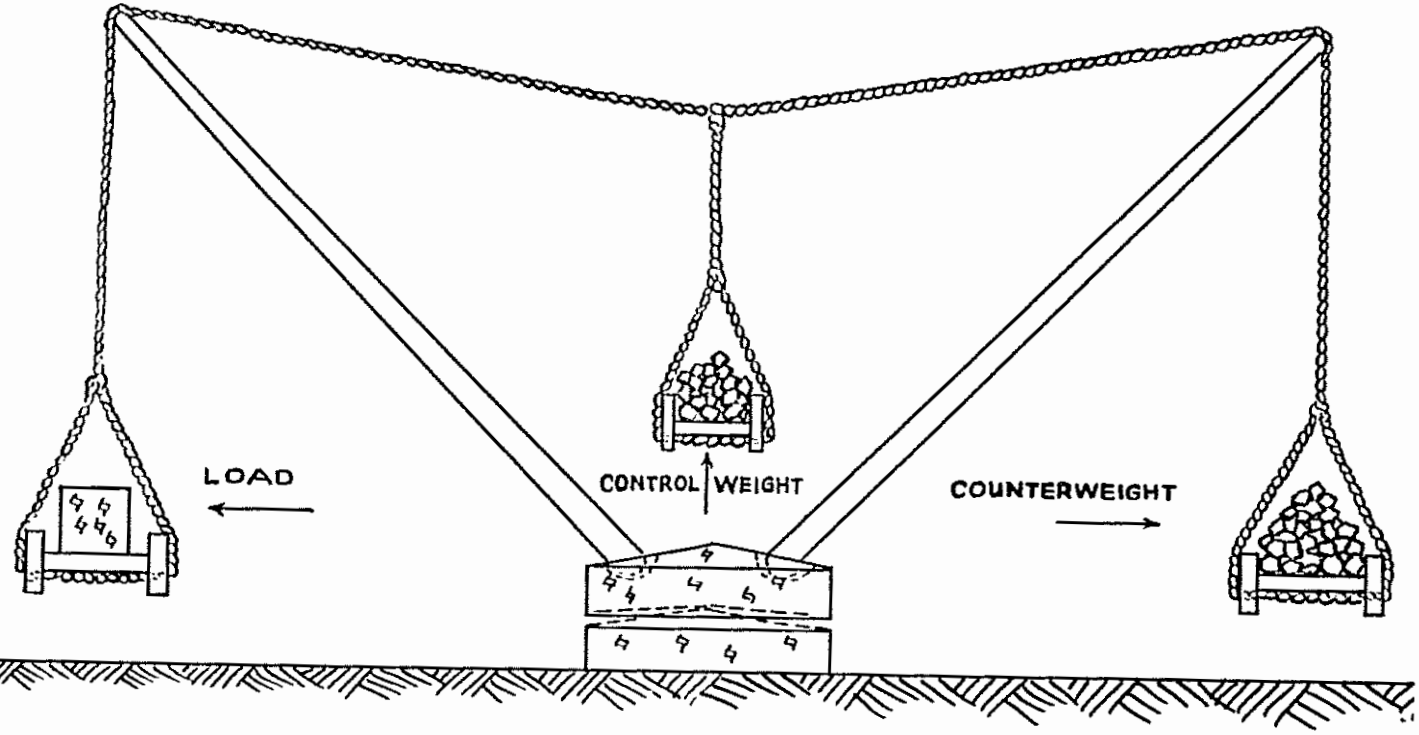
A megalith brought into position on the course of stone being laid is supported on two leather bags filled with sand, one bag at each end. A platform of viscous clay or mortar is

SETTING MEGALITHS

built up between the sandbags. When the bags are opened, the sand pours out, allowing the stone to settle onto the clay platform. As soon as the bags are free of the weight of the stone, they are snatched away by apprentices (the slow boys can be recognized kneading mortar with the stumps of their arms). If the top surface of the clay is slanted, the megalith will slide by its own weight, tight against its neighbor. The only technical problem is mixing clay to support the stone long enough for maneuvering, but still fluid enough to be squeezed out completely by the time the next stone is brought in for laying.

For a megalith weighing dozens of tons to slide easily over the clay, the broad bearing surfaces must be smoothly dressed. As the smoothing of the broad surfaces cannot be left undone, it is no big deal to dress the abutting ends to an equal finish; the precision of the ends is not critical, so the job can be given to apprentices for their practice. A technique like this would be considered only when the cranes raising the stones to the working course were not adequate for precision setting.

It is likely that the millions of blocks used in the construction of the pyramids were transported from the quarry to the job site over a rail skidway. Rails are far more efficient than log rollers. But once you see construction crews at work, other possibilities come to mind. We know that megaliths were transported by barge over water. Now, one technical problem the ancient merchant marine had to solve was getting heavy crates onto a boat. In those days, you see, boats were comparatively small, and when a massive cargo was carried across the gunwales, the boat turned turtle. So the traditional merchantman's crane was developed, using counterweights to maintain an even keel while loading. In the two hundred years since power winches became universal, it has been forgotten that today's basic machinery was developed when all the power had to be supplied by muscle. Winches in the confined area of a top deck are limited to small loads, and pulleys are limited by friction, unless fitted with roller bearings and chain. So when the ancient longshoremen had a heavy idol to ship to Thebes, they used counterweights to lift the thing as well as get it over



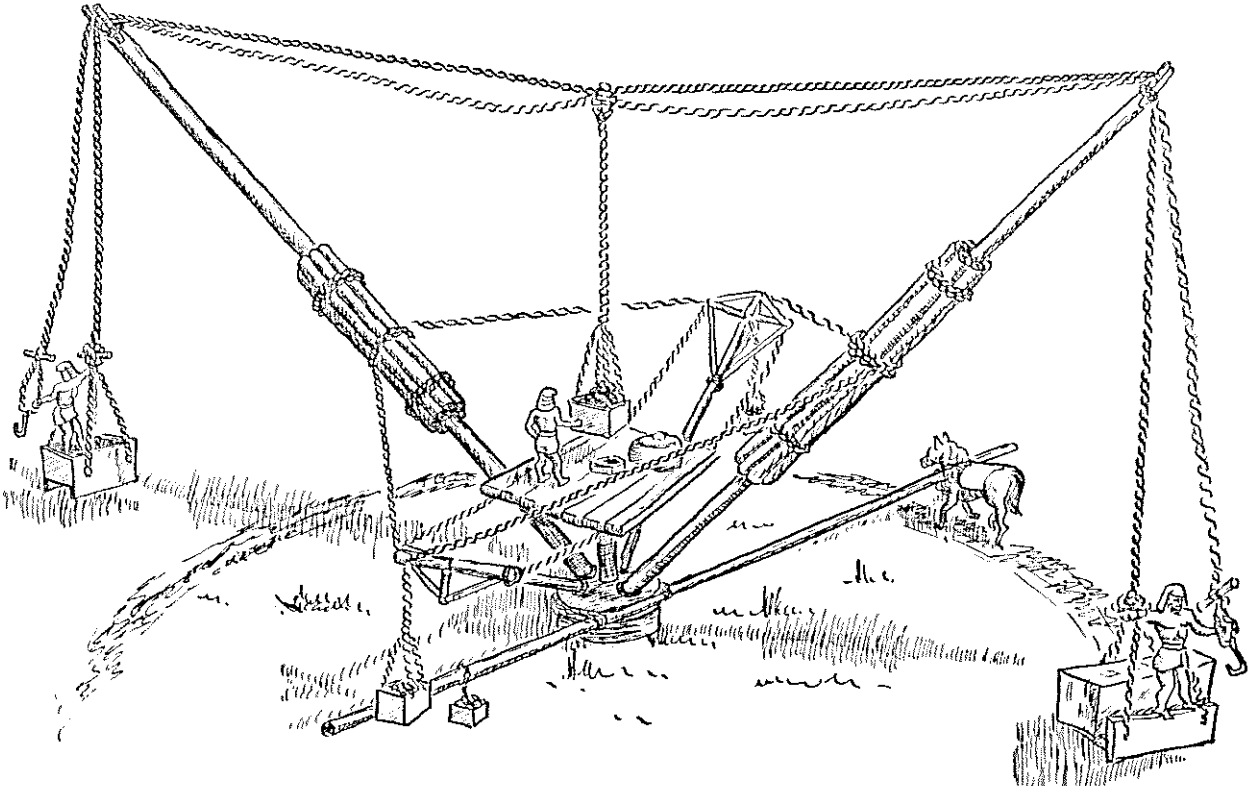
the gunwale without capsizing the boat. Herodotus says that the Egyptians were exceedingly clever in the invention of counterweights.

Once the system of counterweights is developed, construction practice inevitably turns to megaliths, because it is far easier to handle one big stone than to shape the hundreds of little blocks each megalith replaces. By far the biggest advantage of megalithic construction is permanence. Brick buildings can be torn down by every marauding horde that passes through the country, but no one is going to knock over a temple held together by fifty-ton lintels.

The counterweighted cranes developed to pass cargo between ship and shore need not be limited to a single lift. In crowded shipyards today, sections of ships are transported across busy work areas through the air, being passed from one crane to another. Workmen become so skillful that the loads may never be set down between first lift and final deposit. The same principle is practicable for the transport of building stone from the prehistoric quarry to the job site. When heavy cargo is shipped out by the millions of units over hundreds of years, economics justifies the construction of a chain of cranes, set about fifty yards apart, to transport material in a continuous stream over all kinds of terrain—like a pipeline, the most efficient of all material transports.

The design of the merchant ship's crane is scaled up for overland transport of ancient building materials. The base of the transport crane is a stone disc, about six to eight feet in diameter and a foot or two thick. The bottom surface is flat enabling it to rest securely on the ground; the top surface is fashioned into a shallow cone. Another stone disc of the same dimensions is set onto the base. The bottom surface of the top disc is made into a negative cone so that the wheel can rotate, balanced on the base without sliding off.

At opposite sides of the top surface of the upper wheel, hemispherical depressions are carved, about a foot deep and wide enough to contain the fire-hardened butts of a pair of booms. The booms can be extended by splints to extend over one hundred feet upward and outward at a forty–five degree angle. They are held balanced in position by a line passed over



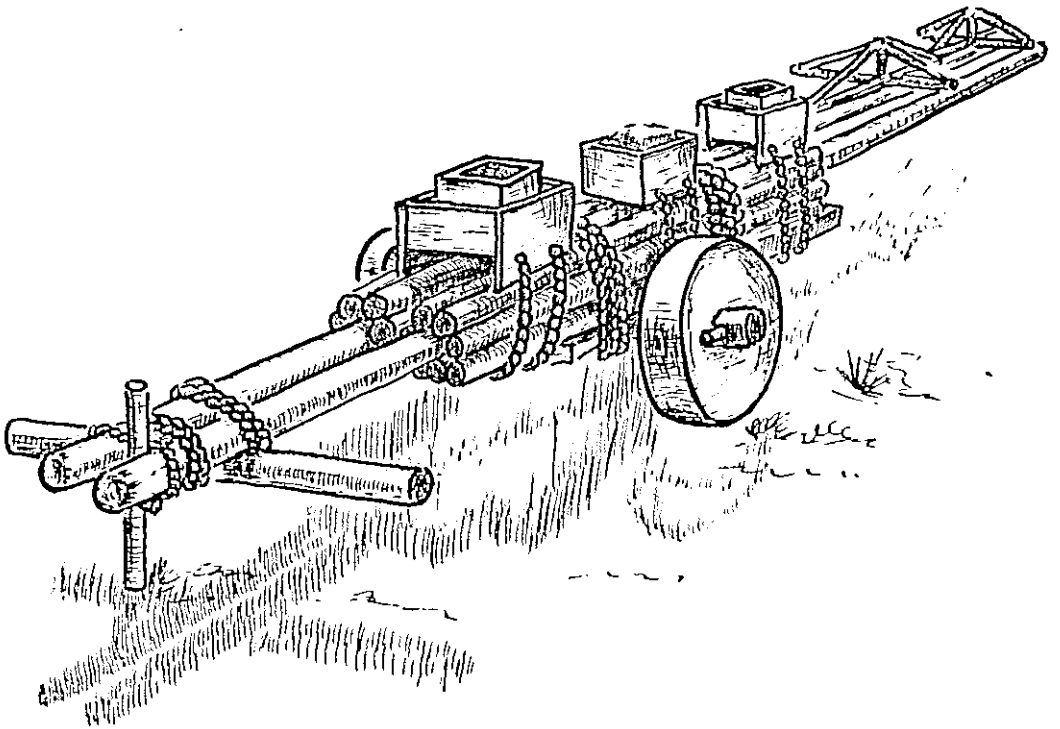
PRINCIPLES OF MEGALITHIC CRANE

their upper ends, from which a heavy container is suspended at each end. Now, if a light line is suspended from the center of the main cross line, a small amount of force will pull the line down; closing the straight angle of the cross line brings the ends of the booms together. As the booms come together, rolling without friction in the cups holding their butts, the top ends rise, lifting the containers. The practical amount of rise is no more than a foot or two before the changing load vectors multiply the tension of the lines to their breaking point. But within this narrow range of efficiency, one man can raise many tons, and the requirements of transport can be served as soon as the load is clear of the ground.

In operation, cargo is loaded onto one container, while the other container is counterbalanced with ballast. When the cargo is a replicated building block, the weight remains constant, so there is no delay in balancing it with a counterweight of known measure. The control line suspended from the cross line carries a counterweight, too, sufficient to balance the container units, so the operator riding the top bearing stone need pull down on the control line with little more than the force required to overcome inertia. The control line also serves to take up slack in the cross line as the hawsers stretch during service. Once off the ground, the load is carried around the reach of the booms by rotating the crane. The friction on the bearing stones is overcome by employing a draft animal.

A chain of these transport cranes would pass a continuous stream of building stone from the quarry to the city at walking speed, pausing only long enough to transfer the loads from one crane to another; while down the other side, an equal weight of ballast would be transported from city to quarry. The ballast side need not be deadheading all the time; instead of ballast, supplies needed by the quarry can be packed for transport in containers of unit weight. This system is low technology, labor intensive and non-polluting; when all the costs are accounted for, we can hardly improve on the efficiency today.

Once industrial machinery is put into production, the men who do the job always add improvements with or without the cooperation of the design office. Sooner or later, it will oc-



MEGALITHIC CRANE IN OPERATION

cur to a crane jockey that his pony is sweating too hard, so he will drill the center out of the top bearing to form a pipe through which he can pour clay slip to lubricate the bearing. The weight of the load will hold the bearing surfaces so tightly together, and they will be ground to such an even curve, that very little—if any—of the slip will be able to flow between them. So the operator will add a pole to the bottom of the counterweight of the control line; the butt of the pole fits nicely into the lubricating hole. When the weight is pulled down, the tamp is forced onto the clay in the pipe, and waddayaknow —pressure lubrication! An alternate means of lubrication probably used, instead of the fanciful design just described, is the inclusion of naturally oily shoes between the bearing surfaces, like the lignum vitae used today in the heaviest marine bearings.

A stationary crane has limited use, even in an industrial yard. When the ancient engineers designed the transport crane, they made it portable. When the job is completed, components are disassembled. The tamp for the pressure lubrication is passed through holes drilled through the centers of both bearing stones so that they will roll like a pair of wheels joined by an axle. The booms and spars are balanced across the axle. The whole bundle of sticks is tied together by the lines, and the draft animal is hitched up to haul the crane away to the next building site.

The first critic to whom I submitted this engineering system was a retired Master of Exams from Cambridge University, J. Lloyd Brereton, to whom I am indebted for first publication. Brereton reasoned that transport cranes must have been as ubiquitous in the Age of Gold as trailer rigs are on today's highways, so he referred to the *Encyclopaedia Brittanica* to see if any available evidence supports such speculation. Obviously, wood and rope do not outlast the pyramids, so we cannot expect to find any organic remains of the prehistoric transport system. But throughout the sands of the Middle East, archaeologists *have* found huge stone discs in considerable numbers. Tribespeople who found them first have been using these "millstones of the gods" for thousands of years to grind their grain. The hole in the center of the upper disc is designed

MEGALITHIC CRANE READY TO ROLL

to pour in grist, and the conical bearing surfaces allow the flour to flow out around the edge as the stone is turned by a draft animal.

Naturally, modern scientists assume without question that the stones were manufactured for no other purpose. But it is curious that no other societies in the world have developed rotary millstones like the "millstones of the gods"; everywhere else, grain is ground by women rubbing it back and forth in cylindrical bowls in mortar–and–pestle fashion.

The real mystery of the megalithic monuments is that no one over the past two thousand years was able to figure out a way to build them. Yet any competent tradesman could have told the authorities how to build these megalithic monuments, if anyone bothered to ask him. But no one *did* ask, because most people believe their authorities know everything. In Rhodesia there is a magnificent city built of precision masonry, constructed on a monumental scale comparable to the minor pyramids; the natives call the ruins Zimbabwe, and they attribute the construction to their ancestors. The European invaders found it necessary to establish the myth of white supremacy in order to justify their rape of the country. If the black people are capable of constructing cities like Zimbabwe, then the whites cannot possibly be biologically superior. So scientific authorities assured the world that Zimbabwe was constructed by a mysterious civilization, most likely the same people who built the pyramids; but whoever they were, they were not black. Now that Rhodesia has been taken over by democratic parties, the country is being called Zimbabwe by its own people, and the world is accepting as fact that the natives' ancestors are the people who built the monumental city.

This essay is not intended to explain how the prehistoric megalithic engineers *did* build their monumental temples. That question can be answered only by archaeologists on the basis of the evidence they dig up. The problem is, *how could it be possible* for a Neolithic society to have engineered the monuments we find today?

Now just because the engineering outlined in this essay is derived through the oldest traditions of the construction

trade, and proven practical for megalithic monuments, it does not mean that the ancients used these methods or anything like them. Construction contracting is the most creative enterprise. At any given time and place, a contractor avails himself—from a variable selection of resources within his competence—to implement the technology he believes most likely to be executed profitably. A big-time operator like General Pyramids Consolidated, needing to keep its army of slaves busy earning its garlic during a slack century, may very well have put them to work piling earthen ramps up the sides of the pyramids with wicker baskets. On the other hand, I believe the way the ancients transported megaliths for their monuments was to attach a small tuning fork to each stone, causing the module to levitate when the properly tuned vibration was sounded. When a monolith is set to resounding, its vibrations keep it in the air most of the time. During the greater part of the wave cycle, when the mass is floating, a light touch will move it in any direction.

I believe ancient engineers used this technology because the ancient myths describe it. This application of musical theory is far too sophisticated for a Stone Age people to incorporate in their myths unless the authors actually witnessed the technology in operation.

You didn't think I was going to let you go without *some* speculation, did you?

2.

THIS CRYSTAL PLANET

How to Create a Worldwide Communications Network—Still Using Bronze Age Technology

One disturbing puzzle of archaeological science is the number of similarities between some aboriginal cultures widely dispersed around the world. Pyramids, for example, are found not only in Egypt, but also in Peru, in Mexico, on the South Sea Islands, and in China. Moreover, many of the details of construction are identical. The present-day Indians of Peru build reed rafts identical to the ones pictured on the walls of ancient Egypt, and the modern Indian word for this craft is the same word spoken by the Nilots thousands of years ago. There are so many similarities between the Aztec tongue and classic Greek that the early European explorers believed they had discovered a lost Greek colony. Aztec-Greek lexicons have been compiled, and modern exploration is finding remains in South

America indicating a Phoenician origin. In *Mysteries From Forgotten Worlds,* Charles Berlitz reproduces an "alphabet" of pictograms found in the ruins of a prehistoric city of western India and compares it with the undeciphered writing of Easter Island; the glyphs are identical.

The evidence indicates a cultural migration from the centers of Mediterranean civilization across the Atlantic and around the world. Thor Heyerdahl proved this theory feasible by mounting a series of daring expeditions to cross the world's oceans on primitive rafts. Anyone who missed the films can read the adventures of this courageous amateur in his books, *Kon-Tiki* and *The Ra Expeditions.*

Heyerdahl proved that the Queen of Sheba could have hocked the crown jewels to outfit a task force of three papyrus rafts for crossing the Atlantic and finding a sea route to Cipango, dispersing Nilotic culture and smallpox en route. But no original thinker constructs a perfect and complete theory. Eventually so many loose ends accumulate that a better theory is required. Heyerdahl left an awful lot of loose ends.

Ever since the first sailor lost sight of land, survivors of shipwrecks have been cast up on faraway shores. But none of them transplanted a civilization. Aside from knowing how to build boats and sail them, most sailors were barely civilized enough to keep themselves stoned on grog. Any of them lucky enough to survive a greeting from headhunters went native as soon as they saw *wahine.*

Drifting sailors did not disperse culture; they dissipated it. It took centuries for Europe's highly organized and heavily supported American colonies to become self-supporting, and most of them could not survive from Thanksgiving to Christmas without help from the native Indians. For Mediterranean culture to have dispersed on papyrus rafts, the sea lanes between Memphis and Mexico must have carried more traffic than the great ocean liners during the heyday of American immigration.

One other problem Heyerdahl neglected to mention: Like wine and oysters, language does not travel well at pedestrian speeds. Within a generation, language changes; within a lifetime, classical Latin became Italian, French, Spanish, Ru-

manian, and Romansh. If a language is to maintain its identity around the world, rapid communication is required. If Nilotic civilization dispersed to the Americas and the South Pacific, it could not have drifted on rafts. Moreover, when the pyramid builders decided to disperse, they did not roam randomly, but proceeded *directly* to locations comprising a global network.

Inspection of a global relief map reveals that the eastern contours of the Americas conform closely enough to the western contours of Europe and Africa for the two sides of the Atlantic to have been joined together at one time. You will also notice a string of salt lakes, progressively diminishing in size, stretching from the Straits of Gibraltar through the Black Sea and along the northern base of the Himalayas, suggesting that an ocean passage once connected the Atlantic with the Pacific between Eurasia on the north and the Afro-Indian land masses on the south. People have noticed this structure since the first world maps were drawn and the Theory of the Continental Drift was proposed for serious scientific consideration over a hundred years ago. The original theory was disregarded until the undersea drilling of oceanographers after World War II brought up cores that could be explained in no other way.

As you can see for yourself, all the southern land masses duplicate the same shape and contours. South America is a larger, elongated version of the Indian subcontinent. Africa is Australia in capitals. In addition, all these large blocks have a large island off their southeastern coasts: Tierra del Fuego, Madagascar, SriLanka, and Tasmania. Such regularity suggests that the continental slabs did not break off and drift in an entirely haphazard manner. The pattern suggests that the entire southern continent of Gondwanaland must have been formed as a regular crystal during the same heat when the geological crust solidified. The lines of cleavage not only follow regular fracture planes, but are also determined by a regular structure governing the dynamic tectonic forces that cause the Continental Drift. There may be a corresponding regularity in the original contours of the northern continents, but the outlines have been obliterated by the collisions that have occurred since. In artistic analysis, a general rule is to begin with the largest forms first, and then follow the natural subdivisions.

The largest geographical feature on our planet is the Pacific Ocean. Notice that the Pacific Rim forms a rough circle defining about a third of the global surface. With such a large fraction of the geography covered by a circular basin, it follows that the center of the Earth's land masses must be approximately opposite the center of the Pacific. When the globe is turned around, you see that antipodal to the center of the world ocean is the region where Europe, Asia, and Africa are in continental collision.

The distribution of land and sea has all the appearance of a global flow carrying the continental crusts from a pole at the center of the Pacific to the opposite pole. The Americas and the World Island have been separated by a counterflow that does not extend into the circle of the Pacific Rim defining a third of the Earth's surface.

In order that Gondwanaland be formed around the South Pole, we may infer that another tectonic current existed during a primordial geological era, flowing south from the Equator, if not from the North Pole. This flow was reversed from south to north during an intermediary era before the present flow pattern became established. The fact that the South Polar region is a circular plateau ten thousand feet above the sea, whereas the North Polar region is a circular ocean basin, indicates that the tectonic current arises roughly around the South Polar Circle and stops roughly around the North Polar Circle. This coincidence, in turn, suggests the angle of the Polar Axis relative to the plane of the ecliptic is involved with the direction of the tectonic currents, just as this angle determines the currents of global weather patterns. In this era the tectonic currents appear to be aligned along an east-west axis. This suggests catastrophic shifts in the Polar Axis. Now, as it happens, drill cores brought up from the ocean beds do show sudden reversals of the Earth's magnetic field in geological times.

Because almost all the visible features of the planet are in the Eastern Hemisphere, a look at the center of the world may give some clue to account for the peculiar geological distribution. As soon as you perceive that the Pacific Rim draws a rough circle around the Nile Delta, you will notice that many of the lesser geographical structures—including under-

sea ridges—also form circles around the Delta. If you take a compass and scribe these circles, you will eventually have enough data to show that the major land forms follow arcs at intervals of 15 degrees from the Delta, especially the arcs at 90 and 120 degrees. These are the major intervals of spherical surface harmonic overtones.

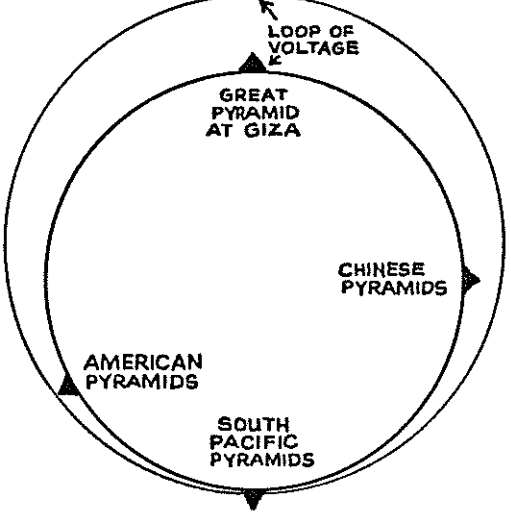
The pattern is quite obvious; the Earth's surface is defined by vibratory currents. The Moon was found to ring like a bell when struck by the first Lunar Lander in a seismic test. If the Moon is a planetary crystal, why not the Earth?

The Great Pyramid at Giza is located at the center of the world's land masses and in the highest concentration of natural voltage combined with a tolerable climate. When the British inventor Sir W. Siemens climbed to the summit of the Great Pyramid, he found his body discharging sparks as if he were standing on a high-voltage coil. In fact, the atmospheric voltage on the Giza has been measured at 500 per vertical meter, and Siemens should be credited for discovering what Pyramid Power is all about.

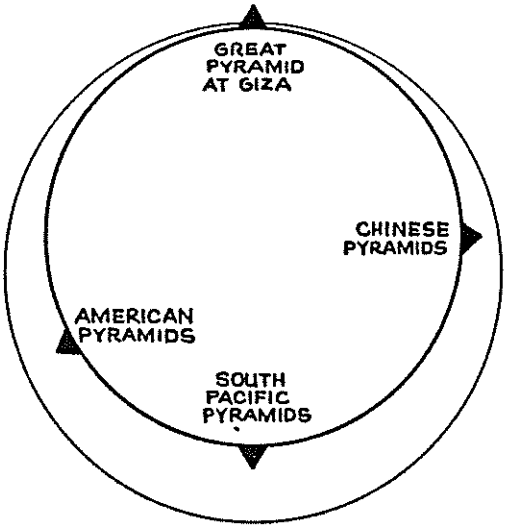
The goal of Heyerdahl's first expedition was Easter Island (also known for manifesting very high electromagnetic potentials), the farthest east of a group of South Pacific islands where the pyramids of another prehistoric civilization have been found. And like the Egyptians, the aboriginal people of this region called themselves Children of the Sun. The South Pacific is at the antipodes—180 degrees from the Nile Delta.

In America, from the Great City of the Sun at prehistoric Cuzco to the Great Pyramid of the Sun at Teotihuacán, a third great-pyramid civilization arose. This culture ranged along an arc 120 degrees from Giza.

A quarter of the way around the world, 90 degrees in the other direction from Giza, recent archaeological digs have uncovered the greatest pyramids known—a thousand feet on a side—buried in the jungles of southern China, and thought to be natural mountains until the overgrowth was cut away. These mountains are the ancestral homelands of the Japanese, who still believe they are Children of the Sun.

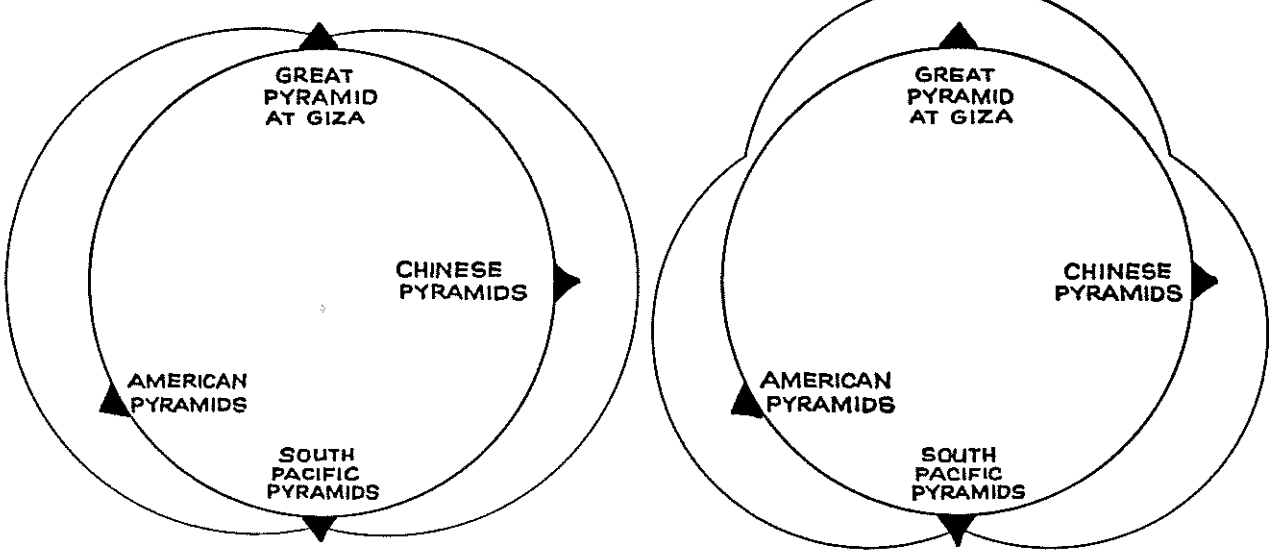


The meaning of this peculiar dispersion was revealed by accident during the early days of World War II. At that



time, radar spotters picked up the echoes of distant aircraft by listening through giant earphones instead of watching blips on fluorescent screens, as is done today. The crews frequently reported hearing whistles of no known cause. Eventually, research reported in *Scientific American* found an ionized layer in the upper atmosphere that filters radio waves selectively in the 7½-cycle-per-second band, and apparently reflects them back to Earth, bringing them to a focus at the antipodes.

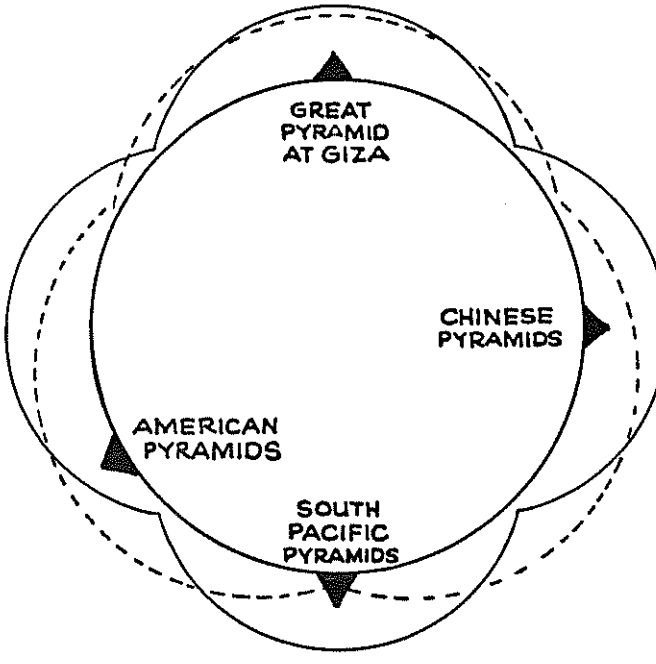
When lightning strikes, a broad band of radio waves is emitted, to be heard as static in unfiltered radio sets. The 7½-cycle-per-second band is filtered from lightning discharging at the other side of the world and brought by the Schumann Layer to a focus 180 degrees distant, where the radar spotters heard the filtered static as whistles.



To military engineers, the 7½-cycle-per-second frequency possesses two properties of great value. The Schumann Layer guides this wavelength all around the world without losing signal strength, like light between two mirrors. This wavelength also penetrates water. The United States Navy realized that this was the frequency needed to keep in constant communication with its nuclear submarine fleet, constantly ranging beneath the surface of the world's oceans, and so it constructed a worldwide radio network broadcasting on the 7½ Hz band, called the Sanguine Project—later extended for civilian shipping as the Omega Navigation System.

The striking property of the 7½-cycle-per-second radio wave is that it is exactly 25,000 miles long. A wave broadcast at this frequency will expand in a growing circle until it is as long around as the equator, and then contract until it comes to a focus at the antipodes. At the other side of the world, it reverses phase and direction, expanding again to girdle the globe before returning to another focus at its exact point of origin. The loop of this wave arrives at its point of origin exactly in time to coincide with its own following wave. This means that only a single wave exists at any time, and that the wave encompasses the whole world. The entire planet beats electromagnetically at this frequency, like a cosmic heart. The 7½-cycle-per-second frequency is the fundamental period of surface resonance of the global crystal.

THE FUNDAMENTAL ELECTROMAGNETIC RESONANCE BETWEEN THE EARTH AND ITS SURROUNDING IONOSPHERE CREATES A VOLTAGE LOOP OSCILLATING FROM ONE SIDE OF THE WORLD TO THE OTHER, AS SHOWN IN THIS DIAGRAM.
THE GREAT PYRAMID AT GIZA AND THE GREAT PYRAMIDS OF THE SOUTH PACIFIC ARE LOCATED WHERE THE NATURAL GLOBAL VOLTAGE ESTABLISHES THE HIGHEST ELECTRICAL POTENTIAL.



AS THE VOLTAGE LOOP OSCILLATES BETWEEN THE NILE DELTA AND THE SOUTH PACIFIC ISLAND AT THE ANTIPODES, AN EQUATORIAL LOOP IS ESTABLISHED BETWEEN THE TWO POLES.
THE CHINESE PYRAMIDS ARE FOUND WHERE THE EQUATORIAL LOOP ESTABLISHES THE HIGHEST ELECTRICAL POTENTIAL.

THE AMERICAN PYRAMID CIVILIZATION IS FOUND WHERE THE LOOP OF THE THIRD HARMONIC ESTABLISHES THE HIGHEST ELECTRICAL POTENTIAL.

Resonance in the Schumann Layer means that overtones will be generated at one half the fundamental frequency, one third the fundamental frequency, and one fourth the fundamental frequency, and so on, in successive fractions. The length of the second harmonic overtone is one half the diameter of the Earth, the third harmonic overtone is one third the diameter of the Earth, and the fourth harmonic is one fourth the diameter of the Earth. The pyramid civilization of the South Pacific is halfway around the world from the Nile Delta, the pyramid civilization of America is a third of the way around the world from the Nile Delta, and the forgotten pyramid civilization of prehistoric China is a quarter of the way around the world from the Nile. The great pyramids of the world are located precisely at the places where the strongest electrical potential is concentrated on the Earth, and at the loops of the harmonic standing waves surrounding the Earth. The Schumann Layer functions as a radio loudspeaker with its diaphragm enclosing the entire planet.

The great pyramids of antiquity are a virtual duplication of the modern military radio-communications network, broadcasting on the 7½ Hz band from the main transmission tower on the Giza Plateau, with studios and executive offices in beautiful downtown Memphis.

If the laws governing radio engineering are correctly stated, the pyramids of the world must function as a planetary radio-communications network. The only question is whether the pyramid architects knew what they were doing when they built the original solid-state electronic modules. Ten thousand years from now, astro–archaeologists finding the Telesat Communications modules in stationary orbit around the Earth will likely ask if these electronic capsules were put into orbit (in locations corresponding to the Great Pyramid Network) entirely by accident. Or were they deliberately intended to function as a global communications system? In *Mysteries of the Great Pyramid,* Peter Tompkins reports that all the great cities of prehistory were built up around a central pyramid, and each was located at an exact degree interval from the Great Pyramid at Giza. Now, when settlers are founding a city, their prime considerations are the availability of food, water, de-

WHEN THE FUNDAMENTAL RESONANCE IS SUPERIMPOSED WITH THE SECONDARY, TERTIARY AND QUATERNARY HARMONIC, A STANDING-WAVE VOLTAGE STRUCTURE IS ESTABLISHED, SURROUNDING THE EARTH WITH THE ELECTRICAL VOLTAGE PATTERN SHOWN IN THIS DIAGRAM. ALTHOUGH THE ELECTROMAGNETIC WAVES FLOW AROUND THE WORLD, THE STANDING-WAVE PATTERN REMAINS STATIC.

fense, and trade. Why would a location at a precise degree interval from the Great Pyramid on the Nile Delta be more important? Well, no civilized city can endure without communications.

The radio diaphragm surrounding the Earth is powerful enough to broadcast radio signals at least as far out into interplanetary space as Jupiter. Is there anyone out there listening? Clear NASA photographs received from the space probes reveal a complex of pyramidal structures on the Moon, called the Blair Pinnacles. Had the same photographs been taken anywhere on earth, the Blair Pinnacles would likely be the ruins of a prehistoric temple complex. Mariner 9 has sent back an ambiguous photograph of a colossal pyramidal structure on Mars. If the site proves* artificial, we may be living through the scene from *2001: A Space Odyssey* in which secrecy surrounds the discovery of a polished black monolith in the crater Clavius.

It is technologically feasible for a galactic civilization to implement the principles of pyramidal harmonics to construct a communications network throughout the Solar System, with relays carrying signals to the stars, requiring no power other than the natural resonance of organized space. Such a civilization could very well employ the natives for sweat labor just as the Pentagon hires Eskimos to clear the building sites for the DEW Line. As long as the aborigines can be induced to follow instructions, it isn't necessary that they have the slightest understanding of what they are doing.

Proof that the great pyramids of the world are solid-state electronic modules in a worldwide power-generating and broadcasting network was established over fifty years ago by that superhuman genius, Nikola Tesla. Tesla knew there is a powerful voltage between the Earth and the upper atmosphere; this is what causes lightning to discharge from the Earth to the sky. When an antenna is raised, this voltage climbs it, in a gradient to be concentrated at the tip. Any fluctuation in the natural voltage between Earth and sky generates a flow of electricity in the antenna. This is how a radio receiver works.

**Tom Bearden just reported new data supporting the likelihood of its artificial nature.*

In radio's early days, the current generated in the receiving antenna was fed into a resonating circuit that would filter out the wavelength of the broadcasting station to which it was tuned and amplify the signal until it had enough energy to actuate earphones.

Tesla figured that the Earth would filter out its resonant frequency, amplify the current by its resonance, and function as a capacitor in a circuit as big as the entire planet. He pumped an electric current into the Earth, and tuned to a precise harmonic length of the Earth's resonant frequency. As he expected, the electric wave traveled to the antipodes and bounced back in time to coincide with its own following wave, doubling its amplitude. After repeated amplification in this manner, the electric energy burst from the top of Tesla's pyramidal tower to illuminate the entire countryside with the most spectacular artificial lightning storm ever seen. The surge melted the wiring in all the power generators serving the whole county. No one would supply Tesla with electricity after that.

Undaunted by superabundant success, Tesla continued his experiments to prove that when his antenna was pumping electric waves into the Earth, a standing-wave pattern was generated in the planet's geo-electromagnetic structure. At precise degree intervals, or harmonic fractions thereof, all Tesla had to do was drive a metal rod into the ground and plug in the electric frying pan, hair dryer, or washing machine. Tesla was the last of the big-time pyramid architects.

It was Nikola Tesla who electrified the world with alternating current. To the end of his life, Tesla dreamed of recycling all those unsightly high-voltage electric power transmission towers and replacing them with broadcast power generated and received through the Earth. But if power could be tapped from the Earth, how would Consolidated Edison-General Electric-Standard Oil bill you for it?

If we can all communicate on Pyramid Power, where does Ma Bell cut in? When he died in New York City on a winter night in 1943, Tesla was alone in a hotel room, possessing little more than when he had arrived as an immigrant with four cents in his pockets. The Secret Service immediately

sealed his room, and whatever papers he had were transferred to government vaults, where they remain to this day.

There is one more discovery to be made by an inspection of a global map. The range of the great-pyramid civilizations is limited to the Tropic Zone, but is not quite parallel to the equator. The Great Pyramid at Giza is just about as far north of the Tropic of Cancer as Easter Island is south of the Tropic of Capricorn. If we tilt the Tropic Zone to pass through those two extreme points, we find that the realigned Tropics contain the Pyramid Zone neatly between them.

If the Tropics are tilted in this way, the new North Pole is located in Greenland—which brings up a curious coincidence. Immanuel Velikovsky states that the North Pole was situated in Greenland during an earlier geophysical period. Look at your globe and draw a circle around the area covered by ice during the last era of planetary glaciation. You will find that its center is in Greenland. Now, how it is possible for Siberia to foster subtropical flora and fauna while Chicago is buried under miles of ice, unless the North Pole is in Greenland?

This suggests that the Great Pyramid Broadcasting System depends upon receiving solar radiation at 90 degrees for the most efficient operation. The source of energy must have come from cosmic space. The power generated by the pyramids depends upon the passage of the Sun, the positions of the planets, and the altitude of the ecliptic. The most important duty of the Priests of the Sun was the forecasting of the ephemerides, and—following the construction of the Great Pyramid—their supreme technological achievement was the perfection of mathematical instruments for celestial observation.

The proclamation that pyramid mathematics was developed to forecast the annual flooding of the Nile could be made only by scholars who never worked on a farm. Farmers don't need such minute precision; for thousands of years, crops have been harvested despite religious calendars—the Moslem calendar, for example—running as much as half a year out of sync with the seasons.

The original network was likely constructed before the last geological catastrophe which shifted the Polar Axis. The original pyramid could be counted on to generate vibrations

for millennia without maintenance, except for adjustments to the calendar from time to time. The power stations could even be left as unmanned posts checked occasionally by servicemen. Resident technicians needed no more knowledge of how the solid-state modules worked than the billing office of the Tennessee Valley Authority knows about electrical wiring. Over thousands of years of undisturbed operation, the regular duties of the staff would degenerate into superstitious ritual (just as occurs in every public-service bureaucracy). A major disturbance of the Earth's electromagnetic parameters, however, would result in an immediate, complete, worldwide power failure. And no one would know what to do.

Sudden and violent change in the Earth's electromagnetic structure includes a breakdown of the radiation shield in the ionosphere, admitting massive floods of cosmic radiation to the Earth's surface. All vital and radioactive processes would be affected, so that the carbon dating process archaeologists rely on may not be reliable for times prior to such a catastrophe. (Naturally, professional archaeologists resist any evidence that the carbon dating on which all their work is based may not be valid.) The Great Pyramid at Giza may be very much more ancient than archaeologists are wont to believe; all the other lesser pyramids may very well be comparatively recent copies.

In some civilized centers, the civil service was well enough established to construct more pyramids to replace the ones which no longer functioned at design efficiency, and the dispersed tribes built smaller pyramids where they settled. These copies were built on a smaller, human scale, however, instead of the former superhuman proportions; the massive megaliths were reduced to adobe bricks. But since the builders had lost the science of harmonics (if they ever possessed it in the first place), they copied their pyramids precisely in all the wrong places. When these new structures failed to function, the ignorant and terrified people sacrificed everything they had to the Sun, imploring it to restore function and power to the pyramid. The Aztecs commemorated these supplications and sacrifices until the modern era.

As long as the American physicist remains in his lab

and the American archaeologist remains in his dig, neither specialist will ever suspect that each sees but a part of the whole truth.

Although the Soviet system is inefficient in delivering consumer goods to its people, Communists are more receptive to revolutionary engineering. So while American authorities deny Tesla's discoveries, Soviet engineers have built a complex of Tesla towers in Karelia. Independent amateurs in America have found that the Soviets are using them to alter the natural pattern of electromagnetic standing waves surrounding the Earth. Because the atmosphere carries electrical charge, air currents tend to follow geo-electromagnetic flow patterns. When the natural standing-wave pattern is changed, the climate changes accordingly. Have you noticed?

Independent researchers, comparing the locations of the exceptional number of severe earthquakes during the past decade with the report of Soviet nuclear tests, conjecture that the Reds are using seismic waves to plot the pattern of standing waves defining the interior of the Earth: They give the planet a concentrated shock at a fault line and wait to see where the impulse emerges on the other side of the world. As long as local authorities deny the existence of this technology, how can the victims prove their earthquake was not a natural event?

One of the most competent authorities on Soviet military technology is Tom Bearden, described by *Fate* magazine as a one-man think-tank who overawes his colleagues by his high-octane genius. After retiring from the United States Army with a rank of lieutenant colonel, Bearden was employed by the military defense establishment to design war games, program computers to play them, and serve as chief planning officer for interpreting the results in deploying America's nuclear missile system.

Bearden has come to the conclusion that the sonic booms and flashes of light over the northeastern American seaboard during 1976–77 were the effects of plasma vortices the Soviets' Karelian Tesla towers have succeeded in transmitting through the Earth.

In theory, Bearden says that these plasma vortices can

pack the zap of a hundred-megaton hydrogen bomb. But not to worry; the Soviets are merely target practicing with low-caliber ammunition. Completely retired now, Bearden is organizing amateur scientists throughout the world to establish evidence that the Soviets are really doing these things. (The findings are published in a quarterly bulletin available from P.O. Box 1182, Huntsville, Ala. 35807.) Curiously, his international organization has recently been decimated by a spate of illness, death, violent attacks, destruction of papers and property, and official harassment—everyone who makes noises about Tesla's inventions receives the same treatment. Bearden is playing General Billy Mitchell; if no one listens, it may be Pearl Harbor all over again.

3.

BEYOND VELIKOVSKY

Einstein's Relativity Demonstrated, Mining Pure Energy from Empty Space, and the Green Hills of Mars

Scientific theory preaches that our Solar System condensed from a cloud of galactic dust. Mutual gravitational attraction is calculated to have drawn the nebulous dust particles toward a common center, inducing rotational velocity in the process. When density of dust at the center became high enough, pressure generated heat for the nuclear fusion of a star to develop. Centrifugal force flattened out the primordial nebula into a disc, and then streamers were thrown off to condense independently, forming a system of planets. Photographs of nebulas in deep space illustrate each stage of the evolutionary process, so why couldn't it have happened here just like that?

Well, to begin with, just about every planet in the Solar System exhibits some anomaly that proves the Nebular Hy-

pothesis could not possibly have happened the way we are told in school.

If you refer to the figures supplied by Funk and Wagnall Encyclopedia, you will see that Jupiter has one tenth the diameter of the Sun, but it rotates a hundred times faster. Volume is diameter cubed, and momentum is one half of velocity squared. Therefore, the Sun has a thousand times the volume of Jupiter, but Jupiter has five times the angular momentum. Jupiter is also a fairly dense planet, containing more mass than all the rest of the Solar System combined, outside of the Sun. Therefore, even after we make allowances for difference of radius, quick and dirty calculation indicates that Jupiter has about as much angular momentum as all the rest of the Solar System put together, including the Sun.

But that should not be! You see, if all the rotational energy in the Solar System is generated by gravitational collapse, then almost all the momentum in the Solar System must be concentrated in the Sun. While not altogether impossible, it is exceedingly unlikely for any planetary material to be flung away from a condensing core without losing the rotational momentum it acquired by condensing in the first place.

Venus rotates backward on its axis, and radiates *more* energy than it receives from the Sun. At some stretch of the definition, Venus can be regarded as a miniature star. Dust clouds whirling in space are almost certain to be as homogeneous as any other gaseous mixture, so why is the chemistry of Venus grossly different from all the other inner planets? And why did Venus just happen to lock into a three-two orbital-rotational ratio with the Earth without inducing corresponding changes in the angular momentum of our planet? We are, after all, more alike in size and mass than any other bodies in the system, so any gravitational friction between us should be settled by mutual compromise; instead, Venus gave in to us entirely.

The Earth has by far the largest satellite in the Solar System, and the farthest away. The moon, in fact, is not a satellite of the Earth at all. Moon and Earth form a double planetary system, both going around the Sun while the Moon is perturbed to cross and recross the Earth's orbit. If you draw

the orbits of the Earth and the Moon to scale, you will see for yourself that the Moon never curves around the Earth as the orbit of a true satellite must. The Moon always falls in a curve to the Sun—sometimes more, sometimes less. When the curve is tighter, the Moon accelerates and passes the Earth; when the curve is less, the Moon falls back until it is swept back across the Earth's orbit again.

The polar axes of the Earth and Mars are tilted nearly 30 degrees from the plane of their orbits. When a nebula condenses into a disc, all spins must be in the same plane. One of Mars's satellites, Phobos, completes an orbital revolution before Mars makes a polar rotation. Such excess of angular velocity makes Phobos one body in the solar system that could have been cast off by centrifugal force, but it is generally agreed to be a captured asteroid.

The Nebular Hypothesis does not account for the swarms of broken rocks and planetoids orbiting the sun between Mars and Jupiter.

Jupiter radiates more energy than it receives from the Sun, and seems to be growing hotter. Jupiter really *is* a small star. If so, then the Jovian satellites will eventually be the ideal homes for life to evolve in the Solar System, independently of the Earth. They already have an atmosphere and ice; they need only heat.

Saturn is lighter than water, and stands out with its well-developed ring system. Faint rings have been found circling Jupiter and Uranus too, so it may be supposed that all giant planets have the gravitational intensity sufficient to hold interplanetary dust. The Nebular Hypothesis does not explain why Saturn should be so egregiously favored while Jupiter has practically no rings to show for itself.

The axis of Uranus and the revolutionary plane of all its satellites are at right angles to the plane of the rest of the solar system. As Uranus makes its annual rounds of the Sun, Uranians see the Sun spiral out from one pole until it circles the equator and then spiral in toward the opposite pole, then back again. While the Sun is over the equatorial region, day and night resemble our daily cycle on Earth, but during the season when the Sun shines directly over a pole, it is seen to

circle around the horizon of the respective temperate region giving constant daylight for (Earth) years without interruption; the equator receives constant twilight while the Sun is over either pole. It is impossible for the velocities of the Uranian system to have evolved at right angles to the solar nebula that created it; it had to have been rolled over onto its side by an interplanetary collision.

The amount of energy required to rotate the axis of a spinning body 90 degrees is equal to its rotational momentum. Uranus is one of the giant planets; an impact sufficient to knock a giant planet onto its side could be delivered by nothing less than a direct impact with another giant planet or a near collision with a celestial body many times more massive. But no other planet can possibly exist in the same region of Uranus' solar orbit while traveling in the opposite direction, necessary if a collision is to take place. Therefore, the anomaly of Uranus can be accounted for most satisfactorily by proposing that an alien star entered the Solar System on a collision course from the interstellar reaches.

If the alien star were the same size as Uranus, a direct impact would be necessary to make the Uranian system turn right about. But a *direct* impact would have exploded both celestial bodies and nothing would exist in the Uranian orbit today except another ring of interplanetary rubble. On the other hand, an alien star the size of the Sun would have torn the entire Solar System to pieces by its massive gravitational field. Therefore, we can infer that the alien must have been about ten times the mass of Uranus, and probably traveling at a speed in the range of solar escape velocity.

Neptune has lost control of its satellites. The inner one revolves backward as a singular retrograde planetoid, while the outer satellite has the most eccentric orbit in the entire Solar System, not including the comets.

Because of its small size—and an orbit so eccentric that its radial differential is greater than the entire Solar System, inclusive of Neptune—it is generally accepted that Pluto must have been a satellite of Neptune that escaped into solar orbit. When professional astronomers admit this much and no

more, they are as guilty of prevarication as ecologists who do not mention that oil is burned to charge the batteries of electric cars. You see, there is nothing at the outermost planetary orbit of the Solar System with sufficient energy to multiply the orbital velocity of Pluto by a factor of $\sqrt{2}$ in order that it can escape Neptune.

Unless you postulate an adventitious interplanetary collision course arriving from interstellar space! Every planet in the Solar System violates the physical requirements of the Nebular Hypothesis. An alien star is the obvious solution to a host of astronomical embarrassments. But it also blows a hole through the theory of planetary evolution. This is exactly what Immanuel Velikovsky did.

When Velikovsky published *Worlds in Collision,* he became the victim of most vehement and scurrilous persecution. To all of us plebes who tread streets of concrete, it doesn't make a damn bit of difference how the Solar System came to be in the shape it is in during our mayfly lives. One story is as good as another as long as it stops the kids from asking "How come?" when you want to put them to bed.

This *story* is not a scholarly examination of Velikovsky's theory to determine its validity. But if you look at some evidence everyone can see for himself with a toy telescope, it appears that authorized science is what remains after the editors have left all the contradictory evidence on the cutting-room floor. Let's run the astronomical scraps through the old Moviola to see if we can splice something together that will satisfy the popular demand for sex and violence without overlooking that the Solar System is as scrambled as an air terminal after a bomb blast.

As we fade in, Star Rangers scanning the heavens from their far-flung outposts on top of prehistoric ziggurats sight a "thing" from outer space on a collision course with the Solar System. Of course in prehistoric times, climbing the steps of a two-hundred-foot pyramid was the service range of the contemporary astronauts, but it doesn't really matter whether an expeditionary force intercepts the "thing" while it is still zillions of parsecs distant at Warp 7, or whether we merely wait

until it comes within the Three-Mile Limit and reveals itself. I mean, unless you can evacuate the entire planet, there is nothing you can do about a cosmic "thing" anyway! You can bet your Trekkie button the Federation isn't going to tell the taxpayers the options have expired before everyone can plainly see for himself that it isn't pie in the sky. It is a matter of common knowledge that several asteroids have come close to the Earth in recent years, and who cared, as long as they stayed out of sight?

So when we cut in the next scene, we see that the "thing" is already in the Solar System, close enough for the ancients to see that it is a small dark star. As it passes by Neptune, at the Federation frontier, it is seen on the video scope to reach Neptune's outermost satellite, Triton, just past conjunction. The advent of massive gravitational attraction causes Triton to stop in orbit and plummet into its giant primary. As it falls, Triton gains enough velocity to reestablish itself in another orbit, but revolving in the opposite direction, as it would when negatively accelerated. This is where we find Triton today.

The middle satellite is approaching conjunction with the dark star, so it is accelerated positively until it leaves Neptune and goes into the planet business by itself as Pluto. And this, O Best Beloved, is why we find Pluto returning to its original orbit around Neptune every year, to this very day, just as it must according to the law by Newton. The innermost satellite, Nereid, is in opposition, so the stellar fly-past merely perturbs it into extreme eccentricity.

Velocity in interstellar space is low on the cosmic speedometer, so the dark star is drawn into solar orbit by the close encounter with Neptune.

As it continues its wild fall toward the Sun, the dark star passes through Uranian territory. The titanic waves raised by the interplay of gravitational and electromagnetic fields draw long streamers of gas and particles from the alien and rocks the Uranian System onto its side. The star is now a comet, the most stupendous comet ever seen by mankind, with its dragon head containing more mass than the entire Solar System exclusive of the Sun, and a fiery dragon tail drawn

halfway round the sky, illuminating all the heavens, day and night.

The most concentrated mass of the tail whirls around itself by the snap of the gravitational whip until it condenses into a ball surrounded by rings of the lighter trailing particles. And this, O Best Beloved, is why Saturn is a giant planet lighter than water, as if it were entirely atmospheric, and it is surrounded by a system of rings today. Vestiges of the cometary tail remain yet as rings surrounding Jupiter and Uranus.

Careening drunkenly now, the dark star strikes the next planet, shattering it to bits. The explosion throws the alien into a stable solar orbit and it takes up permanent residence in our system as the violent overlord, Jupiter. And this, O Best Beloved, is why we find most of the angular momentum in the solar system today to be in the Jovian System; it was the ante the dark star brought with it from the interstellar reaches so that it could sit in on our game. We lost the planet Krypton, but the Earth is saved in the final reel. The debris of the interplanetary explosion fills the orbit of Sol 5 with asteroids, a ring around the Sun like a petrified rainbow signifying God's favor with man. Lest you leave this theater thinking there is no scientic proof for this scenario, Dr. Bill Ovendin, a professor at the University of British Columbia, recently programmed a computer with the orbits of all the known comets and discovered that they trace back to a single explosive point in the asteroid belt.

For human interest between the special-effects shots in interplanetary space, we segue Earthside, and pick up the legends overlooked by Velikovsky. In some early era Neptune and Uranus were visible. They were the original titans, and it was natural that Uranus, being the nearest and brightest, would be regarded as the creator of the heavens.

Saturn was called Kronos by the ancient Greeks. Kronos became Chronos, the God of Time. If Saturn has ever occupied the orbit now holding Jupiter, Saturn's original period would be twelve years, and its location in the zodiac would tell the houses of the horoscope. The planet would serve as a celestial timekeeper for astrologers, a profession enjoying the highest social status in those days. As the new cosmic time-

keeper, it was natural for Saturn to usurp the liege formerly bestowed upon Uranus; imperial jealousies are never generously disposed, so it was natural for the Titans to be buried in the black of deep space. Neptune being put out deeper than Uranus, Poseidon became god of the oceans.

But *kronos* is also the etymological root of *corona,* meaning *crown.* Encircled by shining rings, Saturn is indeed the crowned planet, deserving recognition as the supreme god. Now, the rings of Saturn are barely visible to the sharpest eyes; a simple magnifying mirror will bring them into view. If, however, Saturn ever sat on the throne of the Jovian orbit during an interim reign while the crown prince was off to the wars with Krypton, the crown of Kronos would be clearly visible throughout the Solar System. The Saturnian crown is still used artistically to represent the halo of angels, so we may suspect that men once saw the King's Father directly.

Saturn is said to have eaten his children, fatally overlooking Jupiter. This part of the Greek myth could be describing knots of the original cometary tail condensing into visible satellites before spiraling into their primary as the comet settled into stable orbits. The surviving rings we see today may be merely the last vestige of a multijeweled crown.

The myths indicate that there were several changes in the planetary orbits during the creation of the heavens as we now see them. The various poetic histories conform to the hypothesis of a dark star entering the Solar System because it is unlikely for all planets to be aligned so that everything happened during the course of a single preorbital trajectory. Once caught in a cometary orbit after being trapped on Neptune's gravitational trident, Jupiter probably made hundreds of elliptical circuits between successive encounters of the catastrophic kind, leaving plenty of breathing space for mankind to recover between cosmic disasters and make up different myths.

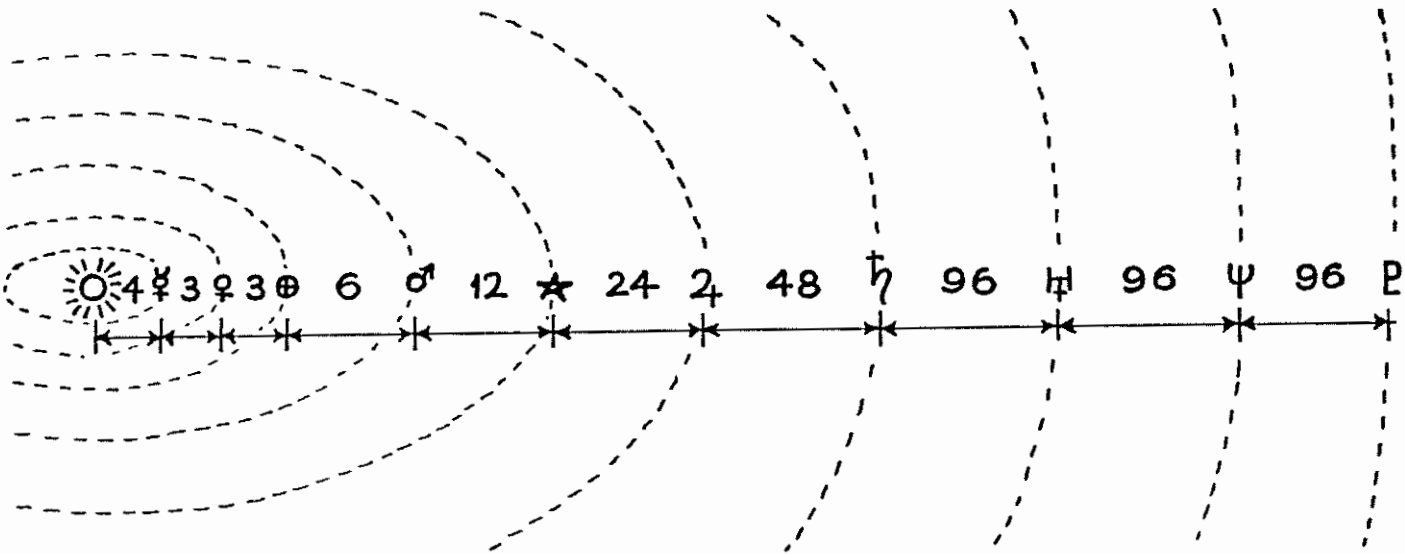
Here is a synopsis of Immanuel Velikovsky's scenario: When Jupiter collided with Krypton, a mass was blown out denser than the Saturnian comet, including some of the rocky core of the doomed planet. The jetsam formed a new, smaller comet swinging tightly around the Sun on an orbit of fifty-four years. Because space is tight in the downtown section of the

solar community (hold tight while we change metaphors again), this comet had close and frequent encounters with all the inner planets. On each strafing run, the inner planets were peppered with meteors. The craters are clearly visible today on Mercury, the Moon, and Mars. The terrestrial craters have been obliterated by our fertile atmosphere, but the fracturing of the Canadian Shield in concentric circles around Hudson's Bay indicates that the northern sea is a meteor crater created by an impact powerful enough to shake the Earth on its axis and probably obliterate large life forms over half a hemisphere; smaller craters pock the entire Atlantic Coast of North America. After a pyrotechnic exchange with Mars, which must have rivaled the spectacle of Jupiter and Uranus for mankind, the daughter comet swung into stable orbit around the Sun as the planet Venus.

The persecution of Velikovsky is most determined from astronomers because it destroys the steady-state theory necessary to make coherent sense out of current measurements. It is necessary to believe that all extant physical activity occurs everywhere at all times at the same rate in order to have a theoretical science and get paid for teaching it. Otherwise all you have is engineering and science fiction. The physical evidence on which Velikovsky has been prosecuted by the establishment is not proclaimed to the public; the excuse is that the public does not understand physics. The result is that Velikovsky was given no chance to defend himself in a manner that habeas corpus is supposed to provide, nor could he put judgment to a public jury.

Insofar as I have been able to get any answer from the enemies of Velikovsky, they base their case on one of Newton's laws conserving momentum. A material body disturbed in its orbit must return to the point of disturbance on each subsequent revolution. The Solar System preserves far too much order today for any collision courses to have occurred in the past, much less the historical past. Most physicists, who are specialists, are satisfied that the law is inviolate. But Einstein opened a completely new and radical conception of Newton's laws.

The solution to Velikovsky's problem is implicated



with the solution to another irritating problem bothering astronomers for over two hundred years, Bode's Law of Planetary Harmonics.

Since it became possible to calculate the distance separating planets with more than accidental precision, it has been known that each planetary orbit is twice as far from the Sun as the one nearer; credit for measuring the intervals has been accorded to the German astronomer Johann Elert Bode, for getting his ratios recognized by publication in a hard-core scientific journal. Bode found that if an Astronomical Unit is established as 9,000,000 miles, the following multiples of that Unit are measured between the planets: Sun 4 Mercury 3 Venus 3 Earth 6 Mars 12 Asteroids 24 Jupiter 48 Saturn 96 Uranus 96 Neptune 96 Pluto.

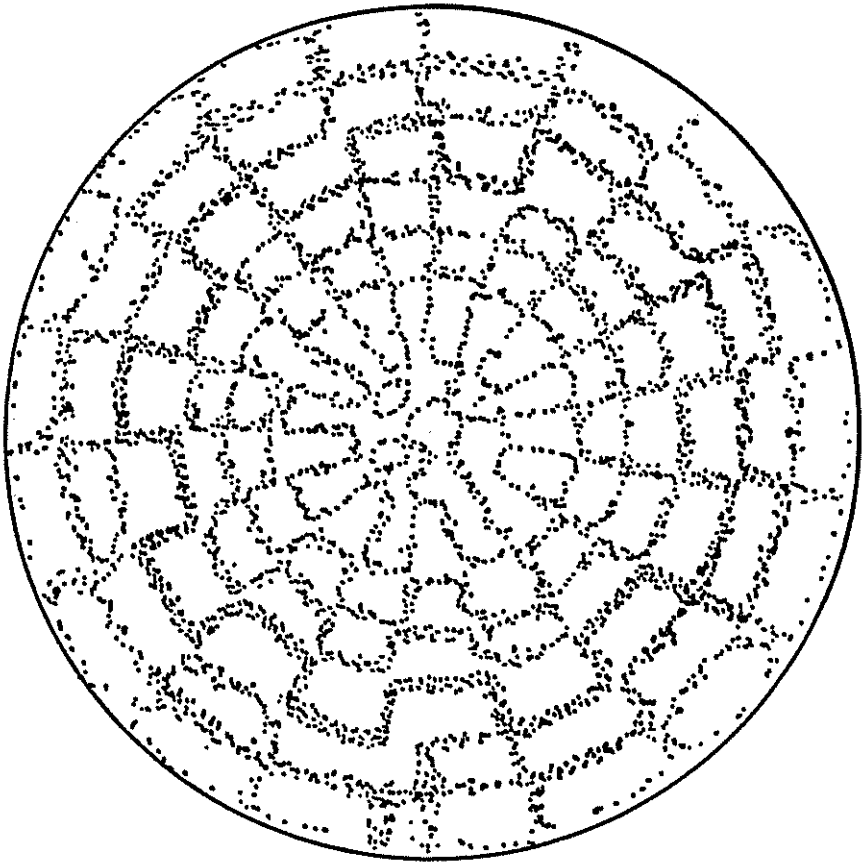
Saturn was the outer limit of the known system when Bode did his number, so the discovery of Uranus was accompanied by great professional excitement to see that Bode's Law was followed indefinitely. But when Neptune and Pluto were discovered to be separated by intervals of 96 Units each, the professional verdict decided that the Law had broken down; and respectable orthodoxy regards the Theory of Planetary Harmonics as an empirical accident with no significance whatsoever.

Upon immediate inspection, the interval between each planet, from Venus to Uranus, increases by a constant factor of two. Bode's Law would be indisputable were it not that Mercury is twice the distance from Venus that the progression demands, and Neptune divides the orbital space between Uranus and Pluto by two. Two is the constant factor throughout, but why does the operation change at the extremes? An almost perfect law like this is what keeps scientists awake more than the 2 A.M. nursing.

Now, in order to understand the conformation of the Solar System, it is exceedingly difficult to avoid the theory of cosmic collisions. In order to understand what happens in the process of cosmic collisions, it is necessary to prove Bode's Law. In order to prove Bode's Law, you must understand relativity. Professional scientists insist that no one can understand

BODE FOUND THAT THE DISTANCE OF EACH PLANET FROM THE SUN ESTABLISHED A REGULAR PATTERN DEFINED BY A FACTOR OF 2.

BODE REDUCED THE APPROXIMATE DISTANCES BETWEEN PLANETARY ORBITS BY THE HIGHEST COMMON FACTOR TO YIELD THE RESPECTIVE RADII IN UNITS OF 9,000,000 MILES, AS ILLUSTRATED IN THIS DIAGRAM.



relativity—not even Einstein was able to do that. The impossible will not take a bit longer. Let me show you.

If you find a thin, vibrant disc, dust the surface with powder, and make it resonate to a musical tone, the powder will move into concentric windrows, spaced a wavelength apart. As the circles approach the center, radial vibrations break up the circular pattern. What you see is a model representing the mechanics of Bode's Law and the General Theory of Relativity.

What you see happening is produced by waves of sound traveling through the disc in all directions. As the waves move, they carry the dust with them. Where two waves meet in opposite directions, a wave pattern is created that does not travel. The pattern is called a standing wave. The standing wave beats up and down in the middle of its length, while there is no motion at all on both ends. As an example, two children swinging a skipping rope between them are making a standing-wave pattern with the length of the rope. The wave energy travels back and forth between the two arms swinging the rope; if the traveling waves coming from both ends are not synchronized, the standing-wave pattern breaks down so that you can see the wave motion travel from one end to the other and back again. A ring strung on the rope will be driven by the waves from the loop in the middle to the nodes at the ends.

Most of us armchair physicists will argue at great length before being stirred to dust a disc with powder or observe children skipping rope. But if you will ring for your maid to bring you tea, you will see concentric standing waves on the surface of the fluid in the cup when she puts the tray down on your end table with sufficient impact to generate vibrations.

Those of you who study any one of several versions of this model will eventually notice that the rings representing planetary orbits around the Sun are spaced equal distances apart, whereas the planetary orbits have a difference between each orbit established by the factor of two. The reason the rings of powder on the disc are equally spaced is that the vibration is supplied by waves of equal length. The field of energy constituting the Solar System is defined by waves of all lengths, like white sound. When a full-frequency spectrum of

DISTRIBUTION PATTERN MADE BY POWDER ON A CIRCULAR VIBRATING PLATE

sound is used to generate standing waves around a focal point the longer waves are superimposed through the shorter waves amplifying them in some places and canceling them out in others. The harmonic beats where all waves coincide to amplify and cancel in the same places form rings separated by octave intervals, just as we see in the Solar System.

Since Niels Bohr published the planetary model of the atom, the atom and the Solar System have been understood to be models of each other. Since Erwin Schrödinger proved the wave equations of quantum physics, the atom has been recognized as a standing-wave structure composed of an infinite spectrum of random vibrations. All we have done is say that if the Solar System is a cosmic atom, and if the atom is a standing-wave structure, then the Solar System must be a standing-wave structure too.

Well, if an atom is the essential unit of material, and if an atom is a standing-wave structure, then all material must be standing-wave structures. Therefore, if the solar system is a standing-wave structure, then the entire gravitational field of the Sun must be solid *material.* The only difference between the material of the Sun's gravitational field and the Earth we stand on is density. The wavelengths of gravity are so long that we can walk through them as if the standing waves were insubstantial, like we walk through air. Many people will snort that this deduction is preposterous; the more schooling you have, the more likely you will insist that it isn't so. But have you forgotten that material, by definition, is identical to mass? Einstein's General Theory of Relativity proves that the Sun's gravitational field possesses mass and functions as a massive structure. Einstein knew it all along; he just stopped talking at this point.

Now, why do you suppose that the curtain of silence is dropped at the point where Einstein and Bode and Velikovsky all meet with mutually supporting calculations?

Well, when Einstein published his equation $E = mc^2$, he proved that all material can be converted into energy, the amount of energy depending upon the wavelength of the standing waves forming the material. This means that the Sun's gravitational field—filling all of interplanetary

space—is *solid energy*, just like uranium, waiting to be mined. Now you can see why Einstein is supposed to be incomprehensible, and relativity is taught to make sure no one can understand it. And now you can see why Bode's Law cannot be allowed to be recognized. And now you can understand one reason why Velikovsky had to be given the deStalinization treatment. You see, the military-industrial-financial establishment can stake out a monopoly on uranium, enabling them to charge whatever OPEC demands for oil, but everyone has free access to the Sun's gravitational field. As Al Capp illustrated with his shmoos, industrial society cannot survive if the universe supplies mankind with the necessities of life free of charge.

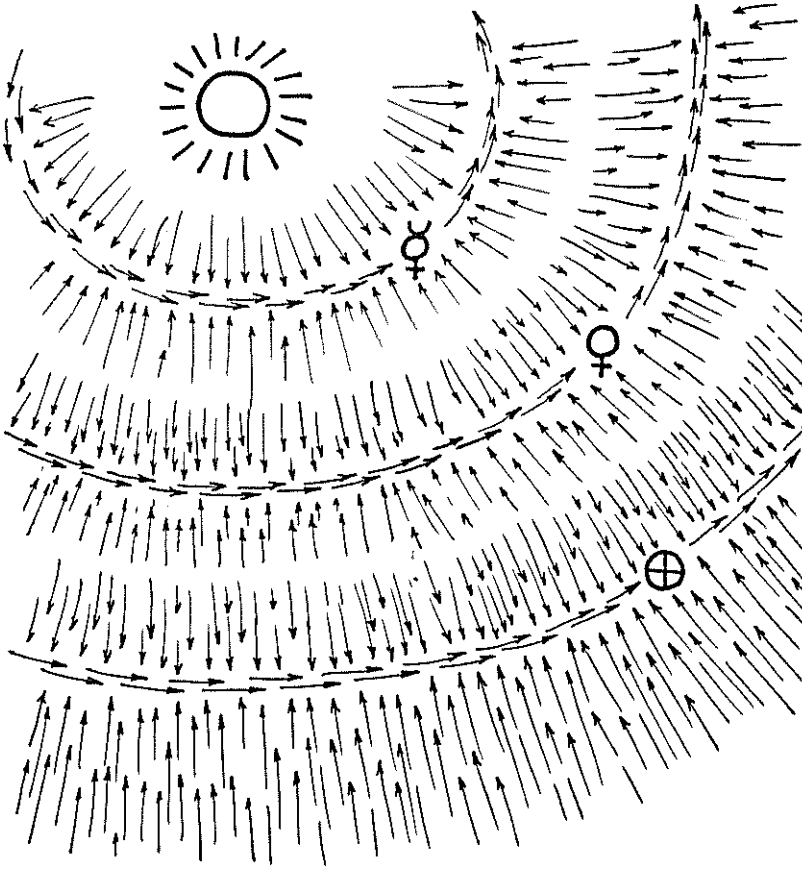
The military-industrial establishment published the first release of atomic energy from uranium in 1945. Would you like to guess when Einstein's equations were proven by releasing the energy contained in the Sun's gravitational field? According to information available to me, Nikola Tesla gained insight into spacic energy at the beginning of this century, before petroleum was used for much except kerosene lamps; by 1925 he was ready with experimental proofs. Reports have reached me of about a dozen private parties making similar discoveries in their own way; they were all given the deep six, like Tesla got. The latest word is that a party in the Northeast, calling itself X-Tec, is trying to get into the consumer market by generating spacic energy from the Sun's gravitational field; we'll see if it survives any longer than its predecessors. In the meantime, the Soviet military-industrial establishment has managed to secure a monopoly on the free air their citizens are allowed to breathe, so it has no reservations about implementing Tesla's theories for generating electric power from the energy of empty space, and they are proceeding apace while Americans are building windmills to get the same energy the hard way.

The most completely documented chronicles of the development of spacic energy in America is reported in the book, *The Sea of Energy*, published privately by the son of the inventor in Salt Lake City. As far back as 1914, before the First World War, Henry Moray, an electrical engineer, perceived

that solar activity generated radio waves in the Earth's atmosphere. An antenna transforms the electromagnetic waves into a standing electrical wave in the conductor. The energy of this wave is amplified by resonance to provide the power for the primitive radio sets Moray played with. From the operation of the crystal radio, Henry Moray acquired an understanding of the Sun's gravitational field as a cosmic standing-wave structure supported by incredibly high-frequency vibrations from the quantum field.

Natural germanium crystals were used for tuning the early radio receivers. Moray inferred that there was something in crystal geometry that could resonate in tune with the quantum field and transform the field energy into electricity by harmonic amplification. So Moray sought the purest germanium crystals chemists could provide, always complaining that the crystallization was not fine enough. Once the alternating current in his crystals was fed into a step-down transformer, Moray drew enough power to supply household appliances with 500 kilowatts indefinitely.

As a reward for bringing his invention to the United States Government, Moray became the target of hired assassins. His laboratory was destroyed and his credibility ruined so that the design of his "valve" was lost with his death. We can infer, however, that the essential design must be so simple that you can pick up all the components to build your own basement electric-power generator from Radio Shack for less than one thousand dollars. After all, in those days not even Moray had enough knowledge of electronics to build a transistor, and the complexity of a TV circuit was beyond conception. However he did it, he tapped infinite energy, like the technologists of Atlantis, without pollution or explosion from the Sun's gravitational field with a circuit essentially no more complicated than a glorified crystal radio receiver.



Now that we have made the engineering discoveries which are the goal of this story, we can return along the trail on which we came to prove that the evidence for the prosecution of Immanuel Velikovsky by the defenders of the established faith is unconstitutional. At the same time, we shall make further discoveries opening new possibilities for more fantastic engineering.

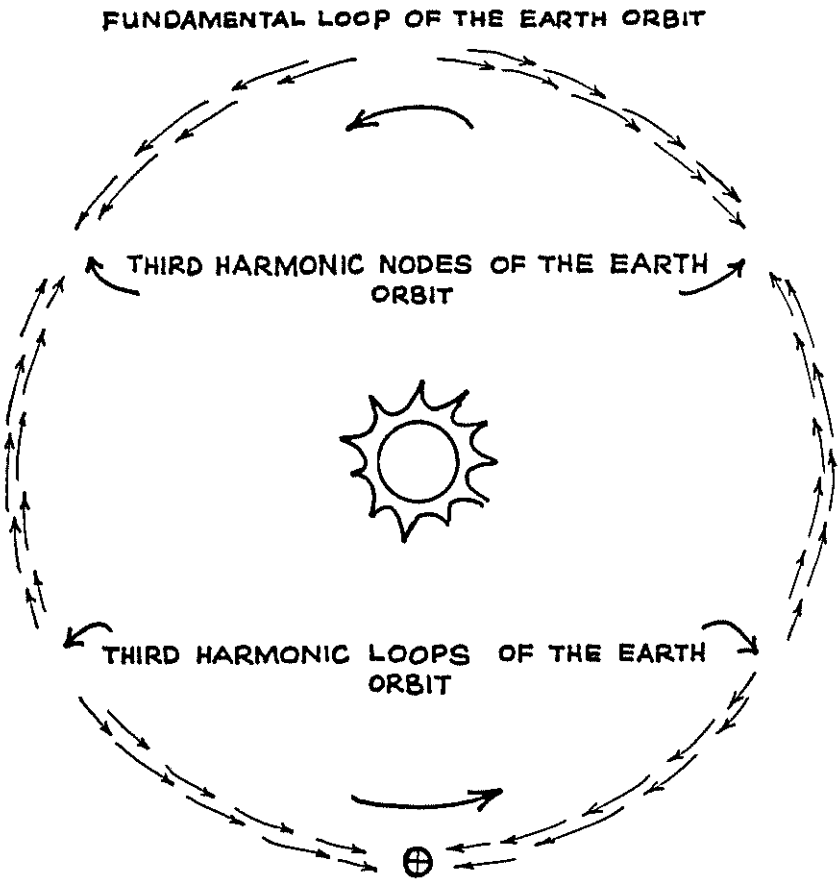
We see the powder bounce up and down on the vibrating disc until it settles at the static nodes of the standing waves. Obviously there is a tangible flow from the loops to the nodes. Therefore, any particle supported by the vibrating field will flow from the loops to the nodes like a chip on a stream of water. The loops can be represented as hills and the nodes as valleys for purposes of illustration, but we can see there are no real hills or valleys in a gravitationally defined space; there is only a flow of energy represented by velocity gradients. So any celestial body let loose in the solar gravitational field will "gravitate" toward the nodal orbits as if attracted by some mysterious force. You will recognize that this model is the very representation of Einstein's General Theory of Relativity.

Now you know why a planet finds an orbit at a specific location in the solar gravitational field, but you may wonder why it revolves around the Sun in that orbit. If you examine the vibrating plate intently, you will eventually discern that the flow of energy does not stop at the nodes, but undergoes an abrupt right-angle rotation of velocity with a transformation of wave frequency and speed. The flow now circles the orbital path, carrying the planet with it like a log on a stream of water between banks.

A scientific intelligence can be gauged by the point at which a person accepts an answer as final and satisfying. So we continue to ask why a planet occupies a specific location in its orbit instead of any other location along the length of the circuit. Well, more inspection eventually reveals that the entire nodal circle vibrates as a linear standing-wave structure, composed of all frequencies, like a circular violin string strummed by a breeze. The fundamental frequency of the orbital resonance is subdivided into harmonic intervals, defined by loops and nodes of different energy levels. Residual discords in the harmonics cause the pattern to revolve around the field center. Therefore, once a body is carried by the solar gravitational field to an orbital node, it will be carried farther in the orbit until it settles into the deepest node in the circuit. That is where it will stay as the entire gravitational field revolves.

If this model is true, then there must be a node of the second gravitational harmonic of the Earth's orbit directly opposite us, on the other side of the Sun where we can never see

UNIVERSAL ENERGY IN THE QUANTUM FIELD FLOWING PERPENDICULAR TO THE PLANE OF THE ECLIPTIC MEETS IN MUTUAL OPPOSITION IN THE INTERORBITAL SPACES. DIRECT OPPOSITION ROTATES THE FLOW BY 90° AND REDUCES ITS VELOCITY BY A FACTOR OF C, TRANSFORMING THE QUANTUM FIELD INTO THE SOLAR ELECTROMAGNETIC FIELD.



THE ELECTROMAGNETIC FLOW IS RADIAL ON THE PLANE OF THE ECLIPTIC. WHEN THE OPPOSING CURRENTS MEET, ANOTHER ROTATION OF 90° REDUCES WAVE VELOCITY BY A FACTOR OF C, AGAIN, TRANSFORMING THE ENERGY INTO THE GRAVITATIONAL ORBITS CARRYING THE PLANETS ON ITS STREAM

it. This calculation is the probable source of the myth of a counter-Earth. The myth, in fact, is true, but its proof is another story for another book. As far as we are concerned here, astronomers have proven that the counter-Earth cannot possibly exist because there is no evidence of the gravitational effects its mass must produce. The reason the counter-Earth is not found where we see it is that the space in which it is calculated to exist happens to be where the fundamental loop also exists. The fundamental loop cancels the secondary node with enough energy left over to raise a sizable gravitational "hill."

But the fundamental loop flows in *both* directions around the orbit to the tertiary nodes, a pair of gravitational nodes located 120 degrees in both directions from us. Therefore we should expect to find smaller masses of interplanetary material caught in these two depressions. In fact, astronomers have observed aggregations of interplanetary debris collected at both these locations. When we see interplanetary bodies attracted to locations where no central masses exist to establish a gravitational field, we have the proof that gravity is inherent in the flow of energy through space rather than a mysterious force generated by a massive body.

We are forced to the further deduction that Jupiter does not possess the most powerful gravitational field in the Solar System because it possesses almost all of the mass, outside of the Sun. It is possible for Jupiter to have been *created* the most massive body in the Solar System because the greatest gravitational flow in the Sun's field is into that location. Jupiter's gravitational field would exist at that location even if Jupiter were not there to occupy the space.

Another proof for the model is derived from the empirical fact that all planets sweep an equal area of their orbital planes in equal times. Momentum is a time function, and the equation for momentum is identical to the equation for circular area. Therefore, the angular momentum of each orbit is identical throughout the solar gravitational field. The energy flow from the loops to the nodes is in direct proportion to the area of the orbits. The area of the orbits increases at a ratio equal to half the square of the radius. First sight tells you that the momentum of each orbit should increase by one half the

THE CURRENT OF GRAVITATIONAL ENERGY FORMING THE EARTH'S ORBIT RESONATES LIKE A MUSICAL STRING WOUND IN A CIRCLE AND JOINED BY A KNOT. THE EARTH GRAVITATES TO THE PRIME NODE. SMALLER MASSES OF INTERPLANETARY FLOTSAM HAVE GRAVITATED TO THE NODES OF THE TERTIARY HARMONIC OVERTONE. LOOPS AND NODES OF HIGHER HARMONIC OVERTONES SUBDIVIDE BOTH THE ORBITAL AND INTERORBITAL SPACE INTO A CONSTANTLY CHANGING PATTERN OF "HILLS" AND "HOLLOWS" REVOLVING AROUND THE SUN AT ORBITAL VELOCITY.

square of the radius if all the energy from the loop area flows into the nodal line. But the solar field is a compound standing-wave structure; the wavelength of the standing waves increases in direct ratio with the radius. The formula equating energy with wavelength states that momentum varies *inversely* with frequency, so that the difference in energy represented by area is exactly balanced by the difference in energy represented by wavelength. Therefore, the momentum of the solar field must be constant throughout.

A final proof is that escape velocity is $\sqrt{2}$ times orbital velocity. Because the increase in field wavelength is continuous along the gravitational radius, the loop between successive orbits is not exactly between them. The peak of the loop divides the interorbital radius into fractions defined by $\sqrt{2}$, like the intensity of light falls off from a point source. An increase of orbital velocity by a factor of $\sqrt{2}$ gives a planet exactly the amount of momentum it needs to surmount the gravitational hill confining it to its orbital valley; and once over the divide, it is downhill all the way to the next star.

The planets occupy the deepest nodes in the solar gravitational field. But the solar space is filled with an infinite number of higher harmonic nodes, each of which is capable of attracting and holding a mass of material. But the higher the harmonic, the less energy flows into it, so the smaller the mass it can attract and retain.

The gravitational node holding the Moon, for example, is so much weaker than the one holding the Earth that by the time a spaceship acquires enough velocity to escape the Earth, it has far too much momentum for the Moon to hold. You may think that landing on the Moon must be as easy as falling out of bed once an Apollo spaceship passes over the gravitational divide and begins to drop down onto the Moon. But this isn't true. Unless the space shot is aimed for a direct hit on the surface of the Moon, anything leaving the Earth must fly right past the Moon into solar orbit. Getting down is the hardest part.

Residual discords in the solar geometry causes the gravitational hollows to wander along courses described by the

Drunkard's Walk, calculated by the mathematics of Probability. The amount of indirection is directly proportional to the value of the harmonic fraction. This means that the major harmonics represented by the planetary orbits will manifest negligible perturbations during any historic period, while the locations of higher harmonic nodes wander around with increasing randomness. Harmonic coincidence of wandering nodes results in periodic intersections; and once again, the lower the harmonic, the longer the period between intersections, while the higher harmonics are mixing together continuously. A small body caught in the shallow depression of a high node will be tipped out when confluence with a harmonic loop causes a temporary reversal of gravitational flow. If a particle is small enough, it can be carried by waves from node to node throughout interstellar space before it gets trapped by the powerful energy flow of a low harmonic. In fact, interstellar space is filled with dust floating around like this. Only the confluence of a low-harmonic loop with a low-harmonic node is sufficient to reverse the gravitational flow keeping a planet in its orbit. When that happens, planets, stars, and even galaxies are set on collision courses. Human history would be briefer than our two thousand years if low-harmonic loops intersected with low-harmonic nodes more often.

Now we can prove why Venus maintains a near-circular orbit today even though it is possible for her to have arrived in our skies within human memory after a series of catastrophic interplanetary collisions. Celestial bodies of planetary mass gravitate quickly to low-harmonic nodes, and low-harmonic nodes are inherently stable in orbit. Lighter celestial bodies can be retained more or less indefinitely in a succession of higher-harmonic nodes; the higher the harmonic, the more eccentric and unstable the orbit will be. This is why we find the planets to follow regular orbits of circular dimensions while the most eccentric and unstable bodies in the Solar System are also the lightest and most vaporous—the comets.

The flow of energy along high-harmonic orbits, not concentric with the field's center, are probably the "rivers of energy" calculated by Professor Eric Laithwaite, which he

hoped to harness with his gyroscopes. Once these currents are charted, they can be used to carry vehicles throughout the universe like floating on a cosmic jet stream across oceans of space and even time. But this is not a prevenient discovery, either. The Orientals have always known of the existence of Ley Lines, and they use Ley Lines to control the flow of energy in their social and personal space.

Meanwhile, back at the Kangaroo Courthouse, let's see how Velikovsky is making out with his defense. If he uses the proof of Bode's Law to disallow the invocation of Newton's law, Velikovsky runs the risk of incriminating himself by failing to foresee all the inevitable consequences of General Relativity. You see, all the octave orbits are occupied in the solar subdivision. If Venus settled on the residential lot at #2 Sunshine Valley, she probably had to evict a previous tenant. Whom do you suppost got bumped? When Venus arrived, the Moon moved in with Mother, and she has been spending the nights with us ever since. Plato mentions a time when there was no moon in the sky, called the Preselenite Era.

As soon as you begin to play musical orbits with the planets, the distribution of angular momentum in the Solar System is disturbed. When Venus brought additional energy from interstellar space, it meant that the gravitational hollow at #3 Sunnydale Circle must have drifted away from the Sun, while the revolution of the Moon made further adjustments to maintain Conservation. If the proposition of interplanetary collision is essentially valid, the Earth must have been closer to the sun during a previous geophysical era. Merely a few megamillion miles nearer would have added enough extra insolation to provide the Earth with an allover suntan from pole to pole. Geologists know that the Earth *did* have a tropical climate during the Paleozoic Age. Various hypotheses have been proposed to explain this anomaly, but they all require special cases involving a great deal of critical ignorance to remain tenable. Special cases do not a science make; the theory of interplanetary collision eliminates all the obvious anomalies with a single, simple, and provable mechanism.

Now if the Earth were forced to leave the Sunshine

Coast of the Solar Estates and rebuild in the cooler hinterlands, whom do you suppose *we* displaced. It had to be Mars. If Mars were ever closer to the Sun than it is right now, it must have enjoyed the most invigorating climate in the entire Solar System while dinosaurs were sweltering in the swamps of the Tethys Sea. If life is a natural and inevitable process of planetary evolution, intelligent life had to appear on Mars before it began anywhere else.

Mars is large enough to hold an atmosphere capable of supporting terrestrial life forms. There is incontrovertible evidence of large flows of water on Mars. Where you find heat and light and soil and water, you must find life, too, or else you must throw out the Theory of Human Evolution from natural causes and return to Divine Creation.

The professionally published explanation for the evidence of liquid water flowing on Mars is that volcanic heat produced massive eruptions of water from sub-Arean rocks which streamed in a deluge for thousands of miles, carving canyons dozens of miles deep in the Martian continent. The professional statement may, in fact, be true, but the authorities cannot expect any high-school kid to believe it unless a lot of obvious contradictions are accounted for.

To begin with, it is almost as cold as liquid air on Mars; that is carbon dioxide we see frozen at the polar caps through our toy telescopes. Water is not going to flow very far from the source of eruption unless the entire hemisphere is warmed by volcanism to keep the water liquid. Enough heat to warm an entire hemisphere for swimming is not localized volcanism. It is either planetary convulsions or else it is climate.

Next, the range of temperature in which water can flow any distance over the land surface of Mars is restricted to the range of human comfort. Water cannot exist on Mars today because of the near–vacuum conditions, but even if Mars had all the air it could hold, the boiling temperature of water would still be so low that it would vaporize from the heat of volcanism before it flowed any distance.

Finally, the surface gravity of Mars is so low that water isn't going to flow rapidly enough to gouge canyons in its path unless it is constantly cascading. The canyons of Mars are

not the kind of erosion carved by sheets of cascades, but more like the Grand Canyon, requiring a constant flow of water in the same channel for millions of years. This condition could not have been satisfied unless there was enough air on Mars to make a Tibetan feel at home, while the climate was no warmer than the USA and no colder than Canada. The absence of densely grouped meteor bombardment and other evidence of erosion subsequent to the carving of the Arean canyons indicates that Mars enjoyed a terrestrial climate very recently in astronomical time—probably within human memory. Mars probably lost its air, water, and climate by a sudden catastrophe involving heat intense enough to flash its oceans into water vapor.

If Velikovsky's scenario were staged during human memory, the people who saw the action were not living on Earth. They were Martians. As Mars is older than the Earth in its physical evolution, people on Mars may be expected to be more advanced technologically than we are now. Once they saw that alien squatters were going to break their leasehold on Sunny Acres, everyone who could raise the price of a ticket on the space ark would pack their luggage with Kodachrome, disconnect the household utilities, and hop over to the Mediterranean Riviera for the Ice Age—bringing their pyramid and crystal technology with them.

Support for the hypothesis of interplanetary colonization is found in comparative anatomy. The human animal is rather poorly adapted to conditions on Earth. The sunlight is too bright for our eyes and skin, our backbones are too long, our feet are too weak, and our weight is ruinous to posture. If all creatures' morphology is determined by an evolutionary adaptation to its environment, we are best adapted for comfortable living on Mars, providing the climate were sweetened.

The white race appears to be new to this planet; civilization appears to have arrived suddenly and fully blown, then decaying for millennia after its initial appearance before recovering to our present eminence. The prehistoric aborigines of the cradles of civilization say they were conquered by Aryan invaders. The word *Aryan* is a variation of *Arean*, and *Arean* means *Martian*. There is a tribe in the Mideast who

claims its ancestors came from Mars. As myths go, this one requires a sophistication of concept not proper to a primitive tribe; the Earth must be recognized as a planet unsupported in empty space, and the bright reddish star must be recognized as another world.

The most interesting evidence for the Martian origin of the white race, if not an extraterrestrial immigration for all of mankind, is provided by science reporter Gay Gaer Luce in *Body Time*. Biologists acknowledge that the vital rhythms of all creatures are established by their place of origin; this is why subequatorial plants bloom for us in the North at Christmas, and species entrained to the periods of the Moon are believed to have evolved in the tidal ocean. When experimental human subjects are isolated from all terrestrial rhythms as much as possible to discover the free period of the human body, it has been found that most people settle into a daily rhythm of sleep and work of twenty-four hours and forty minutes. Twenty-four hours and forty minutes is the daily period of Mars.

The mechanics of evolution make it practically impossible for any species to develop without integration with its environment, yet this is just what we have managed to do. We are profoundly out of order with the rest of terrestrial life. Everywhere we go, we destroy the natural environment with wholesale insensitivity to its rhythms and balances. We are reconstructing the entire surface of this planet to suit our alien dimensions. The distress we stir on this Earth may be due to the fact we don't belong here.

4.

HOW TO BUILD A FLYING SAUCER

After So Many Amateurs Have Failed

At the end of the nineteenth century, the most distinguished scientists and engineers declared that no known combination of materials and locomotion could be assembled into a practical flying machine. Fifty years later another generation of distinguished scientists and engineers declared that it was technologically infeasible for a rocket ship to reach the moon. Nevertheless, men were getting off the ground and out into space even while these words were uttered.

In the last half of the twentieth century, when technology is advancing faster than reports can reach the public, it is fashionable to hold the pronouncements of yesteryear's experts to ridicule. But there is something anomalous about the consistency with which eminent authorities fail to recognize

technological advances even while they are being made. You must bear in mind that these men are not given to making public pronouncements in haste; their conclusions are reached after exhaustive calculations and proofs, and they are better informed about their subject than anyone else alive. But by and large, revolutionary advances in technology do not contribute to the advantage of established experts, so they tend to believe that the challenge cannot possibly be realized.

The UFO phenomenon is a perversity in the annals of revolutionary engineering. On the one hand, public authorities deny the existence of flying saucers and prove their existence to be impossible. This is just as we should expect from established experts. But on the other hand, people who *believe* that flying saucers exist have produced findings that only tend to prove UFOs are technologically infeasible by any known combination of materials and means of locomotion.

There is reason to suspect that the people who believe in the existence of UFOs do not want to discover the technology because it is not in the true believer's self-interest that a flying saucer be within the capability of human engineering. The true believer wants to believe that UFOs are of extraterrestrial origin because he is seeking some kind of relief from debt and taxes by an alliance with superhuman powers.

If anyone with mechanical ability really wanted to know how a saucer flies, he would study the testimonies to learn the flight characteristics of the craft, and then ask, "How can we do this saucer thing?" This is probably what Wernher Von Braun said when he decided that it was in his self-interest to launch man into space: "How can we get this bird off the ground, and keep it off?"

Well, what is a flying saucer? It is a disc-shaped craft about thirty feet in diameter with a dome in the center accommodating the crew and, presumably, the operating machinery. And it flies. So let us begin by building a disc-shaped air foil, mount the cockpit and the engine under a central canopy, and see if we can make it fly. As a matter of fact, during World War II the United States actually constructed a number of experimental aircraft conforming to these specifications, and photographs of the craft are published from time to time in popu-

lar magazines about science and flight. It is highly likely that some of the UFO reports before 1950 were sightings of these test flights. See how easy it is when you *want* to find answers to a mystery?

The mythical saucer also flies at incredible speeds. Well, the speeds believed possible depend upon the time and the place of the observer. As stated earlier, a hundred years ago, twenty-five miles per hour was legally prohibited in the belief that such terrific velocity would endanger human life. So replace the propellor of the experimental disc airfoil with a modern aerojet engine. Is Mach 3 fast enough for believers?

But the true saucer not only flies, it also hovers. You mean like a Hovercraft? One professional engineer translated Ezekiel's description of heavenly ships as a helicopter-cum-Hovercraft.

But what about the anomalous electromagnetic effects manifest in the space surrounding a flying saucer? Well, Nikola Tesla demonstrated a prototype of an electronic device that was eventually developed into the electron microscope, the television screen, and an aerospace engine called the Ion Drive. Since World War II, the engineering of the Ion Drive has been advanced as the most promising solution to the propulsion of interplanetary spaceships. The Drive operates by charging atomic particles and directing them with electromagnetic force as a jet to the rear, generating a forward thrust in reaction. The advantage of the Ion Drive over chemical rockets is that a spaceship can sweep in the ions it needs from its flight path, like an aerojet sucks in air through its engines. Therefore, the ship must carry only the fuel it needs to generate the power for its chargers; there is no need to carry dead weight in the form of rocket exhaust. There is another advantage to be derived from ion rocketry: The top speed of a reaction engine is limited by the ejection velocity of its exhaust. An ion jet is close to the speed of light. If space travel is ever to be practical, transport will have to achieve a large fraction of the speed of light.

In 1972 the French journal *Science et Avenir* reported Franco-American research into a method of ionizing the airstream flowing over wings to eliminate the sonic boom, a seri-

ous objection to the commercial success of the Concorde. Four years later a picture appeared in an American tabloid of a model aircraft representing the state of current development. The photograph shows a disc-shaped craft, but not so thin as a saucer; it looks more like a flying curling stone. In silent flight, the ionized air flowing around the craft glows as a proper UFO should. The last word comes from an engineering professor at the local university; he has begun the construction of an Ion-Drive Flying Saucer in his backyard.

To the true believer, the flying saucer has no jet. It seems to fly by some kind of antigravity. As antigravity is not known to exist in physical theory or experimental fact in popular science, the saucer is clearly alien and beyond human comprehension. But *antigravity* depends upon what you conceive *gravity* to be, doesn't it?

For all practical purposes, you do not have to understand what Newton and Einstein mean by gravity. Gravity is an acceleration downward, to the center of the earth. Therefore, antigravity is an acceleration upward. As far as practical engineering is concerned, any means to achieve a gain in altitude is an antigravity engine. An airplane is an antigravity engine, a balloon is an antigravity engine, a rocket is an antigravity engine, a stepladder is an antigravity engine. See how easy it is to invent an antigravity engine?

There are three basic kinds of locomotive engines. The primary principle is traction. The foot and the wheel are traction engines. The traction engine depends upon friction against a surrounding medium to generate movement, and locomotion can proceed only as far and as speedily as the surrounding friction will provide. The secondary principle is displacement. The balloon and the submarine rise by displacing a denser medium; they descend by displacing less than their weight. The tertiary drive is the rocket engine. A rocket is driven by reaction from the mass of material it ejects. Although a rocket is most efficient when not impeded by a surrounding medium, it must carry not only its fuel but also the mass it must eject. As a consequence, the rocket is impractical where powerful acceleration is required for extended drives. In chemical rocketry, ten minutes is a long burn for powered

flight. What is needed for practical antigravity locomotion is a fourth principle which does not depend upon a surrounding medium or ejection of mass.

You must take notice that none of the principles of locomotion required any new discovery. They have all been around for thousands of years, and engineering only implemented the principle with increasing efficiency. A fourth principle of locomotion has also been around for thousands of years: It is centrifugal force. Centrifugal force is the principle of the military sling and medieval catapult.

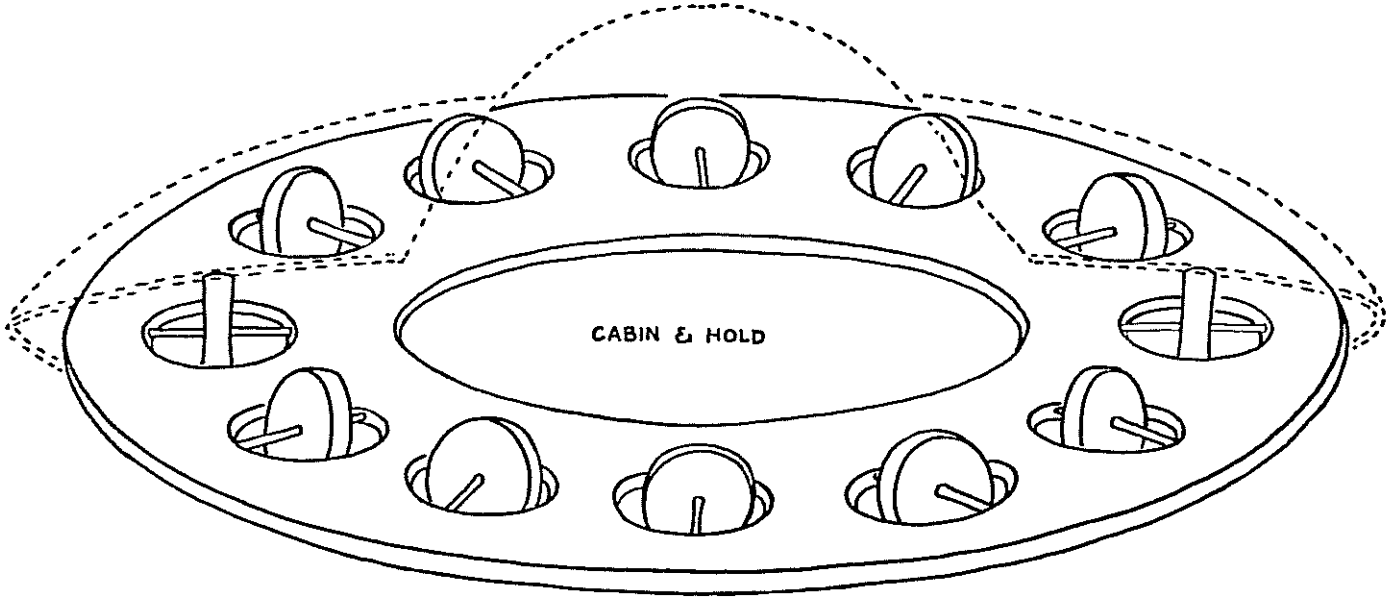
Everyone knows that centrifugal force can overcome gravity. If directed upward, centrifugal force can be used to drive an antigravity engine. The problem engineers have been unable to solve is that centrifugal force is generated in all directions on the plane of the centrifuge. It won't provide locomotion unless the force can be concentrated in one direction. The solution of the sling, of releasing the wheeling at the instant the centrifugal force is directed along the ballistic trajectory, has all the inefficiencies of a cannon. The difficulty of the problem is not real, however. There is a mental block preventing people from perceiving a centrifuge to be anything other than a flywheel.

A bicycle wheel is a flywheel. If you remove the rim and tire, leaving only the spokes sticking out from the hub, you still have a flywheel. In fact, spokes alone make a more efficient flywheel than the complete wheel; this is because momentum goes up only in proportion to mass but with the square of speed. Spokes are made of drawn steel with extreme tensile strength, so spokes alone can generate the highest levels of centrifugal force long after the rim and tire have disintegrated. But spokes alone still generate centrifugal force equally in all directions from the plane of rotation. All you have to do to concentrate centrifugal force in one direction is remove all the spokes but one. That one spoke still functions as a flywheel, even though it is not a wheel any longer.

See how easy it is once you accept an attitude of solving one problem at a time as you come to it? You can even add a weight to the end of the spoke to increase the centrifugal force.

But our centrifuge still generates a centrifugal acceleration in all directions around the plane of rotation even though it doesn't generate acceleration equally in all directions at the same time. All we have managed to do is make the whole ball of wire wobble around the common center of mass between the axle and the free end of the spoke. To solve this problem, now that we have come to it, we need merely to accelerate the spoke through a few degrees of arc and then let it complete the cycle of revolution without power. As long as it is accelerated during the same arc at each cycle, the locomotive will lurch in one direction, albeit intermittently. But don't forget that the piston engine also drives intermittently. The regular centrifugal pulses can be evened out by mounting multiple centrifuges on the same axle so that a pulse from another flywheel takes over as soon as one pulse of power is past its arc.

The next problem facing us is that the momentum imparted to the centrifugal spoke carries it all around the cycle with little loss of velocity. The amount of concentrated centrifugal force carrying the engine in the desired direction is too low to be practical. Momentum is half the product of mass multiplied by velocity squared. Therefore, what we need is a spoke that has a tremendous velocity with minimal mass. They don't make spokes like that for bicycle wheels. A search through the engineers' catalog, however, turns up just the kind of centrifuge we need. An electron has no mass at rest (you cannot find a smaller minimum mass than that); all its mass is inherent in its velocity. So we build an electron raceway in the shape of a doughnut in which we can accelerate an electron to a speed close to that of light. As the speed of light is approached, the energy of acceleration is converted to a momentum approaching infinity. As it happens, an electron accelerator answering our need was developed by the University of California during the last years of World War II. It is called a betatron, and the doughnut is small enough to be carried comfortably in a man's hands.



We can visualize the operation of the Mark I from what is known about particle accelerators. To begin with, high-

energy electrons ionize the air surrounding them. This causes the betatrons to glow like an annular neon tube.

Therefore, around the rim of the saucer a ring of lights will glow like a string of shining beads at night. The power required for flight will ionize enough of the surrounding atmosphere to short out all electrical wiring in the vicinity unless it is specially shielded. In theory, the top speed of the Mark I is close to the speed of light; in practice, there are many more problems to be solved before relativistic speeds can be approached.

The peculiar property of microwaves heating all material containing the water molecule means that any animal luckless enough to be nearby may be cooked from the inside out; vegetation will be scorched where a saucer lands; and rocks containing water of crystallization will be blasted. Every housewife with a microwave oven knows all this; only hardheaded scientists and softheaded true believers are completely dumbfounded. The UFOnauts would be cooked by their own engines, too, if they left the flight deck without shielding. This probably explains why a pair of UFOnauts, in a widely published photograph, wear reflective plastic jumpsuits. Mounting the betatrons outboard on a disc is an efficient way to get them away from the crew's compartment, and the plating of the hull shields the interior. At high accelerations, increasing amounts of power are transformed into radiation, making the centrifugal drive inefficient in strong gravitational fields. The most practical employment of this engineering is for large spacecraft, never intended to land. The flying saucers we see are very likely scouting craft sent from mother ships moored in orbit. For brief periods of operation, the heavy fuel consumption of the Mark I can be tolerated, along with radiation leakage—especially when the planet being scouted is not your own.

When you compare the known operating features of particle centrifuges with the eyewitness testimony, it is fairly evident that any expert claiming flying saucers to be utterly beyond any human explanation is not doing his homework, and he should be reexamined for his professional license.

SCHEMATIC DIAGRAM

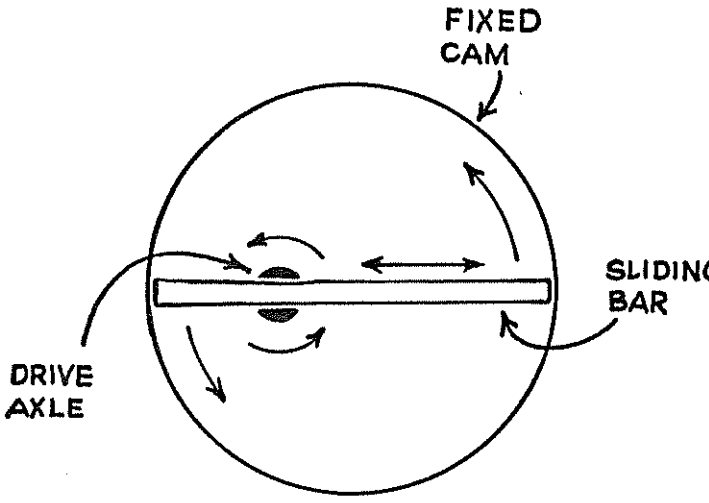
MARK I FLYING SAUCER

A SERIES OF ELECTRONIC CENTRIFUGES BASED ON THE HYPERSPACE OR PLANETARY GEAR DRIVES AND MOUNTED OUTBOARD ON A COWLED DISC ESTABLISHES THE CHARACTERISTIC PROFILE OF THE FLYING SAUCER.

For dramatic purpose, I have classified the development of the Flying Saucer through five stages:

Mark I—Electronic centrifuges mounted around a fixed disc, outboard.

Mark II—Electronic centrifuges mounted outboard around a rotating disc.



Mark III—Electronic centrifuges mounted outboard around rotating disc, period of cycles tuned to harmonize with ley lines, for jet assist.

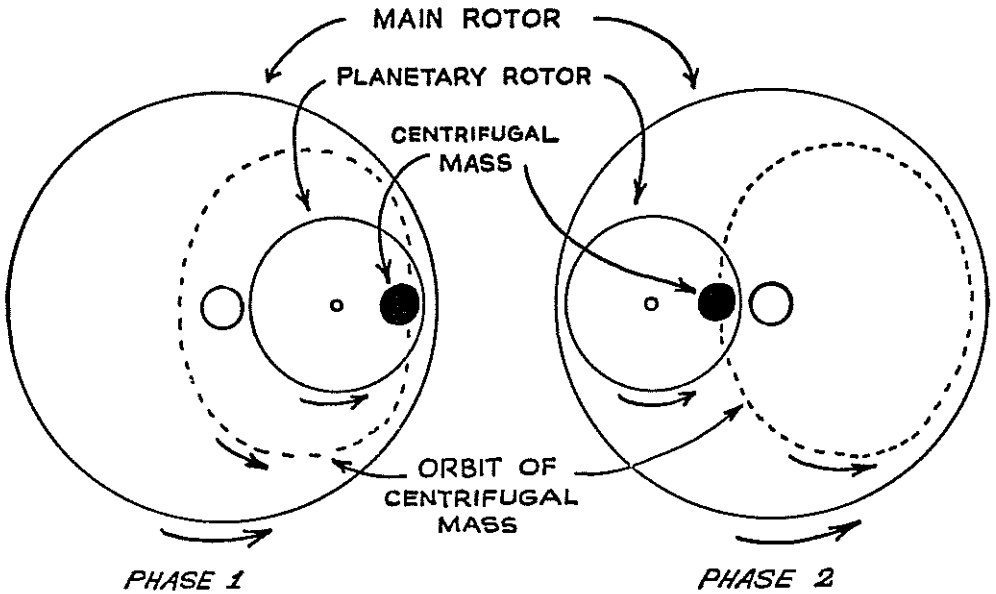
Mark IV—Particle centrifuge tuned to modify time coordinates by faster-than-light travel.

Mark V—No centrifuge. Solid state coils and crystal harmonics transforms ambient field directly for dematerialization and rematerialization at destinations in time and space.

Now that the UFO phenomenon has been demystified and reduced to human ken, we can proceed to prove the theory. If your resources are like those of the PLO, you can go ahead and build your own flying saucer without any further information from me, but I have nothing to work with except the junk I can find around the house.

I found an old electric motor that had burned out, but still had a few more turns left in it. I drilled a hole through the driving axle so that an eight-inch bar would slide freely through it. I mounted the motor on a chassis so that the sliding bar would rotate in an eccentric cam. In this way, one end of the bar was always extended in the same direction while the other was always pressed into the driving axle. As both ends had the same angular velocity at all times, the end extending out from the axle always had a higher angular momentum. This resulted in a concentration of centrifugal acceleration in one direction. When I plugged in the motor, the sight of my brainchild lurching ahead—unsteadily, but in a constant direction—gave me a bigger thrill than my baptism of sex—lasted longer, too. But not much longer. In less than twenty seconds the burned-out motor gasped its last and died in a puff of smoke; the test run was broadcast on radio microphone but the spectacle was lost without television. Because my prototype did not survive long enough to make a run in two directions, I had to declare the test inconclusive because of mechanical

ESSENTIAL DESIGN OF THE HYPERSPACE DRIVE



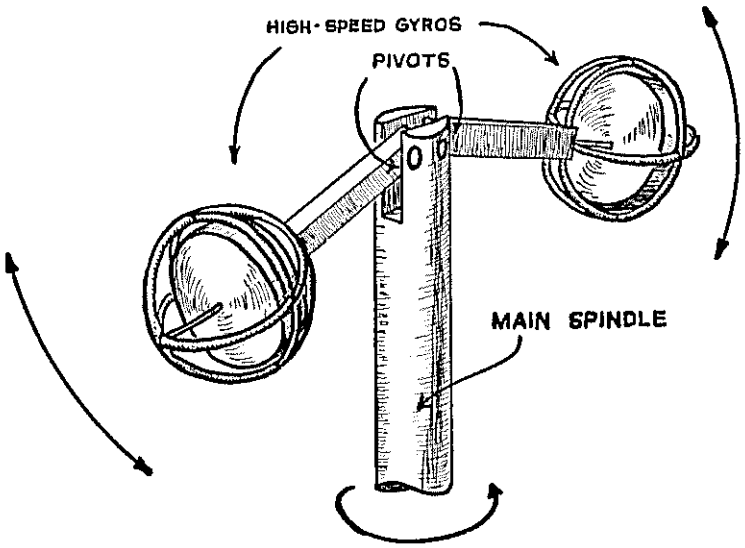
THE ROTATIONAL VELOCITY OF THE OSCILLATOR IS CONSTANT ON BOTH SIDES OF THE DRIVE AXLE. THEREFORE, CENTRIFUGAL ACCELERATION MUST ALWAYS BE HIGHER ON THE LONG EXTENSION.

breakdown. So, what the hell, the Wright brothers didn't get far off the ground the first time they tried, either. Now that I know the critter will move, it is worthwhile to put a few bucks into a new motor, install a clutch, and gear the transmission down. One problem at a time is the way it goes.

A rectified centrifuge small enough to hold in one hand and powered by solar cells, based on my design, could be manufactured for about fifty dollars (depending on production run and competitive bids). Installed in Skylab, it would be sufficient to keep the craft in orbit indefinitely. A larger Hyperspace Drive (as I call this particular design) will provide a small but constant acceleration for interplanetary spacecraft that would accumulate practical velocities over runs of several days.

It is rumored that a gentleman by the name of Dean invented another kind of antigravity engine sometime during the past fifty years, but I have been unable to track down any more information except that its design consists of wheels within wheels. A gentleman in Florida, Hans Schnebel, sent me a description of a machine he built and tested that is probably similar in principle to the Dean Drive. Essentially, a large rotating disc has a smaller rotating disc on one side of the main driving axle. The two wheels are geared together so that a weight mounted on the rim of the smaller wheel is always at the outside of the larger wheel during the same length of arc of each revolution, and always next to the main axle during the opposite arc. What happens is that the velocity of the weight is amplified by harmonic coincidence with the large rotor during one half of its period of revolution, and diminished during the other half cycle. This concentrates momentum in the same quarter continually, to rectify the centrifuge. The result is identical to my Hyperspace Drive, but it has the beauty of continuously rotating motion. Now, if the Dean Drive is made with a huge main rotor—like about thirty feet in diameter—there is enough room to mount a series of smaller wheels around the rim, set in gimbals for attitude control, and Mr. Dean has himself a Model T Flying Saucer requiring no license from the AEC.

In 1975 Professor Eric Laithwaite, Head of the De-



ESSENTIAL DESIGN OF PLANETARY GEAR DRIVE

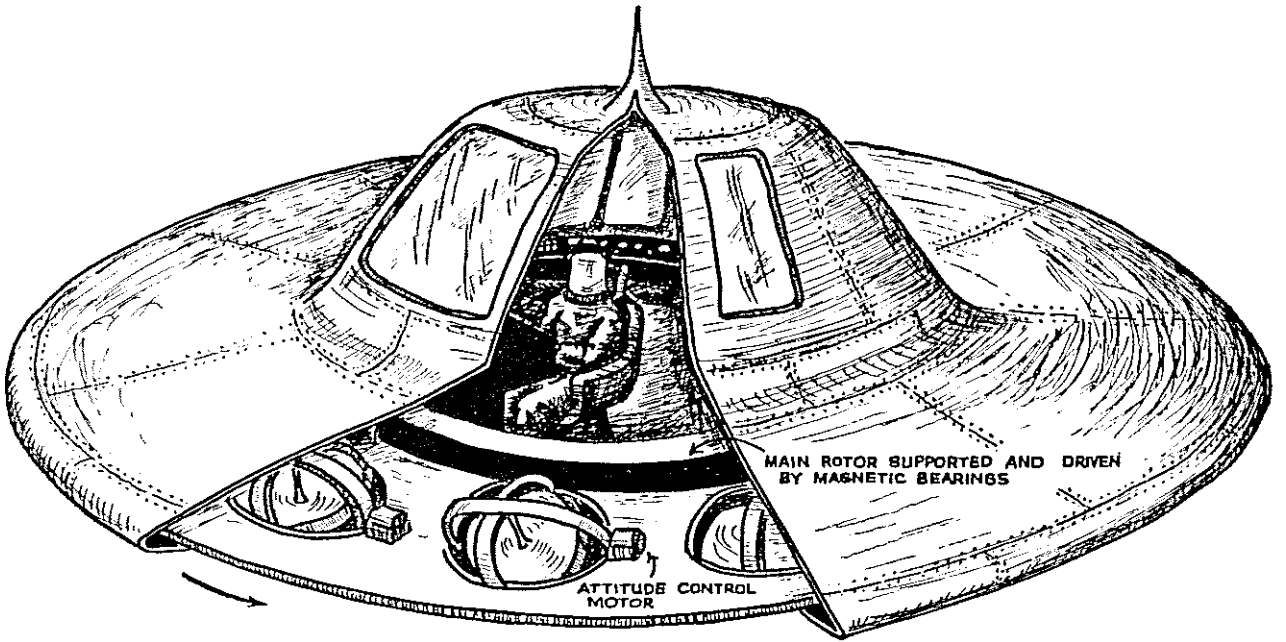
WHEN THE CENTRIFUGAL MASS IS AT THE RIM OF THE MAIN ROTOR, THE VELOCITY OF THE MASS IS ADDED TO THE VELOCITY OF THE RIM. WHEN THE CENTRIFUGAL MASS IS AT THE AXLE OF THE MAIN ROTOR, THE VELOCITY OF THE MASS IS SUBTRACTED FROM THE VELOCITY OF THE RIM. THEREFORE, CENTRIFUGAL ACCELERATION PREDOMINATES ON THE ONE SIDE.

partment of Electrical Engineering at the Imperial College of Science and Technology in London, England, invented another approach to harnessing the centrifugal force of a gyroscope to power an antigravity engine—well, he almost invented it, but he did not have the sense to hold onto success when he grasped it. Professor Laithwaite is world-renowned for his most creative solutions to the problems of magnetic-levitation-propulsion systems, and the fruit of his brain is operating today in Germany and Japan; his railway trains float in the air while traveling at over 300 miles per hour. If anyone can present the world with a proven and practical antigravity engine, it must be the professor.

Laithwaite satisfied himself that the precessional force causing a gyroscope to wobble has no reaction. This is a clear violation of Newton's Third Law of Motion *as generally conceived.* Laithwaite figured that if he could engage the precessional acceleration while the gyroscope wobbled in one direction and release the precession when it wobbled in other directions, he would be able to demonstrate to a forum of colleagues and critics at the college a rectified centrifuge that worked as a proper antigravity engine. His insight was sound but he did not work it out right. All he succeeded in demonstrating was a *separation between action and reaction,* and his engine did nothing but oscillate violently. Unfortunately, neither Laithwaite nor his critics were looking for a temporal separation between action and reaction, so the loophole he proved in Newton's Third Law was not noticed. Everyone was looking for action *without* reaction, so no one saw anything at all. Innumerable other inventors have constructed engines essentially identical to Laithwaite's, including a young high-school dropout who lived across the street from me.

Another invention is described in U. S. Patent disclosure number 3,653,269, granted to Richard Foster, a retired chemical engineer in Louisiana. Foster mounted his gyroscopes around the rim of a large rotor disc, like a two-cylinder flying saucer. Every time the rotor turns a half cycle, the precessional twist of the gyros in reaction generates a powerful force. During the half cycle when Foster's gyros were twisting in the desired direction, his clutch grabbed and transmitted the power

ESSENTIAL DESIGN
OF THE LAITHWAITE ENGINE



WHEN THE MAIN SPINDLE ROTATES, PRECESSIONAL ACCELERATION CAUSES THE GYROSCOPES TO RISE AND FALL DURING EACH REVOLUTION. THE MECHANICAL PROBLEM IS TO ENGAGE THE RISE OF THE GYROSCOPES TO GENERATE A LIFT WHILE DISENGAGING THE DOWNWARD SWING.

to the driving wheels. During the other half cycle, the gyros twisted freely. Foster claimed his machine traveled four miles per hour before it flew to pieces from centrifugal forces. After examining the patents, I agreed that it looked like it would work, and it certainly would fly to pieces because the bearing mounts were not nearly strong enough to contain the powerful twisting forces his machine generated. Foster's design, however, cannot be included among antigravity engines because it would not operate off the ground. He never claimed it would, and Foster always described his invention truthfully as nothing more than an implementation of the fourth principle of locomotion.

What Laithwaite needed was another rotary component, like the Dean Drive, geared to his engine's oscillations so that they would always be turned to drive in the same direction. As it happens, an Italian by the name of Todeschini recently secured a patent on this idea, and his working model is said to be attracting the interest of European engineers.

When the final rectifying device is added to the essential Laithwaite design, all the moving parts generate the vectors of a vortex, and the velocity generated is the axial thrust of the vortex. Therefore I call inventions based on this design the Vortex Drive.

By replacing the Hyperspace modules of the Mark I Flying Saucer with Vortex modules, still retaining the essential betatron as the centrifuge, performance is improved for the Mark II. To begin with, drive is generated only when the main rotor is revolving, so the saucer can be parked with the motor running. This eliminates the agonizing doubt we all suffered when the Lunar Landers were about to blast off to rejoin the Command Capsule: Will the engine start? This would explain why the ring of lights around the rim of a saucer is said to begin to revolve immediately prior to lift-off. A precessional drive affords a wider range of control, and the responses are more stable than a direct centrifuge. But the most interesting improvement is the result of the *structure* of the electromagnetic field generated by the Vortex Drive. By amplifying and diminishing certain vectors harmonically, the Mark III Flying Saucer can ride the electromagnetic currents of the Earth's

MARK II FLYING SAUCER

ELECTRONIC CENTRIFUGES BASED ON THE VORTEX DRIVE ARE MOUNTED IN GIMBALS TO TURN IN SYNCH WITH THE REVOLUTIONS OF THE MAIN ROTOR DISC.
THE TUNED ELECTROMAGNETIC FIELD GENERATED BY THE VORTEX DRIVE CAUSES THE VEHICLE TO BE CARRIED BY THE EARTH'S ELECTROMAGNETIC FIELD LIKE A DIRIGIBLE ELECTRON.
CONTROLLED GEOMAGNETIC PROPULSION IMPROVES THE DESIGN EFFICIENCY TO THE MARK III STAGE.

electromagnetic field, like the jet stream. And this is just what we see UFOs doing, don't we, as they are reported running their regular flight corridors during the biennial tourist season. Professor Laithwaite got all this together when he conceived of his antigravity engine as a practical application of his theory of "rivers of energy coursing through space"; he just could not get it off the drawing board the first time.

The flying saucer consumes fuel at a rate that cannot be supplied by all the wells in Arabia. Therefore we have to assume that UFO engineers must have developed a practical and compact atomic fusion reactor. But once the Mark III is perfected, another fuel supply becomes attainable, and no other is so practical for flying saucers. The Moray Valve will draw all the energy a saucer needs from the space through which it flies. The Moray Valve converts the Mark III into a Mark IV Flying Saucer by extending its operating capabilities through *time* as well as space. The Moray Valve, you see, functions by changing the direction of the flow of energy in the sun's gravitational field. It is the velocity of energy that determines motion, and motion determines the flow of time. We shall continue the engineering of flying saucers in the following essays.

My investigation into antigravity engineering brought me a technical report while this typescript was in preparation. Dr. Mason Rose, President of the University for Social Research, published a paper describing the discoveries of Dr. Paul Alfred Biefeld, astronomer and physicist at the California Institute for Advanced Studies, and his assistant, Townsend Brown. In 1923 Biefeld discovered that a heavily charged electrical condensor moved toward its positive pole when suspended in a gravitational field. He assigned Brown to study the effect as a research project. A series of experiments showed Brown that the most efficient shape for a field-propelled condensor was a disc with a central dome. In 1926 Townsend Brown published his paper describing all the construction features and flight characteristics of a flying saucer, conforming to the testimony of the first flight witnessed over Mount Rainier twenty-one years later and corroborated by thousands of witnesses ever since. (The Biefeld-Brown Effect explains why a Mark III rides the electromagnetic jet stream.)

We may speculate that flying saucers spotted from time to time may not only include visitors from other planets and travelers through time, but also fledglings from an unknown number of cuckoos' nests in secret experimental plants all over the world. The space program at Cape Canaveral may be nothing more than a supercolossal theater orchestrated by Cecil B. DeMille to reassure Americans that they are still *número uno* after Russia beat our atomic ace by putting Sputnik into orbit. We need not doubt that the Apollo spaceships got to the Moon, but we may wonder if Neil Armstrong was the first man to land there. The real space program may have been conducted in secret as a spin-off from the Manhattan Project since the end of World War II, and Apollo 13 may have been picked up by a sag wagon to make sure our team scored a home run every time they went to bat. The exploration of space is the most dangerous enterprise ever taken on by a living species. Don't you ever wonder why the Russians are losing men in space like a safari being decimated in headhunter country, while nothing ever happens to our boys except accidents during ground training?

5.

THE PHILOSOPHERS' STONE

How to Transmute the Elements by Engineering the Geometry of Standing Waves

A series of experiments has been carried out in Japan proving that chickens fed a diet deficient in calcium produced, as the end product of their biological processes, *more* calcium than they were given to live on. The conclusion is that the chickens *created* the calcium they needed by transmuting potassium.

This discovery challenges the basic concepts of science, and the more critically a discovery challenges the foundations of scientific belief, the less it is examined at all. But if potassium can be transmuted into calcium (and by chickens, no less!), we had best construct a new model of the atom to explain how this might be possible. So let's get started, at the level of the subatomic particles that seem to be giving theorists so much difficulty.

After observing that light travels in straight lines to cast sharp shadows, Isaac Newton deduced that light beams could exist only if radiant energy possessed the characteristics of atomic particles. But Sir Isaac went on to pass beams of light through prisms, observing the spectrum of colors projected. The fractioning of light into colors is possible *only* if radiant energy possesses the properties of waves. The problem became a matter of determining whether light was particulate or wavy in nature. Theorists decided that the ultimate elemental substance was both particle *and* wave, depending upon what it happened to be doing with itself when observed. Then realists proceeded to advance science without caring what light was. Nevertheless, the problem for the philosophers remains. The properties of particles categorically exclude the properties of waves, so how is it possible for an elemental substance, whatever it is, to manifest both properties in succession?

After the greatest scientists since Newton have given up, all a lay person has to do is take a couple of cartons of quarter-inch ball bearings to a billiard parlor, rent a table, and spread balls on the baize.

After you have managed to arrange them with a mathematically random distribution, you will see that each ball is equally distant from its neighbors. Absolute chaos is identical to perfect order.

Now try to rearrange the balls so that groups are allowed, but the groupings are mathematically random. Eventually the pattern formed by the balls will follow a density of distribution described by the Bell Frequency Curve of random statistics. The Bell Frequency Curve is a sine-wave form; on a plane surface it is manifest as regular clusters, with small groups of roughly equal numbers being roughly equal distances apart. The smaller groups congregate into larger groups until the entire field can be described as a single sine-wave form of low frequency. Once again, you prove that utter disorder is identical to total organization.

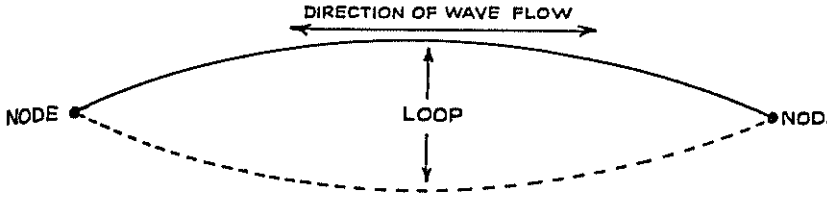
If the balls are small enough and numerous enough in relation to the area you have to spread them on, you will discover the aggregations of particles will assume the pattern of a spiral generated by phi, the ratio between successive numbers

in a series extended by adding consecutive numbers together; it is the ratio of 1:1.1618. All natural growth eventually follows the form of a spiral generated by a phi ratio, from the distributions of atoms to the distributions of stars in galaxies. (In other words, the spiral structure of gas clouds in interstellar space is not necessarily due to the process of gravitational contraction and centrifugal force, as proponents of the Nebular Hypothesis of stellar generation would have us believe. The spiral structure is an inevitable consequence of random distribution.)

You can perform this experiment at less cost by making pencil dots on a large piece of paper, but you will be bothered by constant erasing until you get the dots distributed properly. With pencil and paper, however, you can perform the converse experiment. Draw lines at random, each line representing a wave front. If you have enough lines on enough paper, and enough randomness, the result will look exactly like the random distribution of balls on a billiard table, as the intersections of lines form groupings of density.

Whether you perceive a ball to be an atomic particle or an aggregation of particles depends upon the *scale* of your frame of view. Whether you perceive an aggregation to be a particle or a wave depends upon the *scale* of your resolution. At the limit of resolution, all structures register on all instruments of measurement as particles. And all structures that cannot be resolved sharply by the instrument of measurement register as waves. So the nature of the ultimate element is determined by the instruments of measurement; all we can really know about it is what our instruments measure. Whether you choose to interpret reality as waves or particles depends entirely on what you want to do. The manifestations of energy—i.e., motion—yield measurements as waves; the manifestations of static material yield measurements as particles.

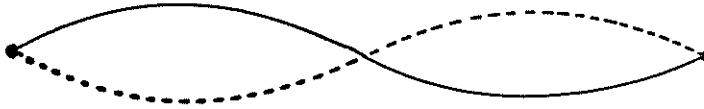
As it happens, everything is moving. Therefore, all events yield accurate measurements only as wave functions. The use of the laser for measurement establishes the wave as the elemental unit of space, time, motion, and energy.



As when Pythagoras studied music, harmonics is still taught from the model of a vibrating string. A plucked string

vibrates back and forth as a unit, forming a standing-wave structure, emitting vibrations through the air to be heard as a musical sound. The tone is the fundamental frequency of the standing wave.

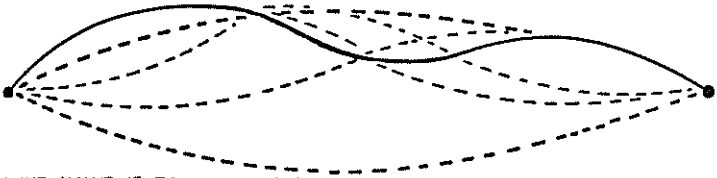
As the string vibrates as a unit, it also divides itself into two halves along its length, and each half vibrates as two individual standing waves independently of the fundamental wave. The frequency of the half lengths is twice the frequency of the fundamental, and the sound emitted is the second harmonic overtone, an octave higher than the fundamental.



And at the same time as the string vibrates as a unit and as independent halves, it also divides its length into three equal parts, each third vibrating independently to emit a sound three times the frequency of the fundamental, called the third harmonic overtone. At the same time, the string also divides itself into fractional lengths of quarters, fifths, sixths, and so on to the elemental molecular unit of vibration, generating successively higher harmonic overtones all the way. The distribution of energy among the overtones determines the unique sound characteristic of each instrument. This is the way harmonics is taught.

Only one thing is wrong with the course of study: The instructors got it all backward, just as electricians are taught that electricity flows in the opposite direction from the way it really flows. Now all the musicians and acoustic engineers will protest; everyone can see the vibrating string, and the course in harmonics describes exactly what you see—doesn't it? No, what is really happening is random motion. Whether or not you can hear the vibrations of a musical string above the audible threshold, the string is *always* vibrating due to the random molecular agitation of heat. (As far as the string is concerned, the extra vibration it gets from being plucked is just more heat.) Molecular motion along the string arranges itself into increasingly longer sine waves according to the Bell Frequency Curve of random distribution, until all the various fractional vibrations come into phase to generate the fundamental frequency. Fractions which do not coincide with the lower harmonics travel back and forth along the length of the string as moving waves until they come into direct opposition, trans-

A MUSICAL STRING RESONATING AS A UNIT-WAVE SOUNDS ITS FUNDAMENTAL FREQUENCY.



NOTE THAT THE FLOW OF ENERGY ALONG THE LENGTH OF THE STANDING-WAVE IS TRANSFORMED INTO AN ALTERNATING CURRENT FLOWING AT RIGHT-ANGLES ACROSS THE LOOP AFTER A REDUCTION OF WAVELENGTH AND VELOCITY AS DETERMINED BY THE LOOP/LENGTH RATIO.

AT THE SAME TIME THAT A STRING RESONATES AS A UNIT, IT ALSO VIBRATES AS TWO WAVE-UNITS TO SOUND THE SECOND HARMONIC OVERTONE AT TWICE THE FREQUENCY OF THE FUNDAMENTAL.

AND AT THE SAME TIME AS A STRING SOUNDS ITS FUNDAMENTAL FREQUENCY AND ITS SECOND HARMONIC OVERTONE, IT ALSO RESONATES AS THREE WAVE-UNITS TO SOUND ITS THIRD HARMONIC OVERTONE AT THREE TIMES THE FUNDAMENTAL FREQUENCY, AND SO ON TO INFINITY BY WAY OF THE FOURTH, FIFTH AND SIXTH OVERTONES.

A COMPOUND WAVE IS FORMED BY SUPERIMPOSED HARMONIC OVERTONES.

forming them into electromagnetic radiation. It's the loss of energy through electromagnetic transformation that causes the molecular vibrations to die down.

Electricians continue to learn their subject backward because which way the current flows makes no difference to the wiring; and besides, alternating current flows both ways. So what difference does it make whether harmonics is taught as division or integration? Well, as long as you believe electricity flows from positive to negative, you will never be able to discover and implement electronics.

If you learn harmonics by distributing ball bearings on a pool table, the way Pythagoras did after he was initiated into the higher dimensions and forswore beans, you will discover how the universe unfolds.

An infinite number of particles distributed and moving randomly through infinite space will divide themselves along a fundamental axis; one half moving in one direction and the other half moving in the opposite direction. This flow corresponds to gravity and antigravity. The reason we rarely see antigravity is that all particles belonging to the opposite pole have already departed in the other direction, and very few are left around here.

Each half of the universal particles traveling in opposite directions along the fundamental axis will divide into two groups again, moving in opposite directions along a plane at right angles to the gravitational axis. This secondary harmonic corresponds to the centrifugal and centripetal forces. The second harmonic will also subdivide into another pair of equal and opposite accelerations that can be represented as a cylinder parallel to the centrifugal-centripetal plane. The tertiary harmonic corresponds to the precessional forces.

Like the conventional view of the musical string, the universe can be described as subdividing itself successively until the ultimate particle is reached—whatever that ultimate particle is.

Of course, the universe does not really divide itself in this manner any more than the musical string does. It assembles its harmonics from random motion to coherent undertones. We proceed to analyze from the fundamental to the

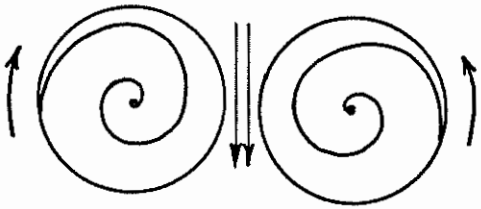
overtones only because it is convenient for our habit of thinking. We shall never know where the universal fundamental axis is, nor what the ultimate particle is, because in an infinite universe we must always find ourselves exactly in the middle of an infinite extension in both directions of whatever dimension we happen to be considering. What we call gravity, centrifugal-centripetal, and precessional forces are merely arbitrary conventions established for the convenience of our habitual mode of perception.

Once we perceive that all parts of space contain an indefinite number of particles moving at random to form the force fields we are familiar with, we understand how to engineer field energies directly. You see, one phase of precessional acceleration proceeds in the same direction as antigravity. To invent an antigravity engine, therefore, all you have to do is amplify the centrifugal harmonic until the antigravitational phase of the precessional harmonic exceeds the acceleration of gravity, and then eliminate the gravitational phase. This is exactly what Professor Eric Laithwaite calculated; he failed only because of errors in arithmetic. Other engineers have found the errors and corrected them. Whether or not the Laithwaite Engine worked, the fact remains that all antigravity engineering and all other field engineering can be reduced to the geometry of harmonics generated by random particles.

An infinite universe defined by an infinite number of randomly moving particles establishes the scientific principle of parity, meaning that energy will be equal in all directions and at all locations. In current physics, the concept of the cosmic hologram is still not accepted, so parity is limited to equality of motion in all directions.

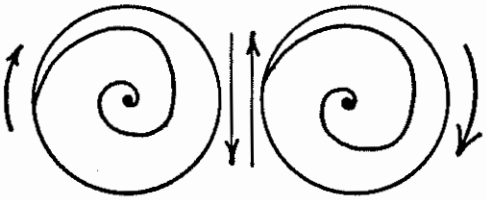
When all the vectors of the gravitational-fundamental vibration and the centrifugal-centripetal secondary harmonic and the precessional tertiary harmonic and all the other harmonics are integrated into a resultant, the trajectory of any given particle must follow the course of a spiral vortex with a phi generator. Therefore, any part of space you choose as a frame of reference will be defined by a fundamental field vortex, subdivided into an indefinite number of harmonic overtone vortices.

A vortex can spin in only one direction. Parity demands that for every vortex there must be a countervortex. This is why all dynamic structures are created, like men and women, in equal and opposite numbers.



Two vortices spinning in the same direction flow in opposite directions along their interface. Therefore, if pushed together, they will annihilate each other. This is why when particle meets antiparticle, they are transformed into radiant energy. The closer two vortices spinning in the same direction are pushed together, the more energy is brought into opposition along their interface. Therefore, all vortices rotating in the same direction will tend to move away from each other until they are spaced equally apart.

Conversely, two vortices spinning in opposite directions are flowing in the same direction along their interface. Therefore, they tend to merge. But they are not drawn together so much as pushed together by the pressure of similar vortices.



It is evident that the mechanics of vortices determines the force physicists call charge. Spin determines polarity.

Physical experiment has proven conclusively that electrons and protons are monopoles. The fact that electric charge is monopolar while magnetic charge is dipolar is one of the problems in the search for a Unified-Field Theory. If the vortex model is valid, however, electrons and protons should be dipolar, depending on which way they are oriented. But protons *always* repel each other, so all respectable physicists are convinced the vortex model is mistaken.

But protons do *not* always repel each other! When they come close enough together, they cleave together with greater force than any glue known. Physicists call this attraction the nuclear force, and they are unable to explain why it can be so powerful, but only over extremely close distances, within the nucleus of the atom. The answer is self-evident by a simple experiment. If you float a number of bar magnets in a fluid medium, and enclose the experimental setup in an electromagnetic field, the field will align all the magnets in the same direction and they will repel each other—like protons. But if the magnets are small enough, and are brought closely

A RANDOM DISTRIBUTION OF PARTICLES IN UNIVERSAL SPACE CREATES VORTECES IN PAIRS TURNING IN OPPOSITE DIRECTIONS. AT THE INTERFACE BETWEEN CONTRAROTATING VORTECES, THE FLOW IS IN THE SAME DIRECTION, SO OPPOSITELY TURNING VORTECES TEND TO MERGE.

AT THE INTERFACE BETWEEN VORTECES TURNING IN THE SAME DIRECTION, THE FLOW IS IN OPPOSITE DIRECTIONS, SO VORTECES TURNING IN THE SAME DIRECTION TEND TO PUSH AWAY FROM EACH OTHER.

THE BLACK HOLES THROUGH WHICH THE VORTEX FLOWS INTO HYPERSPACE IS THE OPPOSITE POLE OF THE CIRCLE FROM WHICH THE VORTEX FLOWS INTO THIS SPACE. THE BLACK HOLE AND THE WHITE CIRCLE ARE OPPOSITE SIDES OF THE SAME GATE TO AND FROM HYPERSPACE. THE EXPANSION OF THE POINT TO THE CIRCLE WITH SPACE SEPARATING THEM IS THE EFFECT OF PROJECTION BETWEEN HYPERSPACE AND REAL SPACE.

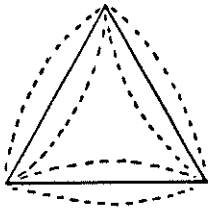
enough together, the mutual attraction of their opposite poles will overcome the force of the external field keeping them aligned—and they will flip, one relative to the other. With opposite poles tightly together, they will cleave together most tenaciously over a short distance. But once separated beyond the critical distance, the external field will align them in the same direction, and they will repel each other again. Scientists have come to perceive the electromagnetic field aligning particles in an atom as *the* electromagnetic field, so when particles flip and join in the nucleus with a thousand times more force than the attraction between proton and electron, a radically new force is postulated.

As it happens, Immanuel Velikovsky proposed an equivalent hypothesis to explain why planets in the Solar System do not collide. You see, if there is mutual gravitational attraction among the planets, they must clump together over the course of time. But observations prove that the planets maintain the greatest possible distance from each other. When an extreme condition is maintained indefinitely, you cannot explain it as accidental; there must be a physical force keeping the planets apart. Unfortunately, it was Velikovsky who proposed this hypothesis, and no scientist who is not independently wealthy and careless of reputation can afford to prove anything that Velikovsky said.

Field forces are defined, by many criteria, so physicists may be on firm ground when they establish a nuclear force distinct from the electromagnetic force—but the experiments proving electrical particles to be monopolar do not contribute to that support.

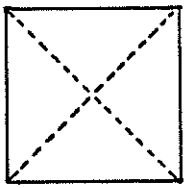
When harmonic calculations are transferred to spaces of more than one dimension (the musical string is the standard object lesson), the same principles are assumed to be valid. As a consequence, spherical harmonics is interpreted as a circular wave expanding from a point of origin on the global surface, and the harmonic ratios are measured along a radius. This conception works very well as far as it goes, but as you will learn, plane harmonics has some extremely practical differences from linear harmonics.

A plane cannot exist as a vibrating structure unless it



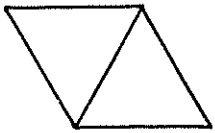
has at least three sides. The triangle, therefore, must be established as the fundamental unit of plane harmonics. When the sides of an equilateral triangle are bisected and joined, the result is four triangles, just as a square makes four squares when its sides are bisected and joined. The operations of plane harmonics apparently observe the rules of plane geometry.

William H. Whamond, writing in *Pursuit*, pointed out that if the sides of a polygon are not of a ratio that mutually reinforces each other's vibrations, the plane structure will disintegrate. All equal-sided polygons maintain their sides by mutual reinforcement, but all those which cannot be triangulated in harmonic ratios must collapse under pressure. It is surprising that Buckminster Fuller was able to build a career without realizing the function of harmonics in maintaining basic stability of structure.

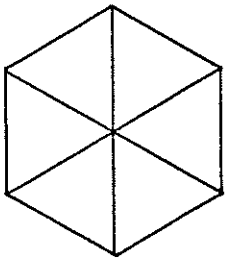


Whamond went further to point out that although stabilizing the dimensions of diagonals may be sufficient for practical structures, theoretical requirements are not satisfied unless the diametric vibrations reinforce the perimetric vibrations to establish the polygon's rigidity through and through. The simplest polygon generated by a mutually harmonic reinforcement of both sides and center is the hexagon. This is the probable reason why six acquired a reputation for being the perfect number among the ancient philosophers, and why a circle's circumference was accepted as being three times its diameter, although every wheelwright knew better.

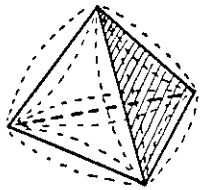
If you draw a grid of squares, and then draw all the diagonals, you will find yourself with a grid composed of two sets of squares. One set is rotated forty–five degrees from the other, and their dimensions are related to each other by a ratio of $\sqrt{2}$. This self-evident transformation assumes engineering significance when harmonic structures extend into higher dimensions.



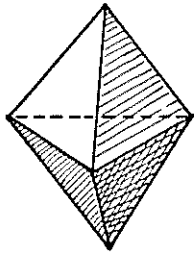
As Buckminster Fuller pointed out, not only is the triangle the basic unit of plane space, but the principle of triangulation also establishes the tetrahedron as the basic unit of solid space. Like the triangle, however, the tetrahedron maintains its structure only by the triangulated rigidity of the mutually reinforcing vibrations of its sides. In order to possess in-



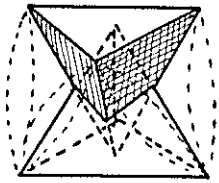
A TRIANGLE IS THE MINIMUM UNIT OF PLANE SPACE, DEFINED BY THREE WAVES IN A MUTUALLY REINFORCING STRUCTURE.



THE SQUARE IS CREATED BY FOUR MUTUALLY REINFORCING VIBRATIONS, BUT THE DIAGONALS ARE OF A RATIO INCOMMENSURABLE WITH THE SIDES IN WAVE UNITS.



THEREFORE, THE SQUARE TENDS TO COLLAPSE INTO A PAIR OF MUTUALLY REINFORCING TRIANGLES.

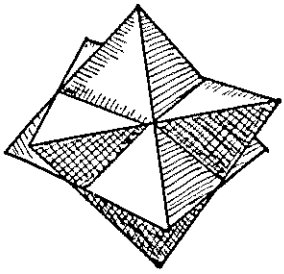


THE HEXAGON IS THE SIMPLEST, SYMMETRICAL PLANE SPACE ESTABLISHED BY A MUTUAL REINFORCEMENT OF THE DIAMETRIC WAVES WITH THE PERIMETRIC WAVES.

THE TETRAHEDRON IS THE MINIMUM UNIT OF VOLUME, DEFINED BY SIX STANDING-WAVES UNITED INTO A STRUCTURE OF MUTUALLY REINFORCING VIBRATIONS.

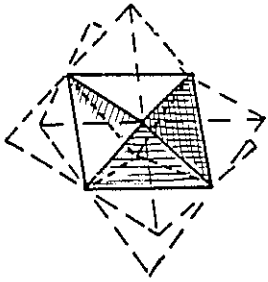
THE PRINCIPLE OF PARITY AROUND AXES ALIGNED AT RIGHT-ANGLES REQUIRES TETRAHEDRONS TO BE PAIRED.
A PAIR OF TETRAHEDRONS SHARING THE SAME BASE CONSTITUTES THE REGULAR TETRAHEDRON.

A PAIR OF TETRAHEDRONS INTERPENETRATING EACH OTHER POINT TO BASE IS STABILIZED BY A SET OF SIX WAVE UNITS RESONATING BETWEEN THE SIX EXPOSED VERTECES TO FORM A VIRTUAL OCTAHEDRON.
INTERNAL RESONANCE INTEGRATES WITH MUTUALLY REINFORCING EXTERNAL DIMENSIONS TO CREATE A POLYMORPHOUS HARMONIC STRUCTURE.



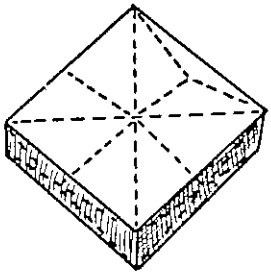
ternal stability, the tetrahedron must be doubled, one intersecting another, with points aligned on a polar axis.

To establish stability, tetrahedrons must always be manifest in mutually opposed and supporting pairs in this way. When this geometrical structure takes form from universal vibrations, however, it is not the simple pair of tetrahedrons it appears to be at first sight.

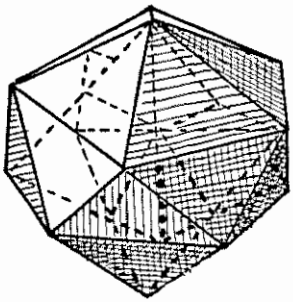


If lines are drawn joining all the points of the paired tetrahedrons, you have a cube. If lines are drawn between the centers of each face of the cube, they form the edges of an octahedron.

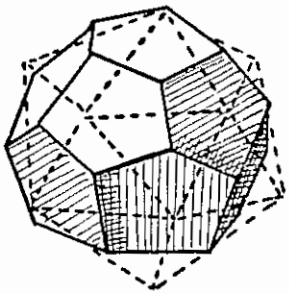
If circles scribed around the bases of the two tetrahedrons are divided into five equal arcs and all the points joined by lines, a symmetrical polyhedron defined by twenty equilateral triangles is defined. If all the points are joined by lines through the center of the icosahedron, twenty equal tetrahedrons will be defined. The space defined by an icosahedron is stabilized by mutually reinforcing resonance around all sides, along all edges, and through all diameters. Like the hexagon, the twenty faceted icosahedron is the perfect solid.



Now, bisecting all the lines forming an icosahedron produces a twelve-sided symmetrical polyhedron called a dodecahedron—the solid projection of the five-pointed star circumscribed by a pentagon. All ratios of the dodecahedron approximate the values of various mystical triangles, but they are incommensurate with the icosahedron by integers; the internal structure of the dodecahedron is irrational, like pi, phi, $\sqrt{2}$, $\sqrt{3}$, $\sqrt{5}$, etc. As you know, the diagonal of a square is related to its sides by $\sqrt{2}$, and the diagonal cross of a square is also the *negative* of the square. The dodecahedron is the negative of the icosahedron. In this context, the octahedron is the negative of the cube. Because a tetrahedron is the elemental unit of solid space, no other polyhedron can function as its inferior negative, so the tetrahedron is rotated 180 degrees to function as its own solid negative. Lines drawn from the points of a tetrahedron to its internal center form a linear structure called the Miraldi angle, resembling a caltrop; this is the true negative of the tetrahedron, but the field rotation required to transform a



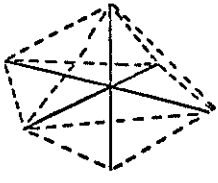
THE PRINCIPLES OF PARITY, HARMONIC INTEGRITY AND ROTATION TOWARDS THE SIMPLEST POSSIBLE ISOMETRIC STRUCTURES UNITES TETRAHEDRONS IN POLAR OPPOSITION BETWEEN FOUR PAIRS OF VERTECES, INTERPENETRATING EACH OTHER AT MIDSECTION. EACH EDGE IS DIVIDED INTO HALVES. EACH POLAR AXIS IS DIVIDED INTO THIRDS. A POLAR PROJECTION SHOWS THE EQUATORIAL PLANE DIVIDED INTO SIXTHS. EACH POINT IS A TETRAHEDRON DEFINED BY EDGES ONE-HALF THE LENGTH OF MAIN TETRAHEDRONS.



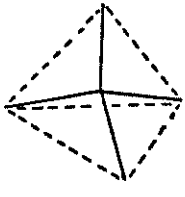
WHEN THE TETRAHEDRONS FORMING THE VERTECES OF THE EIGHT-POINTED SOLID STAR ARE CUT OFF, THE CORE REMAINING CONSTITUTES AN OCTAHEDRON.
THE HARMONIC INTEGRATION OF QUARTERS AND EIGHTHS WITH HALVES AND THIRDS IS REVEALED

WHEN THE VERTICES OF THE PRIME TETRAHEDRONS ARE JOINED BY LINES, A CUBE IS DEFINED.
THE VERTECES OF THE OCTAHEDRON DEFINE THE CENTRES OF THE SQUARES FORMING THE CUBE AND EACH EDGE OF THE PRIME TETRAHEDRONS ESTABLISHES THE DIAGONALS OF THE SQUARES.
NOTE THAT THE AXES OF EACH SOLID HARMONIC IS ROTATED RELATIVE TO THE STRUCTURE WHICH GENERATES IT.
THIS PROVES THAT A GIVEN SET OF VIBRATIONS DEFINES THE FIELD IN SEVERAL DIFFERENT STRUCTURES AT THE SAME TIME IN THE SAME PLACE AS DETERMINED BY THE PHASE HARMONICS INTEGRATING THE SET. A GIVEN STRUCTURE BECOMES TANGIBLE WHEN ITS PHASE IS TUNED TO THE PERCEIVER.

WHEN CIRCLES DRAWN AROUND THE BASES OF A PAIR OF MUTUALLY OPPOSED TETRAHEDRONS ARE DIVIDED INTO FIVE EQUAL SEGMENTS AND THE POINTS JOINED BY LINES, TWENTY EQUILATERAL TRIANGLES ARE FORMED AS THE FACETS OF A REGULAR ICOSAHEDRON. THE TRIANGLES ARE THE BASES OF TWENTY REGULAR TETRAHEDRONS RADIATING FROM THEIR APECES AT THE CENTRE OF THE ICOSAHEDRON.
THE ICOSAHEDRON IS THE SOLID CORRELATIVE OF THE PLANE HEXAGON, BEING STABILIZED BY DIAMETRIC VIBRATIONS MUTUALLY REINFORCING ITS SURFACE VIBRATIONS.

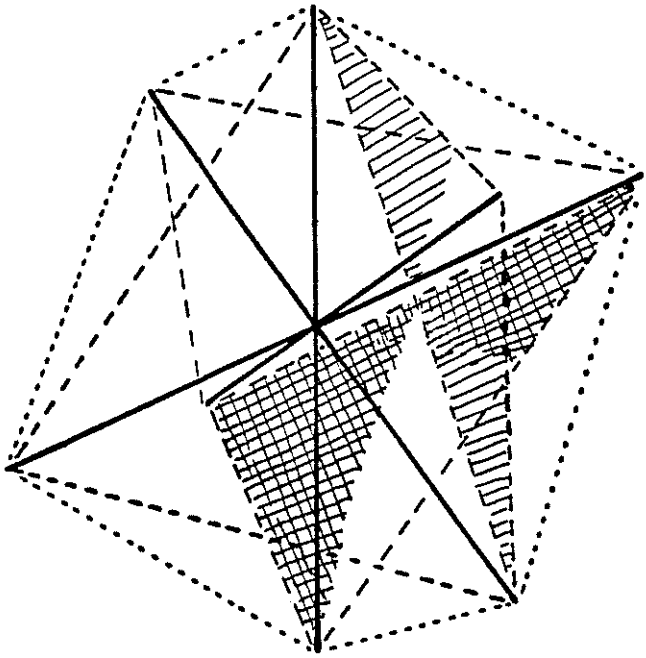


LINES CONNECTING THE CENTRES OF THE FACETS OF THE ICOSAHEDRON DEFINE THE EDGES OF TWELVE PENTAGONS FORMING THE FACETS OF A REGULAR DODECAHEDRON.
THE BISECTING LINES ARE THE CENTRAL AXES OF THE TRIANGLES, RELATED TO THE SIDES AS $\sqrt{3}$ IS TO 2. THEREFORE, THE CENTRAL AXES OF THE TRIANGLES ARE THE NEGATIVES OF THE TRIANGLES AND THE DODECAHEDRON IS THE NEGATIVE OF THE ICOSAHEDRON. CORRELATIVELY, THE OCTAHEDRON IS A PARTIAL NEGATIVE OF THE CUBE.



tetrahedron into a caltrop projects the structure into fewer dimensions.

Now, the relationship between a square and its diagonals is a 45-degree rotation on plane space, which is the projection of a rotation of 90 degrees in hyperspace. The relationship between the tetrahedron, the octahedron, the cube, the dodecahedron, and the icosahedron is also established by a definite rotation through hyperspace. The notes of a musical scale are also defined by a definite rotation of energy through hyperspace, which transforms one frequency into another. As an illustration, rotation through hyperspace transforms the wavelength of the side of a square to the wavelength of its diagonal. The ratio of the side to the diagonal is the same as the ratio between G and C# on the musical scale.



You have just made a discovery sought by philosophers throughout history; the regular Platonic solids are re-

THREE AXES ALIGNED AT RIGHT-ANGLES TO EACH OTHER ESTABLISH THE SIMPLEST STRUCTURE POSSIBLE IN 3-D SPACE. THE NEGATIVE (HYPERSPACIAL) AXES GENERATING THE OCTAHEDRON CONFORM TO THIS LIMITING CASE OF SIMPLICITY. THIS IS WHY RIGHT-ANGLE COORDINATES ARE FUNDAMENTAL TO GEOMETRY INSTEAD OF THE TRIANGULATION FAVOURED BY BUCKMINSTER FULLER.
THE OCTAHEDRON IS THE SIMPLEST STABLE ELEMENT OF GEOMETRY.
THE TETRAHEDRON IS THE THIRD HARMONIC OF THE BASIC OCTAHEDRON

FOUR AXES ALIGNED AT 127° INTERVALS ARE NEEDED TO GENERATE THE TETRAHEDRON. THE PRINCIPLE OF PARITY GIVES LOW PROBABILITY TO TETRAHEDRONS EXISTING BY THEMSELVES; LIKE HYDROGEN ATOMS, THE PREFERRED STATE OF THE TETRAHEDRON IS IN PAIRS. THE SAME AXES WHICH GENERATE THE ELEMENTAL TETRAHEDRON ALSO GENERATE A PROPERLY OPPOSED PAIR WHEN EXTENDED TO DEFINE THE DIAGONALS OF A CUBE.

NOTE THAT THE AXES GENERATING THE OCTAHEDRON FORM THE CORE OF THE TETRAHEDRON PAIR.

THIS MODEL REVEALS THAT THE INTERSECTION OF HYPERSPACIAL FIELDS AT RIGHT ANGLES ON ALL AXES GENERATES OCTAHEDRONAL STRUCTURES IN REAL SPACE. WHEN FIELDS IN HYPERSPACE INTERSECT WITH AXES ALIGNED ALONG THE TERTIARY HARMONIC, CUBIC/TETRAHEDRONAL STRUCTURES ARE CREATED. BY ROTATING HYPERSPACIAL AXES, ALL CONCEIVABLE STRUCTURES CAN BE CREATED IN REALSPACE. THIS IS THE BASIS OF ALCHEMY, MAGIC AND WITCHCRAFT. THE MIND IS A HYPERSPACIAL ENTITY CAPABLE OF AUTONOMOUS ROTATION OF FIELD AXES. THE TRANSLATION OF BRAIN MECHANICS INTO TECHNOLOGY IS WHAT PSYCHOTRONIC ENGINEERING IS ALL ABOUT.

lated to each other as musical notes on a hexatonic scale. Extend the sides of the dodecahedron until they meet, and you have the frame of a pair of tetrahedrons exactly twice the size of the pair you started with to continue the scale on the second octave. You have discovered the Music of the Spheres.

Parity is not satisfied by the creation of nuclear particles in the form of equal and opposing standing-wave vortices. The axes of the pair, you see, are both aligned in the same direction; that is a manifestation of directional preference. In order that axes be balanced in all directions, particles must congregate in groups of six: three pairs of mutually opposed particles with the axis of each pair at right angles to the other two. This assemblage puts each vortex at the vertex of an octahedron.

The octahedron is not stable because each pair of vortices grind gears against the other two. But if the equatorial pair of particles move away from each other along the polar axis, the six can mesh together like two pairs of crown gear clusters fitted at right angles to each other.

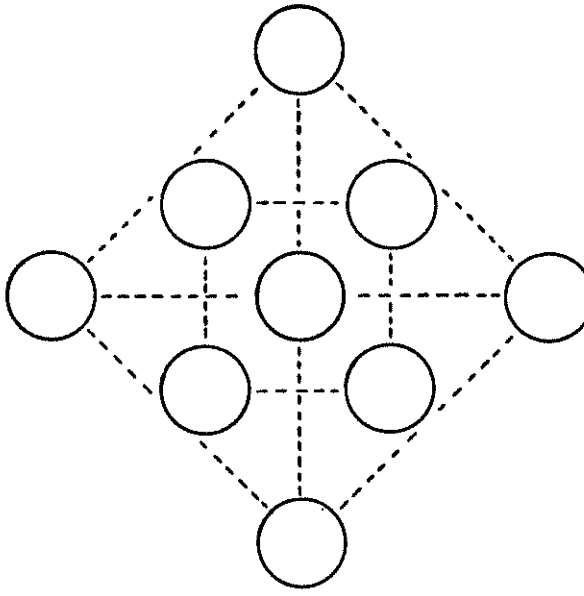
The vortex model suggests that the basic particle is likely to be composed of three pairs of finer particles bound together in the harmonic structure of an octahedron. The geometry of the three pairs bears a striking correspondence to the characteristics of the elusive quark. Charm, beauty, and color appear to be manifestations of angle in hyperspace; axial angles account for fractional electric charge.

The octahedron still does not quite satisfy parity. The polar pinions of the crown gear clusters are both spinning in the same direction; this will give the octahedron a net charge. If four more pair of vortices, forming the negative of the octahedron, are spaced in a cube arrangement between the vertices of the octahedron, all the gears will spin in the right direction, all spins will be equally opposed, and all axes will be balanced in all directions. The cube-octa is the likely conformation of the neutron. Proof will be slow coming because at least half the particles are in the quantum field at the instant any measurement is made; this is why the quarks are so damned elusive.

The cube-octa contains fourteen particles. If struck, it

could collapse, with twelve arranging themselves around one in the center, in the form of a dodecahedron, while the fourteenth spins free into orbit. The transformation is remarkably similar to what appears to happen when a neutron is converted by impact into a proton and an electron.

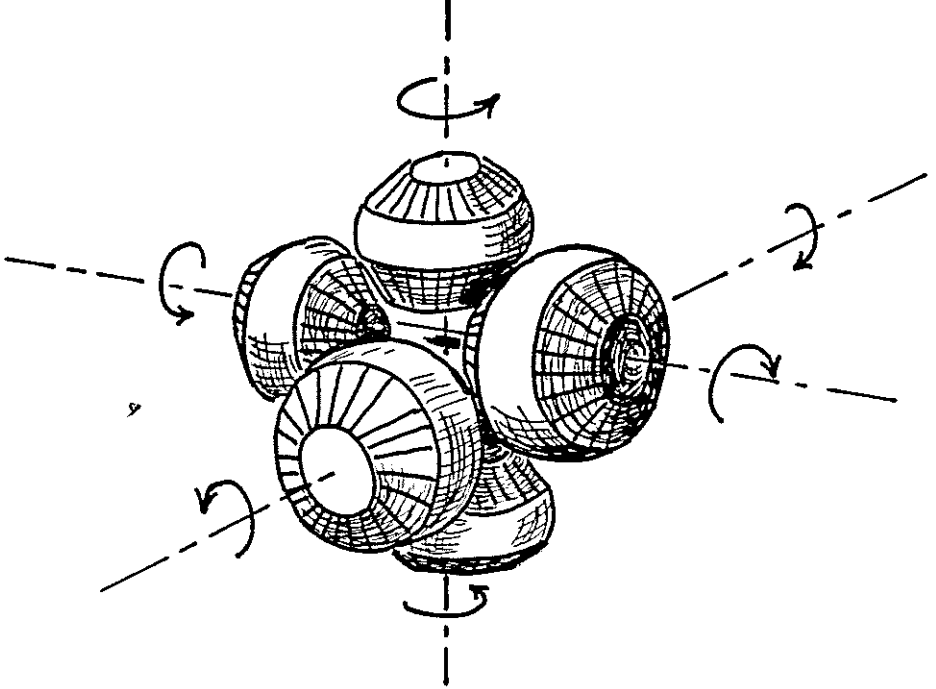
If the proton has the geometry of a dodecahedron, it will be a charged particle, so every proton will seek another proton as a mate. This may be why hydrogen is a diatomic molecule. After the neutron collapses, parity is not reestablished absolutely until the helium atom is formed. This would explain why helium is monatomic, with all the properties of an overgrown neutron.



Now that we have our electrons, protons, and neutrons straightened out, let's put them all together!

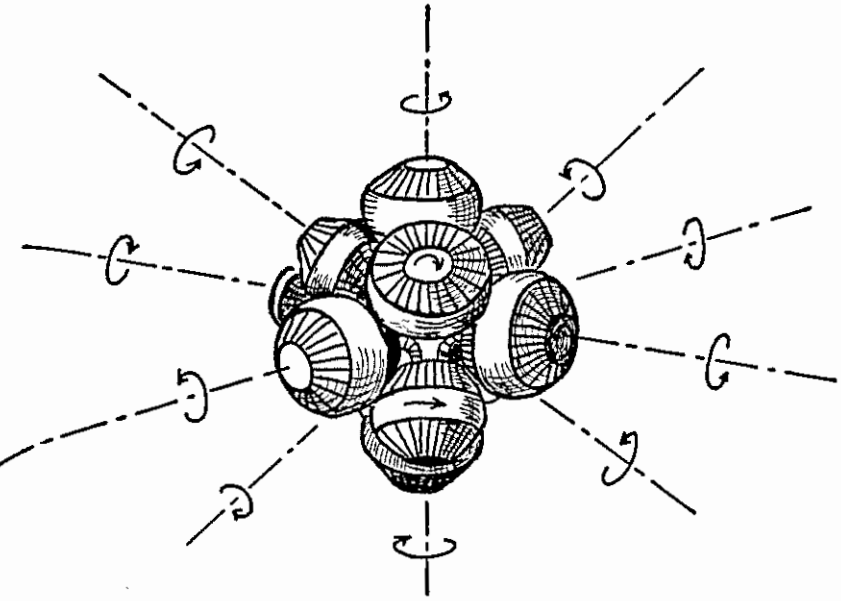
Niels Bohr described the atom as a miniature Solar System, with the nucleus serving as a Sun, orbited by electron "planets". The Bohr model is represented in all popular scientific literature despite the fact that any child can see it must be impossible. You see, if you have electrons orbiting in all directions around a nucleus, they are bound to collide; and on the atomic time scale, *eventually* is something sooner than a microsecond.

The atomic traffic problem was solved by giving each electron a different radius to orbit, but this solution won't work, either. An electron's wavelength is defined by its orbit. If every electron has its own orbital radius, each electron will manifest a different wavelength. This does not happen.



Erwin Schrödinger resolved the problem by proposing that electrons were standing waves, but his equations required three dimensions for each electron. Although the standing-wave equations were accepted, the necessity for multiplied space was not. As a consequence, mathematical physicists are still searching for a model that will make the atom possible! They have given up seeking a model that can be represented as a mechanical structure, and physics builds increasingly complicated and abstract equations.

The model of solid harmonics indicates that the node of the electronic standing wave revolves around the equator of the hydrogen nucleus. The node requires only half the quan-



POLAR VIEW OF THE PROBABLE DISTRIBUTION OF ELECTRONS IN THE OUTERMOST SHELL OF THE KRYPTON ATOM. THE OPPOSITE HEMISPHERE IS THE SAME.
THE BASIC OCTAHEDRON COMBINED WITH THE CUBE REESTABLISHES THE GEOMETRY OF THE NEUTRON ON A LARGER SCALE.

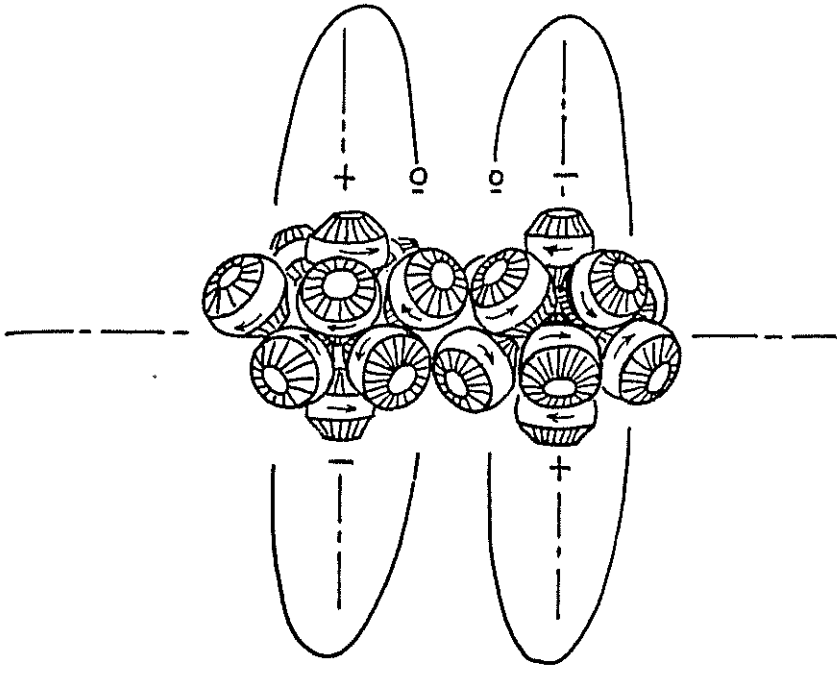
PARITY OF THE MODEL BREAKS DOWN AT THIS STAGE OF DEVELOPMENT. KRYPTON CAN BE MADE TO COMBINE CHEMICALLY BUT ITS ACTIVITY IS FAR FROM COMMENSURATE WITH THE FAILURE OF PARITY. THEREFORE, ANOTHER HARMONIC FEATURE MUST BE INTRODUCED IF THIS MODEL IS TO REMAIN VALID FOR HEAVIER ELEMENTS.

PARITY DEMANDS THAT VORTECES BE CREATED IN THREE PAIRS OF OPPOSITELY SPINNING SPHERES WITH THEIR AXES ALIGNED AT RIGHT ANGLES.
IN THIS DIAGRAM, THE POLAR VORTECES SPIN IN THE SAME DIRECTION, VIOLATING PARITY.

INTRODUCING AN INTERMEDIARY SET OF VORTECES INTO THE NEGATIVE SPACE, FORMING A CUBE WITHIN THE OCTAHEDRON, CORRECTS THE ROTATION SO THAT EACH POLAR VORTEX ON EACH AXIS SPINS IN OPPOSITE DIRECTIONS. PARITY IS SATISFIED BY ALL DIRECTIONS OF SPIN AND AXIAL ALIGNMENTS.

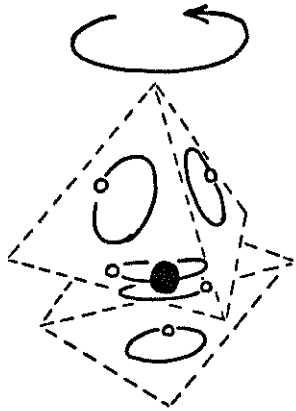
NOTE THAT THIS STRUCTURE IS A HARMONICALLY INTEGRATED SOLID SCALE CORRESPONDING TO THE MUSIC OF THE SPHERES.

IF REALITY IS STRICTLY GOVERNED BY PARITY, AND IF PARITY IS ESTABLISHED BY RANDOM VECTORS, THEN THIS MODEL MUST BE THE PROBABLE STRUCTURE OF THE NEUTRON.



THE SPIN, MASS AND CHARGE OF EACH VORTEX DEPEND ON ITS AXIAL ALIGNMENT TO THE FRAME OF REFERENCE AT THE INSTANT MEASUREMENT IS MADE. THEREFORE, THE NATURE OF SUBATOMIC PARTICLES MUST BE INDEFINITE IN THEIR VARIETIES. THE ONLY CONSTANT IS THE FREQUENCY AND STABILITY OF EACH HARMONIC STRUCTURE AS ESTABLISHED BY PROBABILITY.

tum orbital space it has, so another electron can share the same shell to form a helium atom. To maintain parity, each moves to a polar hemisphere separated by the equator, and revolves in opposite directions.



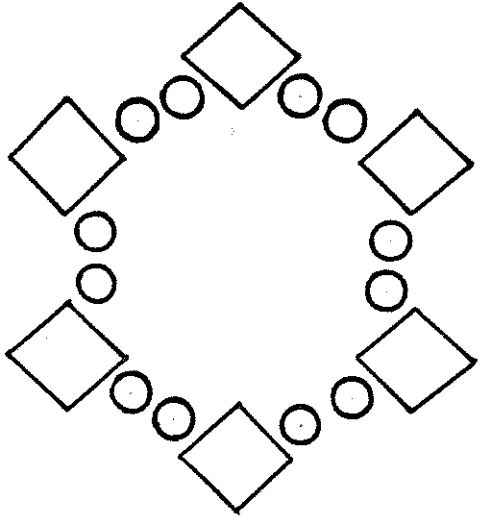
Space is insufficient for a third electron, so the lithium atom must start another shell. The second shell has enough area for eight electrons, so the surface of each hemisphere is divided harmonically into successive halves, thirds, and quarters. Apparently the equatorial division establishes a hemispherical sector that is never crossed. The eight facets form the sides of an octahedron (the ubiquitous octahedron again) and each facet has just enough room to hold an electron; each facet is a quantum unit of space relative to the frequency of the electron. When the octahedron is complete, the atom is electrically neutral, as all octahedrons with their gears running smoothly are supposed to be. Neon is almost as inert as helium, but parity must be observed; and a second octahedron is laid over the first with the spins of each electron aligned at a different angle. The fourth orbital shell has sufficient radius for its surface to hold many more electrons. If you move the eight electrons to the vertices of the octahedron harmonic structure, so that each hemisphere is covered by a square pyramid with the equatorial cleavage separating them, you will find enough room to add another electron to the center of each facet, defining a cube-octa. The total of electrons will be eighteen; this is the number of electrons proven to be established in the subsequent shells in the generation of the Periodical Table of Elements. The electrons of each shell align their axes to balance parity.

But apparently it is a long way from helium to the next perfect atomic geometry. If the equatorial cleft is retained throughout the generation of elements, the model of heavier atoms will assume the dumbbell configuration of the electromagnetic field surrounding a bar magnet. (Structural weakness at the waist may be the reason that atoms heavier than bismuth break spontaneously.)

To illustrate how the geometry works in practice, the atom of carbon has a pair of miter caps, one over each polar hemisphere. There is space for two more electrons in each

THE PROTON PROBABLY ASSUMES THE STRUCTURE OF THE DODECAHEDRON. THE DODECAHEDRON ASSEMBLAGE OF VORTECES HAS THE POLAR PAIR SPINNING IN THE SAME DIRECTION, GIVING THE PROTON A NET CHARGE. THE CHARGE IS NEUTRALIZED WHEN THE PROTON UNITS IN PAIRS ALIGNED IN OPPOSITE DIRECTIONS CREATE THE HYDROGEN MOLECULE ILLUSTRATED ABOVE. THE HYDROGEN MOLECULE STILL FAILS AXIAL PARITY, SO HYDROGEN REMAINS CHEMICALLY ACTIVE. THE ADDITION OF A PAIR OF NEUTRONS BETWEEN THE ELECTRONS ON AN AXIS PERPENDICULAR TO THIS PLANE ESTABLISHES THE AXIAL STRUCTURE OF THE OCTAHEDRON, MAKING THE HELIUM ATOM UTTERLY INERT.

THE OXYGEN ATOM PROBABLY HAS THREE ELECTRONS REVOLVING IN PLANES FORMING A TETRAHEDRON OVER EACH POLAR HEMISPHERE. THE RADIUS OF REVOLUTION IS THE SAME FOR ALL ELECTRONS IN ALL SHELLS SO THAT THE FREQUENCY OF THE ELECTRON CAN BE IDENTIFIED AS CONSTANT. THE SHELLS SPIN AROUND THE NUCLEUS, SATISFYING THE EXPERIMENTAL BASIS OF THE BOHR MODEL. THE STATE OF ATOMIC EXCITEMENT IS DETERMINED BY THE VARIABLE RADIUS OF THE SHELL AS IT IS TRANSFORMED FROM ONE HARMONIC OVERTONE TO ANOTHER.



hemisphere to complete the octahedron. When it takes the electrons attached to hydrogen atoms, the hydrogen nucleus is going to stick out as a lump. In order to maintain parity, the angles at which the hydrogen atoms will join the carbon atom to form methane conform to the points of a tetrahedron. This fact is taken for granted in stereochemistry today, but established authorities put down the first chemist who suggested that molecules had solid structures, quite different from the empirical formulas used to describe them.

The oxygen atom is capped by three-sided pyramids with room for one more electron in each hemisphere. Parity allows a 120-degree angle between the hydrogen nuclei, and so water forms ice crystals in a hexagonal geometry.

Outside of the innermost shells, electrons do not orbit the nucleus of their atoms at all; they orbit the space of their octahedronal facet at a constant radius. This geometry makes it possible to avert collisions and maintain a constant frequency of orbit, regardless of an electron's distance from its atomic center. When atoms are excited by absorbing radiation, a rotation in hyperspace causes the shells to move out to a greater radius from the nucleus to the positions calculated from experiment.

You have been taken along this line of superficial physics and chemistry to give you a basis for the possibility that all molecular structures are generated from the elementary geometry of the Platonic solids, with the elements combined in various combinations of harmonically integrated angles, like crystals. If this is so, then each chemical element and compound will resonate in sympathy to a specific geometric solid. Furthermore, each solid structure can be excited and modulated by musical sound. This is not a novel concept, but the very basis of alchemy.

Now, each solid can be transformed into another structure by a regular rotation through the hyperspace of the quantum field. Each chemical atom is also transformed by a rotation of its geometrical structure in hyperspace. Therefore, by employing tuned vibrations it is theoretically possible to transform lead into gold (or gold into oil, which is considerably more valuable these days).

WHEN A HYDROGEN ATOM COMBINES WITH EACH POLAR HEMISPHERE OF THE OXYGEN ATOM, THE HEXAHEDRON GEOMETRY IS TRANSFORMED INTO THE STABLE OCTAHEDRON. THE PLANES OF THE OCTAHEDRON MEET THE POLAR AXIS AT AN ANGLE LITTLE MORE THAN 30°.
THEREFORE, WHEN WATER MOLECULES ARE CRYSTALLIZED BY THE HYDROGEN BOND, THE SNOWFLAKE TAKES FORM AS A HEXAGON.

Fitting experimental data to the theory of solid harmonics is a task requiring professional competence. Even if the essential concept is correct, conflicting data is turning up day by day inspiring many false starts.

In the meantime, back at the bench, we have discovered the Philosopher's Stone. If a birdbrain can transmute the elements, so can engineering geniuses—as soon as we figure out how those stupid chickens did it.

6.

TIME TRAVEL

How to Navigate the Streams of Time Through Hyperspace

The technology dominating a civilization is determined by the concept of reality believed by its social leaders. Concepts of reality are axioms which cannot be tested. This is not to say that cultural beliefs are refractory to proof; it is impossible for people to examine their concepts of reality because there is a mental block at the depths of individual and collective psychology enforced by taboo. The concept of reality must be guarded inviolate from question. Merely to think about it begins to dissolve its absolute power over us and leads to the transformation of one person after another until the civilization disintegrates.

The fundamental and unquestionable concepts of our civilization are Absolute Time, Absolute Space extending in

three dimensions, Absolute Velocity, and Conservation. These realities are so self-evident to us that we are unable to perceive evidence to the contrary. We cannot believe that people in other times and places do not perceive time and space as we do. If we could see the everyday life of the Middle Ages, as it was experienced by the average person who lived then, we should regard the entire population of medieval Europe as paranoid schizophrenic. When Einstein proved that time, space, velocity, and conservation were not absolute but mutable, the heresy was allowed to exist only because it was expressed in a language defying all comprehension.

Modern inquisitors state that the psychedelic experience provides no insight into the nature of reality, as the mystic heretics claim; the psychedelic experience is nothing but the hallucinations of a disordered mind. But Einstein pointed out that it takes only a single contradictory fact of evidence to demolish a scientific theory. So of all the various psychedelic experiences, we need only one to prove that the prevailing concepts of reality must be profoundly mistaken. It is fairly common for freaks to experience time flowing backward. Now, for time to be experienced in retrograde, it is necessary that a person have a clear and continuous memory of the future. If the concept of absolute time is true, then it is absolutely impossible for anyone to experience a memory of the future, no matter how disordered his mind may be. Therefore, time cannot be absolute.

Mystics are handicapped by lacking scientific concepts to explain their experience in scientific terms to scientific critics. Anyone who has passed high-school science, however, has all the scientific concepts needed to comprehend both the psychedelic experience and the Theory of Relativity, provided he is an acute observer and uses common sense instead of believing the professional gurus.

To show you how easy it is to break the taboo maintaining mistaken concepts of reality, Buckminster Fuller holds a global map of the world in his hand so that a triangle drawn on its surface can enclose 270 degrees of angle. The first man who got his observation of spherical geometry published in a hard-core scientific journal is regarded as a great mathematical

genius, but everyone has always seen that gores on a curved surface enclose more or less than 180 degrees of angle. Tailors and sheet-metal mechanics have practiced spherical geometry since prehistoric times.

Spherical geometry leads directly to the Theory of Relativity and the transformation of our civilization by introducing radically different concepts of reality. The atomic bomb and atomic power are merely the first technological advances made possible by the new beliefs. A number of more or less simple models will enable you to understand the consequences of Relativity and the incredible technology already under study in laboratories for research and development.

Take a flat sheet of metal or vibrant plastic, sprinkle its top surface with a fine powder, and strum a bow across one of its edges. The sheet will resonate like a violin string. The sonic wavelengths which coincide harmonically with the dimensions of the particles of powder will cause the particles to vibrate sympathetically and bounce up and down. These vibrations carry the particles with them, making the pattern of the field of sound waves visible. This Plate Flutter Model illustrates the structure of the entire universe and shows how it unfolds.

Sound vibrations travel eleven hundred feet a second in air, faster in solids, so their movement is much too rapid for the eye to follow on a small plate. What you see are standing waves formed when radiant vibrations meet from opposite directions. It may help you to understand standing waves by studying waves on a body of water. Water molecules vibrate as waves traveling through the liquid with sonic velocity. Where these waves intersect to augment each other, a wave pattern is created that doesn't move. If enough sonic waves augment each other at the same location, the standing-wave pattern grows large enough to be seen as waves rising and falling on the surface of the water. A standing wave is like a stroboscopic image, whereby a high-speed, repeating pattern is made to appear to move slowly.

In an ideal experiment, the pattern of the standing waves would reveal only the structure of the sound vibrations. A real model, however, is limited to revealing only the pat-

terns which conform to the resonance of the particles and the plate. Furthermore, sound waves are three-dimensional structures; they fill solid space. All the model can show is a plane section through the solid field of sound waves. These limitations must be borne in mind when reading the experiments.

You can change the frequency of the tuning by sounding another note. You can change the way the vibrations meet by cutting the plate to other shapes. If you use a chord for sounding, instead of a single note, a change of individual notes in the chord will change the patterns. If you use a tuning fork to apply sound to the plate, the patterns will change according to the position of the fork, and you can use more than one fork to alter tuning by varying their positions one to another. The powder will respond to all these changes by moving to form other patterns in other places.

Watch closely while tuning is changed. As opposing vibrations are shifted from perfect congruence, the standing-wave patterns move. As a standing-wave pattern acquires velocity, its extension in the line of travel contracts. What you are seeing is an illustration of the Fitzgerald Contraction described in Einstein's Special Theory of Relativity happening right in front of your eyes.

Time is defined by vibrations. If you inspect a standing-wave pattern intently, you will see that as it acquires velocity, it vibrates more slowly; the reciprocating motion is transformed into linear motion. What you are seeing is the slowing down of time as velocity is increased. In most cases, the motion will require high-speed movie film to make it fully visible.

A standing-wave structure manifests all the properties of material mass in physical equations. When a standing-wave pattern is accelerated to the velocity of the radiant waves which create it, its three-dimensional structure disappears altogether. What you are looking at now is the conversion of pure matter into pure energy, as described by Einstein in his famous equation, $E = mc^2$. An atomic bomb is nothing more than the explosive acceleration of solid atoms to the velocity of light, at which speed the material is transformed into radiant waves.

The model makes it obvious that no material structure can be accelerated to a speed greater than the speed of the waves which create it. This is why the speed of light is the limiting velocity for all material bodies.

If time slows down in your frame of reference as you acquire velocity, the time of the frame surrounding you appears to accelerate in comparison. The effect is the same as traveling through time into the future. The Theory of Relativity makes it theoretically possible to travel through time.

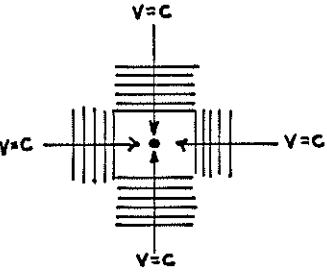
In fact, when you leave the city at the end of the day to spend the night in the suburbs, the city you return to is shifted into the future relative to where it would be if you spent the night in a downtown hotel. The shift is negligible, however, because the speed and duration of your commutation is nominal relative to the flow of time. If you could travel to the Sun and back at the speed of light, the Earth would progress sixteen minutes into the future while you were experiencing no passage of time at all. You would have to travel to the nearest star and back at the speed of light to step off your time shuttle ten years in the future.

Acceleration to the speed of light takes you on a one-way trip into the future. Without a return ticket, the trip is as attractive as dying. If acceleration transports you to the future, then you must travel at less than zero velocity to return to the past. It is possible to have less than nothing in your bank account by overdrawing, but moving slower than standing still seems impossible. Minus velocity only appears to be impossible, however, because of the way we think about speed. In the mathematics of relativity, less than zero velocity is equivalent to hyperlight velocity, like five to noon is merely another way of saying fifty-five minutes after eleven o'clock.

The logic of traveling backward in time is as simple as the logic of traveling forward into the future. You see, all acceleration must be through time as well as space. From zero velocity to light velocity, all travel must be into the future. There is only one way to go after the velocity of light is exceeded. That way is back into the past.

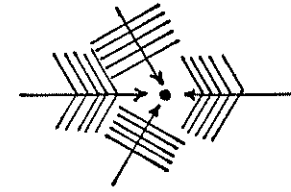
You have just seen the Plate Flutter Model demonstrate Einstein's proof that no material body can be accelerated

above the speed of light, so how is it possible to attain the hyperlight velocities required to travel backward into time? Intensive analysis of the Plate Flutter Model will show you that although no standing wave can exceed the speed of light, the information contained in the pattern of the standing wave can be accelerated to infinite velocity in the form of a shear-wave pattern.



A shear wave is illustrated by the angle formed by a pair of scissors. As the blades close, the point of the intersection accelerates to infinite velocity.

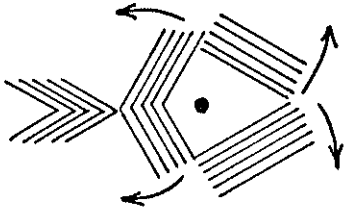
A material standing-wave structure is a highly compounded shear-wave structure. A standing wave is created when a pair of radiant waves meet at an angle of 180 degrees, interpenetrating each other. Three pairs of mutually opposed radiant waves must meet at the intersection of three axes, all at right angles to each other, to generate a solid-material body. The acceleration of a body in a field is the effect of a rotation of the flow axes of the radiant waves which generate it.



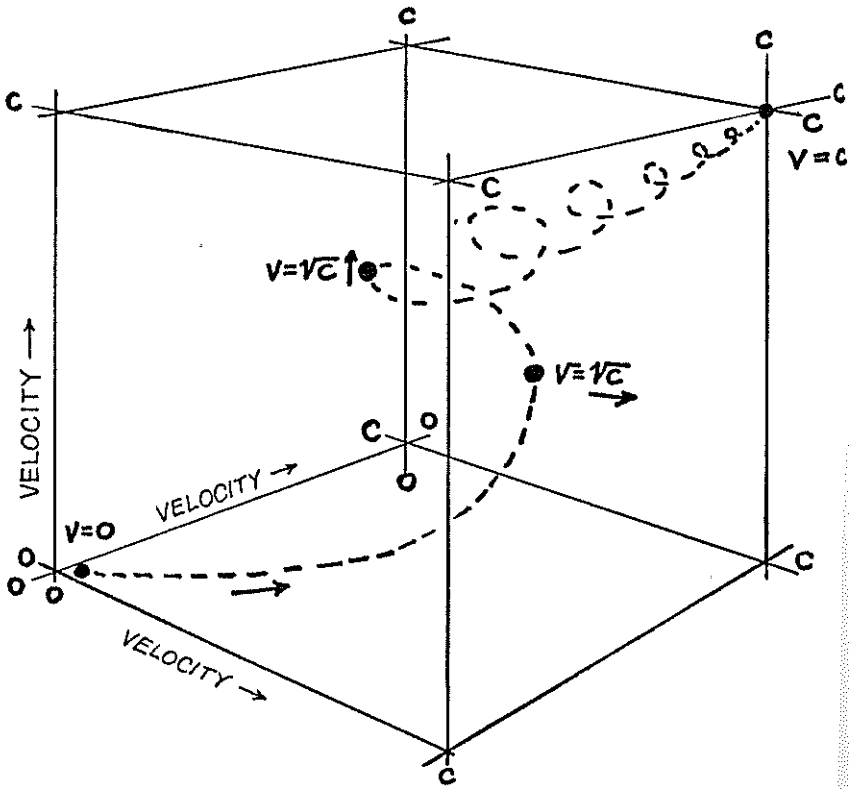
As the straight angle closes like a pair of scissors on one axis, the standing wave accelerates at right angles to the direction of radiant-wave flow. You can observe this in moiré patterns available from the Edmund Scientific Company, advertised in many technical magazines on the newsstand.

As a standing wave acquires shear velocity, it can be seen to disintegrate in the line of travel; its material dimensions are transformed into radiation according to the Fitzgerald Contraction. The radiation emitted ranges from the gravity waves broadcast by a massive body accelerated in a gravitation field to the synchrotron radiation beamed by an atomic particle accelerated in an electromagnetic field. This disintegration is apparent only to observers in the original frame of reference. To the accelerated body, it is the observers at the home base of reference that disintegrate into pure radiation.

As an accelerating body disintegrates along the axis of travel, it re-forms along an axis proceeding at right angles to the line of travel. As a result, the standing wave is observed to veer to the right as Relativistic velocities are reached. This is the reason for the right-hand rule learned by electrical engineers.



SHEAR VELOCITY

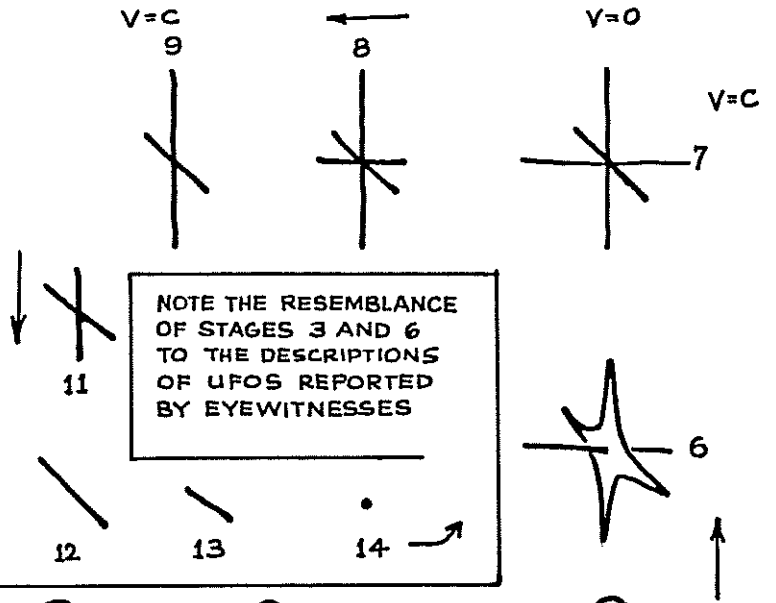


ALL MATERIAL BODIES ARE STANDING-WAVE STRUCTURES CREATED BY UNIVERSAL VIBRATIONS COMING TO A FOCUS FROM ALL DIRECTIONS IN PROPER PHASE AND RETURNING TO THE QUANTUM FIELD AT THE PARTICULATE CENTRE.

ALL BODIES MOVE AS THEIR PROPER WAVEFRONTS ROTATE ON THE PLANE OF THEIR FLOW. WAVEFRONT ROTATION IS DUE TO THE ROTATION OF THE UNIVERSAL FIELD AROUND THE AXES OF PHASE AND FREQUENCY.

AS SHEAR VELOCITY APPROACHES THE SPEED OF LIGHT, THE TRAILING WAVEFRONTS LAG BEHIND THE MOVING BODY. AS THE VELOCITY OF THE SHEAR ANGLE OPENING THE LINE OF TRAVEL EQUALS AND THEN EXCEEDS THE FLOW VELOCITY OF THE WAVES, THE REDUCTION OF THE FREQUENCY OF THE WAVES CREATING THE ACCELERATING BODY IS MANIFEST AS A SLOWING OF TIME UNTIL TIME STOPS. WHEN THE ROTATIONAL VELOCITY MOVING AWAY FROM THE FOCAL POINT EXCEEDS THE WAVE VELOCITY FLOWING TO THE BODY, THE WAVE VECTORS ARE REVERSED IN DIRECTION AND TIME FLOWS BACKWARD.

AS AN EVENT IS ACCELERATED, IT FOLLOWS THE RIGHT-HAND RULE GOVERNING ELECTROMAGNETIC VECTORS TO TRACE THE TRAJECTORY OF A SPIRAL VORTEX.



As an accelerating body acquires velocity on the second axis of travel, it begins to disintegrate in that direction also, and re-form along a third axis at right angles to the other two. As a consequence, all particles moving at Relativistic velocities are seen to travel in a corkscrew trajectory. The velocity of light is never quite reached in any direction because the trajectory curves over an angle of 45 degrees every time the velocity on the relevant axis reaches $\frac{c}{\sqrt{2}}$.

The speed of light is reached on all axes simultaneously when all the flow axes of the waves which create the standing wave rotate through a total of 540 degrees. At this point, the 3 axes of generation close from 180 degrees to zero degrees simultaneously; the standing wave disappears over the event horizon of a Black Hole at the speed of light, and jumps to infinite velocity. At the speed of light, the traveling body is transformed into pure radiation. When the information contained in that radiation flips into the Black Hole, the waves themselves explode in all directions into the quantum field in the form of virtual particles.

If the coordinates of the moiré pattern are properly programmed into a computer to be projected onto a screen, a strange phenomenon will become manifest when the three generating axes become parallel. The standing-wave pattern is reconstructed the instant it passes through the Black Hole and the corkscrew trajectory unwinds, reversing the directions it took while accelerating. The information exploded into the quantum field re-forms the original standing wave, but now the acceleration is reversed. Time flows backward. We cannot see images of events flowing backward in time on the other side of Black Holes because all the radiation containing this information is flowing at the speed of light away from us. The past is reached by passing through a Black Hole. Whatever can be demonstrated by a tangible model can be translated into practical engineering.

As soon as explorers leave familiar landmarks by venturing over land or sea, they are in danger of becoming lost. As long as exploration was confined to the surface of a small planet, adventurers could wander all over the world with a fair

A SPHERICAL EVENT IS TRANSFORMED INTO ITS NEGATIVE BY COMPRESSION OF ITS EXTENSION ALONG EACH AXIS IN SUCCESSION AS IT ACCELERATES AROUND THE TRAJECTORY OF A VORTEX TOWARDS THE VELOCITY OF LIGHT. AN ACCELERATED EVENT DOES NOT REACH C ON EACH AXIS IN SUCCESSION, BUT TURNS TO C ON ALL AXES AT THE SAME TIME. THEREFORE, THE ACTUAL TRANSFORMATION PROCEEDS THROUGH STAGES 1, 2, 3, 6, 8, 14, WITHOUT ANY EXTENSION COMPLETELY DISAPPEARING BEFORE ALL EXTENSIONS ARE COMPRESSED TO A POINT

chance of blundering their way back home. The advent of space exploration, however, demanded accurate courses plotted before the first Mercury capsule blasted off from Cape Canaveral; the navigator had to know exactly where to go and how to get back. Traveling to the future is not quite so simple as hopping into a time shuttle and going. Which way do you go?

If you blast off at the speed of light and return six months later to the location you left, all you will find is empty space. The Earth and the Solar System will be long gone in their galactic orbits, six months away. To reach a future Earth, you must plot a return course that will bring you to the location the earth will occupy at the other side of its orbit six months from now.

Relativity proves that the future lies in a straight line in any direction. The past extends from the line of travel at right angles in all directions. This is the basis of navigation through time. But if the future of this Earth lies only in the direction taken by this Earth along its trajectory in space, what future can possibly lie in all other directions? Each direction of travel leads to a different future. When Einstein demolished the concept of absolute time, he proved that each location in the universe travels a unique trajectory constituting a unique stream of time.

The reason time has been so refractory to scientific understanding is that we have conceived time to be a special kind of dimension. But time is not a dimension at all, any more than fire is the element the Greeks believed it to be. Time is measured in units of intervals, spans, durations, speed, and sequence; each of these measurements refers to a dimension of the waves constituting the universal field of vibrations. Einstein showed that a stream of time is defined by the unique sequence in which events are experienced at each location. Once Relativity proved that events follow each other in a unique sequence at each location, an infinite number of unique time streams must flow through the universe. Each time stream is identical to the course of travel in space.

The existence of alternative time streams can be deduced from a simple thought experiment. When you look at

the Sun, the image of the Sun takes its place in your time stream in a certain spatial sequence relative to all the other events you experience. When you move, the position of the Sun relative to all other events in the universe changes in your perspective. Each relationship defines a different time stream. We are always moving through space. New time streams are created every time an observer changes directions. The creation of new time streams by steering courses in life is the basis of the concept of free will and an undetermined future. We are all spinning through space together on this planet, so the difference between everyone's personal time stream amounts to no more than a difference in the time of day when we look at the Sun.

Although sequence is created uniquely by each observer in the course of existence, events are eternal. This paradox can be explained by referring again to the Plate Flutter Model.

If the model is cut into the shape of a square and strummed along one edge, the powder will move from the edges to form a diagonal cross. The free vibration of the edges drives the powder to the diagonals, where there is no vibration at all. The edges represent a pole of pure radiant waves while the diagonals represent an opposite pole of pure standing waves. Between the two poles, the sonic velocity of the radiant waves is reduced along a line of continuous transformation toward standing waves. If a chord comprising a full range of musical notes is used to activate the model, the harmonic interactions of the different notes generate a sequence of audible undertones, and the patterns formed by the powder will move to correspond to the continuously changing harmonic beats. When the harmonic interactions exhaust all permutations of tone and sequence, the entire pattern in time and space will repeat itself again. This means that all the events the field of vibrations can possibly generate must exist somewhere in the field at all times as a wave pattern forming or disintegrating between the poles of pure radiation and pure standing waves. An event manifest as a standing wave represents a material body existing in the immediate present. All the wave patterns proceeding from the radiant pole toward the standing-wave

pole constitute events of the future. All the wave patterns proceeding from the standing-wave pole toward the radiant pole constitute events of the past. In other words, everything that ever existed, everything that exists, everything that ever will exist, and everything that can possibly exist exists right now somewhere in the universal field of vibrations as a wave pattern in a state of continuous transformation.

Not only does every possible event exist at all times, somewhere in the field, as a wave pattern in a state of becoming real or disintegrating, but every event also exists everywhere throughout the entire field as a wave pattern in a state of realization or decomposition. To illustrate this deduction, waves reaching us from the Sun are manifest as a standing-wave structure when they come to a focus to form the Earth at this location. But radiation does not change from pure waves to pure matter the instant it reaches us. Over the entire distance from the Sun, wave patterns are building up the structure which will become the Earth when the radiation arrives here. The pattern of what the Earth will be in eight minutes' time already exists 93 million miles from us in space. By measuring the alignment of waves in the ambient field wherever we are, it is theoretically possible to calculate the location of any event in the universe and the time at which it will become manifest as a material body at that location. This is how a navigator plots courses through time.

Space is filled solid with vibrations. If all possible events exist as a wave pattern throughout the universe, it means that the space in your room must be filled with incompletely formed patterns of yourself doing whatever else you could be doing if you were not reading this. When you put this down and move, the standing-wave structure of your body disintegrates at the location where you are, here and now, and reforms in a succession of proximate locations along the path of your movement. But when you move, the wave pattern of you reading this continues to exist in an unmaterialized state. Outside of your home, patterns of you doing everything you can possibly do cover the entire Earth, not to mention other patterns of the Earth filling universal space. This is the basis of the science-fiction theory of alternative realities. Each se-

quence of events relating all possible events constitutes parallel time streams. Given enough time, all possible events must become materialized and all possible sequences must become realized. On another time stream, the Confederate States of America is defeated by a Soviet-Nazi Axis in World War II. I'd like to know where I missed the intersection with the time stream where I am irresistible to nubile blondes; that is probably the time stream where I become allergic to penicillin. This may not be the best of all possible worlds, but it isn't the worst, either.

Pure wave energy is not a mathematical abstraction. You can see it with your eyes. Each wave is seen as a light of the color defined by its frequency. Of course, we can see no more than a small spectrum with normal vision, but our eyes are sufficient to establish the principle. We cannot see a standing-wave structure because all material is a perfect black body. What we see is radiation emitted from either black bodies or white bodies. Between these two poles, radiation carries information of its source in the form of wave patterns. This information is not a mathematical abstraction either, because you can see it, too. Wave patterns between pure light and pure material exist as images.

Images which can be brought to a focus are called real images. We can see real images because our eyes can bring the waves to a focus. Images which cannot be brought to a focus are called virtual images. We cannot see virtual images. The space in your room is filled solid with wave patterns of yourself doing all the things you could possibly do if you were not reading this, but you cannot see these patterns because they are virtual images.

The reason virtual images cannot be seen can be demonstrated by looking at the Sun; don't burn out your retinas. You can see the real image of the Sun only along the radial line of sight. There is another image of the Sun just beside your head, but you cannot see it because the radiation does not impinge upon you. As long as you are where you are, the images of the Sun filling all the space around you cannot be seen. The other side of the Sun can never be seen from here because all the radiation is going away from us at the speed of light.

The images of the Sun on all sides of you are virtual images on your time stream. Alternative realities exist in the quantum field as virtual state. All radiations in the virtual state of the quantum field possess a vector at right angles to our line of sight. This vector reduces the velocity of waves radiating toward us so that it no longer has the velocity of light at the point of impact. Therefore, no electromagnetic interaction can take place. Whatever does not interact with us does not exist as a real substance.

The solution to the Michelson-Morley paradox is *not* that light always travels at the same speed regardless of the relative velocities of the source and observer. "Light" waves travel at all velocities conforming to the classical Newtonian laws of relativity—but only the waves traveling 186,000 miles per second can be detected as light. Waves of all other velocities are not detectable, so they disappear into the virtual state of the quantum field as corresponding waves "materialize" from the cosmic plenum to maintain the absolute velocity of light.

A lens makes it possible to bend the flow of radiation so that virtual images are transformed into real images, making it possible for us to see parallel time streams. If you will take the lens of your camera—or a simple reading glass—to cast an image onto a small screen, you will make another discovery about the structure of the universe that will demolish your conceptions of reality and contribute further to the technological achievement of time travel.

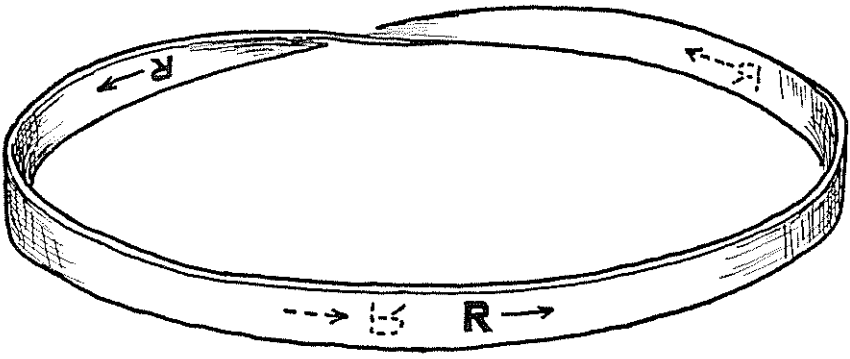
Our cultural concepts lead us to perceive the image cast by a lens as two-dimensional. This is so self-evident to us that we cannot understand how anyone could possibly see anything other than a plane image. The image cast by your lens is really three-dimensional. You can prove it by moving the screen along the axis of projection to reveal an infinite number of planes of focus.

The normal lens transmits an image from an acceptance angle of 45 degrees square. Fish-eye lenses accept radiation within an angle of 180 degrees square. In theory, an ideal lens can transmit an infinite spectrum; a pinhole functions as this kind of lens. If you can imagine your lens as a fish eye

with perfect transmission, you can see that within the image cone it projects, there is all the information required to reconstruct a replica of everything in the universe on the objective side. But light goes through a lens both ways. On the other side of the lens there is an image cone projected containing all the visual information pertaining to the other half of the universe. As most of this information is contained within a sphere you can cup in your hands, you can see that you can literally hold the entire universe in your hand. That is an awesome lot of information to pack into a handful of space.

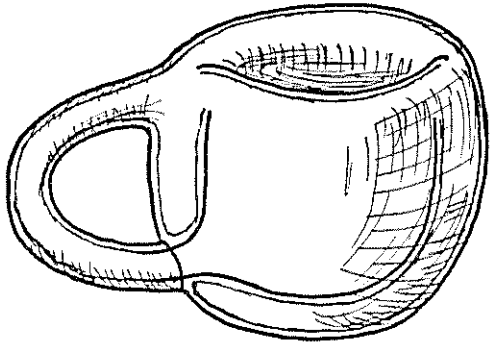
You may remark that the image cone does not contain all the information needed to reconstruct everything in the universe because most of the universe is hidden behind obstructions to the line of sight. But no material structure is absolutely opaque. Radiation streams through everything. Material opaque to our eyes merely transforms the incoming radiation to invisible wavelengths. With proper technology, the radiation emitted by an opaque object can be transformed back to visible light so that we can see through the opaque material. Image amplifiers used on night scopes are examples to prove that your lens does, in fact, project all the information of the universe into its image cone.

Cultural concepts lead us to perceive that the information projected by a lens is received from a more or less distant source. If you know enough about photography to use filters, you know that all the information contained in the image cone existed a microsecond earlier at the surface of the objective element. In other words, all the information needed to reconstruct the entire universe exists at the surface of your lens, whether or not it is brought to a focus by projection into the image cone.



Now, move your lens around. You will find that no matter where the lens is located, it always projects a pair of image cones containing all the information in the universe. You have just proven that in the real universe, every part contains all the information of the whole universe. A structure that contains all its information in all its parts is a hologram. The universe manifests the structure of an infinite hologram.

In a universe possessing the structure of an infinite



hologram, every possible event not only exists in material form somewhere at some time, but every possible event must exist everywhere all the time in a material form. In other words, the universe contains an infinite number of three-dimensional material structures in the same location at the same time. This can be possible only if the universal hologram extends into a fourth dimension of space. Space is not filled solid with dense material because all standing waves except the ones we can see and touch exist in the virtual state of the quantum field. The quantum field, therefore, is the fourth dimension. All events that are going to happen and all events that have happened are invisible and intangible to us because they exist in the virtual state; this is why Einstein described time as a fourth dimension. Actually, the time Einstein referred to is a fifth dimension extending through the quantum field; the fourth dimension to be discovered was energy level defined by frequency. When Max Planck discovered the quantum effect, he discovered a fourth dimension without knowing it.

The photographic lens cannot show you that virtual images of past and future events exist right here and now; much less can you see them exist in a material state. But another simple model will demonstrate the principle. Cut a strip of paper about an inch wide and two feet long. Put a half twist into its length and paste the two ends together. This construction is called the Möbius Strip. The Strip is a model of plane space extending for an infinite distance while rotating around 360 degrees on one axis and 180 degrees around the other. The Strip appears to have two sides and two edges, but if you trace a line with a pencil along one side, you will return to your starting point after traveling 720 degrees of length without crossing over an end or an edge. Likewise, if you trace along one edge, you will find that you have covered "both" edges without raising the pencil from the paper. The Möbius Strip has only one side and one edge.

Now, if you trace a line around 360 degrees of length, you will find yourself back at your starting point but on the "other side" of the paper, a paradox because there is no other side to a Möbius Strip. If the Strip were an ideal plane, the back side and the front side must not only be the same side,

THE MÖBIUS STRIP

THE KLEIN BOTTLE

but they must also be in the very same space. If you cut a small asymmetrical figure—such as the letter L—from a piece of paper, and move it around the Möbius Strip for 360 degrees to reach the "opposite" side, you will see that its orientation has been reversed up for down. In other words, traveling to the farthest end of a Möbius Strip is identical to remaining where you are and rotating the structure of your body 180 degrees on a horizontal axis.

Regardless of its length, any location on a Möbius Strip can be defined by a distance expressed as degrees around its circumference. If the length of the Möbius Strip is reduced to zero as a limiting case, it means that traveling to any location on its length is identical to rotating the equivalent number of degrees around a horizontal axis without changing location at all.

A universal hologram must possess the structure of a Möbius Strip; the only difference is that universal space rotates around five axes instead of two. This means that the farthest end of the universe occupies the same three-dimensional location as your material body does right now.

A standing-wave structure is the black-body pole of the universal field. The opposite pole is pure radiant energy. If our material body is what exists here, then pure light must be found at the farthest end of the universe where time ends.

But both poles of the universe exist in the same place, separated only by axial rotation of wave flow. Therefore, each person's body must be filled with light. This light can be seen in certain states of consciousness—it is the human aura.

The rotation of wave flow from the radiant pole is what transforms pure radiation into wave patterns and wave patterns into solid material and vice versa. In between the two poles of light and darkness, the wave patterns pass through stages of radiation as real images. These images are what we see radiating as photons from all objects. This radiation is the only way that black bodies can be seen.

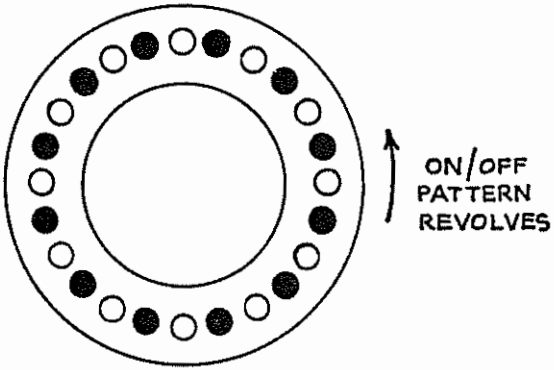
It is the rotation of the line of sight that makes it impossible to see images of the Sun radiating on all sides of us. Therefore, it must be rotation of the axis of wave flow that transforms the material structures existing in the quantum field as virtual images of infinite probability into real images

we can see and then into real material and back again. The rotation of wave axes is identical to the flow of time.

If the two poles of the universe coexist in our bodies, then all the images in the quantum field must also exist within our bodies. As these images are transformed from the virtual state to the real state, they become visible as the form of ideas in the mind.

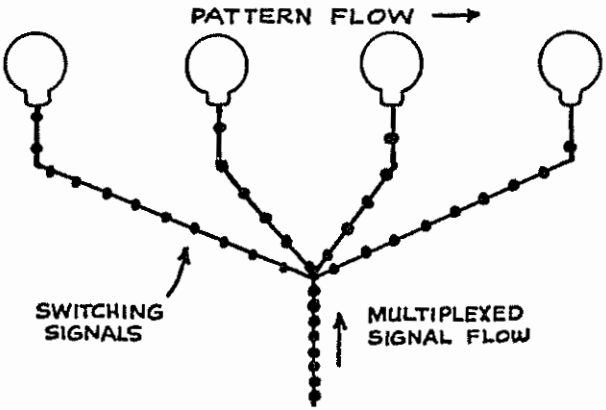
The farthest end of the universe is the ultimate goal of all exploration. Now that we have reached it, we find that it has been here all the time. Because the universe is a hologram, we also find that our personal bodies contain a perfect replica of the entire universe. This is what William Blake saw when he discovered the universe in a grain of sand.

Outside of our personal bodies, the universe is perceived only as images—real images and virtual images. All images are replicated in the human body, forming the stream of ideas we call consciousness. Therefore, your mind already contains all the knowledge informing the entire universe. The real images in your mind constitute your state of consciousness. The virtual images in your mind constitute your unconscious. The whole universe is a state of consciousness, and the quantum field is identical to mind. The dichotomy of mind and matter, one of the basic conceptions of this civilization, is resolved. Although the discovery that the quantum field is identical to the mind blows the heads of Western scientists like a dose of acid, the fact that everything is a creation of mind is the basic concept of Oriental civilizations. This is why Orientals perceive space, time, and conservation differently from the way we do, and they developed a different technology. We call them backward mystics because we cannot comprehend that what they say and do are real.



The conclusion is inescapable. Time travel is a head trip. In fact, all transportation is a head trip. The Oriental mystics have always been telling us that *everything* is a head trip. It was this understanding that led them to train their minds to achieve the powers we call Psi, clairvoyance, telepathy, visions of the future, memories of past lives, levitation, soul travel, and the miraculous materializations commemorated in the miracles performed by Jesus. All that we disbelieve as mysticism

is another kind of science, and all that we call science is our kind of magic. Whatever can be done by a mystical transformation of the human mind can be duplicated and made more reliable with technological assistance. This is why drugs are useful to stimulate the psychedelic experience, and why television has replaced clairvoyance, even in Japan.



So now we can understand that the achievement of scheduled time travel devolves on giving technological stimulation to the mind of the traveler. Chemicals have the troubles associated with blasting the mind in all directions at once. Television is limited to network scheduling. What we need is a portable TV transceiver in every garage capable of focusing on any location in the quantum field.

Note well that the camera lens reverses the orientation of the projected image—up for down, right for left, and proximity for infinite, like traveling around a Möbius Strip. The virtual state of alternative realities in the quantum field of time is the *negative* of material reality.

The lens shows us that it is possible to bring virtual images into focus as real images. The time transport, therefore, will be modeled after the operation of a fishbowl lens, capable of rotating waves flowing from all directions so that they come to a focal point at the intersection of three axes to materialize as a real structure. The principle has already been proven for the practicability of this kind of lens, beginning with the experiments of Nikola Tesla. The best-confirmed proof for transforming information from the quantum field to this reality is provided by the inventions of Henry Moray. An array of electrical transformers amplifying the geometry of a crystal lattice will function as a variable-focus zoom lens to rotate the flow of waves in a resonant chamber contained within its coils. David John Graham of Toronto has already put an electronic head transport on the market in competition with street drugs; his invention stimulates a psychedelic state by rotating its passenger in an electromagnetic field. It can be speculated that the Mark IV flying saucers use the electromagnetic field generated by the annular particle accelerators as a tunable transformer to bring about its levitation, flight, dematerialization into a holographic image, and materialization at other times and place.

IF LAMPS IN A SERIES AROUND A CIRCLE ARE WIRED SO THAT EACH ONE SWITCHES ON AS SOON AS IT "SEES" THE ONE NEXT TO IT GO ON, AND SWITCHES OFF AS SOON AS IT "SEES" THE ONE NEXT TO IT GO OFF, THE PATTERN OF LIGHT WILL REVOLVE AROUND THE CIRCLE AT A SPEED CLOSE TO "C".

SWITCHING SIGNALS CONDUCTED TO A SERIES OF LAMPS SO THAT EACH ONE GOES ON AFTER THE ONE NEXT TO IT, BUT BEFORE IT CAN "SEE" THE LIGHT OF ITS NEIGHBOR WILL CREATE A PATTERN CHASING AROUND THE CIRCLE FASTER THAN LIGHT, SENDING INFORMATION BEYOND THE "C" BARRIER OF RELATIVITY. BY REPLACING THE LAMPS WITH ARMATURES, AN ELECTRO-MAGNETIC FIELD CAN BE MADE TO SPIN FASTER THAN LIGHT WITH NO MOVING MECHANICAL PARTS. REPLACEMENT OF THE MAIN ROTOR AND GIMBAL GEARS WITH SOLID STATE ELECTRONICS CONVERTS THE MARK III FLYING SAUCER INTO A MARK IV TIME TRANSPORT.

Optical engineering has already proven the principles involved in the engineering of a variable-focus transformer with an acceptance angle of 360 degrees solid. When you look at the Sun, you are seeing rays diverging from a point source, and the image you see contains the past of the point source. Therefore, the past is found on diverging radiation. A converging lens is used to bring diverging radiation to a focus as a real image. When real images projected from all directions are brought to a common focal point in the resonant chamber contained by the transforming coils, a real material structure is created. The process is the reversal of the operations that make an atomic bomb explode. Conversely, radiation coming to you from all directions contains the information of your personal future on your unique time stream. Therefore, the future is found in the ambient field of the universal hologram by a lens that selectively filters the converging rays of a specific angle and bends them apart by a diverging optical formula. Diverging radiation contains virtual images, so another converg ing lens must bend the incoming radiation again to bring the virtual images into focus as a real image. When the real images are brought to focus from all directions, the future reality be comes materialized in the resonant chamber. Outside the resonant chamber, the transformers alter the angles of radiation from the capsule perceived by observers so that the time transport is seen to condense into the future or explode into the past, disappearing from detection as well as view.

Time is a function of field acceleration. Therefore, any engineering that can accelerate the acceleration of any field will serve as a time transport. If, for example, you can build a vehicle that will be accelerated by a gravitational field, you will eventually reach the velocity of light and disappear through a Black Hole. We already know that time travel can be achieved in this manner, and we already have a vehicle that is being accelerated in a gravitational field. We are traveling through time on the Spaceship Earth. What we want is to accelerate the gravitational acceleration so that we can get to the future sooner or later than everyone else in this planetary time stream.

As Einstein proved, a traveler can reduce the velocity of his personal time stream and reach the future by increasing the gravitational acceleration generated by a vehicle containing him. Conversely, a traveler can reach the past by reducing the attractive forces holding his personal material together; reducing cohesive forces is identical to achieving hyperlight velocity so that matter waves explode into the quantum field. Time travel, therefore, is implicit in the antigravity engineering of flying saucers.

The most clearly defined experiment proving the feasibility of field engineering by the tuned focus of ambient radiation was performed by directing the beams of four microwave generators to a resonant chamber in the center. A hundred-gram weight suspended over the focal point loses seventy-five milligrams. A reduction in the acceleration of gravity can be expressed as a negative acceleration added to the universal constant. A negative acceleration of gravity carries a vehicle into the past. This experiment shifted the hundred-gram weight into the past about as far as orbiting astronauts are shifted into the future, but the achievement is as significant as splitting an atom of uranium for the first time. It is only a matter of time before enough engineers will have undergone a change of basic concepts of reality so that the manpower required to field a flying saucer, complete with its operational infrastructure, is assembled.

If time travel is feasible, then it must be inevitable on some time stream or other. If time travel is achieved on our time stream, then it must be achieved in our future because we have no record of the technology being developed in our past. If a future people have achieved time travel, we should expect an expedition of future historians to have visited us by now on their field trips into primitive civilizations. As we know no future anthropologists resident in our camp, it is reasonable to conclude that time travel was never achieved in our future; the theory will never be developed beyond speculation.

But time travel is not so simple as Margaret Mead taking a trip to New Guinea. Our belief about reality determines whether any records of visitors from the future will be entered into our annals. A lot of people testify that they have

seen flying saucers, and a lot of photographs have been published. Nevertheless, all of the evidence and testimony have been denied credence by the authorities. I have little doubt that most of the reports are either mistaken identity or hoaxes, but even if they were true, the authorities would still deny the facts. Unless the UFOnauts decide to announce their presence to everyone by means of their own superior communications technology, we could be a colony of a galactic empire and never know it; the aborigines of the East Indies were colonies of the European nations for centuries without knowing that white men existed.

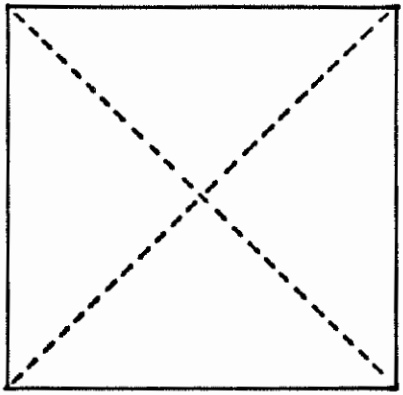
The beliefs a person holds determine what he will perceive of reality. According to Magellan's log book, cited by Lawrence Blair in *Rhythms of Vision*, the barefoot natives of Patagonia could not see the European ships when they arrived at South America for the first time. To the aborigines, the shore party appeared out of thin air on the beach. Eventually the shamans discerned a faint image of the tall ships riding anchor offshore. They pointed the images out to their tribespeople, and after everyone concentrated on the concept of giant sailing ships for a long time, the galleons materialized. And then the aborigines were annihilated by cultural shock. The UFO phenomenon is presenting our civilization with the same kind of experience.

Cruising the seas of time in a Mark V Flying Saucer is a profoundly different reality from sailing a Spanish galleon. When the time transport lifts off its launching pad on a trip to the past, it rises straight up on an antigravity beam and explodes into virtual radiation. The virtual radiation comes to a focus to form real images at the destination. The formation of a real image is attended with electromagnetic effects in the focal space; this is why disturbances are manifest where UFOs appear. Although a saucer from the future appears as an image to us, the vehicle is perfectly solid to its crew; it is we that appear to be a ghostly image. As a holographic image, the Saucer can maneuver without being subject to inertial forces generated by their incredible accelerations.

As an image, the Mark V is actually a mental structure. Whether or not one of us natives will be able to perceive

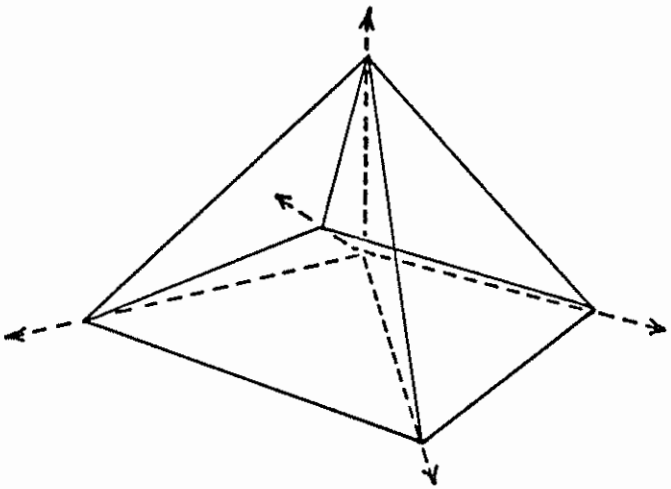
a flying saucer depends on whether that person's consciousness is tuned to the proper time stream. All of us do not see the same material structures in this reality, as you realize in court; much less do we all perceive the same real images. What is a tangible body to some people is a real image to others. By and large, there is general agreement within any given civilization as to which patterns are solid material and which are merely images. The Patagonians, for example, perceived the European vessels to be images when they were first able to see them, while other people will perceive the images on a movie screen as material bodies.

At the borderline between real images and virtual images there is much less agreement as to which is real. When you experience a hallucination, the images you see are perfectly real to you, but they are merely virtual images to everyone else. If someone else could see your virtual image too, he would not regard it as a hallucination. Other cultures have a whole world of images which they recognize as real—the colony at Findhorn, for example—but those images are virtual to us, so we say that the whole community is subject to mass hallucination. The Mark V Flying Saucer travels along flight corridors where virtual images are transformed into real images. These corridors are the creation of the universal field as radiant energies are transformed into terra firma. Along these corridors, some people will see flying saucers, and other people won't. Some cameras will register a real image on film and others won't. An image will appear on some wavelengths while being absent on others. As long as the basic concept of our civilization maintains that whatever is real must be equally real for all observers, and all the more equal to all laboratory instruments, the flying saucer must be ignored as unreal.



Modern Americans are not altogether unlike the barefoot Patagonians who were psychologically blind to the sight of a superior technology. There are historical records of time travelers among us, but they are not perceived even by the people who read them. The twenty-fifth chapter of Exodus was written over three thousand years ago. Regardless of the distortions accumulated over the millennia of successive translations, there is not the slightest doubt that the King James Ver-

sion has been reproduced to the letter for over three centuries; antique copies are still available to anyone determined to establish the date of printing. Now, if you follow the directions the Lord gave to Moses for constructing the Ark of the Covenant, you will build yourself a spark-gap radio transceiver powered by a Leyden-type condenser, almost identical to the models Marconi began his experiments with. Shittimwood is no longer stocked, and the price of gold is a barrel of oil, but pine and aluminum foil can be substituted. The Ark of the Covenant has been recognizable as an electronic device for the past hundred years; finding a modern radio in ancient Judea is as significant as finding a flying saucer in modern America. As long as the first is ignored and denied, even when you have the palpable evidence in your hands, you can be reasonably sure that the other will not be recognized on sight.



Critics disregard the Ark of the Covenant as a coincidence. After all, many religious artifacts have electrical properties. But the Bible clearly states that God told Moses to use the Ark for communication with Him. The Ark of the Covenant was intended to be used as a radio. Any God worthy of His divinity communicates to His Chosen People by means of mystical visions vouchsafed to Holy Prophets, so how come the Lord who walked the Earth as a man had to equip Moses with CB?

Radio cannot possibly be developed outside of a society so widely spread that electronic communication is necessary to keep it organized. The description of the Ark of the Covenent in the Holy Bible is proof that a vast and technologically sophisticated society existed on this Earth over three thousand years ago, within historical time, without leaving any recognition of their existence.

In the heart of the Great Pyramid there is a stone coffer said to possess the same volume as the Ark of the Covenant. Considering the precision demanded by the Lord in the dimensions of the Ark, it is difficult to accept the coincidence between the Ark and the coffer as chance. The Pyramid is a solid-state module in a worldwide radio-communications network capable of broadcasting and receiving intelligence throughout interplanetary space. The Ark of the Covenant has

THE SQUARE AND ITS DIAGONALS ARE NEGATIVES OF EACH OTHER.

THE PYRAMID TRANSFORMS RADIANT ENERGY CONFORMING TO ITS STRUCTURE INTO ITS NEGATIVE FORM AND BEAMS THE INFORMATION ALONG THE NEGATIVE AXES.

the features of a mobile remote unit in the broadcasting system.

As well as being a radio, the Great Pyramid is the most precise and durable clock known to exist. Navigation through the seas of time is impossible without a chronometer of absolute accuracy. The Great Pyramid could not be better designed to function as an unmanned radio beacon marking traffic lanes through the holographic oceans of the universe. If this is so, we may expect to find other pyramids on other planets, like the black monolith in *2001: A Space Odyssey.*

The most fascinating problem of time travel is the Time-Loop Paradox. What happens when a traveler from the future meets his ancestors and alters history? It is generally concluded that any alteration of the past will cause the future to disappear, leaving the time trekkers stranded. The Time-Loop Paradox is inevitable if time travel is ever achieved, so this is the main argument against the feasibility of the technology. The Time-Loop Paradox, however, is a figment of the concept of absolute time. As soon as time trekkers touch down in the past, they create an alternative time stream, running more or less parallel to the manifold time streams we call our own world time, but existing in the virtual state of the quantum field. When the trekkers want to return home, they beam themselves back to the future and then across the angular distance separating the two divergent time streams. The proof that absolute time does not exist provides a Time-Loop Exclusion principle that makes the Time-Loop Paradox impossible.

The beliefs a society holds about reality determine the technology it will develop. The technology determines the direction and the range the civilization will develop. As long as beliefs are constant, technology proceeds slowly and steadily to the limit of belief. When the limit of belief is reached, the development of technology must stop. At this point, the civilization becomes old and decays. But all people do not accept the same beliefs. Those who do not agree with the cultural limitations are regarded as mystics, if not disregarded as insane. The leaders who take technology to the limit of the culture are the people in the most favored position to carry technology beyond the limits of belief. Advanced physicists have reached the lim-

its of our civilization right now, and this is why the rest of us in the rear regard them as reverting to mysticism.

The insights and discoveries of the scientific vanguard cannot be believed by the people in the mainstream of civilization, nor can the facts make sense because the new information contradicts the basic concepts holding the civilization together. Taboo prohibits thinking about the basic concepts.

If it should ever happen that a party acquires the means to advance technology beyond the limits set by the culture, new concepts drive engineering to a quantum leap beyond the ken of ordinary people. When the force of this engineering becomes too great for the mainstream to deny, like the atomic bomb was introduced to the citizens of Japan, the civilization is subjected to cultural shock. The shock forces social leaders to examine the basic concepts of reality; the taboo is broken. When the taboo is breached, the civilization must collapse. Although it was the Japanese who were the target of the atomic bomb, Americans are also being subjected to cultural shock from the advance of technology, so the civilization of the victors is doomed to dissolution along with the vanquished. The only way to survive the collapse of civilization is by reconstructing the basic concepts of reality capable of comprehending the facts of life as rapidly as the old beliefs are swept away. Those who are capable of reconstructing their beliefs suffer a psychological death and rebirth into a new reality; they transfigure their civilization as a consequence of their personal renaissance and they become the founding fathers of a new civilization on the ruins of the old.

The development of any system of beliefs by expression through a technology fertilizes the seeds of doubt, which must eventually transform belief. The technology of Rome led ineluctably to the monotheism of Christendom. Unfortunately for the Romans, most of them were unable to change their beliefs before collapse set in, so little remains of Rome except ruins and an alphabet. The monotheistic belief of Christianity made it possible for an agrarian society to become transformed into an industrialized society. Industry brought belief of God into question by bringing the power of machinery into existence. The leaders of the industrial society changed their be-

liefs just as rapidly as technology advanced beyond the limits of the writers of the Holy Bible, so when Sir Isaac Newton appeared to lead civilization into a new age by proclaiming a Third Testament of classical physical laws, the transition was made without the usual traumata of death and rebirth. Albert Einstein is the latest prophet; he gave us a Fourth Testament of universal laws to guide us into the coming holographic age. The Japanese civilization has built-in feedback mechanisms enabling them to examine their basic concepts of reality at the drop of an atomic bomb, and reconstruct new concepts without dying from shock.

The industrial development of time travel, therefore, will be subsumed into the systems familiar to us, with no more changes than the technology enforces for its operation. Time travel begins with the testimony of prophetic visionaries who are disregarded as insane. But as soon as a few solitary freaks produce convincing proof that time travel is really possible, think tanks begin to organize around the world to do research, completely unknown to the general public. Then the military takes over and nothing more is heard for a generation. After all the mistakes and expenses are underwritten by the taxpayers, the machinery is handed over to Pan Am and Aeroflot to operate at a profit.

Time travel will be sold to the public when trips can be packaged like Cook's Tours. It would be impolitic to shatter faith in established reality by opening alternative time streams; commercial transport will be limited to the current time stream, and all other channels will be reserved for military patrol and exploration. You will buy your ticket for a vacation on a planet in the Sirian System much as you go to a travel agency for a trip to Hawaii. Departures are scheduled by harmonic windows through hyperspace, as sailing ships wait for wind and tide. All seats are coach class because transit is instantaneous. As soon as the mooring lines are cast off, beams of radiation come to a focus on the starship, and it dematerializes while accelerating straight up to the velocity of light. No one plays holographic chess to pass the time en route, because rematerialization at Starport follows immediately after takeoff. After docking, passengers are discharged. The crew takes leave

to exotic fleshpots, cargo is off-loaded, and the officers prepare ship's articles for the return voyage. The return of the starship to Earthport could be scheduled for any time before or after the original departure, but there would be continual problems if tourists returned home before they left, and if they remained away more than a month, their employers would complain. Two weeks is just about the time everyone needs to complete the paperwork between shipments. The only limit on the time that travelers spend on the Sirian planet is the amount of money they take with them. The one problem defying solution is negotiating scale with the Space Jockeys' Interplanetary Union for time worked in hyperspace.

The holographic civilization is based on a concept of infinities. Infinity is supposed to be beyond any human conception and apprehendable only by God. But it isn't. It is our cultural beliefs alone that make it impossible for us to conceive of infinity. As holograms become increasingly understood, the concept of infinity will become as self-evident as any other basic belief, and we shall take another faculty for granted, a faculty hitherto perceived as an attribute of divinity.

Holographic concepts do not merely advance technology. The achievement of time travel literally demolishes the cosmos and creates a new Earth under new heavens. When it is possible to travel to the future, time ceases to exist as we know it. The future becomes an immediate present, just as Los Angeles is the suburb of New York to the jet set. The power to travel through time is the power to create sequence at will. Sequence is the principle of order by which all reality is established. Therefore, the technology of time travel confers upon the technocrats the power to create entire worlds to order. The engineers accede to the power of the immortal gods, transcending time and space.

When we meet the gods, we shall find that they are us.

Have you ever wondered . . .

- How the Pyramids and Stonehenge were really built?
- If the Russians can trigger earthquakes in the U.S.?
- Whether the alchemists really transmuted iron into gold?
- If time travel is really possible?

If scientists really wanted to, could they . . .

- Demonstrate the Theory of Relativity with a pinch of salt on the kitchen table?
- Draw free energy from the earth's atmosphere?
- Construct a flying craft that behaves just like a UFO?

Now in HOW TO BUILD A FLYING SAUCER, T. B. Pawlicki reveals the known technology and forgotten inventions (including some registered with the U.S. Patent Office) that show how many "impossible" inventions might actually be accomplished today! Here are sketches for cranes that could have transported the pyramid stones to Giza, the principles for traveling between time streams, and a new scenario of how our solar system evolved.

Copiously illustrated with detailed diagrams and "blueprints," HOW TO BUILD A FLYING SAUCER will delight armchair physicists, weekend engineers, science-fiction buffs, the insatiably curious—and anyone who relishes informed speculation.

T. B. PAWLICKI, who lives in Victoria, British Columbia, is a former tradesman, sign writer, and lifelong inventor whose articles have been published in many magazines and newspapers here and abroad.

CHAPTER SEVEN: 241
DISPOSITION OF GERMAN SAUCER TECHNOLOGY AFTER THE WAR

CHAPTER EIGHT: 261
CONCLUDING THOUGHTS

PREFACE

This book is a guide into the world of German flying discs. You may have picked up this guide because you are unfamiliar with the German production of flying saucers during World War Two. The basics of this production will be revealed to you in the following pages. An adventure awaits you.

On the other hand, you may be looking for nothing more than a rational explanation of the UFO phenomenon. The UFO phenomenon involves sightings of unidentified flying objects. This means that any unidentified flying object is a UFO, regardless of its alleged source. Because the object is unidentified, the object's source is also undetermined. Only a leap of faith can connect UFOs to an extraterrestrial course without first introducing proof. A radical hypothesis such as an extraterrestrial origin of UFOs requires overwhelming proof in order to be generally accepted. No such overwhelming extraterrestrial proof has ever been offered which has stood up to scrutiny. No crashed alien craft have ever been produced by anyone, inside or outside government. Likewise, no alien bodies have ever been found. No extraterrestrial culture, or alien technology has ever been uncovered by anyone. There is simply no actual evidence at all linking UFOs with an extraterrestrial source. Therefore, no such leap of faith should be made. We need to start all over again. All rational earthly explanations need to be exhausted before any extraterrestrial theories are even put forth.

Unfortunately, the simple truth is that, for the most part, UFO research has done a leap-frog to the extraterrestrial explanation without ever adequately exploring and exhausting a terrestrial origin. This statement is inclusive of everyone regardless of background or education. It applies to the charlatan UFO attention-getters as well as to former NASA scientists with Ph.D.s. This is the condition of our current state of affairs in the UFO world.

Let me expound on this. For over fifty years, the UFO research paradigm has been fundamentally wrong. A proper attempt to explain the UFO phenomenon would involve a gathering or the evidence and then explanation by proceeding from simple solutions involving known facts and conditions and totally exhausting these as possibilities before postulating explanations, conditions, or entities not represented by fact. Only after known facts fail us can we move on to postulate explanations beyond our realm of experience.

Even then, an idea which may fit the observed facts but which is not in evidence itself cannot be accepted as fact until it is tested. This is nothing new. This is simply the way logic and science test new explanations of reality. This method is the foundation of our modern western technological culture.

Unfortunately, research in the field of flying saucer phenomena has never been undertaken with this principle in mind. More and more frequently, UFOs are attributed to an extraterrestrial source by the media, or the "witnesses", as a sort of knee-jerk reaction. It seems if one sees something for which he has no prior reference, then it must be extraterrestrial as a matter of course. Over the years sightings have become "encounters," then "abductions." Such reports are increasing even as the use of regression hypnosis replaces the scientific method for finding the truth. The same individuals often have repeated "experiences" each of which becomes stranger than the last.

If no real research has ever been done on the UFO phenomena, then how has thesis extraterrestrial theory crept into popular culture? One simple answer is the media. The media loves extraterrestrials. Why? It is because the extraterrestrial hypothesis is marketable. It sells copy. Just look at the number of books, magazines, movies and television programs devoted to this explanation. Look at your check-out counter in the supermarket.

The government itself is another answer. The word "government" from here on will basically mean the government of the United States of America but will sometimes include other governments, as specified. The government has used "flying saucers" to cover its own testing of secret aircraft. It uses the UFO-extraterrestrial ploy superbly. When a UFO is seen by civilians, a controlled procedure is enacted. This procedure plants or encourages witnesses who expound an extraterrestrial origin in a given sighting. The government may even go so far as to fund television programming and magazines devoted to this explanation. After all, a huge part of the C.I.A.'s budget goes into such covert conditioning of the American people. However, Americans are not the first to be fooled, as we shall see.

In most cases, any extraterrestrial hypothesis is acceptable to government manipulators, especially if it is so ridiculous that the witnesses end up discrediting themselves. The government is so successful at this that the entire topic of UFOs has become somewhat of a joke. This is done deliberately. Thus, serious people with "something to lose" are afraid to stake their reputations on a public announcement of their UFO experience, no matter how real it

may have been. At this point the government has achieved its purpose which is to discredit and suppress all serious inquiry into the UFO question.

Supposedly, UFO research has been left to large, well-financed UFO "research organizations". The largest of these is MUFON (Mutual UFO Network). This organization "trains" people to report sightings, then collects the data and organizes it using some sort of multi-variant analysis into something meaningful. Over the years MUFON has had the opportunity to collect and "organize" thousands of sightings into something meaningful.

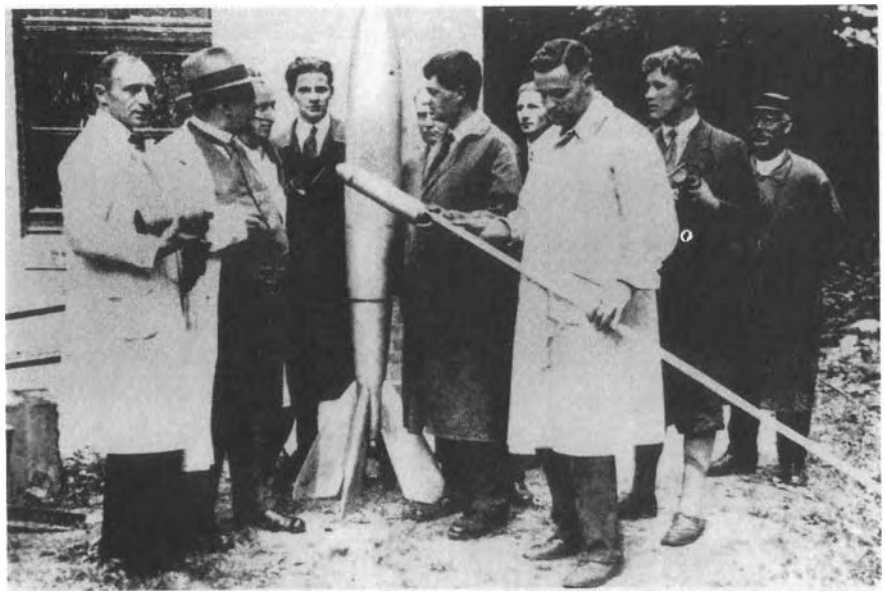
In reality, the information is organized into gibberish. After a body of knowledge has been studied and organized, usually, certain facts or at least generalizations can be gleaned form this kind of work. In its fifty years of existence can anyone name one new fundamental fact that MUFON has provided us? They have provided us with nothing. Someone once said that MUFON is really a black hole into which information is attracted and does not have the power to escape on its own. We will return to MUFON and explain this reasoning at a later point.

If we are to seek any real explanation of the UFO phenomenon, we must make a clean break with the past. We must go back to the basics of simplicity and logic. One basic question is this: could we humans be capable of making the unidentified flying machines which have been seen in abundance in the sky since the Second World War? Until we answer that question in the negative, there is no reason to postulate an alien origin for UFOs.

One purpose of this book is to give an individual new to this subject an overview into the study of German flying discs. Never fear, this is not a disjointed spook-hunt, chasing sightings and abductions. There are real facts in this field. There are real people with real names and histories and there are real saucer designs.

Another purpose is to give the reader references, upon which statements in this book are based. Given these references, the reader may then research the topics of particular interest in more detail.

The research methodology is straightforward. We will listen to what is claimed about German saucers by Germans of those times or from other individuals who are in a position to know something about this topic. We then attempt to verify it using an independent historical source. Corroboration from other independent sources, especially from witnesses, is also acceptable and important. Photographs are important but nowadays pictures can be manufactured on a computer. Well-documented pictures which

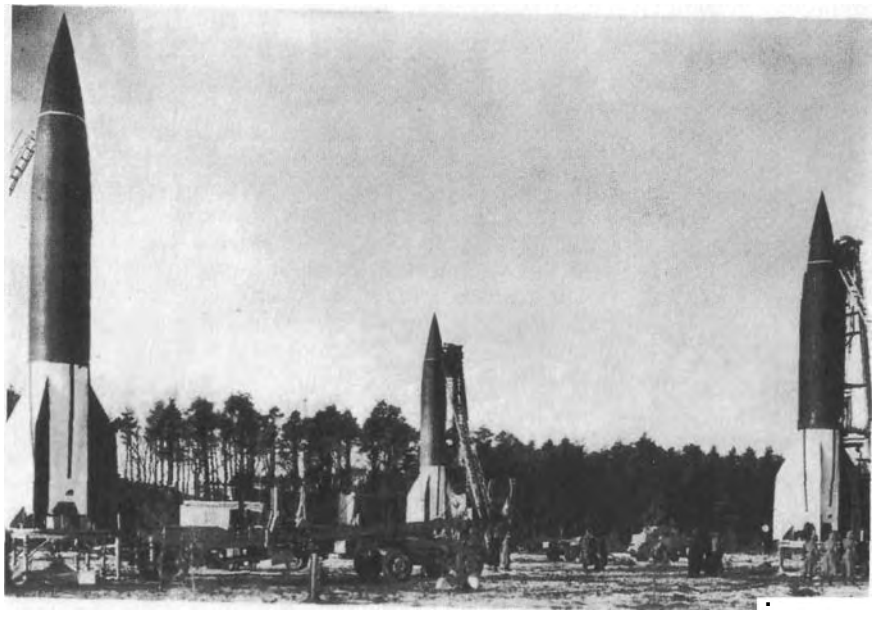


appeared before the modern computer age are perhaps best. Also, pictures accompanied with negatives may be considered better documents than those without negatives.

Government documents can be great sources of confirmation. Unfortunately, governments cannot be trusted and have historically attempted to manipulate UFO research. Therefore, these sources are best not used to formulate ideas but to confirm ideas first developed through independent sources.

Politically, time is on our side. Since the Berlin Wall fell, more and more German researchers are going public with their findings. There is more freedom to research this subject now than at any time in the past sixty years. As each piece fits into the puzzle, a consensus of public acceptance acknowledging the reality of German flying discs grows. All we really have to do is find the pieces, confirm them and keep putting them together. The truth will emerge by itself and in the end nobody, no special interest of any sort, will be able to deny this basic truth.

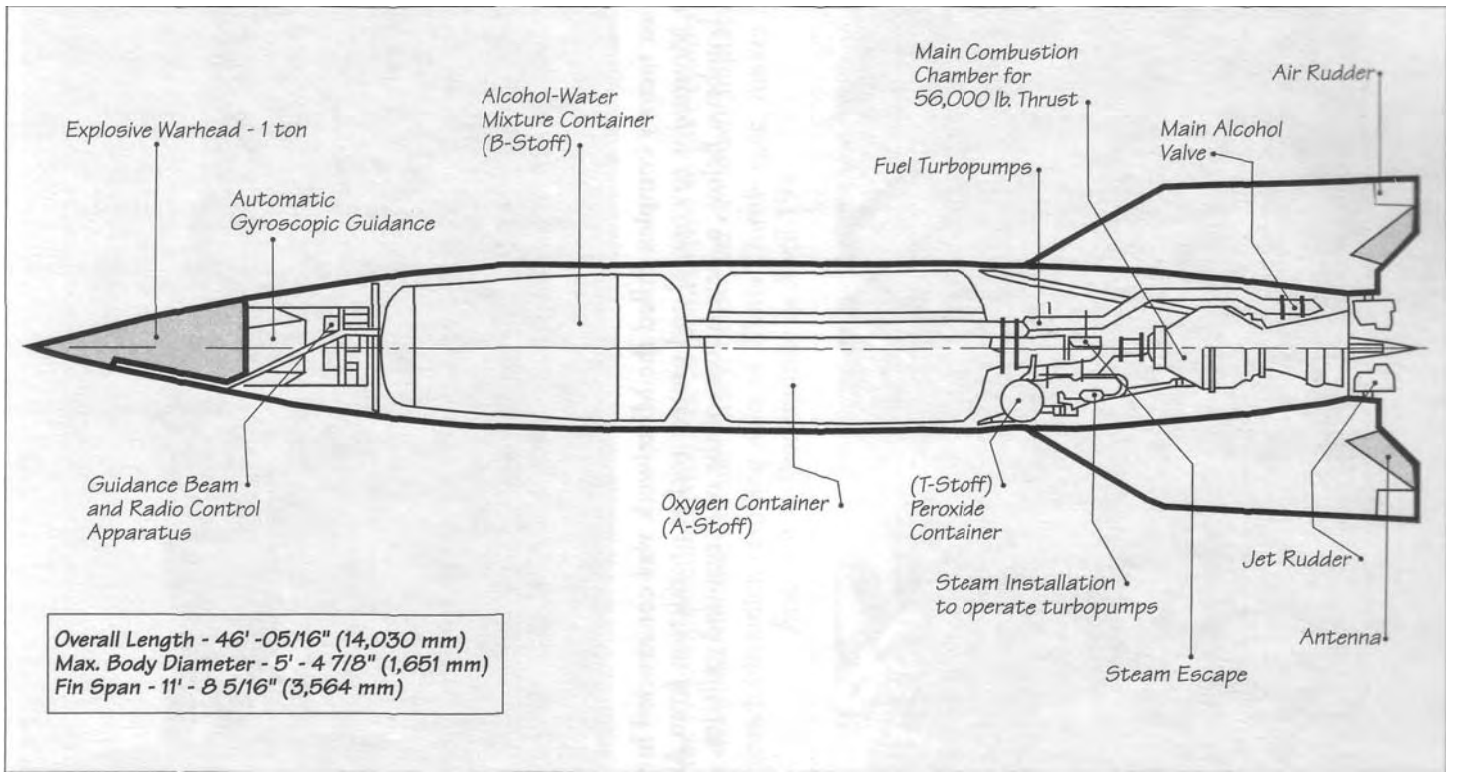
The writer of this book is not an authority to be believed upon face-value alone. New assertions made in this book about German saucers will be accompanied with documentation. Assertions made by others will be accompanied with their references. This book will briefly touch upon most of the facts, ideas, writers and researchers in this field. With the sources given, the reader will be able to confirm the veracity of the position put forth independently.



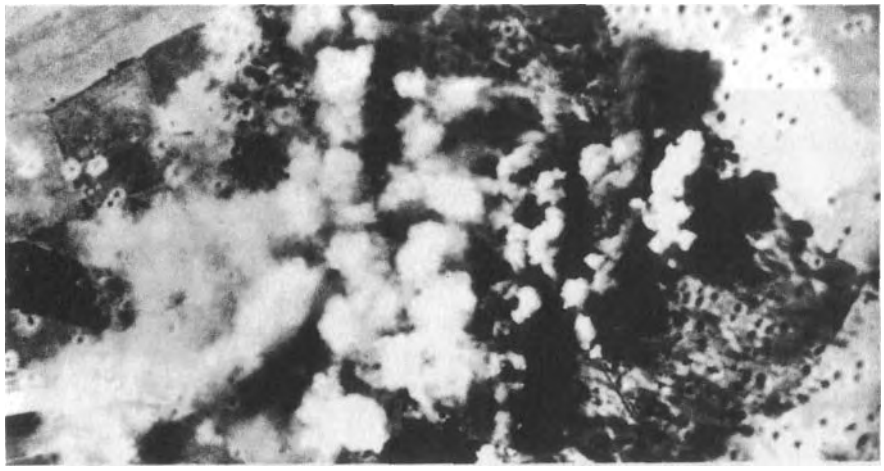
In an attempt to explain the field of German saucers to someone new to it some background is necessary. First, we will discuss the situation within wartime Germany. Then, there will follow a discussion concerning reliable sources in this field. An overview of German flying discs will follow. Finally, various trains of thought or schools or thought in this field will be presented in a discussion section along with some odds and ends which do not fit into any neat pattern. At that point, the post-war disposition of German saucer technology will be discussed before concluding with some thoughts on the topic.

A meeting of Germany's early rocket pioneers, including Rudolph Nebel at left, Hermann Oberth, to the right of the rocket, Klaus Riedel, holding the small rocket, and behind him the dapper young Wernher von Braun.

After the rise of Hitler, von Braun found himself with a new circle of acquaintances, as well as a new research facility at Peenemunde.



As the A-4 neared completion, the SS maneuvered to take control of the weapon from the German Army. Below, an obviously impressed Heinrich Himmler, standing next to Walter Dornberger, makes his first visit to Peenemiinde in April 1943.



A vast factory complex called the Mittelwerk was constructed in the Harz Mountains to conceal and protect rocket production from Allied bombers. Below, a view of one of the underground galleries.

Explosive Warhead - 1 ton
Automatic Gyroscopic Guidance
Alcohol-Water Mixture Container (B-Stoff)
Main Combustion Chamber for 56,000 lb. Thrust
Air Rudder
Main Alcohol Valve
Fuel Turbopumps
Guidance Beam and Radio Control Apparatus
Oxygen Container (A-Stoff)
(T-Stoff) Peroxide Container
Jet Rudder
Steam Installation to operate turbopumps
Antenna
Steam Escape
Overall Length - 46' -05/16" (14,030 mm)
Max. Body Diameter - 5' - 4 7/8" (1,651 mm)
Fin Span - 11' - 8 5/16" (3,564 mm)

Allied intelligence was able to identify the "ski sites" originally designed to launch the V-1. While Operation Crossbow unleashed thousands of bombers against the sites, the Germans meanwhile switched to more flexible, and inconspicuous, launch methods.

The gigantic V-2 storage bunker at Wizernes, France after absorbing 14 Allied air attacks. Today the bunker is a museum run by the French government called La Coupole. It contains originals of the V-l and V-2 and also celebrates space travel.

Carefully considered German camouflage schemes were designed to conceal the weapons among trees.

CHAPTER ONE:

THE SITUATION WITHIN NAZI GERMANY

CHAPTER ONE

The Situation Within Nazi Germany

Thanks to the American media and what passes for history, most Americans have no idea of wartime conditions within Germany. The topics most germane to this discussion are the means of wartime industrial production and transportation within Germany.

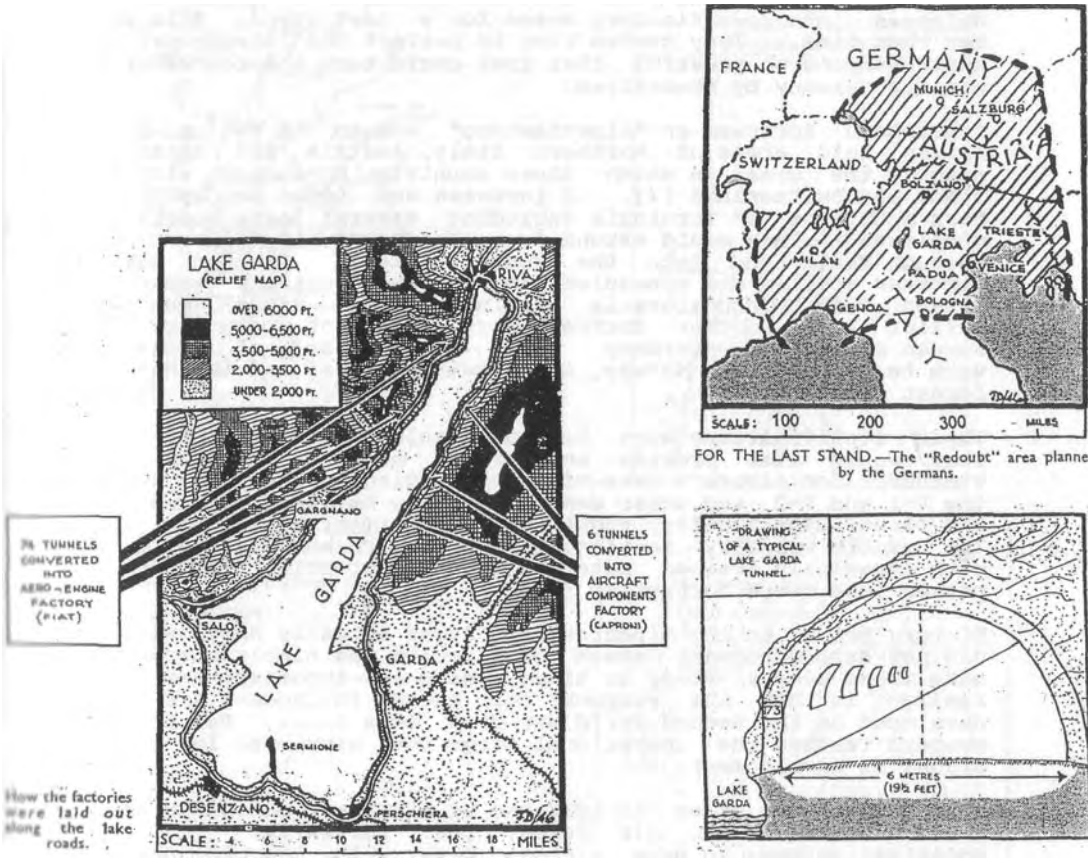
After the Battle of Britain, Germany's air domination over Europe began to decline, sliding down a slippery slope which ultimately resulted in one major reason for its defeat. German means of industrial, arms, and energy production became increasing venerable to attack by Allied bombers. The munitions plants needed to produce the arms to maintain the war effort, such as tanks, airplanes and cannons were all targets of Allied air bombardment. Likewise, high priority targets included oil production and refining facilities which produced the fuel and lubricants needed to make the war effort possible.

One way Germany responded to air attacks was by moving munitions facilities and high-value industrial plants underground (1). Some of these facilities were vast, encompassing miles of underground tunnels. They housed both the industrial means of war production and the workers themselves. The facilities at Nordhausen in Thuringia are well known as the site of production for the V-l and V-2, but there were others. The newly discovered underground complexes of the Jonas Valley south of Nordhausen in Thuringia constitute another vast complex (2)(3). This facility was to serve as a center of government and most probably a research center for advanced weaponry. This is also true for the many underground complexes in what is now Poland. Notable among these is a facility called "Der Riese" (The Giant). Der Riese served as a uranium mine, uranium processing facility, and research and development facility for secret weapons (4). Underground facilities for weapons production were found throughout Germany, Austria, Czechoslovakia and Poland. Underground production facilities were also set up to refine synthetic petroleum products from coal and to generate electricity.

In addition to underground facilities, camouflage was used to hide numerous smaller facilities. These many camouflaged and underground plants formed a web of sub-assembly producers. Each sub-assembly facility sent their product to a larger or a more centrally located facility for further work. From there it might be transported again for final assembly. As an example, type XXI U-boats were modular, being produced in pipe-like sections throughout Germany. They were transported by rail to sites near the North Sea and only finally assembled at water's edge. Likewise, some types of aircraft were only finally assembled near the runway.

Further confusing Allied air intelligence, the plants were constantly moving. Eventually everything of value was to be moved underground, to bomb-proof shelters. Facilities were kept on the move until space was available for this underground re-location. These tactics worked for the Germans. There were simply too many moving targets for the Allies to completely stop German war production.

Of course the weak link in this scheme was transportation. The railroad system was the only practical and most energy efficient method of moving all these sub-assemblies. Trucking material was done but in a petroleum-starved Third Reich, it was not possible to sustain a truck-based transportation system necessary to meet all the requirements of wartime Germany. Recognizing this, the Allies bombed railroad centers using the heavy, four-engine B-17 bombers.



By mid-1943 the American P-51 Mustang was introduced into the field of play. This aircraft could be thought of as a Spitfire which could fly for eight hours. Its range allowed it to escort Allied bombers to their targets throughout the Reich. After escorting the bombers to their targets the P-51s were released to attack "targets of opportunity". A P-51 can fly close to the ground and attack individual trains, which they did. Perhaps you will recall the many wartime film clips showing these P-51s destroying German trains as they traveled. By mid-1944, it is a wonder that any trains within Germany could move at all. Some were forced to hide in mountain tunnels, as they did near the Jonas Valley, running at night or when there were no enemy aircraft reported.

As a result of these day and night air attacks, Germany found itself increasingly the victim of shortages of material and fuel, limiting its ability to make war.

Though Germany's air defence system was the best of any warring nation, it was clear that if Germany was to survive, improvement was imperative. Germany experimented with radically new types of air defense systems. Anti-aircraft rockets, guided both from the ground and by infra-red homing devices were invented. Vortex cannons, sun cannons, air-explosive turbulence bombs, rockets trailing long wire to ensnare enemy propellers, numerous electronic jamming devices, electronic devices designed to stop ignition-based engines, magnetically repulsed projectiles and long-range x-ray "death rays" were all under development as the conflict ended (5) (6). Among these exotic solutions were saucer-shaped interceptor aircraft.

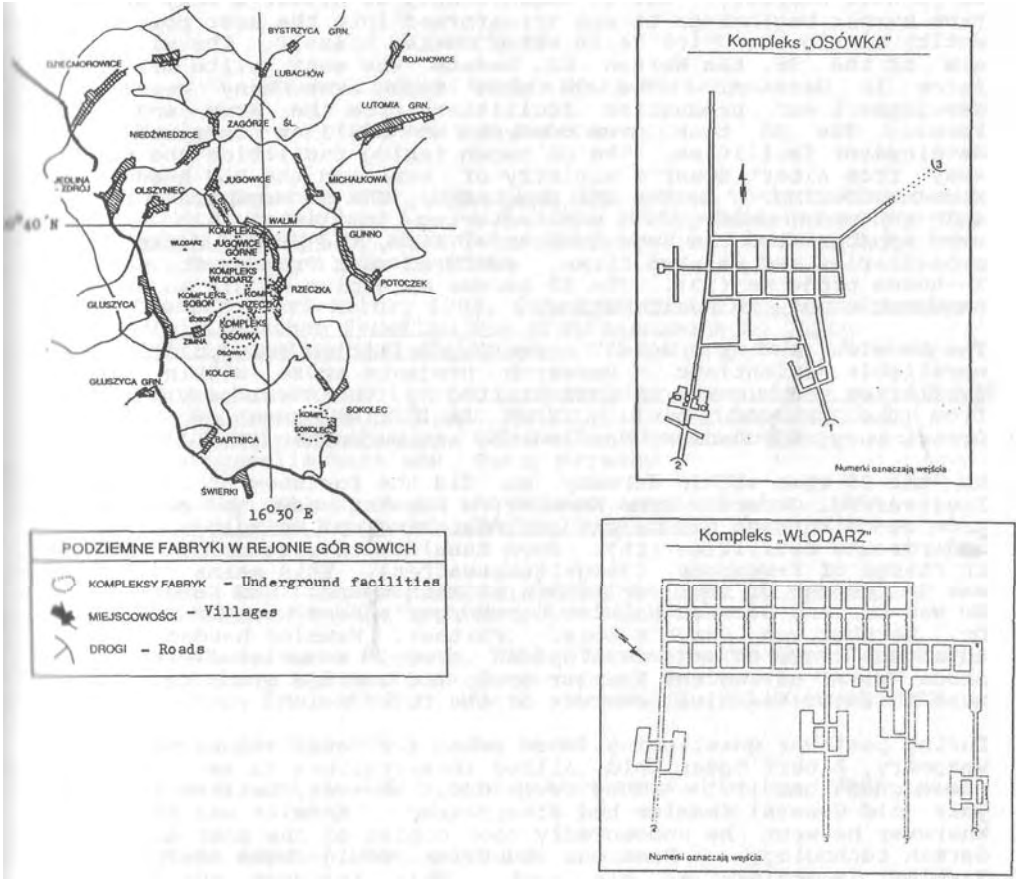
The Germans already had jet and rocket interceptors as well as jet and rocket attack vehicles. German skies were full of these and other exotic aircraft so this new saucer shape was not considered as important then as we do today looking back upon it from a UFO perspective. To the German military and civilians alike these were just more new weapons.

The "Alpenfestung"

FOR THE LAST STAND.—The "Redoubt" area planned by the Germans.

From top to bottom, right to left are: The "Alpenfestung" which was the southernmost island of defense planned by the Germans; Diagram of the Fiat underground facility at Lake Garda in Northern Italy which worked under direction of the Germans; A cross section of the tunnel. It was in this facility where Renato Vesco worked during the Second World War.

As the conflict drew to its conclusion, military planners in Germany considered the idea of concentrating their ground and air defenses into specific fortresses for a last stand. This would buy them time. They needed time to perfect new "Siegerswaffen", super-weapons so powerful that they could turn the course of the war for Germany by themselves.



A mountain fortress or "Alpenfestung" was to be set up in the German held areas of Northern Italy, Austria and Germany in roughly the areas in which these countries converged with each other and Switzerland (7). A fortress was to be set up in the Harz Mountains of Thruingia including several large underground complexes. This would extend from Nordhausen in the north down through Kahla and into the Jonas Valley. Another similar fortress complex was scheduled for the Owl Mountains separating Poland from Czechoslovakia including "Der Riese" mentioned earlier (8). Another fortress was to be set up in the Black Forest of Southern Germany. Other minor islands of resistance were to be set up in Norway, the Bohemian forest and the Bavarian forest (9).

These fortifications were to house soldiers, mostly SS units. They would also provide underground hangers and bomb-proof overhangs for aircraft take-offs and landings. Missiles, such as the V-l and V-2, and other weapons were to be mass produced there and fired automatically, right off the automated assembly line. The exotic weaponry mentioned above was to be employed, along with especially trained mountain troops, defending the mountain passes into these fortresses (10).

History tells us the Alpenfestung never actually happened. It did not happen because German construction was simply not able to make these places ready in time. What is important for us to realize is that the weaponry for these fortresses was being developed as the Second World War drew to a close. Few of these weapons reached the operational stage but many were in various stages of development.

When Hitler took power in 1933 one of his first decisions was to rebuild the German Air Force, the Luftwaffe. This new organization was to make a clean break with the old and this reasoning was reflected in its research and development facilities, the RLM, which were the finest of any branch of the German military. Two brilliant research facilities were also in the possession of the Luftwaffe, the Lilenthalgesellschaft and the Academy of Air Research. Besides the Luftwaffe, there was the Army which did develop such things as the V-l cruise missile. There was the Speer Ministry of Arms which did research. In addition, a system of research and development facilities was set up headed by a research council, the "Reichsforschungrat". Their job was to coordinate the technical schools and universities, the military and governmental research groups, and the research and development facilities into a concerted effort (11).

The Underground Complex "Der Riese"

"Der Riese", ("The Giant" in English), is located in the "Gory Sowie" or Owl Mountains of modern-day Poland. It consisted of seven undergound complexes which concerned themselves with the mining, refining, research and development of uranium both for energy producing machines and weapons of war. The tunnels of the larger complexes are almost two miles in length. Courtesy of Robert Lesniakiewicz. Mr. Lesniakiewicz is a Polish engineer and a member of the research group responsible for opening, exploring and maping of "Der Riese".

Another fact that influences our story was the ascendance of the SS (Schutz Staffel). The SS began simply as Hitler's body guard. From humble beginnings it was transformed into the most powerful entity within the Third Reich after Hitler himself. The military arm of the SS, the Waffen SS, became the most elite military force in Germany. The SS also took over many research, development and production facilities from the Army and Air Force. The SS took over control of civilian research and development facilities. The SS began taking facilities and power away from Albert Speer's Ministry of Arms and the RLM headed by Hermann Goering. As the war progressed, the SS organized, built and ran many underground manufacturing facilities (12). They even appropriated the huge industrial firm, the Skoda Works, its subsidiaries and related firms, centered near Prague, for their in-house projects (13). The SS became an empire within an empire answerable only to Adolf Hitler.

The SS also set up special research facilities for politically unreliable scientists. Research projects arose within these facilities which were in part staffed by technical people drawn from the prisoner pool. Such facilities were set up at Oraneinburg, Nordhausen, Mechlenburg and Mathausen (14).

As the SS rose within Germany, so did the fortunes of Doctor of Engineering, General Hans Kammler. Kammler seems to come into prominence through his talent at designing and building massive underground facilities (15). Soon Kammler was placed, by Hitler, in charge of V-weapons (Vergeltungswaffen). This means Kammler was in charge of the facilities at Peenemuende and Nordhausen. He was Dr. and General Walhter Dornberger's boss who, in turn was Dr. Wernher von Braun's boss. Further, Kammler headed up an advanced research and development group, associated with the Skoda Works, called the Kammler Group (16). This group held the most advanced technical secrets of the Third Reich.

During post-war questioning, when asked for details concerning V-weaponry, Albert Speer told Allied interrogators to ask Kammler these questions (17). They never did, however, because the 42 year old General Kammler had disappeared. Kammler was no fool. Wherever he went he undoubtedly took copies of the most advanced German technology. Numerous countries would have dealt with Kammler, regardless of his past. This includes the U.S.A. Couple this with the fact that no search was ever made for General Kammler in spite of the fact that he extensively employed slave-labor in his projects.

Did Kammler do a secret deal with an Allied government, exchanging information for a new identity? Or did Kammler escape Allied clutches to some safe haven such as South America? It is known that the Nazis set up shop in large, secure tracts of land between Chile and Argentina. It is also known that UFOs were seen earlier in that region than in the USA after the war. Many post-war stories involve German scientists relocating in South American countries formerly friendly to the

Nazis and there building and flying German saucers.

ENGINEER CLAIMS "SAUCER" PLANS ARE IN SOVIET HANDS; SIGHTINGS IN AFRICA, IRAN, SYRIA

GERMAN ENGINEER STATES SOVIETS HAVE GERMAN FLYING SAUCER EXPERTS AND PLANS -- Athens, I Vradyni, 13 May 53

Vienna (Special Service) -- According to recent reports from Toronto, a number of Canadian Air Force engineers are engaged in the construction of a "flying saucer" to be used as a future weapon of war. The work of these engineers is being carried out in great secrecy at the A. B. Roe Company [translitteration from the Greek] factories.

"Flying saucers" have been known to be an actuality since the possibility of their construction was proven in plans drawn up by German engineers toward the end of World War II.

Georg Klein, a German engineer, stated recently that though many people believe the "flying saucers" to be a postwar development, they were actually in the planning stage in German aircraft factories as early as 1941.

Klein said that he was an engineer in the Ministry of Speer [probably refers to Albert Speer, who, in 1942, was Minister for Armament and Ammunition for the Third Reich] and was present in Prague on 14 February 1945, at the first experimental flight of a "flying saucer."

[illegible] the experiment, Klein reported, the "flying saucer" reached -- [illegible] meters within [illegible] es and a --

A C.I.A. document dated August 18, 1952 mentioning that the Germans were building "flying saucers" as early as 1941. From the German book Die Dunkle Seite Des Mondes (The Dark Side of the Moon) by Brad Harris (1996, Pandora Books, Germany).

CHAPTER TWO:

RELIABLE SOURCES

CHAPTER TWO

Reliable Sources

Much has recently been written concerning German flying discs. To the best of my knowledge, no single source has all the answers. To piece this puzzle together information from various sources must be used. Of course, some sources are better than others. Categories of sources, in a somewhat descending order of reliability are:

1. Those actually involved with these projects.

2. Witnesses of flying saucers who had prior knowledge that the sighting was of a German saucer as opposed to an unidentified flying object.

3. Those who at the time had good reason to know of German saucers.

4. Third-party intelligence sources which verify claims made by the higher categories above.

5. Researchers who have interviewed principals involved in German saucer research.

6. Studies or scientific papers published by individuals identified as participants in these projects.

Sources without names are not as good as sources with names. Information, data, or pictures without a "chain of evidence" linking them to the event are not as good as those with proper documentation.

After almost sixty years, nothing is going to be perfect. These categories are not meant to be absolute. Some sources fit into multiple categories. Some reports have value even though they are not rigorous simply because they were later corroborated by other sources.

When reading allegedly factual statements, the reader should always be looking for the source documentation for these statements. A writer's opinion or interpretation may be valuable but it should always be made clear which is who.

Examples of the first category are those who worked on German saucer projects:

Among these is Rudolf Schriever. Schriever was involved in a German saucers project which sometimes bears his name. As a source of information, he wrote an article on German saucers for the very respected Der Spiegel magazine (1).

Likewise, Joseph Andreas Epp was a self-admitted consultant for both the Schriever-Habermohl project at Prag and the Miethe project in Dresden and Breslau. Mr. Epp wrote to me personally (2) and has written several articles and a book about German saucers before he died in 1997 (3).

An example of a witness who had prior knowledge of German saucers would be Georg Klein. Klein was an engineer, an eyewitness to a saucer lift-off on February 14, 1945. He was also Special Commissioner in the Ministry of Arms Production who oversaw both the Schriever-Habermohl and Miethe-Belluzzo projects for Albert Speer. Mr. Klein has written some newspaper articles about these facts such as his article in Welt am Stonntag, titled "Erste "Flugscheibe" flog 1945 in Prag" (The First Flying Disc flew in Prag in 1945)(4) . Other newspaper references of Mr. Klein will be mentioned. He has also written under the pen-name of Georg Sautier.

Another example would be the unnamed eyewitness provided by researcher Horst Schuppmann and first reported in Karl-Heinz Zunneck's book Geheimtechnoloaien. Wunderwaffen Und Irdischen Facetten Des UFO-Phaenomens (Secret Technology, Wonder-weapons and the Terrestrial Facts of the UFO Phenomenon). In this report the informant relates a wartime experience in which he witnessed several small flying saucers in a hangar (5).

George Lusar is an example of a source falling under category three. Lusar worked for the German Patent Office during World War Two. He saw many secret patents as they came into his office. After the War he wrote a book and some articles concerning this technology which was taken by the Allies (6).

Likewise, Italian engineer Renato Vesco worked with Germans while at a secret division of Fiat housed in an underground facility on Lake Garda, right in the middle of the proposed Alpenfestung. After the war, Vesco also researched British Intelligence data. This data was volumnous. Of course, Vesco knew what to look for based upon what he had learned while working in a secret Axis underground facility. Vesco is an example of category three and the next one, category four.

Category four involves intelligence information obtained from governmental sources. This information mostly comes from the very entities who are trying to suppress this information. It should always be suspect. It should be used only to verify information obtained from higher sources (categories 1 through 3) or from governmental sources of another government. For instance, information concerning flying objects which Renato Vesco called "Fireballs" was verified using information obtained from the U.S. government under laws forcing it to divulge some types of information (Freedom Of Information Act) (7).

Category five would include, for instance, Callum Coats whom spent three years with mathematician and physicist, Walter

Schauberger, son of Viktor Schauberger. Mr. Coats consequently learned a great deal of information concerning the ideas of Viktor Schauberger. Mr. Coats is a scientist and architect. Coats wrote Living Energies about the ideas of Schauberger and his saucer models (8).

In the same category we find Michael X. Barton, who, through a translator, Carl F. Mayer, received information from an informant in German, Hermann Klaas, who claimed to have actually been involved with some of the German saucer projects. Klaas' peripheral knowledge (category three) also seems to have extended into other aspects of secret German research and technology. Barton wrote one of the earliest books on this topic, The German Saucer Story in 1968 (9).

One unique source is Wilhelm Landig. Landig wrote three novels dealing with the Second World War. Following the title of each novel, Landig tells the reader that this is a "novel based on realities". The reader is given to understand that the technology described was based on hard fact. Landig's works contain more than cold facts, however. Landig deals with a large variety of topics in his books. Sometimes facts or opinions are stated or "stories behind the story" are told. He writes, unashamedly, from the National Socialist perspective. Landig was obviously a Nazi and an intellectual insider. His history always remained unclear, at least to this writer, until his recent death. Because of his unclear background and the fact that he wrote in novel form, there has been a reluctance to ascribe full creditability to the statements he makes regarding the technology of the Third Reich.

This all changed in 1999 as a result of research done by Margret Chatwin with an organization called "Informations diesnst gegen Rechtsextremismus" (Information service against the extreme right) (10). Coming in from this perspective, they, certainly, would not be accused of aggrandizing Landig's career. Some details of Landig's biography are now filled in. In that article we learn that Landig, an Austrian, took part in the unsuccessful Vienna Putsch of 1934. Thereafter, he fled to Germany and was inducted into the SD, the SS and the Waffen SS. There he rose to the rank of "Oberschafuehrer". Eventually, Landig was detailed to
oversee government security concerns and given a position in the Reichs Security Department. Landig, in this position, was assigned to cover the security for the development of "UFOs" (11). It turns out that Landig was not only a source but a great source concerning the development of German saucers.

Returning to unnamed sources, they should never be given the weight as named sources are given. Many times writers use unnamed sources to advance a radically new and fantastic hypothesis in the UFO world. This type of source may sound convincing, given the "secret" nature of the message, but they should only be accepted if they yield new information which can be verified independently. This goes double for unnamed

government sources. Government has a history of manipulation of information concerning UFOs and UFO origin theories. One of the most famous was the Majestic 12 or MJ 12 affair which was based on unnamed government sources. This house of card finally fell apart but the real issue before us is why this house of cards, the MJ-12 affair, was ever allowed so much attention in the first place.

Government information should, therefore, never be used as the primary basis for a UFO hypothesis. It should only be used to verify a hypothesis developed, ideally, from multiple, independent sources. Concerning German saucers,this means that information or ideas from German sources might be checked using U.S. or British governmental archives, but not the reverse. Similar assertions given by official records of two different countries is notable. If both United States and British or German governmental sources agree upon something, then something might be said of the assertion. Of course there are those that say this only points to a conspiracy between the two governments to conceal a deeper truth. This may be true in some cases. These are all really judgment calls which the reader will have to make for himself, in the end.

Regarding individual sources cited, an effort will be made to describe the type of evidence each cited reference uses when that information is available.

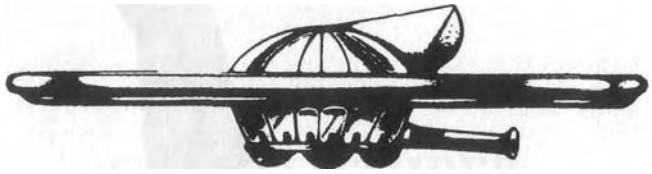
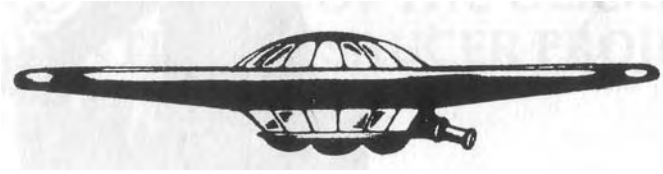
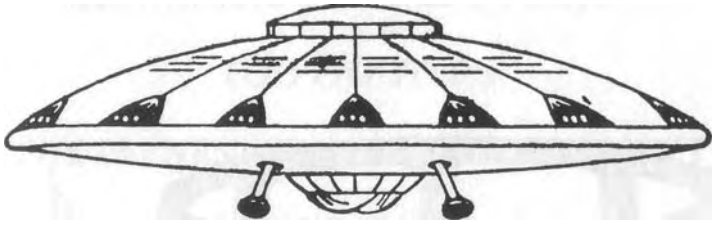
TOP SECRET FILE



Classification Made

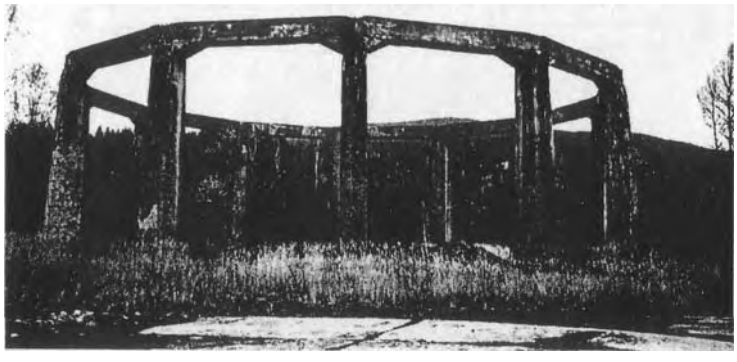


CON:FBL:er



A September, 1946 Top Secret Memorandum on Ghost Rockets.

The above photo, showing six saucers in formation, was given to Dr. J. Allen Hynek in the early 1950s by the director of the Ondrejov Observatory in Czechoslovakia. No details of the sighting are available, but the photo is thought to have been taken near Prague, perhaps during WWII.



Above: Drawings of the Project Saucer craft designed in 1941 by Rudolf Schriever, a Luftwaffe aeronautical engineer, and his three colleagues, Habermohl, Miethe and Bellonzo. The first prototype was flown in June 1942 and larger versions were apparently designed and manufactured at the BMW factory near Prague, Czech Republic.

Above: The circular "Mucholapka" building in Poland. According to Polish Military Historian Igor Witkowski it was used for testing saucer-type craft.

CHAPTER THREE:

AN OVERVIEW OF THE GERMAN CONVENTIONAL SAUCER PROJECTS

THE SCHREIVER-HABERMOHL PROJECT(S)

THE MIETHE-BELLUZZO PROJECT

FOO FIGHTERS

THE PEENEMUENDE SAUCER PROJECT

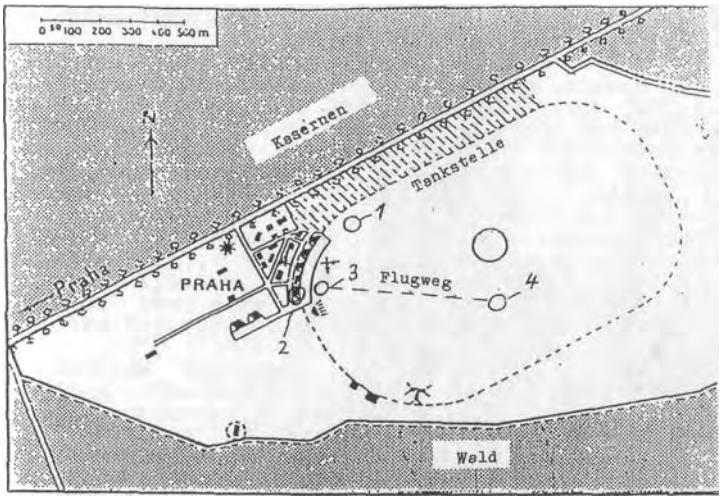
CHAPTER SUMMARY

CHAPTER THREE

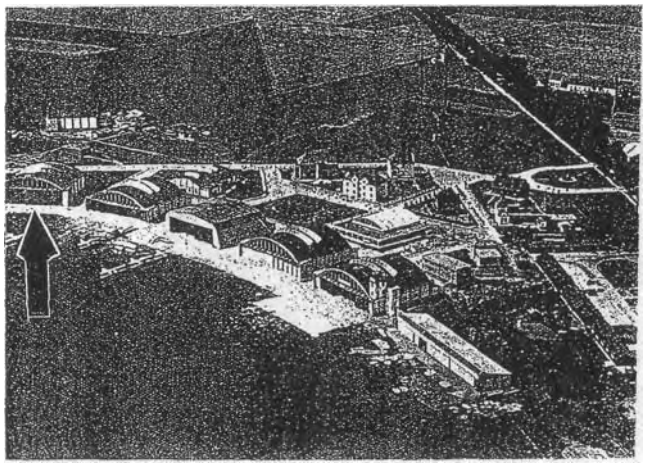
An Overview of the German Conventional Saucer Projects

In this section we will progress from saucer projects with are absolutely factual and of which detail is known and proceed to projects which are less known.

Several types of flying craft we would call flying saucers were built by the Germans during the Second World War. The exact number is still open for debate but it certainly must vary from between three to seven or possibly eight different types. These different types do not mean experimental models or variants of which there were many. What is meant here is that there were very different lines of flying machines being built in wartime Germany at different places by different groups of people. Since more than one saucer-type may have been produced by a single group, we will review this data group by group. We will progress from saucer projects which are factually better known and which deal in conventional propulsion methods and then move to lesser known projects which deal in more exotic propulsion methods which are less well documented and so more controversial.



The Schriever-Habermohl Project(s)

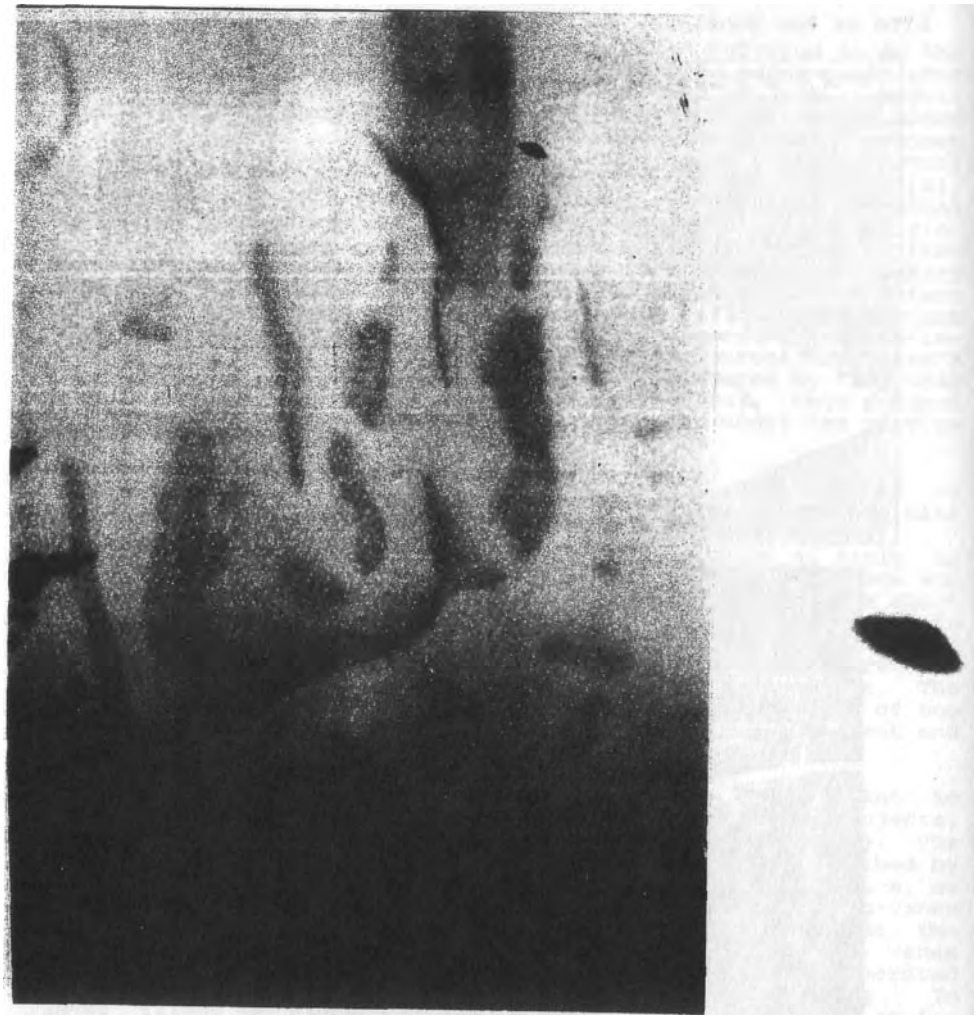


The best known of these projects is usually referred to as the Schriever-Habermohl project although it is by no means clear that these were the individuals in charge of the project. Rudolf Schriever was an engineer and test pilot. Less is known about Otto Habermohl but certainly he was an engineer. This project was centered in Prag, at the Prag-Gbell airport (l)(2). Actual construction work began somewhere between 1941 and 1943 (3)(4). This was originally a Luftwaffe project which received technical assistance from the Skoda Works at Prag and at a Skoda division at Letov (5) and perhaps elsewhere (6). Other firms participating in the project according to Epp were the Junkers firm at Oscheben and Bemburg, the Wilhelm Gustloff firm at Weimar and the Kieler Leichtbau at Neubrandenburg (7). This project started as a project of the Luftwaffe, sponsored by second-in-command, Ernst Udet. It then fell under the control of Speer's Armament Ministry at which time it was administered by engineer Georg Klein. Finally, probably sometime in 1944, this project came under the control of the SS, specifically under the purview of General Hans Kammler (8).

According to his own words, Georg Klein saw this device fly on February 14, 1945 (9). This may have been the first official flight, but it was not the first flight made by this device. According to one witness, a saucer flight occurred as early as August or September of 1943 at this facility. The eyewitness was in flight-training at the Prag-Gbell facility when he saw a short test flight of such a device. He states that the saucer was 5 to 6 meters in diameter (about 15 to 18 feet in diameter) and about as tall as a man, with an outer border of 30-40 centimeters. It was "aluminum" in color and rested on four thin, long legs. The flight distance observed was about 300 meters at low level of one meter in altitude. The witness was 200 meters from the event and one of many students there at the time (10).

Joseph Andreas Epp, an engineer who served as a consultant to both the Schriever-Habermohl and the Miethe-Belluzzo projects, states that fifteen prototypes were built in all (11) (12). The final device associated with Schriever-Habermohl is described by engineer Rudolf Lusar who worked in the German Patent Office, as a central cockpit surrounded by rotating adjustable wing-vanes forming a circle. The vanes were held together by a band at the outer edge of the wheel-like device. The pitch of the vanes could be adjusted so that during take off more lift was generated by increasing their angle from a more horizontal setting. In level flight the angle would be adjusted to a smaller angle. This is similar to the way helicopter rotors operate. The wing-vanes were to be set in rotation by small rockets placed around the rim like a pinwheel. Once rotational speed was sufficient, lift-off was achieved. After the craft had risen to some height the horizontal jets or rockets were ignited and the small rockets shut off (13). After this the wing-blades would be allowed to

The Airport at Prag-Gbell



Site of the Schriever and Habermohl Flying Saucer Projects

In the top diagram the hanger which was the site of the research is marked as number 2. The same hanger is indicated in the picture below with an arrow.

The Habermohl Saucer In Flight

To the left is the closest shot of the two taken by Joseph Andreas Epp as he drove to the Prag airport in 1944. To the right is a blow up (400 times) of that same saucer. Epp remembers a date of November, 1944 but the foliage on the trees argues for a date earlier in the year.

rotate freely as the saucer moved forward as in an auto-gyrocopter. In all probability, the wing-blades speed, and so their lifting value, could also be increased by directing the adjustable horizontal jets slightly upwards to engage the blades, thus spinning them faster at the digression of the pilot.

Rapid horizontal flight was possible with these jet or rocket engines. Probable candidates were the Junkers Jumo 004 jet engines such as were used on the famous German jet fighter, the Messerschmitt 262. A possible substitute would have been the somewhat less powerful BMW 003 engines. The rocket engine would have been the Walter HWK109 which powered the Messerschmitt 163 rocket interceptor (14). If all had been plentiful, the Junkers Jumo 004 probably would have been the first choice. Epp reports Jumo 211/b engines were used (15). Klaas reports the Argus pulse jet (Schmidt-duct), used on the V-l, was also considered (16). All of these types of engines were difficult to obtain at the time because they were needed for high priority fighters and bombers, the V-l and the rocket interceptor aircraft.

Joseph Andreas Epp reports in his book Die Realitaet der Flugscheiben (The Reality of the Flying Discs) that an official test flight occurred in February of 1945. Epp managed to take two still pictures of the saucer in flight which appear in his book and are reproduced here. There is some confusion about the date of these pictures. In the video film "UFOs Secrets of the 3rd Reich", Epp states these pictures were taken in the Fall of 1944. In his book the date is given as the official date of February 14, 1945. In personal correspondence to me of December, 30, 1991, he indicated the date of the pictures as August, 1944. In that correspondence he further revealed that the official flight had been February 14, 1945 but an earlier lift-off had taken place in August of 1944. The pictures show a small disc-like object in the distance at some altitude posed above a landscape. The saucer is at too great a distance and altitude to show any mechanical detail. As Klaus-Peter Rothkugel points out, the foliage on the trees indicates the August date as being the most accurate.

Very high performance flight characteristics are attributed to this design. Georg Klein says it climbed to 12,400 meters (over 37,000 feet) in three minutes (17) and attaining a speed around that of the sound barrier (18). Epp says that it achieved a speed of Mach 1 (about 1200 kilometers per hour or about 750 miles per hour) (19). From his discussion, it appears that Epp is describing the unofficial lift-off in August, 1944 at this point. He goes on to say that on the next night, the sound barrier was broken in manned flight but that the pilot was frightened by the vibrations encountered at that time (20). On the official test flight, Epp reports a top speed of 2200 kilometers per hour (21). Lusar reports a top speed of 2000 kilometers per hour (22). Many other writers cite the same or similar top speed. There is no doubt of two facts. The first is that these are supersonic speeds which are being discussed.

Second, it is a manned flight which is under discussion.

But at least one writer has discounted such high performance (23). It is argued that the large frontal area of one of the possible designs in question makes Mach 2 flight impossible. The argument seems to be that given the possible power plants the atmospheric resistance caused by this frontal area would slow the craft to a point below the figures stated earlier.

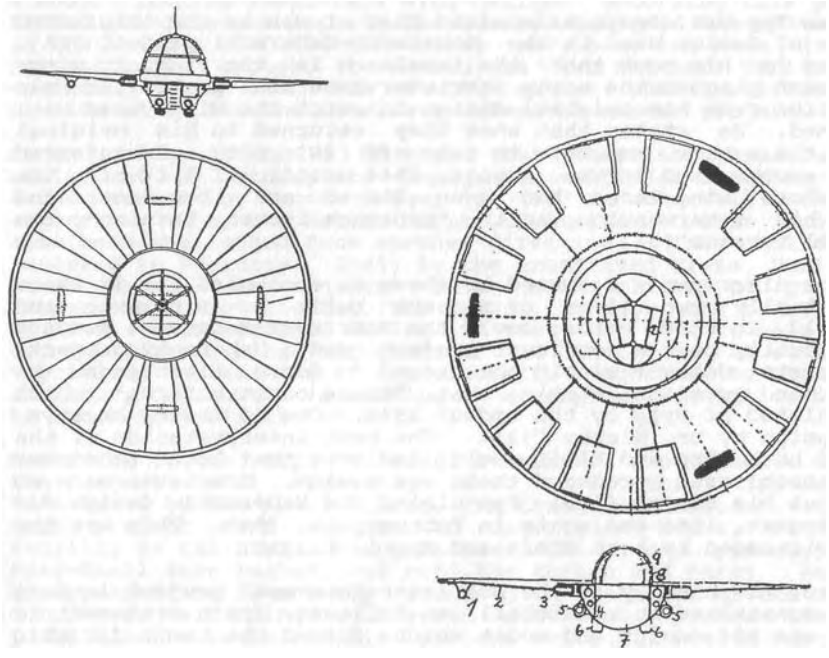
Some new information has come to light regarding the propulsion system which supports the original assessment. Although actual construction had not started, wind-tunnel and design studies confirmed the feasibility of building a research aircraft which was designated Project 8-346. This aircraft was not a saucer but a modern looking swept-back wing design. According this post-war Allied intelligence report, the Germans designed the 8-346 to fly in the range of 2000 kilometers per hour to Mach 2. (24). Interestingly enough, it was to use two Walther HWK109 rocket engines. This is one of the engine configurations under consideration for the Schriever-Habermohl saucer project.

As an aside, it should be noted that there are those who will resist at any attempt to impugn the official breaking of the sound barrier by Chuck Yeager in 1947 in the Bell X-l rocket aircraft. They had better brace themselves. This record has also been challenged from another direction. This challenge was reported in February, 2001, by the Associated Press, Berlin. It seems that a certain Hans Guido Mutke claims he pushed his Messerschmitt jet fighter, the Me-262, through the sound barrier in 1945. This occurred during an emergency dive to help another German flyer during air combat. At that time he experienced vibrations and shaking of the aircraft. According to the report, a Hamburg Professor is working on a computer simulation in order to check the validity of this claim.

Returning to the topic at hand, Schriever continued to work on the project until April 15, 1945. About this time Prag was threatened by the Soviet Army. The Czech technicians working on this project were reported to have gone amuck, looting the facility as the Russians approached. The saucer prototype(s) at Prag-Gbell were pushed out onto the tarmac and burnt. Habermohl disappeared and presumably ended up in the hands of the Soviets. Schriever, according to his own statements, packed the saucer plans in the trunk of his BMW and with his family drove into Southern Germany. After cessation of hostilities Schriever worked his way north to his parents house in Bremerhaven-Lehe. There Schriever set up an inventor-workshop. On August 4, 1948 there was a break in to the workshop in which Schriever's plans and saucer model were stolen (25). Schriever was approached by agents of "foreign powers" concerning his knowledge of German saucers. He declined their offers, preferring rather menial work driving a truck for the U.S. Army (25).

Schriever is reported to have died shortly thereafter in 1953.

There is a report, however, that his death was reported prematurely and that he was identified by a witness who knew him in Bavaria in 1964 or 1965 (26). The publisher of this book, Thomas Mehner, was so kind as to send me a copy of the statement by a Bavarian woman who knew Schriever and made this claim (27). This means that there is a possibility that Schriever did do post-war work on flying saucers.



Interestingly enough, Schriever never claimed that his saucer ever flew at all! If this true, Schriever's saucer was still in the pre-flight stage at the time of the Russian advance and its ultimate destruction on the Prag-Gbell tarmac. This is in direct contradiction to the sources cited above and the photographic evidence. How can this seeming inconsistency be explained?

J. Andeas Epp has always maintained that it was he who originated the type of design used in the Schriever-Habermohl project (28). He states in his book that the imbalance in the ring of wing-vanes which plagued the early Schriever-Habermohl prototypes was a deviation from his original design in which the wing-vanes were lengthened. He states that when they returned to his original design, the saucer was able to take off (29) (30). He referred to the saucer used in the August, 1944 unofficial lift-off, the saucer whose wing-vanes had been altered and then corrected through his intervention, as the "Habermohlischen Version", the Habermohl version (31).

Could the discrepancy referred to above be accounted for if there were actually two lines of saucers built by Schriever and Habermohl? In other words, could the Schriever-Habermohl project have actually been a Schriever project and a Habermohl project, two separate designs within the team? Georg Klein seems to answer this question, stating that "three constructions" which were finished at Prag by the end of 1944. One of these, he says, was a design by Dr. Miethe (32). The best interpretation of the words of both Epp and Klein would indicate that both Schriever and Habermohl each produced their own design. Schriever made no claim that his design flew. Epp claims the Habermohl design did fly in August, 1944 and again in February 14, 1945. This was the saucer witnessed by both Klein and Epp in flight.

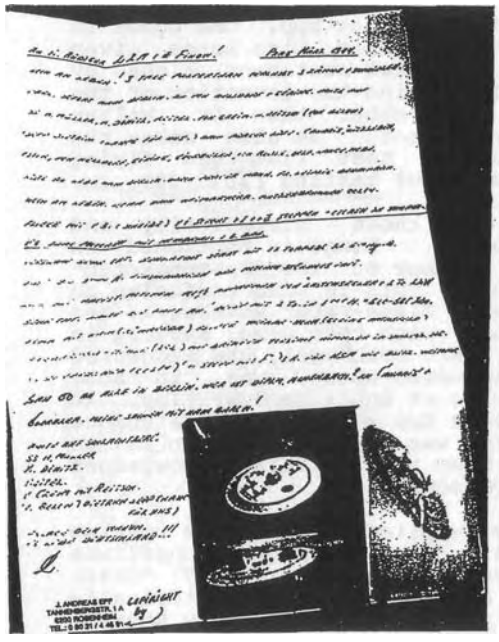
Therefore, the history of the Schriever-Habermohl project in Prag can be summarized in a nutshell as follows: Epp's statement is that it was his design and model which formed the basis for this project. This model was given to General Erst Udet which was then forwarded to Dr. Walter Dornberger at Peenemuende. Dr. Dornberger tested and recommended the design (33) which was confirmed by Dornberger to Epp after the war (34). A facility was set up in Prag for further development and the Schriever-Habermohl team was assigned to work on it there. At first this project was under the auspices of Hermann Goering and the Luftwaffe (35). Sometime later the Speer Ministry took over the running of this project with chief engineer Georg Klein in charge (36). Finally, the project was usurped by the SS in 1944, along

A Comparison of the Schriever and Habermohl Designs

On the left is the Schriever design while on the right is the Habermohl design. Please note the differing dimensions of the vane blades. This difference caused instability in the Schriever design. Drawings adapted from the work of Klaus-Peter Rothkugel.

with other saucer projects, and fell under the purview of Dr. Hans Kammler (37). Schriever altered the length of the wing-vanes from their original design. This alteration caused the instability. Schriever was still trying to work out this problem in his version of the saucer as the Russians overran Prag. Haberrmohl, according to Epp, went back to his original specifications, with two or three successful flights for his version.

While speaking of flight success, two more pieces of important evidence exists which were supplied by Andreas Epp. One comes in the form of a statement by a German test pilot, Otto Lange, given years after the war to Andreas Epp. In that statement, signed by Lange, Epp is credited with the idea behind the invention of the flying saucer and states that none other than Dr. Walter Dornberger had a hand in its development. He also makes the astonishing claim that he, personally, test flew this flying saucer for 500 kilometers in the course of testing (38) (39).



otto Lange is a person who is known historically and independently of any connection to Epp. Lange is mentioned in U.S. intelligence documents as a member of the "Rustungsstab" (Armament Staff), for aircraft (40). This is some confusion on this issue since a German researcher, Klaus-Peter Rothkugel, has f ound evidence for three individuals with this name serving in the German military at this time. Mr. Rothkugel, has suggested that the statement by Lange, discussed above, was, in fact, written by Epp based on known examples of Epp's hand writing. It was signed by another hand, so perhaps Epp and Lange had a chance meeting in 1965 wherein the letter was drafted by Epp in an effort to further document his, at that time, little-acknowledged involvement in the German saucer projects.

The second piece of evidence, also supplied by Epp, is a wartime Letter from Prag, dated March, 1944. It speaks to the conditions behind German lines with its opening greeting, simply "Still Alive!". It follows in a cryptic style describing historically well known political and military people who apparently knew or had something to do with the saucer project at Prag. The letter also describes some early prototype saucer models and their shortcomings. Interestingly enough figures on thrust are given (40) (41).

Three pictures appear at the bottom of the letter. One definitely shows a saucer in flight. There is no mention of these pictures in the text of the letter. Because they are not referenced and from their placement on the face of the letter it is possible that these pictures may have been a later addition to that letter. There are some other reasons why these pictures may not have been connected to the Schriever-Habermohl project or the Miethe-Belluzzo project. We shall return to these pictures at a later time.

An interesting fact elucidated by Epp is that the senior experts

Es lebe Deutschland!!!

On the left is the original letter sent to the author by Andreas Epp. On the right is a typed version done by Kadmon. Notes in English are directed to the author. The letter starts without any formal or Informal greeting, stating only "Still alive". Flying disc research "sehr gut" with vertical take-off at speeds of 860-880 per hour (525-550 milesper hour).

Unfortunately late, but not too late!
After 21 years, I have once more found the flying disc inventor, Epp.

As an engineer-pilot who in wartime-built flying discs V-I, VII and VII, I would like to document before the whole world that Mr. Joseph Andreas Epp was the originator of the idea and designs of the flying discs! The designer Epp developed this idea to prototype for 25 years inspire of hinderance and difficulties. To me, as chief pilot, who flight tested the first flying discs of Epp's idea, and have flown for over 500 kilometers, it is incomprehensible that the realization of Epps flying disc designs have been ignored. Well known scientists and technicians have confirmed to me in writing the correctness of designer Epps flying discs designs.

Among these, Dr. W.R. Dornberger, Schriever as co-designer, certified engineer Langendorf, Sinecnia, France, certified engineer Flanian Bertin, France, engineer Alex Consinet, Paris, certified Rolf Engel, Rome, Italy and so forth.

From now on I will take Epps cause and make it my own and wish that all those who are interested be permitted a realization.

Munich, July 10, 1965

Flight Chief Headquarters Engineer, Retired

Otto Lange

Translator's note: the "V" designation in VI, VII, VII do not mean "Vergeltung" or vengeance but more likely "Versuchs", test, or "Varante", variant. Epp states that 15 designs were known to him to have been built.

Original and author's translation of letter signed by Lange acknowledging Epp's role in flying disc history

and advisors for both the Schriever-Habermohl project and the next project to be discussed, the Miethe-Belluzzo project, were exactly the same individuals (43).

The Schriever-Habermohl Project(s)

The Miethe-Belluzzo Project

This saucer project may have been an outgrowth of flying wing research. It was begun in 1942, and was under the on-site nuthority of Dr. Richard Miethe, sometimes called Dr. Heinrich Richard Miethe. Not much is known about Dr. Miethe before the war. After the war Dr. Miethe is rumored to have worked on the Anglo-American saucer project at the firm of Avro Aircraft Limited of Canada. Such is stated Klein (1)/ Epp (2), Barton (3), Lusar (4), as well as a myriad of other sources. We will return to the Avro projects later.

Working with Dr. Miethe was an Italian engineer, Professor Guiseppe Belluzzo. Belluzzo was the Deputy, Senator and Minister of National Economy under Mussolini. He had written several books on technical matters including Steam Turbines in 1926 and calculations and Installations of Modern Turbine Hydrolics in 1922 (names are English translations of Italian titles). Belluzzo was considered to be an expert in steam turbines. Dr. Belluzzo was not a junior scientist and he was not Dr. Miethe's assistant. He was a senior scientist whose expertise was somehow invaluable on the saucer devices or planned further developments of them.

After the war Belluzzo seems to have led a quiet life in Italy until his death on 5/22/52. Unlike Miethe, however, Belluzzo went on record about German flying discs after the war. He is quoted on the subject in The Mirror, a major Los Angeles newspaper in 1950. This may be the first mention of the subject in the American press. In his obituary in the New York Times his work on the German saucer program is mentioned. (Please refer to copies of these articles).

This team worked in facilities in, Dresden, Breslau and Letow/Prag according to Epp (5). Both this project and the Schriever and Habermohl projects were directed by the same experts and advisors (6). From Epp's discussion, it is clear that Dr. Walter Dornberger first evaluated and recommended his saucer model for further development (7). Miethe is described by Epp in translation as a "known V-weapons designer"(8). The association of both projects to Peenemuende is clear. Both were sanctioned and set up by officials there, probably by Dr. Walter Dornberger himself. Miethe and Belluzzo worked primarily in Dresden and Breslau but for a brief time they may have actually joined forces with Schriever and Habermohl in Prag, as evidenced by Klein's statement that three saucer models were destroyed on the Prag tarmac (9). One saucer, which Klein he describes as Miethe's was among these. Klein acknowledges that Peenemuende, and its nearby test facility at Stettin, retained and developed the Miethe design as an unmanned vehicle (10)(11).

Epp tells us that the Miethe-Belluzzo project was organized under exactly the same authority as the Schriever-Habermohl project and

Flying Discs 'Old Story,' Says Italian

ROME, March 24 (AP)—An Italian scientist said today that types of flying discs were designed and studied in Germany and Italy as early as 1942.

Adolph Hitler and Benito Mussolini, he added, were interested in the instruments, and the idea was developed concurrently both in Italy and Germany.

Flying discs or saucers have been reported sighted recently in many parts of the world. There has been no scientific confirmation of the existence of such things, nor any universally accepted explanation of what their purpose might be.

The Italian scientist, Giuseppe Belluzzo, noted Italian authority on projectiles and cannons and builder in 1905 of the first steam turbine in Italy, made his declarations in Rome's independent Giornale d'Italia.

Frequent Reports

"There is nothing supernatural or Martian about flying discs," he said, "but they are simply rational application of recent technique."

Prof. Belluzzo expressed the opinion "some great power is launching discs to study them."

Reports of flying discs in Italian skies have been frequent. The latest report came last night from Northern Turin, where several persons said they saw a saucer speeding across the moonlit sky leaving a fiery trail.

GIUSEPPE BELLUZZO, SCIENTIST, ECONOMIST

ROME, May 22 (AP)—Giuseppe Belluzzo, Italian scientist and former Cabinet Minister, died here today at the age of 76.

An authority on projectiles and cannons, he reportedly drew up plans for a flying disc which were shown to Adolf Hitler.

Professor Belluzzo, a former Deputy, Senator and Minister of National Economy under Mussolini, said in a newspaper article in March, 1950, "there is nothing supernatural or Martian about flying discs. They are simply rational application of recent technique." He expressed a belief then that "some great power now is launching discs to study them."

In 1905, he built the first steam turbine in Italy.

As Minister of National Economy, Professor Belluzzo told the Italian Chamber in 1927 that Italian industrialists should adopt American industrial organization as their aim. He admitted, however, that Italy could not hope to reach the "rhythm of production and wages existing in America."

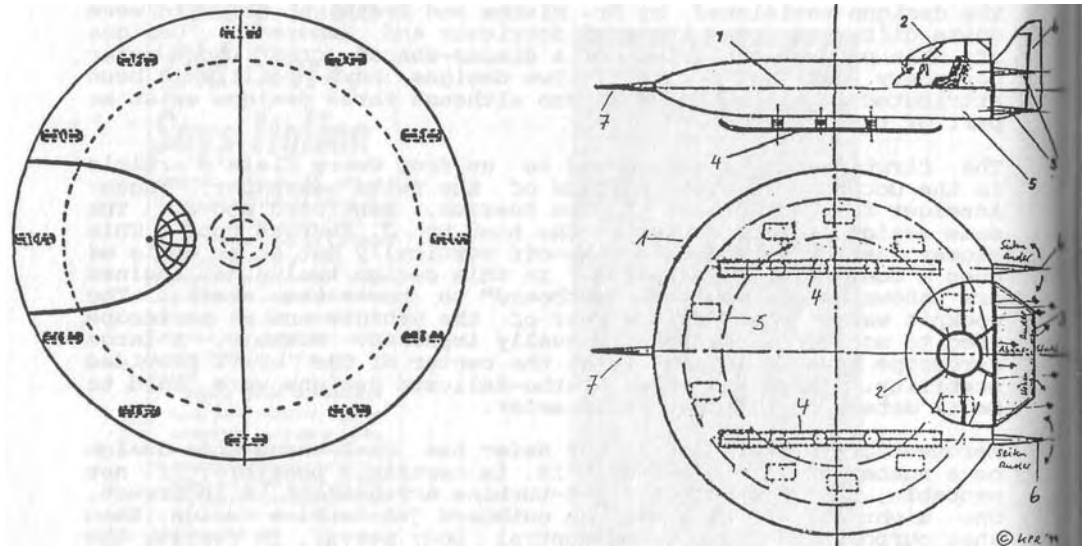
He said that Italian manufacturers should reduce the cost of production through technical improvement rather than lowered wages.

In the same year, he noted the tendency of farm youth to migrate toward urban areas and characterized this before the Senate as "pernicious, pathological, anti-social and uneconomic." Senator Belluzzo urged that youths be judged fit or unfit for city life, and that life on farms be made more attractive by grants for agriculture and free education.

On the left, a column from The Mirror, dated March 24, 1950. This is one of the earliest English references to German flying discs. On the right is Dr. Belluzzo's obituary, dated May 22, 1952 from the New York Times which again mentions German flying discs.

he further identifies the very same industrial firms which supported Schriever-Habermohl as supporting this project (12). In reality, both should be viewed as one project with different aspects.

The designs envisioned by Dr. Miethe and Professor Belluzzo were quite different from those of Schriever and Habermohl. Designs of this project consisted of a discus-shaped craft whose outer periphery did not rotate. Two designs have positively been nttributed to Miethe and Belluzzo although three designs exist as part of their legacy.



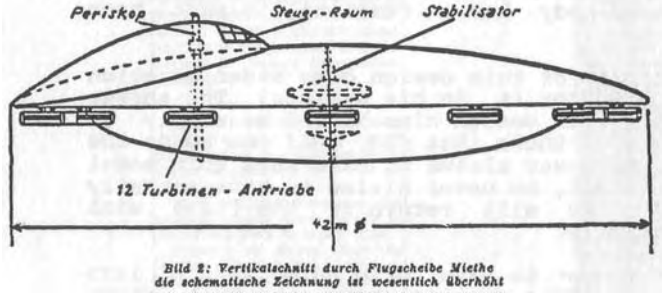
The first design is made known to us from Georg Klein's article in the October 16, 1954 edition of the Swiss newspaper, Tages-Anzeiger fuer Stadt und Kanton Zuerich, mentioned above. The same design is reproduced in the book by J. Andreas Epp. This saucer was not intended to take-off vertically but at an angle as does a conventional airplane. In this design twelve jet engines are shown to be mounted "outboard" to power the craft. The cockpit was mounted at the rear of the vehicle and a periscope used to monitor directions visually impaired. Notably, a large gyroscope mounted internally at the center of the craft provided stability. This and other Miethe-Belluzzo designs were said to be 42 meters or 138 feet in diameter.

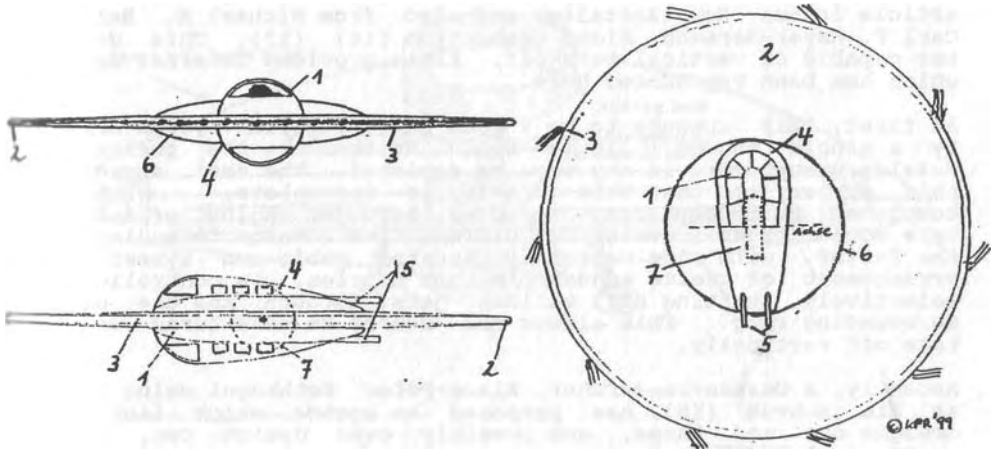
Aeronautical writer Hans Justus Meier has challenged this design on a number of grounds (13). It is certainly possible, if not probable, that the outboard jet-turbine arrangement is incorrect, one might ask, if this was an outboard jet-turbine design, then what purpose did the bloated central body serve? In reality the twelve jets may simply have been jet nozzles of one engine. Certainly the large central body had a function, it must have housed the engine.

But how could the authenticity of this design come under question when Georg Klein is vouching for it in his article? The answer may be that Klein never saw this design himself and he simply is relying on the descriptions of those that did. If one reads the works of Klein carefully, he never claims to have seen this model in flight. As a matter of fact, he never claims to have actually seen this design at all. We will return to the flaws with Klein's description momentarily.

The second Miethe design seems to have originated with a 1975 German magazine article (14). This version shows a cockpit above nnd below the center of the craft. Four jet engines lying behind the cockpits are shown as the powerplants. No real detail is supplied in this article. This design is not ever discussed in the text which deals primarily with the Schriever-Habermohl Project. Some writers have speculated on this particular design, supplying detail (15). For now, however, no named source seems to be able to link this design with the Miethe-Belluzzo Project. Therefore, at least for the time being, we must put this design in suspense and focus on the first and next design in discussing

The Miethe-Belluzzo Disc--Design One





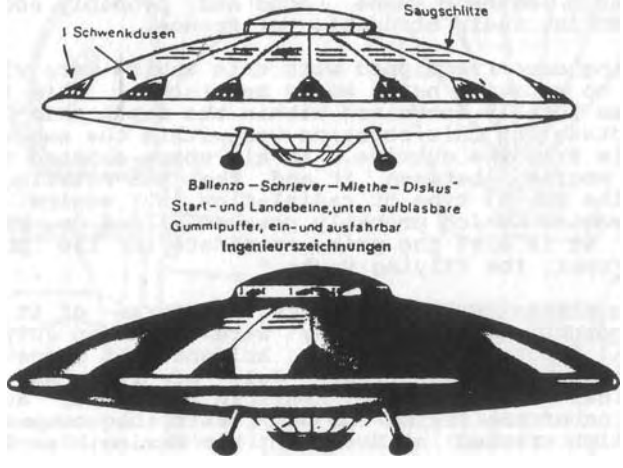


Bild 2: Vertikalschnitt durch Flugscheibe Miethe
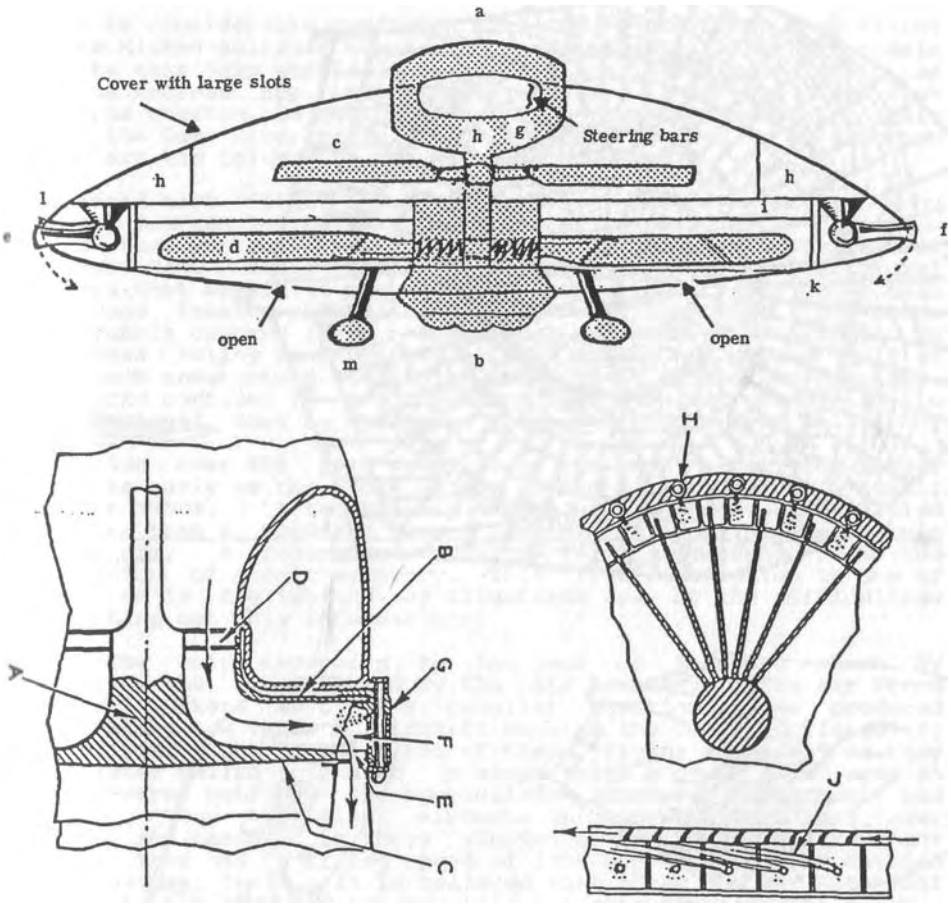
die schematische Zeichnung ist wesentlich überhöht

On the left is a reconstruction by Georg Klein, 10/16/54, from the Swiss newswaper Tages-Anzeiger. Note the small "Stabisator" and the outboard jet engines. On the right is Klaus-Peter Rothkugel's more probable reconstruction incorporating fins, skids, and the inner-lying Rene Leduc engine.

On the top is Miethe-Belluzzo design two. Note rotating disc (2) and stabilizing wheel (7) acting as a gyroscope. (Courtesy of Klaus-Peter Rothkugel) It is the author's opinion that this design was never built. On the bottom is Miethe-Belluzzo design three, capable of vertical take-off.

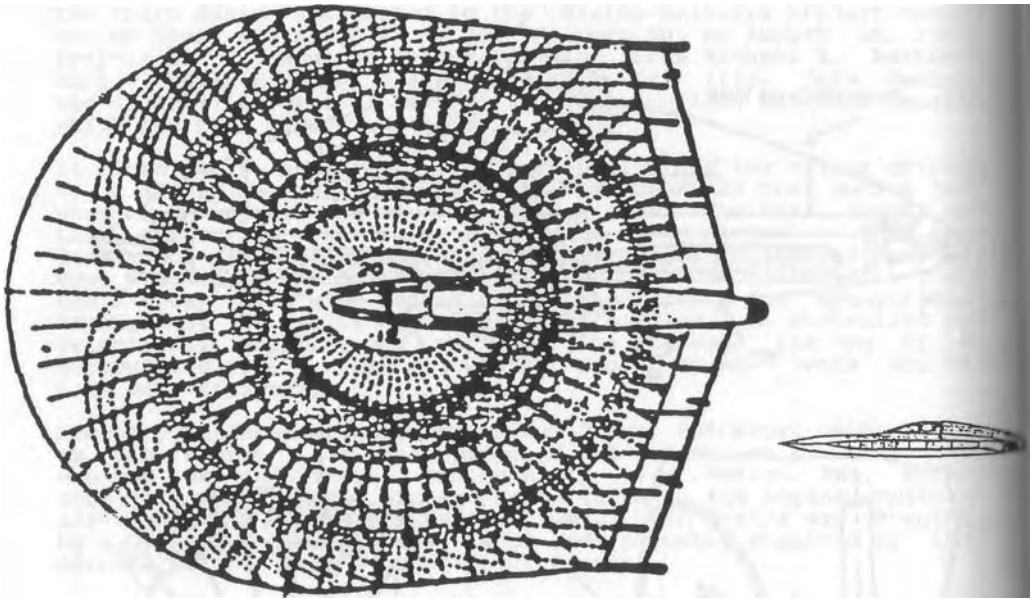
the aforementioned saucer project.

The third design attributed to the Miethe-Belluzzo Project comes to us from and article by Jan Holberg in an August 20, 1966 article in Das Neue Zeitalter and also from Michael X. Barton-Carl F. Mayer-Hermann Klaas connection (16) (17). This design was capable of vertical take-off. Klaas provides internal detail which has been reproduced here.

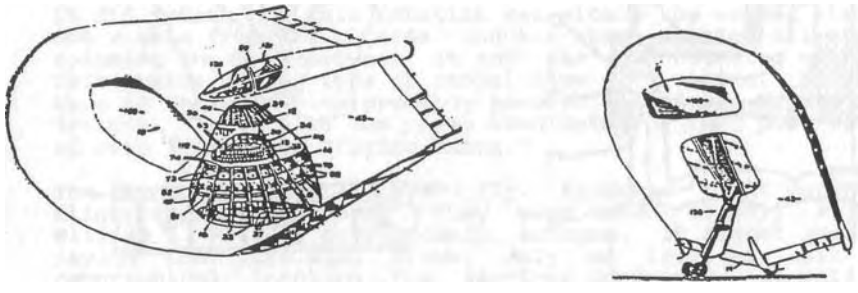


At first, this appears to be a push-pull propeller system driven by a single engine. It is not. Neither are the twelve jet nozzles unsupported in any way as depicted. The real answer to this mystery is that this drawing is incomplete. With the completed parts depicted, a radial turbojet engine of special type would appear. Design one differs from design three in that the latter, with its centrally located cabin and symmetrical arrangement of twelve adjustable jet nozzles, is controlled by selectively shutting off various jets through the use of a surrounding ring. This allows the saucer to make turns and to take off vertically.

Recently, a German researcher, Klaus-Peter Kothkugel using Vesco as his source (18), has proposed an engine which links the designs one and three, and possibly even design two, while supplying the missing pieces needed to make the engine depicted air-worthy and resolves other problems. This engine was invented by a French engineer, Rene Leduc and probably acquired by the Germans during their occupation of France.



If a flying saucer equipped with this engine were viewed from the outside, no rotating parts would be visible. This is because the engine was totally contained within the metal skin of the saucer. It did rotate but this rotation was within the saucer itself and not viable from the outside. An air space existed all around the spinning engine, between it and the non-rotating outer skin. This engine was a type of radial-flow jet engine. It was this type of engine which probably powered all of Dr. Miethe's saucer designs. It is also the prime candidate for the post-war design of John Frost, the "Flying Manta."



The Flying Manta actually did fly. Pictures of it during a test flight are unmistakable. They were taken on July 7, 1947 by William A. Rhodes over Phoenix, Arizona. It almost goes without saying that the time frame, July of 1947, as well as the geographical location, the American Southwest, as well as the description of the flying object itself, beg comparisons to the saucer which crashed at Rosewell, New Mexico, earlier that same month.

If one looks at what is known of Dr. Miethe's saucer design, the Leduc engine, and the Frost Manta, it must be acknowledged that a connection between these three not only explains apparent inconsistencies in the existing Miethe designs but also links them to the post-war American Southwest, the precise spot where

Top: Hermann Klaas' diagram of the workings of the Miethe-Belluzzo Disc. Note: intake screw (c) Carrying wing blade (d)affixed to a piston engine, jets nozzles (e) with no apparent engines. Close but not exactly right. Bottom: Leduc design. A-Rotor B-Front Bulk-head C-Rear Bulk-head D-Intake Vane E-Compressor Vane F-Combustion Chamber G-Bulk-head H-Fuel Injection Jets J-Fixed Flame Ring From I Velivoli Del Mistero I seareti technici dei dischi volanti by Renato Vesco

This is the mounting of the Leduc engine as illustrated by the later Avro diagram (Canada-USA). The outer hull is fixed. The inner rotating engine draws in the air from between it and the hull and exhausts through rear or sides as needed for steering. Compare this design to Miethe-Belluzzo designs, especially to the first design.

captured German World War Two technology was being tested and evaluated.

There is considerable confusion as to where the first test flight of the Miethe-Belluzzo saucer occurred. Epp tells us that models made by this team were flight tested since 1943. Georg Klein, as well as Andreas Epp, state that a test model of this craft took off from Stettin, in northern Germany, near Peenemuende, roughly where the Oder River meets the Baltic, and crashed in Spitsbergen which are the islands to the north of Norway.

A manned test flight in December, 1944 has been mentioned by Norbert Juergen-Ratthofer and Ralf Ettl in one of the films on which they worked. The pilot named was Joachim Roehlicke or perhaps Hans-Joachim Roehlicke (19). Klaus-Peter Rothkugel reports that Roehlicke was under the direction of none other than Dr. Hans Kammler himself and was stationed at the Gotha Wagonfabrik company (20). The Gotha Wagonfabrik company is in the Jonas Valley in Thuringia. This valley was packed full of high-tech underground facilities which included nuclear research. Roehlicke confided to his daughter after the war, according to Mr. Rothkugel, that he "had seen the earth from above" (21).

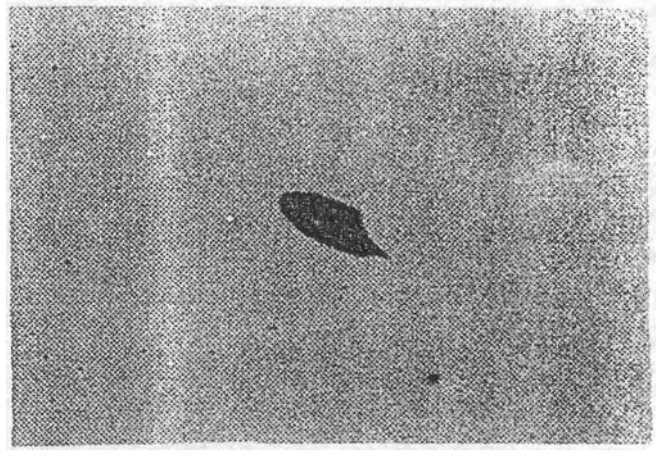
Confusion over the test details of the Miethe-Belluzzo saucer start as early as the whole German flying disc controversy itself in the 1950s. In the English translation of his book, titled Brighter than a Thousand Suns A Personal History Of The Atomic Scientists. a footnote appeared which deviated from the discussion of atomic weaponry. This 1958 description is one of the first in English and may illustrate some of the difficulties in sorting out this information:

" *The only exception to the lack of interest shown by authority was constituted by the Air Ministry. The Air Force research workers were in a peculiar position. The produced interesting new types of aircraft such as the Delta (triangular) and "flying discs." The first of these "flying saucers," as they were later called—circular in shape, with a diameter of some 45 yards—were built by the specialists Schriever, Habermohl and Miethe. They were first airborne on February 14, 1945, over Prague and reached in three minutes a height of nearly eight miles. They had a flying speed of 1250 m.p.h. which was doubled in subsequent tests. It is believed that after the war Habermohl fell into the hands of the Russians. Miethe developed at a later date similar "flying saucers" at A. V. Roe and Company for the United States." (22).

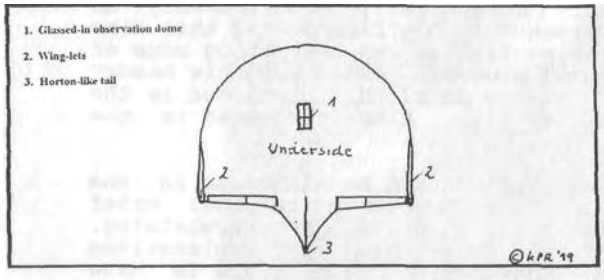
One big difference between the Miethe-Belluzzo design and the Schriever-Habermohl designs is that the former craft was alleged to have, or be designed to have, a longer flight range. This point is reinforced by the Spitzbergen flight mentioned above. Klein states that the Germans considered long range, remote controlled attack from Germany to New York using this craft.

Miethe-Belluzzo Saucer In Flight

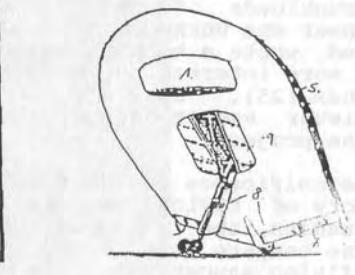
Top picture is of a September 6, 1952 article in the Italian newspaper "Tempo". This article deals with the work of Dr. Miethe and features a photograph of his saucer allegedly dated April 17, 1944, taken over the Baltic. Bottom is an enlargement of the photograph. It seems to be a Miethe-Belluzzo type 1 but could also be a type 3. Courtesy of Klaus-Peter Rothkugel.



As stated earlier, both projects were under the same authority. Experts and advisors included, according to Epp, among others, head-designer Kalkert of the Gotha Waggonfabrik, head-designer Guenther of Heinkel, engineer Wulf of Arado, engineer Otto Lange of the RLM, and engineer Alexander Lippish of Messerschmitt. Pilots were Holm, Irmler, Kaiser and Lange. The test pilot was Rudolf Schriever.



There does exist two alleged still pictures of the Miethe craft in flight. One is reproduced here. It may be the first design. A picture claiming to be of what is called here the third design can be found in W. Mattern's book, UFO's Unbekanntes Flugobiekt? Letzte Geheimwaffe Des Dritten Reiches? (23). Efforts have been made to acquire the picture for this book but the inquiry went unanswered by the book's publisher.



Politically, in 1944, Heinrich Himmler, head of the SS, replaced Albert Speer's appointee, Georg Klein, with Dr. Hans Kammler as overseer of this combined saucer project (24). This is a little confusing, however, since Kammler retained Klein as his employee, Perhaps a more practical way to look at this is that Kammler, Himmler's employee, replaced Speer while Klein did what he always did. The result was that the SS took direct and absolute control over these projects from this point until the end of the war.

Prior to this happening, news of these designs or application itself was made to the German Patent Office. All German wartime patents were carried off as booty by the Allies. This amounted to truckloads of information. Fortunately, Rudolf Lusar, an engineer who worked in the German Patent Office during this time period, wrote a book in the 1950s listing and describing some of the more interesting patents and processes based upon his memory of them (25). They are surprisingly detailed. Included is the Schriever saucer design with detail. Also discussed is the Miethe project.

The significance of these two teams can not be minimized in the history of flying saucers or UFOs. Already in this brief discussion, the evidence, taken as a whole, is overwhelming. Please compare this to any and all extraterrestrial explanations of flying saucers. Here we have Germans who claim to have invented the idea of the flying saucer. We have Germans who claim to have designed flying saucers. We have Germans who claim to have built flying saucers. We have Germans who claim to have flown flying saucers. We have Germans who claim to be witnesses to flying saucers known beforehand to be of German construction. We have German construction details. And finally, we have a man who took pictures of a known German flying saucer in flight. The facts speak for themselves. During the Second World War the Germans built devices we would all call today "flying saucers". No other UFO explanation can even approach this in terms of level of proof.

Top: a picture from the July 9, 1947 edition of the Arizona Republic taken by William A. Rhodes as it flew over his home in Phoenix. Lower Left: a drawing of the craft by Klaus-Peter Rothkugel. Lower Right: one view of the Avro Frost-Manta design, predating the Silver Bug Project. Was this a captured Miethe-Belluzzo-Leduc saucer?

Foo Fighters

"Foo fighter" is a name given to a small, round flying object which followed Allied bombers over Germany during the latter phases of the air war. There are also some reports of foo fighters in the Pacific theater of the war. Sometimes they would appear singularly but more often in groups, sometimes flying in formation. By day they appeared to be small metallic globes. By night they glowed with various colors. These object attempted to approach Allied bombers closely which scared the bomber crews who assumed they were hostile and might explode. Upon taking evasive maneuvers they found the foo fighters would keep pace with them in some instances. Besides the name foo fighter this device is sometimes called "Feuerball", its German name or its English translation, fireball. More about names later.

For those readers who have not been exposed to foo fighters before, following is an American flight account found in Intercept UFO by Renato Vesco:

"At 0600 (on December 22) near Hagenau, at 10,000 feet altitude, two very bright lights climbed toward us from the ground. The leveled off and stayed on the tail of our plane. They were huge bright orange lights. They stayed there for two minutes. On my tail all the time. They were under perfect control (by operators of the ground). They turned away from us, and the fire seemed to go out".

Vesco goes on to say:

"The rest of the report was censored. Apparently it went on to mention the plan's radar and its sudden malfunctioning" (1).

Flying saucer books of the 1950s usually mentioned foo fighters and recounted the sightings of Allied servicemen. Later, due to the extraterrestrial hysteria, publications tended to omit descriptions of foo fighters, preferring to begin the tale of flying saucers with Kenneth Arnold in 1947.

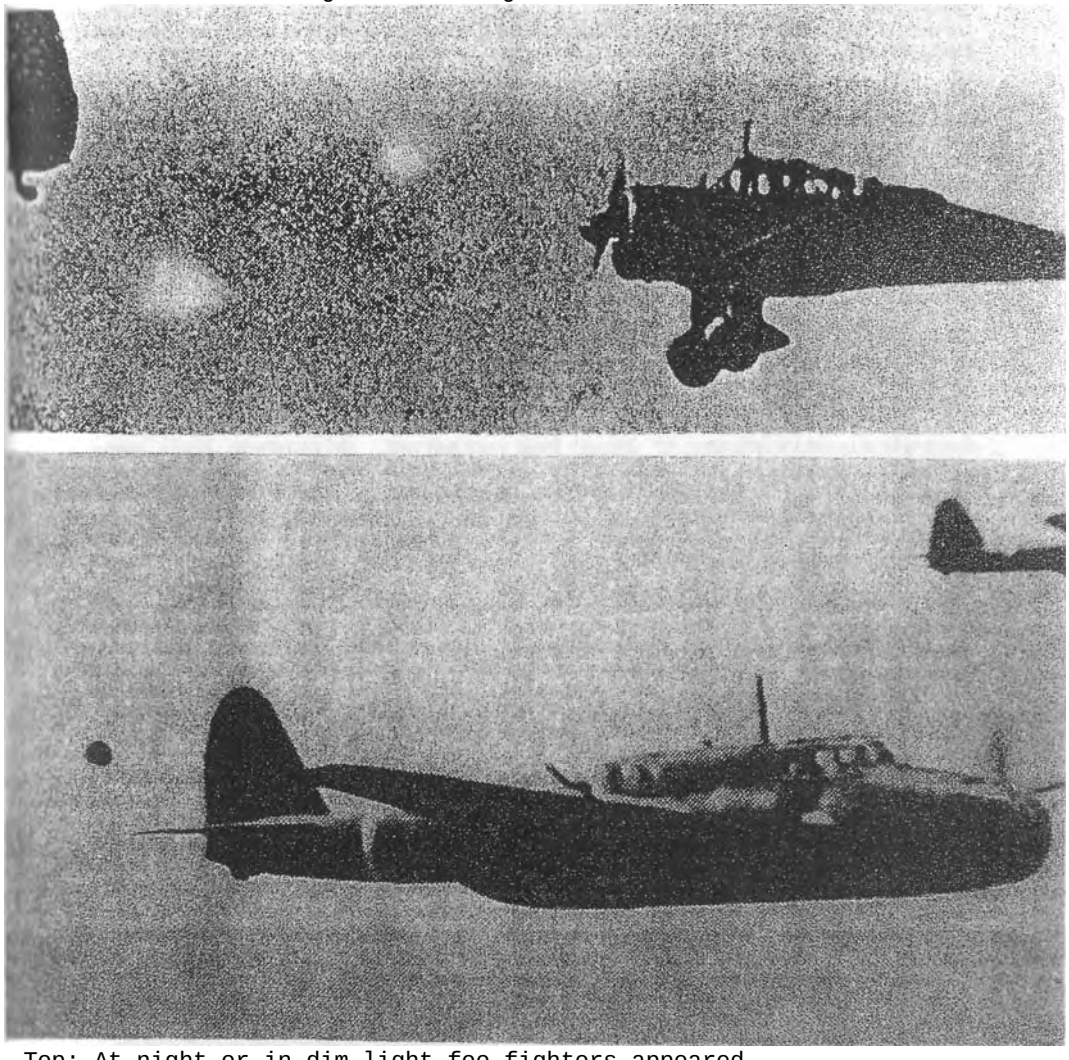
In modern times, if they are mentioned at all by mainstream UFO magazines or books, an attempt is sometimes made to confuse the issue of the origin of foo fighters in one of three ways. First, they say or imply that both sides in World War Two thought foo fighters were a weapon belonging to the opposite side. They may cite as a source some German pilot obviously "out of the loop" who claims the Germans did not know their origin. Second, they attempt to advance the idea that foo fighters are still unknown and a mystery or possibly a naturally occurring phenomenon. Third, they advance an extraterrestrial origin.

It is difficult to imagine a vast bad faith plot, extending over years, which attempts to discredit or confuse the issue of foo fighters. Perhaps the authors of these UFO magazines and books

SUPREME HEADQUARTERS, Dec. 13 (Reuter)—The Germans have produced a "secret" weapon in keeping with the Christmas season.

The new device, apparently an air defense weapon, resembles the huge glass balls that adorn Christmas trees.

There was no information available as to what holds them up like stars in the sky, what is in them, or what their purpose is supposed to be.



Floating Mystery Ball Is New Nazi Air Weapon

SUPREME HEADQUARTERS, Allied Expeditionary Force, Dec. 13—A new German weapon has made its appearance on the western air front, it was disclosed today.

Airmen of the American Air Force report that they are encountering silver colored spheres in the air over German territory. The spheres are encountered either singly or in clusters. Sometimes they are semi-translucent.

Top: A Reuters report from December 13, 1944
Bottom: The New York Times, December 14, 1944

Foo Fighters In Flight

Top: At night or in dim light foo fighters appeared luminescent. Bottom: In strong light foo fighters appeared as silvery balls. This picture was taken over the Pacific in 1943. There are many stories speaking of small, round flying balls sent to Japan by the Germans via submarine.

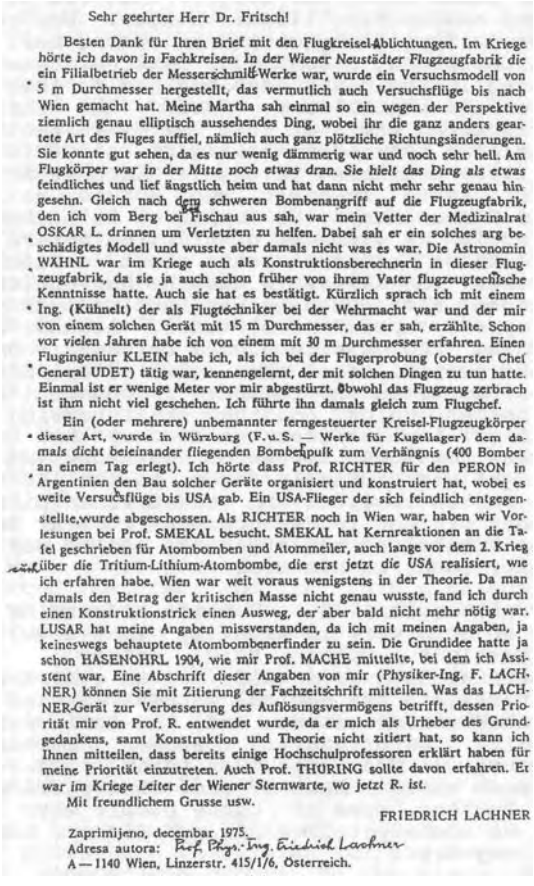
are truly without a clue and simply perpetuating old and bad information as a convenient explanation. In any event, it is now clear they utterly failed to do their homework on foo fighters before writing about them.

The U.S. military, too, has always denied knowledge of foo fighters. Numerous Freedom Of Information Act (FOIA) requests have been filed, for instance, by this writer as well as other researchers asking for information on foo fighters. A "no record" response always followed. All U.S. governmental agencies queried claimed that they had never heard of foo fighters. This happened in spite of the fact that all known alternate names for foo fighters were submitted as well as a detailed description of the device itself. This was the situation until the late 1990s.

Vesco is by far the best source concerning the foo fighter which he calls "Feuerball". He describes it as a radio controlled missile, built at an aeronautical establishment at Wiener Neustadt (Austria) with assistance of the Flugfunk Forschungsanstalt (Radio-Flight Research Installation) of Oberpfaffenhoffen. The project was under the control of an SS technical division. It was armored, circular in shape, resembling the shell of a tortoise. The device was powered by special flat, circular a turbojet engine. After being guided to the proximity of the target from the ground, an automatic infra-red tracking device took over control. The circular spinning turbojet exhaust created a visual effect of a bright, fiery ball in the nighttime sky. Within the craft itself a klystron tube pulsated at the frequency of Allied radar making it almost invisible to those remote eyes. A thin sheet of aluminum encircled the device immediately under the layer of protective armor but was electrically insulated from the armor. Once a bullet pierced the armor and the thin aluminum sheet, a circuit was formed which had the effect of triggering the Feuerball to climb out of danger at full speed (2).

Once within range, special chemical additives were added to the fuel mixture which caused the air in the vicinity of the device to become ionized. This meant that electricity could be conducted directly through the air itself (3). Any ignition-based engine coming into range of the ionized region would become useless, misfiring, stalling and eventually crashing.

Vesco goes on to say that with the advance of the Soviets into Austria the production facilities for the Feuerball were moved to a number of underground plants in the Black Forest run by the Zeppelin Works (4).



Recently an Austrian researcher, Kadmon, who specializes in uncovering the esoteric, sent to me a copy of a letter describing details of the foo fighter from the German perspective. This letter is reproduced here for those who read German language. It is a letter from physicist Friedrich Lachner to Professor, Dr. Alois Fritsch. The letter tells Dr. Fritsch that in an aircraft

plant which was a branch of Messerschmitt at Weiner-Neustadt, Austria, a test model of a flying craft was built with a diameter of five meters which presumably made a test flight to Vienna. "His Martha", his wife, saw the outline of an exactly elliptical flying object in the twilight which appeared to her to be operating by some other means of flight that was normally the case because of its sudden directional changes. Her reaction was
that it was an enemy flying object and it scared her. After the bomber attack on the plant, a doctor, "Oskar L." saw a model of this frightful thing in the plant also and had no idea of what it was. The astronomer Waehnl was, during the war, employed calculating construction costs at this aircraft facility where she had earlier in life learned something of aircraft technology from her father. She confirmed it also. Lachner briefly spoke with an engineer named Kuehnelt who worked as in flight technology for the German Army. He explained to Lachner that he saw such a device with a diameter of fifteen meters. Lachner says that he had known for some years about a machine with a thirty meter diameter. He also says that he had gotten to know a flight engineer named Klein when he was active near the flight testing of the supreme chief General Udet. Lachner claims that "Klein had something to do with these things". One or more unmanned and remote controlled of this sort of spinning-top-like flying objects are mentioned by Lachner in connection with the massive Allied bomber raids on the ball-bearing plant at Wuerzburg. Finally, Lachner goes on to say that a Professor Richter built these devices for Peron in Argentina. A long distance test-flight was actually flown to the United States. There the device was intercepted and an American pilot was shot down. The remainder of the letter concerns nuclear developments in Austria and the USA before and after the Second World War and misunderstandings by Lusar in his book.

This letter was written in 1975. Details concerning Klein and the larger flying objects were in print by that time. There are important confirmations within this letter. These are revelations concerning Lachner's wife as an eyewitness to the object in twilight flight, the medical witness who saw the object within the plant at Wiener-Neustadt, and the confirmation of the astronomer, Waehnl. Unfortunately, Kadmon advises that Dr. Waehnl is now deceased. The important point is that these are real people with real names. Most of whom were alive at the time of this letter. Further, some of these people were scientists with a reputation at stake yet they did not disavow the substance of this letter in any way.

In the closing months of the last millennium witnessed a breakthrough regarding foo fighters. The break came by accident and from the government of the United States. Remember, Freedom Of Information Act requests regarding foo fighters had been filed with many branches of the U.S. military and intelligence services as well as with their repository, the National Archives. Even though all known alternative names were included, as well as a detailed description of the device in question was provided, a

Austrian Atomic Scientist Professor Friedrich Lachner's Letter

Sehr geehrter Herr Dr. Fritsch!

Besten Dank für Ihren Brief mit den Flugkreisel-Ablichtungen. Im Kriege hörte ich davon in Fachkreisen. In der Wiener Neustädter Flugzeugfabrik die ein Filialbetrieb der Messerschmitt-Werke war, wurde ein Versuchsmodell von 5 m Durchmesser hergestellt, das vermutlich auch Versuchsflüge bis nach Wien gemacht hat. Meine Martha sah einmal so ein wegen der Perspektive ziemlich genau elliptisch aussehendes Ding, wobei ihr die ganz anders geartete Art des Fluges auffiel, nämlich auch ganz plötzliche Richtungsänderungen. Sie konnte gut sehen, da es nur wenig dämmerig war und noch sehr hell. Am Flugkörper war in der Mitte noch etwas dran. Sie hielt das Ding als etwas feindliches und lief ängstlich heim und hat dann nicht mehr sehr genau hingesehn. Gleich nach dem schweren Bombenangriff auf die Flugzeugfabrik, den ich vom Berg bei Tischau aus sah, war mein Vetter der Medizinalrat OSKAR L. drinnen um Verletzten zu helfen. Dabei sah er ein solches arg beschädigtes Modell und wusste aber damals nicht was es war. Die Astronomin WÄHNL war im Kriege auch als Konstruktionsberechnerin in dieser Flugzeugfabrik, da sie ja auch schon früher von ihrem Vater flugzeugtechnische Kenntnisse hatte. Auch sie hat es bestätigt. Kürzlich sprach ich mit einem Ing. (Kühnelt) der als Flugtechniker bei der Wehrmacht war und der mir von einem solchen Gerät mit 15 m Durchmesser, das er sah, erzählte. Schon vor vielen Jahren habe ich von einem mit 30 m Durchmesser erfahren. Einen Flugingenieur KLEIN habe ich, als ich bei der Flugerprobung (oberster Chef General UDET) tätig war, kennengelernt, der mit solchen Dingen zu tun hatte. Einmal ist er wenige Meter vor mir abgestürzt. Obwohl das Flugzeug zerbrach ist ihm nicht viel geschehen. Ich führte ihn damals gleich zum Flugchef.

Ein (oder mehrere) unbemannter ferngesteuerter Kreisel-Flugzeugkörper dieser Art, wurde in Würzburg (F.u.S. — Werke für Kugellager) dem damals dicht beieinander fliegenden Bomberpulk zum Verhängnis (400 Bomber an einem Tag erlegt). Ich hörte dass Prof. RICHTER für den PERON in Argentinien den Bau solcher Geräte organisiert und konstruiert hat, wobei es weite Versuchsflüge bis USA gab. Ein USA-Flieger der sich feindlich entgegenstellte, wurde abgeschossen. Als RICHTER noch in Wien war, haben wir Vorlesungen bei Prof. SMEKAL besucht. SMEKAL hat Kernreaktionen an die Tafel geschrieben für Atombomben und Atommeiler, auch lange vor dem 2. Krieg über die Tritium-Lithium-Atombombe, die erst jetzt die USA realisiert, wie ich erfahren habe. Wien war weit voraus wenigstens in der Theorie. Da man damals den Betrag der kritischen Masse nicht genau wusste, fand ich durch einen Konstruktionstrick einen Ausweg, der aber bald nicht mehr nötig war. LUSAR hat meine Angaben missverstanden, da ich mit meinen Angaben, ja keineswegs behauptete Atombombenerfinder zu sein. Die Grundidee hatte ja schon HASENOHRL 1904, wie mir Prof. MACHE mitteilte, bei dem ich Assistent war. Eine Abschrift dieser Angaben von mir (Physiker-Ing. F. LACHNER) können Sie mit Zitierung der Fachzeitschrift mitteilen. Was das LACHNER-Gerät zur Verbesserung des Auflösungsvermögens betrifft, dessen Priorität mir von Prof. R. entwendet wurde, da er mich als Urheber des Grundgedankens, samt Konstruktion und Theorie nicht zitiert hat, so kann ich Ihnen mitteilen, dass bereits einige Hochschulprofessoren erklärt haben für meine Priorität einzutreten. Auch Prof. THURING sollte davon erfahren. Er war im Kriege Leiter der Wiener Sternwarte, wo jetzt R. ist.

Mit freundlichem Grusse usw.

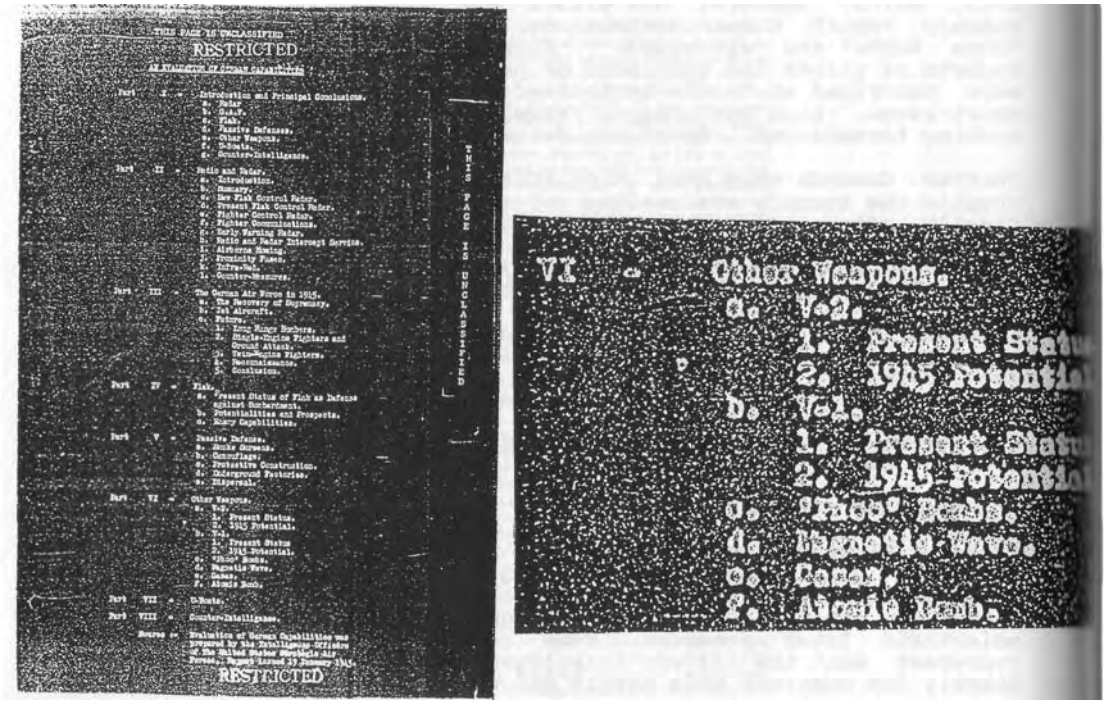
FRIEDRICH LACHNER

Zaprimijeno, decembar 1975.
Adresa autora: Prof. Phys.-Ing. Friedrich Lachner
A — 1140 Wien, Linzerstr. 415/1/6, Österreich.

Professor Lachner describes a sighting of a foo fighter by none other than his wife, Martha. Lachner mentions that he heard that Professor Richter built these devices for Juan Peron in Argentina. This, incidently, is the same Professor Richter involved in an ill-fated attempt to produce fusion generators for Peron.

"no record" response was uniformly generated by all facets of government.

A German researcher, Friedrich Georg, recognized a valuable entry in a microfilm roll, titled a 1944 U.S. Strategic Air Forces In Europe summary titled An Evaluation Of German Capabilities In 1945, which, somehow, had eluded the censors (5). In that summary report German devices called by American Intelligence "Phoo Bombs" are discussed. Sources for this summary were reports of pilots and testimony of prisoners of war. Phoo bombs were described as "radio-controlled, jet-propelled, still-nosed, short-range, high performance ramming weapons for use against bombing formations". Speed was estimated at 525 miles per hour.



Further demands were made using FOIA as to the raw data used to compile the summary evaluation. Of course, denials followed, but finally, after an Appeal, the government indicated that more information did exist concerning Phoo Bombs. Most of this was a repeat or re-statement of the summary document. One document was hand-written and may have served as the basic text of the report.

It seems the U.S. Air Force was never aware of a threat to aircraft engines coming from over ionization of the air around these devices. Likewise, the claim by Vesco that they possessed klyston tubes which pulsed at the same freguency of Allied radar and so jammed radar on board was not recognized. Vesco cites the aircraft radio research institute at Oberpfaffenhofen (F.F.O.) as having invented such devices (6).

The Combined Intelligence Objectives Sub-Committee report on this facility. Report 156, states that work there involved several types of klystron tubes and that one of this facilities principal functions was inventing technology to jam Allied radar, unfortunately all the secret material held at this facility was burned in the face of the advancing Allies. Individual scientists later produces some copies of documents which represent what the Allied intelligence strike teams took away. Exactly how complete this sample was we will never know (7).

Other very exotic research did go on at the F.F.O. installation which might be mentioned. They not only did work on klystron tubes but on magnetrons also. They did work on generation of millimeter range radio wave through the use of crystal vibrations. They also experimented with silicon and germanium "crystals" (8). These two substances figure prominently in the making of what we call today semiconductors which form the basis of the transistor. Invention of the transistor is credited to William Shockley, for which he won the Nobel Prize, about two years after the Second World War.

This bit of research explodes an argument made by the late Col. Philip j. Corso in his book The Day After Roswell that transistors were, at least in part, based upon alien technology (9). The only guestions which remain are: exactly how far the

U.S. government's own documents prove they knew of the German origin of foo fighters. This table of contents of a "Intelligence Digest" document, with a February, 1945 date, addresses German military capacities. It lists "Phoo Bombs" as a weapon in the German arsenal (see VI- Other Weapons) Taken from microfilm negative image.

PART SIX - OTHER WEAPONS

1. In the following paragrpahs are listed the actual or potential weapons which the Germans may use against USSTAF operations in 1945. For the most part they include the so-called V weapons. No consideration is given to those for which there is lacking evidence of possible use for some time to come. Both V-1 and V-2 are considered in the analysis because, even though they are, in effect, long-range artillery, they do possess the ability to affect our operations by hitting airfields, and supplies enroute and in concentrations.

2. V-2:

a. Present status. The V-2, or rocket projectile, with a warhead of approximately one ton, and a current range of 225 miles; is being fired at London at the rate of 180/250 per month, and against Continental ports at the rate of approximately 300 per month.

Against London its accuracy is currently rated at 3.2/1,000 per square mile at the main point of impact. Against Continental ports it is estimated at the least 6.1/1,000 per square mile at the main point of impact. The best record was 75 in a twenty-four hour period within a four square mile area of the Antwerp Docks.

b. 1945 Potential: The German plan calls for an increase in monthly production from 600 to 1200. It is known, however, that any increase would be at the expense of the aircraft industry in radio equipment and certain essential components. An increase in accuracy would depend upon increased firings and increased use of already proved radio equipment, without which the majority of firings are conducted today. It is thought unlikely that range will be materially increased. Accuracy begins to fall off somewhere between 165 and 190 miles, and becomes increasingly inaccurate to the maximum of 225 miles. Whether or not V-2 becomes an increased menace in 1945 must depend upon the position of the aircraft industry and its requirements. Its potential lies in stabilization of the expanding aircraft program.

Larger rockets (68 feet in length as against 45 feet) are known to exist, and may appear in small quantities during the year. They would have a considerably larger warhead.

3. V-1:

a. Present Status: The so-called Flying Bomb is being fired from launching ramps against Continental targets, ports and supply concentrations, at the rate of 600 per month, and against England by airborne launchings, at the rate of 250 per month. Accuracy against Continental targets is now between 11.0/1,000 per square mile at main point of impact, and against England at 3.3/1,000 per square mile at main point of impact.

b. 1945 Potential: Here again, the German plan calls for an expansion in production, but, as in the case of V-2, this expansion must be at the expense of other vital industries. Authoritative estimates state that airborne launchings against England may reach 450 per month, and that a very substantial increase of launchings on the Continent will take place. On the other hand, the number of He-111s available for airborne launchings is distinctly limited, and the demands of other industries are such that the expended production may not be carried out as planned.

4. "FOO" BOMBS: Occasionally reports by pilots and the testimony of prisoners of war and escapees describe this weapon as a radio-controlled, jet-propelled, still-nosed, short-range, high performance ramming weapon, for use against bombing formations. Its speed is estimated at 525 mph

[redacted]

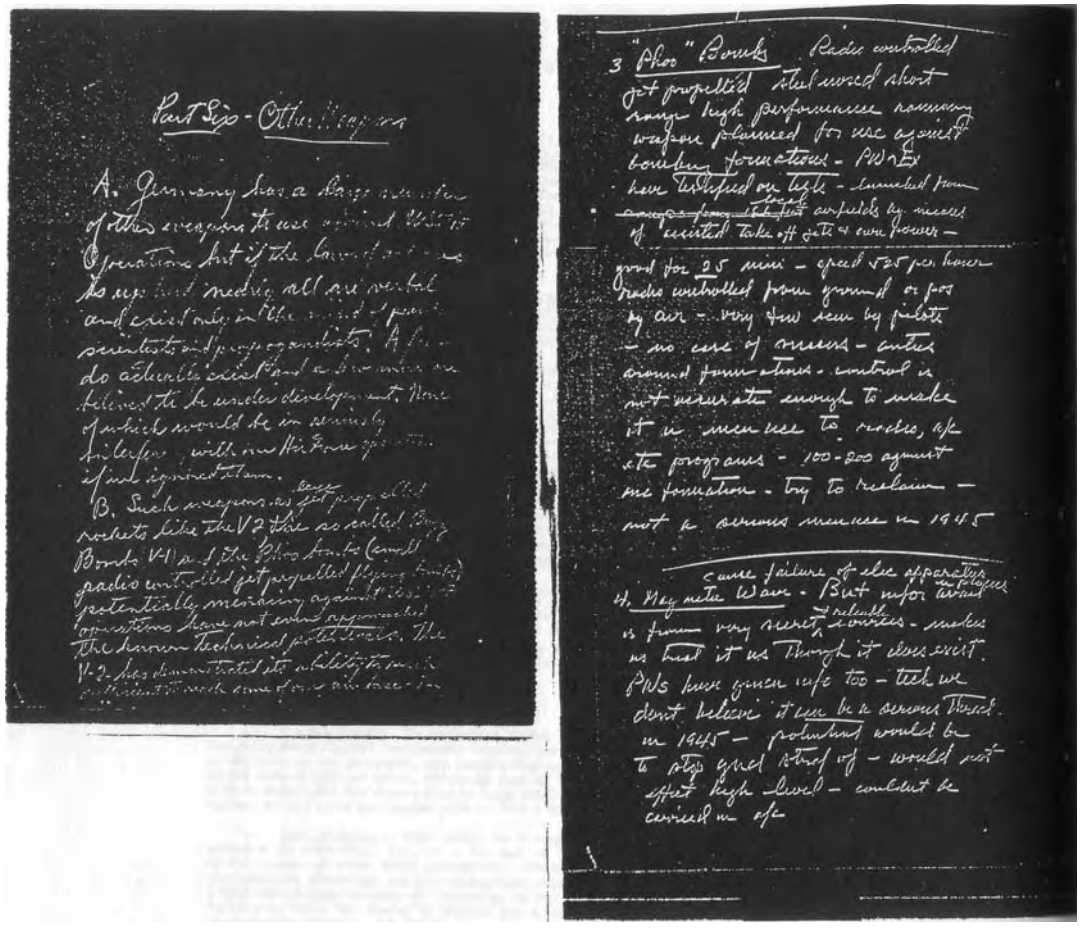
THIS PAGE IS UNCLASSIFIED

A UFO Rosetta Stone

THIS PAGE IS UNCLASSIFIED

[redacted]

and it is estimated to have an endurance of 25 minutes. These bombs are launched from local airfields, and are radio-controlled, either from the ground, or possibly by aircraft. The few incidents reported by pilots indicate no success. They have passed over formations, andperformed various antics in the vicinity of formations. It is believed that in order to be effective some 100/200 would have to be launched against a formation, and it is also believed that they will not be produced in sufficient quantities to prove a real menace in 1945.



5. MAGNETIC WAVE: The best information available is from very secret and reliable sources, and forces the conclusion that this weapon exists as a possibility. It is designed to cause failure of various electrical apparatus in aircraft. Technically it does not appear to be a possible serious threat in 1945. At most it would be effective at a few locations for preventing ground strafing. Evidence to date indicates that it could have little effect against high level attack, since the apparatus would be too cumbersome to permit its use in aircraft.

6. GASES APPLICABLE TO AIRCRAFT: Two types of gases applicable to aircraft are known. One is designed to cause pre-ignition, blowing the heads off cylinders; and the other is designed to break down the viscosity of lubricating oils. Under laboratory conditions, free from operational considerations, these gases are a distinct possibility. It is doubtful, however, that with proper fighter escorts a sufficient concentration of either of these gases could be thrown against our formations to have any serious effect. Similarly, it is doubted whether sufficient anti-aircraft guns are available to produce an effective concentration, and it is probably that any possible concentration would be no more effective than a similar amount of well-directed flak.

7. ATOMIC BOMB: Close check of every report, and close surveillance of the area in which tests are alleged to have taken place lead to the conclusion that such bombs are not a likelihood in 1945.

Phoo Bombs—An Intelligence Officer's Hand Written Notes

Part Six - Other Weapons

A. Germany has a large number of other weapons to use against Allied Operations but if the Germans have the weapons and means all are verbal and exist only in the minds of propagandists and propagandists. A few do actually exist and a few more are believed to be under development. None of which would be in service by Hallowe'en with new Air Force operations against them.

B. Such weapons as jet propelled rockets like the V-2 the so called Buzz Bombs V-1 and the Phoo bombs (small radio controlled jet propelled flying bombs) potentially menacing against Allied operations have not entered appreciably the known Technical picture of the war. The V-2 has demonstrated its ability to reach a continental target such as London but has

3 "Phoo" Bombs. Radio controlled jet propelled steel missiles about range high performance necessary weapon planned for use against bombing formations - PW's have testified on this - launched from ~~ground~~ ~~take off~~ catapults by means of assisted take off jets & own power -

good for 25 min - speed 325 per hour - radio controlled from ground or pos by air - very few seen by pilots - no use of numbers - enter around formations - control is not accurate enough to make it of much use to rockets, a/c etc programs - 100-200 against one formation - try to reclaim - not a serious menace in 1945

H. Magnetic Wave - But info ~~came~~ failure of elec apparatus is from very secret ~~and reliable~~ sources - makes us trust it as though it does exist. PWs have given info too - tech we don't believe it can be a serious threat in 1945 - probably would be to stop great bomber stream - would not affect high level - combat be carried on as

Obtained in a freedom Of Information Act asking for more information after learning the government's code word for foo fighters ("Phoo Bombs").

Germans progressed in their work on semiconductors and should the scientists at the F.F.O. have been given credit for this discovery, the transistor, instead of Shockley? This example also illustrates exactly how far the military will go, or at least individuals in the military, to perpetuate the notion of high-technology derived from aliens. It also illustrates the willingness of large establishment publishing firms to assist in the propagation of these ideas.

Returning to the subject of foo fighters and the governments suppression of this information, it seems the government feels it has the right to deny FOIA reguests, no matter how detailed the description may be, unless the requestor uses exactly the same name as the government uses. Was the name "foo fighters" as opposed to "Phoo Bombs" just not close enough to trigger a response under the law or was this just another example of the government's bad faith regarding FOIA? Probably it was the latter. Friedrich Georg's research work which produced the first document naming Phoo Bombs acted like a Rosetta Stone in that it was a translation of their terms into ours. This applied not only for foo fighters but for the other topics mentioned below which the government had previously denied.

With these documents as proof of American knowledge of foo fighters, the understanding with regard to foo fighters is quite different than the confusion generated heretofore. The fact is that Vesco has been vindicated. The fact is that foo fighters were German-built flying weapons of war. The fact is that they were the very first modern UFOs. And finally, the fact is the government of the United States has known this all along and kept these facts from us for almost sixty years.

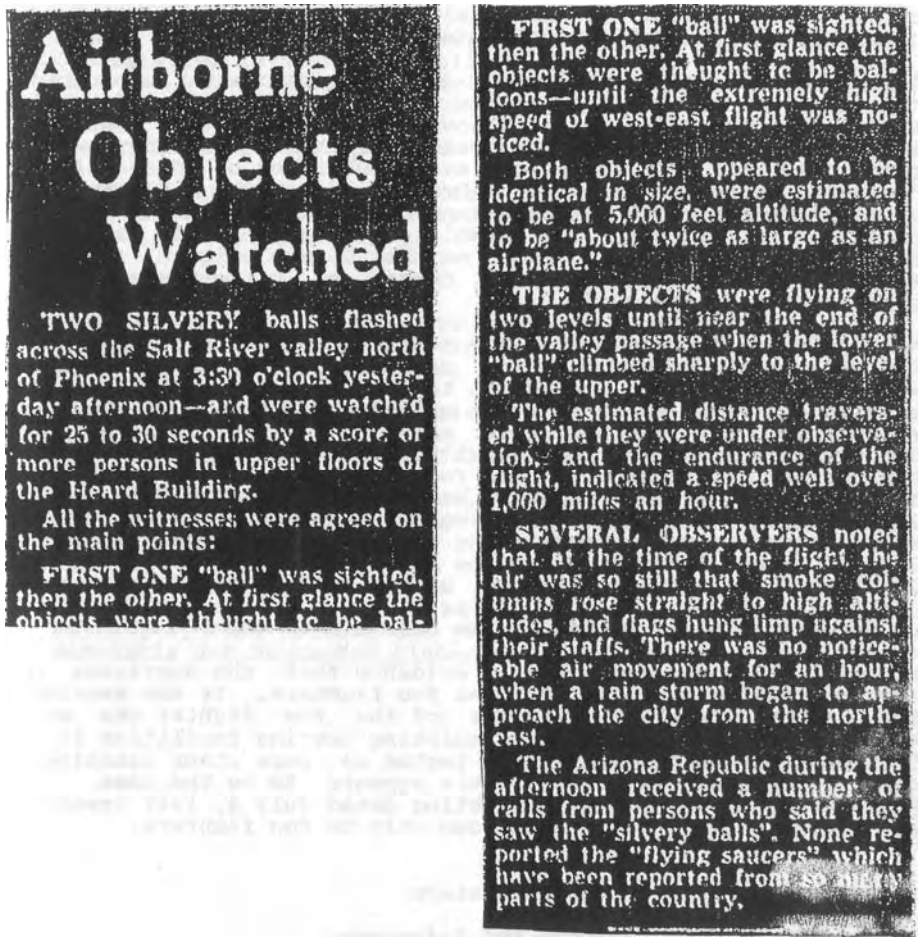
It should be noted that the documents which are in my possession are all documents written during the Second World War. No mention is made of Phoo Bombs in any post-war documents I have seen. Examples or at least plans of these flying devices must have been recovered. It seems there are still secrets hidden away in government files. To keep these secrets the government is willing to violate its own Freedom Of Information Act laws.

It should be noted that the document uncovered by Mr. Georg describes several weapons systems previously not disclosed by the U.S. government. This includes German rockets larger than the V-2. The government document states:

"68 feet in length as against 45 feet"

The forty-five foot figure signifies the V-2, while the sixty-eight foot rocket is completely unknown.

In this same document is a description of a gas-weapon first described by Vesco and designed to down enemy aircraft (10). Actually, there are two such gas weapons. The first gas is designed to cause engine destruction through pre-ignition as



described by Vesco. The second gas is designed to cause engine seizure through the breakdown of the viscosity of the engine's lubricating oil. This is another vindication of Vesco. Therefore, when Vesco states that this very weapon was successfully used against Allied aircraft in a second-generation saucer, the Kugelblitz, perhaps he should be taken seriously (11).

Finally, this document describes something the Americans call the "Magnetic Wave" but which the Germans always described as "Motorstoppmittel", meaning literally, "means to stop motors". Motorstoppmittel and other German death rays were also the subject of repeated FOIA requests which were all denied. It was only with the code-word "Magnetic Wave" that the dam of information was finally broken concerning this device and other German ray-weapons. Not only did the Germans use ionization of the atmosphere to halt ignition based engines but they also experimented with x-ray weapons and an even more exotic method, possibly involving use of the laser (12).

Vesco places construction of the foo fighter at the Austrian site of Wiener-Neustadt (13). Indeed, the testimony supplied by Kadmon does indicate an Austrian home for the foo fighter. The most likely site for foo fighter development was the Rax Works. The Rax Works were an outgrowth of the combinations and growth of several firms, the Wiener-Neustaedter Flugzeugwerke GmbH, the Flugzeugbau der Hitenberger Patronenfabrik, the Flughafenbetriebsgesellschaft Wiener-Neustadt
and the Wiener Neustaedter Lokomotiv-Fabrik which was acquired by Henschel after the unification of Austria and Germany (14).

All the sources cited place foo fighter production in Austria. It is often repeated that this was a purely SS project, built at Wiener-Neustadt, with the help of the F.F.O. It is possible that these craft had an independent origin, outside the scope and sphere of Peenemuende. At about this same time, early 1943, Professor Alexander Lippisch broke away from Messerschmitt to head the Vienna based Luftfahrtforschungsanstalt-Wien (LFW). This was a first-class facility and Professor Lippisch is a figure central to the understanding of German flying discs. Vesco links the foo fighter, his "Feuerball" with a further-developed manned saucer, the "Kugelblitz". It is possible that both these craft had an independent origin, that is outside the purview of officials at Peenemuende under the direction of Dr. Lippisch at the LFW. In this case their link to Peenemuende would have become stronger as the war progressed and on a higher order, that of the SS through Dr. Hans Kammler and the Kammler Group based near Prag. It is also possible that the research and controlling authority of the German disc program moved from Peenemuende to Wiener-Neustadt as researcher Klaus-Peter Rothkugel suggests.

Questions arise with the acknowledgement of "Phoo Bombs" by the government. The first is what is the agenda of those seeking to

Airborne Objects Watched

TWO SILVERY balls flashed across the Salt River valley north of Phoenix at 3:30 o'clock yesterday afternoon—and were watched for 25 to 30 seconds by a score or more persons in upper floors of the Heard Building.

All the witnesses were agreed on the main points:

FIRST ONE "ball" was sighted, then the other. At first glance the objects were thought to be balloons—until the extremely high speed of west-east flight was noticed.

Both objects appeared to be identical in size, were estimated to be at 5,000 feet altitude, and to be "about twice as large as an airplane."

THE OBJECTS were flying on two levels until near the end of the valley passage when the lower "ball" climbed sharply to the level of the upper.

The estimated distance traversed while they were under observation, and the endurance of the flight, indicated a speed well over 1,000 miles an hour.

SEVERAL OBSERVERS noted that at the time of the flight the air was so still that smoke columns rose straight to high altitudes, and flags hung limp against their staffs. There was no noticeable air movement for an hour, when a rain storm began to approach the city from the northeast.

The Arizona Republic during the afternoon received a number of calls from persons who said they saw the "silvery balls". None reported the "flying saucers" which have been reported from so many parts of the country.

From "The Arizona Republic", July 8, 1947

deny this fact both in and out of government? Are these just extraterrestrial "true believers" gone amuck? There is no doubt that the government has known the truth about foo fighters and German saucers in general for almost sixty years, yet they have never been willing to publicly acknowledge these facts. Why is this? What issues of national security could possibly be compromised with such a disclosure over a half-century later?

Is this denial of foo fighters just of government inspiration? The sad truth is that the private "information" or disinformation sector is also guilty in of a cover-up. Why do they contribute to the denial of the German origin of this technology? What major New York publisher has ever published on German flying discs as opposed to the libraries of books pushing the extraterrestrial UFO hypothesis—a hypothesis totally lacking in proof? Let me pose the specific question: would Simon and Schuster ever publish a book on the German origins of flying saucers as they did for Col. Corso and his extraterrestrial hypothesis? If not why?

Another question arises from the confirmation of foo fighters by the government. This question concerns the veracity of Renato Vesco who originally placed the topic before us in his Italian edition as early as 1968. The question is this: If Vesco is right about foo fighters, what about the other claims he made about German saucers? Specifically, these are claims made about the further development of the foo fighter technology resulting in a manned saucer project he called "Kugelblitz" (ball-lightning). As well as claiming the Kugelblitz actually flew, Vesco gave us some tantalizing details of the development of German saucer technology by the Anglo-Americans after the war. In view of Vesco's track record, we can not simply dismiss these claims as has been done in the past. Vesco's assertions should be borne in mind as further facts become evident.

Finally, there is some small evidence that the Americans did acquire working examples of these foo fighters. If the Americans had captured complete examples of the foo fighter one would expect they would be taken to existing testing facilities in the Southwestern United States and tested as were other examples of captured German technology. This appears to be the case. The Arizona Republic reports a sighting dated July 8, 1947 involving two flying silvery balls which can only be foo fighters.

Foo Fighters

The Peenemuende Saucer Project

A report comes to us from Russian immigrant Paul Stonehill concerning the experience of a Russian POW in Northern Germany. The report was first published some time ago in UFO Magazine, volume 10, number 2 in 1995, but this witness describes a story so different from other German saucer reports that it is worth emphasis at this point. The witness is unnamed but the source of the original report is known to Paul Stonehill and he vouches for its authenticity. The unnamed witness is called mister "X".

Mister X was taken prisoner by the Germans in the Ukraine in 1941, early in the German offensive. From there he was housed in a concentration camp where he contracted typhus. X improved and even managed to escape but was re-captured and taken to Auschwitz concentration camp. There, he worked as a medical orderly before a typhus relapse made this work impossible. X was scheduled for a one-way trip to the crematorium but was saved from this fate by a woman German medical doctor who cured him of the typhus. Not only did she do this but, for some reason not made clear in the article, she supplied him with false identity papers stating that X was a mechanical engineer.

In August of 1943 X was moved to KZ (concentration camp) A4 at Trassenhedel in the vicinity of Peenemuende to work on project Hochdruckpumpe's removal from that area. Hochdruckpumpe, or high pressure pump in English, was a long distance cannon with fired in sequential states as the projectile moved by each charge and along an very long barrel. From here X was reassigned to work at Peenemuende itself.

In September of 1943, X and some other prisoners were engaged in demolition of a reinforced cement wall. At lunch time the other prisoners were driven away from this site but for some reason, possibly a dislocated foot, X was left behind.

After the others had gone, four workers appeared from a hangar and rolled out a strange looking craft onto the concrete landing strip nearby. It was round, had a teardrop-shaped cockpit in the center and was rolled out on small inflatable wheels, like an "upside down wash basin". After a signal was given, this silvery metal craft began making a hissing sound and took off, hovering at an altitude of about five meters directly over the landing strip. As it hovered, the device rocked back and forth. Then the edges began to blur. Suddenly the flying craft's edges seem to blur as it jumped up sharply and gained altitude in a snakelike trajectory. X concludes that because rocking was still exhibited, the craft was advancing erratically.

A gust of wind blew in from the Baltic. The flying craft was turned upside down and began to loose altitude. Mr. X was enveloped by hot air and the smell of ethyl alcohol as he heard the craft grinding into the earth. Without thinking, X ran for

the craft in an effort to assist the downed pilot. The pilot's body was hanging out of the broken cockpit and the craft was engulfed in blue flames of fire. X glimpsed the still hissing jet engine before everything was swallowed in flames.

What can be gleaned from this account? Mr. X certainly saw a German flying disc. But the "smell of ethyl alcohol" and the "blue fames of fire" set this engine apart from any so far described. German jet engines ran on jet fuel, a light oil something similar to kerosene. The Walter rocket engines ran of very exotic hypergolic fuels which burst into flames automatically once they made contact with each other. Ethyl alcohol is the alcohol of fermentation as, for instance, potatoes are fermented and distilled into vodka. Ethyl alcohol is not the best substance for aircraft fuel since it is low calories by weight and volume in comparison with the other fuels mentioned. The advantage of alcohol for the shortage plagued Germans was that it was available. Ethyl alcohol and liquid oxygen were exactly the fuels which powered the V-2 rocket developed at nearby Peenemuende.

Given this report, we have a reason to consider Peenemuende as a German site which produced flying discs. But before proceeding with our inquiry as before we must take a step back from our strictly detailed survey of German flying saucers in order to get better perspective of this overall body of information.

To this point any reader somewhat familiar with German flying discs might find the level of detail and proof enlightening but might feel that the basic story is known and has already been told. These readers will be pleasantly surprised by this chapter of our story. Not only is new evidence presented here but a new interpretation of existing evidence sheds a whole new light upon the study of German flying discs.

This new evidence and this new way of looking at things are primarily the result of the input of German aeronautical investigator Klaus-Peter Rothkugel. Within the last year or so he has proposed to me and to another investigator, Heiner Gehring, ideas which were previously overlooked. Mr. Rothkugel has investigated and documented his ideas to both of us and has convinced us of their merit. In turn, both Mr. Gehring and myself have spent some time and effort in advancing this research ourselves and sharing the results. These researchers have published their findings in Germany and have allowed me to make use of these ideas here.

The careful reader will note that mention has already been made of Mr. Rothkugel and his contributions. In this section some of the ideas which he first put forth will be examined as will hie emphasis on the overall organization and understanding of the material.

It was Vesco who first gave us an explanation of foo fighters.

Vesco relied upon his own understanding of the subject which was gained during the war and documented them with facts gleaned from his research into British intelligence files. His explanation has been largely vindicated both by reports of sightings within Austria and through United States military documents obtained independently through the Freedom Of Information Act. Why then should not the other explanations given us by Vesco be worthy of further inquiry? While discussing German saucer development, Vesco described German research designed to overcome the drag limitations imposed upon aircraft by boundary layer effects.

Boundary layer effects refer to the flow of air across the wing of an aircraft in flight. The air forms sheets of air moving across the wing, the slowest moving sheet being closest to the wing. At high speeds these slower moving layers collide with oncoming air molecules of the atmosphere causing areas of turbulence with translate into atmospheric drag as a practical matter. Elimination of the boundary layer would mean that the aircraft could fly faster or expend less energy to fly at any given speed (1)(2).

Swept wings, a German innovation, represent an aircraft designer's response toward lessening the effects of drag on high speed aircraft wings. It was found that air passing over the wings at an angle retarded boundary layer formation. Therefore, turbulence was less apt to form. The swept back-wings of the Me-163 rocket interceptor may have been the result of this research. An advanced model of the Me-262 jet fighter was to incorporate fully swept-back wings. But German aircraft designers of those times wanted to go further. They wanted to eliminate the boundary layer completely.

They proposed to do this with suction wings (3). The literature on German efforts toward elimination of the boundary layer using suction wings is voluminous, as Vesco has pointed out. Beginning in the early 1940s German designers cut slots into experimental aircraft and auxiliary engines were employed to suck in the boundary layer through the wing itself and redirect this air into the fuselage and out the rear of the aircraft.(4). This proved to be more complicated than first anticipated. It was found that the area of turbulence, eddy currents caused by the boundary layer, moved across the wing from front to back as air speed increased. A slot at one position on the wing might work at one speed but not another. This meant that many, many slots covering the expanse of the wing would be needed to totally defeat this boundary layer problem. This proved impractical for a number of reasons.

One reason this was so was that multiple engines had to be used. The first engine had to provide power for flight as in any airplane. The second engine, mounted in the fuselage, was necessary to draw in air through the slotted wings and exhaust it towards the rear. Interestingly enough, it was found that the boundary layer could be eliminated by "sucking it in" or by

"blowing it off" using a strong flow of air to disrupt it (5).

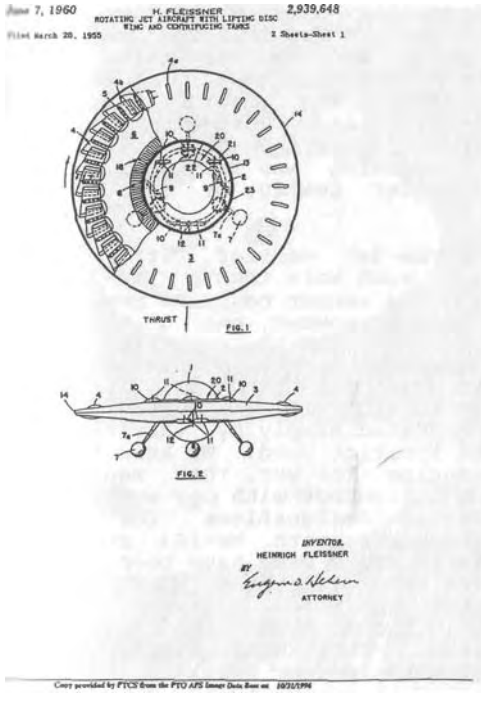
Full scale suction wing aircraft were built for purposes of testing this concept. These were the Junkers "Absaugeflugzeug" (suction aircraft) AF-l and the Fieseler "Absaugestorch" (suction-stork) AF-2.

Concurrent with these experiments, work was being done into the feasibility of circular wings. This work also began in the 1930s with the basic ideas being credited to Professor Ludwig Prandtl. Early scientific papers on circular winged aircraft were written beginning in 1936 by Wilhelm Kinner (6) and in 1938 by M. Hansen (7). Both of these scientists worked at the Aerodynamic Research Facility at Goettingen. By 1941 Dr. Alexander Lippisch was also engaged in experimentation on circular wings at the Messerschmitt firm. His design, designated J1253, was tested at the wind-tunnel at Goettingen (8). Dr. Lippisch was visited by Dr Giuseppe Belluzzo while at Messerschmitt in Augsburg and Lippisch worked together with Dr. F. Ringlib on a "Drehfluegel" or "rotating wing" which was tested at Peenemuende (9). As with suction wings, a body of scientific literature from those times documents this early circular-wing experimentation.

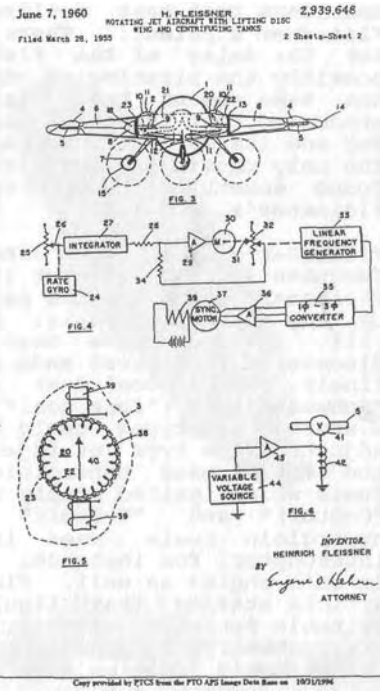
The genius of the German designers was to combine the ideas of suction and circular wings into a single aircraft. Housing complete aircraft within its wing would eliminate the fuselage and so eliminate an unnecessary, drag-causing structure.

Prandtl and Lippisch were not comparably to Schiever and Habermohl. Prandtl and Lippisch are not even comparable to Dr. Richard Miethe. Pradtl and Lippisch were senior scientists who were well established in their worlds, either of whom would have been capable of heading a major project. In fact they did. In fact neither the Schriever-Habermohl or what we have called the Miethe-Bellonzo projects were major projects. This is another significance of what is being discussed here because what is being discussed here is a completely different organization and understanding of German flying discs than has been presented heretofore.

Remember that controlling authority for both the Schriever-Habermohl and the Miethe-Bellonzo projects came from officials in Peenemuende? J. Andreas Epp makes the point in his book that he originated the idea of the Schriever-Habermohl-type of flying disc and actually made a model of this flying craft. Setting aside for the moment the subject or originality, Epp sent his model to General Ernst Udet of the Luftwaffe whom he had met as a child. General Udet must have been impressed with this idea because he sent the plans and model to Peenemuende for evaluation. Peenemuende authorized the Schriever-Habermohl team to further develop the idea and as you might recall, Epp chided Schriever for straying from his original blade dimensions while crediting Habermohl for keeping them. The point is that Peenemuende set up Schriever and Habermohl to construct and



further develop this design as they set up Dr. Miethe to set up further develop the Leduc engine based design. The Germans even refer to the Schriever-Habermohl design as a "Flugkreisel" or flying top in English and the Miethe design as a "Flugdiskus". Our vernacular, "flying saucer" originally corresponded to the German folk-word "Flugschiebe" or flying disc. If the Flugkreisel, Flugdiscus and Flugschiebe are all different machines and we know who built the first two then who built the third, the Flugscheibe? The answer is that Peenemuende built the Flugscheibe. Officials at Peenemuende saved the best for themselves while controlling the other two.



Let's look at some evidence. The May, 1980 issue of Neue Presse featured an article about the German fluidics engineer Heinrich Fleissner (10). Fleissner was an engineer, designer and advisor to what he calls a "Flugscheibe" project based at Peenemuende during the war. It is interesting to note that Fliessner's area of expertise, fluidics, is exactly the specialty involved in investigating problems with boundary layer flow. Fleissner reports that the saucer with which he was involved would have been capable of speeds up to 3,000 kilometers per hour within the earth's atmosphere and up to 10,000 kilometers outside the earth's atmosphere. He states that the brains of the developmental people were found in Peenemuende under the tightest of secrecy (11). We will return to this article again, at a later point, but what is of most interest to us here are three facts. First, that Fleissner worked at Peenemuende on a flying saucer project. Second, that a hint of this design has survived to this day. Third, the surviving design can be linked to photographic evidence of a German saucer, circa World War Two.

Almost ten years after the war, on March 28, 1955, Heinrich Fleissner filed a patent application with the United States Patent Office for a flying saucer (Patent Number 2,939,648). Fleissner's saucer was unlike Schriever's, Habermohl's, or Miethe's. The engine employed by Fleissner rotated around the cabin on the outside of the saucer disc itself. It was set in motion by starter rockets as with Schriever and Habermohl. The difference is that this engine was really a form of ram-jet engine. It featured slots running around the periphery of the saucer into which air was scooped. The slots continued obliquely right through the saucer disc so that jet thrust was aimed slightly downward and backward from the direction of rotation. Within the slots, fuel injectors and a timed ignition insured a proper power curve which was in accordance with the speed and direction of the saucer much like an automobile's fuel injection is timed to match the firing of the spark plugs. Steering was accomplished by directing the airflow using internal channels containing a rudder and flaps which ran alongside of the central cabin. The cabin itself was held stationary or turned in the desired direction of flight using a system of electromagnets and servo-motors coupled with a gyroscope (12).

It is interesting to note that while the patent was filed on

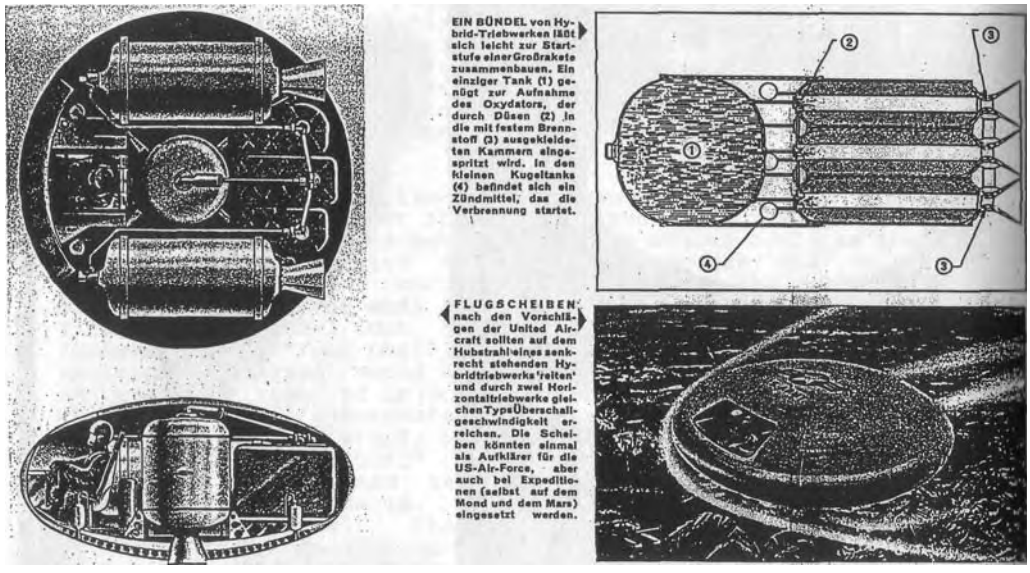
Fleissner was a technical advisor on the Peenemuende saucer project. An eye witness, known by Fleissner, told him this: "Shortly before the Capitulation, on April 24, 1945, a squadron of four flying discs took off-manned with two pilots whose names are unknown-under heavy artillery barrage from the German and Russian sides from the Berlin-Lichterfelde Airport to a still-today unknown destination." (Neue Press, 5/2/80, page 3)

March 28, 1955, it was not granted until June 7, 1960, over five years later! What could possibly have been the reason for the delay? The only possible reason concerns the American Silver Bug Project which was being developed at the same time. This was a project which was tasked with further development of the Miethe design or an outgrowth of it and simply referred to as a "radial jet engine". But we now know this Miethe project was not the equal of the Peenemuende project in terms of speed. The Americans must have realized this sometime after the filing of Fliessner's patent. There can be little doubt that the reason for the delay of the Fleissner patent was the evaluation and possibly the pirating of his design by the Americans. At about the same moment that Fieissner's patent was granted, it was announced that the joint Canadian-American saucer project, Silver Bug and its derivatives, had been abandoned by those governments. The only possible reason for this abandoning was that they had found something better and the better design, by far, was Fieissner's.

Fieissner's design was likened to a ram-jet earlier. It could function in this way but it was also much more than a ram-jet. Fleissner states in his patent that the saucer could be powered by any number of fuels: "liquid, dust, powder, gas or solid" (11). It could have used, for example, used the recently re-discovered fuel first made by Dr. Mario Zippermayr consisting of finely powered coal dust in a suspension of liquid air (13) or "Schwaramkohle" ("foam coal") and liquid air (14). Different fuel mixtures and types could be accommodated simply by varying or adjusting the type of injectors and ignition used. We know that the Germans used hypergloic fuels during the war, that meaning fuels which ignited simply by coming in contact with one another. "C-Stoff" and "T-Stoff" were German designations for the hypergloic fuels used in the Messerschmitt Me-163 rocket interceptor, for instance. These fuels could also have been used in this engine as well. Fleissner further elaborated in his 1980 article stating that liquid hydrogen and liquid oxygen were suitable for this design (11). Liquid hydrogen and liquid oxygen are rocket fuels of the highest order. This means Fieissner's saucer could function as a rocket with the proper fuel.

Shall we assess the implications? In its simplest form, Fieissner's saucer could have operated as a ram-jet on jet fuel. At its highest level, Fieissner's saucer could have operated outside the atmosphere on liquid hydrogen and oxygen. Or it could have done both. Fieissner's saucer could have taken off as a ram-jet, gained speed and aititude but at some point, reached a limit of diminishing returns. At this point, the saucer would have been able to slowly bleed liquid oxygen into the ram-jets for further performance enhancement. Further, it could slowly have replaced jet fuel with liquid hydrogen. This would be accompanied by a closing of the air intake apparatus. At this point there is no reason this saucer can not become a space ship, that is, able to operate beyond the fringes of the earth's atmosphere. Is this performance enough to impress the U.S. Air



Detailed Picture Of A German Saucer

This is a blow-up of the picture attached to J. Andreas Epp's "Still Alive" letter from Prag, March, 1944. Note air intake ring and crest for steering on the roof of the cabin. Diameter is about six meters. Is this the saucer described in the Aftonbladet article? Possible location is Stettin near Peenemuende.

Thinking Outside The Box

Hybrid Liquid-Solid Propellant Rocket

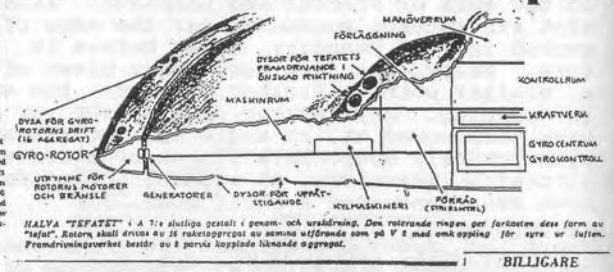
Top Right: 1. Liquid Oxidizer 2. Injection Jets for Oxidizer 3. Combustion Chamber Constrictions 4. Ignition Mechanism Solid fuel shown running along sides of combustion chamber (dark color). "Schaumkohle" (porous compressed coal) are suitable as fuel as would a mixture of Aluminum power and polyurethan combined with liquid nitrogen tetroxide. Thrust controlled by amount of oxidizer injected. Hypergolic mixtures would require no ignition system. Alternately, oxydizers could be solid and fuel liquid. "Nichts ist unmoeglich" Nothing is impossible

Force and the civilian population of the late 1940s and early 1950's? The answer is certainly in the affirmative.

There are design elements in the Fleissner saucer which link it to the work of Prandtl and Lippisch. It should be noted that the slot air intakes mounted near the edge of the saucer would have sucked in the boundary layer before it got any real chance to form. Below, the jets would have blown off the boundary layer at a similar point. Further, because the entire wing, the saucer, is spinning, any further development of a boundary layer would have been moved at an angle and so almost nullified as happens with severely swept-back wings of a conventional high-speed jet aircraft. Therefore, at supersonic speeds, this saucer might not have even generated a sonic boom.

There is some proof that the Fleissner-type of saucer was actually built and flown at Peenemuende or a nearby test facility at Stettin. Fleissner's patent is likened to wartime reality by a photograph. Actually, it is three photographs. These photographs have appeared in a fragmentary, vintage Dutch article on German saucers and they are attached to a wartime letter from Prag sent to this writer by J. Andreas Epp and later published in Ahnstern (15). No specific mention of the photograph is made in the letter and so it could be that the late Mr. Epp included it as a general example rather than a specific reference. Epp never claimed the saucers in these photographs as his design. Epp himself claimed to have the only photographs of that device. There is reason to suspect, however, that this design does bare a relationship to the Fleissner design.

The pictures show a small saucer with some telling features. One point of correspondence with the Fleissner patent is that the air intake is located near the periphery of the saucer wing. This is seen as seen in the ring just inside the saucer's edge. The other is that the directional control is clearly viable in the rudder mounted on the top of the cockpit or central cabin. In the picture the control is external and not as sophisticated as the Fleissner patent but the idea behind both are the same. In the pictured saucer, turns would be made by turning the cabin as a whole, thus, turning the rudder just as the prehistoric flying reptile, the Pterodactyl, turned its flight direction using a rudder located on top of its head.



Further confirmation of a Peenemuende saucer project comes from a Stockholm evening newspaper, Aftonbladet, dated October 10, 1952. It reports that a flying saucer, a "space ship", was developed by the Germans during World War Two at Peenemuende by Dr. Wernher von Braun and his rocket team. A test-model of this craft lifted off in April of 1944. It was six meters in diameter. The ultimate craft to be built, was a space ship of 42 meters in diameter, capable of flying an astonishing three hundred kilometers in altitude! Not stated in the article but interesting to note is that this 300 kilometers represents a higher altitude than the first American earth orbiting satellite.

Flygande tefat var Hitlers A 7-vapen

Genom det material som finns i Sverige kan det fastställas, att det s. k. flygande tefatet är en tysk konstruktion. Det konstruerades i robotanläggningen i Peenemünde med början omkring 1936 under ledning av professor WERNER VON BRAUN. I serien "robotvapen", den s. k. A-serien, hade det beteckningen A 7. Den flygande bomben V 2 hade här beteckningen A 4.

I april 1944 var man färdig med provflygningen, med ett tefat på 6 meters diameter och provet blev lyckat. Sedan kom den ryska invasionen i vägen och man blev aldrig färdig med slutprodukten, ett rymdskepp med 42 meters diameter avsett för höjder upp till 300 km. Ryssarna äger liknandem om konstruktionen, men originalritningarna till A-serien samt 90 konstruktörer skadas till Amerika, och konstruktörerna "Med von Braun i spetsen arbetar sedan 1945 i White Sands i New Mexico och har säkerligen kommit långt med sina konstruktioner.

Se även art. på sid. 6.

HALVA "TEFATET" i A 7:s slutliga gestalt i genom- och uppsprängning. Den roterande ringen ger farkosten dess form av "tefat". Rotorn skall drivas av 16 raketaggregat av samma utförande som på V 2 med omkoppling för styrning ur luften. Framdrivningsverket består av 8 parvis kopplade liknande aggregat.

BILLIGARE

Tyska tefatsbyggare i USA sedan 1945

Siktar på atomkraftdrivet rymdskepp

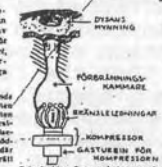
Det flygande tefatets såväl som de andra tyska fantomvapnens konstruktör är i första hand professor Werner von Braun och hans bror, men många andra deltog också, bl. a. den av Aftonbladet för några dagar sedan omnämnde överingenjör Georg Klein. Bröderna von Braun började redan på 1920-talet, men från och med 1934 tog Hitler hand om saken och kort därpå började man anläggra Peenemündeverken, som var färdiga 1938 och där fantastiska saker skedde.

De hemliga vapnen blev till slut, A 1 till A 16. Det flygande tefatet var A 7, men det kallades länge bara rymdskepp eller något dylikt. Först efter kriget har det efter lättgjelser på bilden dåpts till tefat. A 13 skulle bli det förkortningsvis av alla typen, användbart vid bombardering av Amerikanska städer, men det blev aldrig färdigt utan på pappret.

Rymdskepp på 200 ton

Byrået med A 7, tefatet, var att kunna nå ut i den luftlösa rymden med en farkost, som kunde förflytta sig med enorm fart på höjder där jordens dragningskraft avtar och driva med reaktionsdrift. Men redan i utgångsläget kunde man få tillräckligt användning för mindre typer av farkosten.

Bränslekonstruktionen skulle ha en diameter av 42 meter och 24 en vikt av 200 ton, varav troligen hälften bränsle, dvs syre och alkohol. Reaktionsaggregatens mynningar, de s. k. dysorna, placerar runt om och på undersidan. De ändamålende skulle driva upp den, "farkosten" stabiliserar genom en 12 à 13 ton tung ring som roterar runt centralkroppen. Detta är en gyrostabiliseringsring och den är förutsätter allt nödvändig i luftlösa rymder, där den inställer farkosten vinkelrätt mot jordens dragningskraft.



Rotorn är avsedd att rotera 3.000 varv i minuten. För förflyttning i sido- och höjdled på de stora höjderna skulle behövas mycket små reaktionskraftlar på grund av förhållandevis av luftmotstånd. Ändå skulle den i luftlösa rum uppnå en fart på 3 à 5 gånger ljudets. Rotorn skulle drivas av 16 raketaggregat av samma slag som V 2:n. Detta vapen var uppe på 120 km:s höjd.

Ideala drivmedlet

Detta är allmänt några data om A 7:an slutprodukt, som dock aldrig blev färdig i tysk uppläga. Det svåraste problemet att lösa även tekniskt var bränslefrågan. Det skulle åtgå oerhört mycket bränsle utöver farkosten som upp- och nedgående luftlösa rum. Även tyngdrutorn för bromsningen är en svår fråga. Det ideala drivmedlet för ett flygande tefat vore atomkraften, och förmodligen inriktar man sig i Amerika på att lösa detta problem.

Så länge hade alltså tyskarna kommit och ansåg sig ha löst problemen teoretiskt och laborativt möjligt. Sedan dess har de arbetat i Amerika i sju år ostörda av krig och med tillgång till nationens alla resurser. Man bör beräkna att det här är fråga om en parallell till stambesökens framställande, och för det ändamålets gjorda fantastiska ansträngningar.

Det är inte nödvändigt att inrikta sig på rymdskeppet, utan konstruktörerna kan mycket väl ställa på tefat för användning inom atmosfärens gränser och med mindre

Principiellt över raketaggregatet i A 7. Maximitryck i förbränningskammaren c:a 60 atmosfärer. Bränslen sker genom att gaser från en separat förbränningskammare tillföres gasturbinen, som sedan driver kompressorn för bränslets inspruta i förbränningskammaren.

Ingen inte ryska utan amerikanska. Nu åra obehindrat arbete i USA har troligen inte blivit alldeles fruktlöst.

Fakta hände i Sverige

De militära och tekniska fackmännen i de flesta länder är negativt nedervärdade om den sålunda kallade A 7-konstruktionen hade vid Tysklands sammanbrott. Även det svenska flygvapnet ställer sig avvisande, men redan 1945 meddelade det en teknikalitets rapport om hela A-serien från en svensk som visiterat i åtta tyska konstruktionsorganisationer.

Såväl flygvapnet som robotcentralen känner väl till saken och har givetvis kunnat identifiera "tefatet", när fakta om det på allenast blev dragits ifrån. Utgångspunkten för spekulationerna om tekniskt nuvarande ståndpunkt är just de tyska konstruktionerna av 1944 och 1945.

"astronomiskt" uppträdande av A 7:an slutmål.

Karaktäristiska iakttagelser

Alla länders krigsmaktsmän tager som mutton om tefatens hemligheter. Finns verkligen användbara konstruktioner av denna "förtrollerier"? Här kan allmänheten bara lita till iakttagelser. I Amerika har gjorts 1.800 iakttagelser som påstås vara flygande tefat. De flesta av dem har naturligtvis annan förklaring.

Men varför har dessa iakttagelser dykt upp endast efter kriget, och varför hållar man dem för "tefat", som är en mycket iakttagande beskrivning? Förmodligen har ej just det Ljusfenomen som man kan tänka — på de stora höjderna kan de vara nalbelysta medan det är mörkt på jordytan. Även dgras rörelser erfarge som stabiliseringsverkningar, och ljusstrimmorna efter dem är typiska. Men det jders naturligtvis ingenting till jordytan."

Om tefaten finns, så finns de i Amerika och Sovjet. De som anars vara iakttagna i Amerika är säker-

Dyrbar ring var nagellack

En stulen ring, som föregivits vara mycket dyrbar, då den var besatt med diamanter och en exklusiv röd sten, har vid granskning på kriminalen visat sig vara *ett falsarium*. Den röda stenen bestod endast av — rött nagellack, som fyllts i den lilla infattningen!

Det var i somras, som en amerikanska på hotell Malmen blev bestulen på sina smycken och för detta har nu en ingerarbetare häktats. Han gav smyckena till en väninna. Vid ett tillfälle blev de saknade och riktade i allmänhet. Under tumultet revs den rikliga röda stenen på fingret ur sin infattning. Kvinnan, som tyckte det såg tomt ut, fyllde i rött nagellack som länger tyste och gällde för en dyrsten. Det har sitt.

16—17-års FLICKA
med intresse för allär erhåller anställning i AFTONBLADETS depeschkontor, Norrmalmstorg 1. Den som kan något språk, främst engelska, har företräde. Rutigt, anständigt arbete, trevliga kunder och bra arbetsförhållanden. Sök anställningen kl. 10—12 i dag.

Höghusen blir stridsäpple

Fastighetsnämnden synnar just nu med frågan om vem som skall bygga höghusen vid Sveavägen. Ärendet berörde i går, hvrälll därför står som fete kommer överens.

Det vea likaret vill att Byggnadsentreprenörernas fastighetsaktiebolag (»BEFA»), 165:b, Skånska cement eller Olle Engkvist skall få bygga dessa hus. Majoriteten håller på att staden, Byggnadsbolag Svenska bostäder skall få uppdraget. Den skiljepunkten förfaktar ordföranden i fastighetsnämnden, borgerrådet Gösta Wennström.

Mot det förslaget hävdas att staden vinner mest på att den fria konkurrensen bibehålles. För höghusen skulle staden bilda ett nytt bolag och detta i sin tur anlita Svenska bostäder som entreprenör. Sådan är situationen för dagen. Innan man beslutar vill fastighetsnämnden invänta fastighetsdirektör Jarl Bergs återkomst på lördagen från en konferens i Lissabon.

Pojkar tog checkhäfte

Två 13-åriga pojkar gjorde i går en kupp mot en affärsinnehavarinna vid Bolinders plan på Kungsholmen. De greps nu av polisen. De brukar köpa tuggummi i affären, i vilken de rände ut och in på onödestermiddagen. I ett obevakat ögonblick stal en av pojkarna in på kontoret bakom affären. Då innehavarinnan försökte stoppa dem, förvrann de springande med ett checkhäfte, en bankbok och en lotteisedel.

Lampan med världsrykte

Swedish newspaper "Aftonbladet", dated 10/10/52, describes a German saucer built by Wernher von Braun at Peenemuende, six meters in diameter, which lifted off in April, 1944. The article states that high fuel consumption was the major problem, a problem which would be solved utilizing atomic power.

The construction drawings for this device are in the USA, according to the article, and the drawings are also known to the Russians. The chief difficulty with the saucer, according to the report, is the tremendous fuel requirements during its assent. This problem, it goes on to say, could be solved through the utilization of atomic energy.

Let us look at the picture of the three saucers again. In the lower left picture two dark objects can be seen resting on its top. Mr. Rothkugel suggests these may be bombs or fuel. Let us assume the latter, that they are fuel drums for refueling the saucer. In the USA metal drums of this type commonly contain petroleum products. They measure about three feet in height. Two are shown but six lengths could be stretched across this saucer with perhaps inches to spare. A meter is slightly over a yard. This saucer roughly corresponds in size to the description given in the Aftonbladet article. The picture on the right, minus the fuel drums and poised above some buildings, clearly shows that this saucer actually flew.

A whole technical history and organizational hierarchy can be pieced together from this picture, the Fliessner patent, and the Aftonbladet article. The Fleissner design minimizes the effects of boundary layer resistance reflecting the outcome of work starting with Ludwig Prandtl. It is a circular aircraft and a linear descendant of the circular aircraft designed by Dr. Prandtl and Dr. Alexander Lippisch. Fleissner states that he worked at Peenemuende. Peenemuende functioned as the head of all German saucer research. A fact of life at Peenemuende was that all German scientists deferred to Dr. Wernher von Braun who was an expert, the only expert, at everything. Dr. von Braun did have an organizational supervisor, Dr. Walter Dornberger, later to work for Bell Aircraft in the USA. Above Dr. Dornberger was Dr. Hans Kammler, the SS chief of all jet aircraft and vengeance weaponry. All these named men and organizations were part of the German saucer program, their public denials not withstanding.

One more loose end is tied up relating to the Fleissner design. This is the relationship of Dr. Giuseppe Belluzzo to the German saucer projects as a whole. Remember, Dr. Belluzzo was a senior scientist and engineer who specialized in materials and steam turbines. The Fleissner saucer design is normally thought of as a sort of ram-jet. But this ram-jet spun due to thrust imparted to it by its exhaust. This exhaust-supplied motion scooped in and compressed the incoming air before ignition. Low speed flight would have been impossible without this feature just as it is with any ram-jet. So another way to look at this engine is that it was a turbine-ram-jet no matter how incongruous this may sound at first. It should also be noted that in the rocket mode, when the saucer is burning only liquid oxygen and liquid hydrogen, the products of this combustion are only heat and water. Another way to say heat and water is steam. To repeat, Dr. Giuseppe Belluzzo was a steam-turbine expert. As mentioned earlier, Mr. Rothkugel reports that Dr. Belluzzo visited and,

presumably consulted with. Dr. Alexander Lippisch at Augsberg. Dr. Belluzzo's involvement with the German saucer projects should not be assumed to be confined to the Miethe project.

Let's review the Peenemuende Project to this point. It is a wide ranging project with at least two spin-offs, the Schriever-Habermohl project and the Miethe project. The Schriever-Habermohl project(s) employ a whirling set of vane-blades and one or more rocket or jet engines in a kind of "spinning top" manner. It may have been capable of supersonic flight. The Miethe project differs in that it employs an internal spinning turbo-jet first invented by Rene Leduc. Depending of the saucer configuration, its thrust can be vented in any direction for steering purposes. It also may have been capable of supersonic flight.

This design was given further study and was probably developed after the war in the form of the John Frost "Manta". A design such as this may have been responsible for the sightings by Kenneth Arnold near Mt. Rainier in the State of Washington in June of 1947. It was probably responsible for the pictures taken by William Rhodes as seen and described in the July 9, 1947 edition of the newspaper, The Arizona Republic. This same design, described as a "Flying Shoe" may have figured in the Roswell crash. Ideas from this design may have been further developed by A.V. Roe, Limited company in Canada.

Besides retaining overall control of these two saucer projects, the officials at Peenemuende retained and developed their own saucer project. Using similarities between surviving pictures from the time and the patent filed by a former member of that project, Heinrich Fleissner, we can piece together something of its design. Its identifying characteristic is its engine which has been described earlier as a turbine-ram-jet. It could operate using a variety of fuels. It could function as a jet engine within the atmosphere or covert to a rocket engine using liquid oxygen and liquid hydrogen. Its speed and altitude limits would have been much greater than either the Schriever-Habermohl or the Miethe saucers, yet its construction would have been less complex than the advanced designs of the radial-jet engines being developed in the Canada as part of the Silver Bug Program. Recognition of these facts, especially after the 1955 patent application by Fleissner, probably lead to the abandonment of the A.V. Roe, Limited project(s). A cover project, the "Avrocar" was released to the public, discredited by its own designers, and put away to be forgotten.

In discussing the Aftonbladet article we have jumped ahead of our story slightly in order to connect the three saucers pictures with the Fleissner saucer patent in a proper context. The Aftonbladet article has other implication which will be discussed. Now, however, we must once again return to basics in order to illustrate the next stage of saucer development envisioned by the German scientists.

Vesco makes mention of liquified air or liquid propellants or explosives numerous times in discussing flying saucers (16)(17)(18)(19)(20). Vesco refers to saucers powered using "liquid air". On page 135-136 of Intercept UFO he says:

"After the German surrender in May 1945, when the British examined the secret papers of the technical departments of certain factories hidden in the forested area of the Schwarzwald-another region earmarked as an "island" for a last-ditch stand-they discovered that some of the documents miraculously spared from the retreating S.S. units' destruction of papers concerned "the important experiments conducted with liquid air as a power supply for certain new types of turbine engines capable of producing tremendous power outputs. At first the discovery led them to believe that a new system for powering submarines was under study, but ancillary information about the construction of powerful apparatuses working on principle of electromagnetic waves that would make it possible to exercise radio control at great distances, as well as photographs showing some parts of the new turbine, caused them to change their minds. Thus they got on the track of a preliminary preparatory stage for a new and very powerful type of armored, radio-controlled aircraft".

Mr. Rothkugel points out that the logical projection of Vesco's statements on liquid air would involve a saucer in with air would be drawn in through the skin or through slots in the upper wing (saucer), then rapidly cooled by special equipment into liquid air. The liquid air would be burnt in a combustion chamber and the hot air and steam would be exited through a turbine used to produce the electricity which this process would require.

The saucer would be drawn along through the atmosphere by the low pressure area to its front and top as well as by aerodynamic forces caused by its wing at low speed. With the addition of more liquid air into the combustion chamber, the expansive forces involving the conversion of a liquid to a gas would provide additional performance enhancement. This amazing and little-know method was invented and patented by the Austrian Karl Nowak in 1943 (21) and will work even with inert gasses. Of course, even nitrogen, sometimes considered an inert gas and which constitutes the major component of our atmosphere, can be burnt with sufficing electrical ignition as is witnessed in lightning. The cooling needed to liquify the air would be generated using a cryostat, probably liquid helium. Liquid helium is the coldest of gasses, minus 452 degrees F, just above absolute zero. In addition to the cryostat, magnetic cooling machinery, such as is employed to produce liquid nitrogen would be employed (22). From the cooling power of liquid helium and evaporative techniques, liquid nitrogen and liquid oxygen can be made which are the major constituents of our atmosphere.

A saucer which could gather its fuel along the way has one obvious advantage. It could stay aloft for days if not weeks. More conventional chemical power could be employed for take-offs

and landings and for bursts of speed necessary for military applications. In fact, there is no reason that the propulsion systems of the Fleissner saucer and the liquid air saucer envisioned by Vesco could not be combined into one aircraft.

It is unknown at this time if actual steps were taken to realize a liquid air powered flying saucer by the Germans. Whether it was undertaken or not it certainly did lead thinking on to the next step in this process and for this step there is more than a little evidence. This step was mentioned in the Aftonbladet article. It involves atomic power. Yes, the Germans intended to build a nuclear powered flying saucer (23).

These are the conclusions first reached by Dr. Milos Jesensky and engineer Robert Lesniakiewicz in 1998. The former author is a Czech and the latter author is a Pole. Both belong to a large UFO organization which functions in both countries. After the Soviet pullout there were no restrictions on excavation of unused military sites belonging to the Germans during the Second World War. This organization got busy interviewing witnesses who had connections to those times as well as identifying German underground facilities. They opened up as many of these as they could find, and they were numerous. Most of the Polish sites were within the borders of Germany at that time since the borders, before and during the Second World War, extended into about 20% of Western Poland. Other sites were in the heavily German dominated areas of Moravia and Bohemia, now the Czech Republic.

Of course, the Germans had taken out what they wanted before retreating and then sealed up the entrances with explosives. As an example of how far this research group was willing to go, they not only opened up and explored the upper levels of Der Riese, mentioned earlier, but also explored the flooded lower levels, in the cold, silent darkness using scuba gear. Besides Der Riese, other very large sites were discovered and explored including "Robert 1", "Robert 11", and "Robert 111".

They found that the larger sites were really composed of a complex of sites. For instance, at Der Riese some of these sites within the larger facility were involved in mining uranium ore. Some were involved in refining the ore. Some other sites were involved in nuclear research (24).

Wartime German work in nuclear research was not confined to bomb building, as it was in the USA. The Germans were also interested in harnessing the atom as an energy source. Remember, Germany was dependent upon foreign sources of oil for energy. German planners long realized this was a weakness and had been trying to correct the problem since the early 1930s. Great plans were in the works, if not actually built, for atomic reactors used to generate electricity. These were sometimes called "uranium machines" by the Germans. Not only were these uranium machines to be used to generate electricity but they were also destined to

power submarines and aircraft.

Dr. Jesensky and Mr. Lesniakiewicz assembled and analyzed the great volume of evidence they had gathered over the years. They analyzed the physical evidence of the sites and interviewed as many people as possible. From the thousands of observations made and facts collected, they tried to draw conclusions. They found a close proximity and close association of the German nuclear program to the German flying saucer program. They concluded that one aim of the German nuclear program was to build a nuclear powered flying saucer (23).

There is some independent evidence supporting this conclusion. After the war, German physicist Werner Heisenberg wrote a paper concerning German interest in atomic energy. In that paper Heisenberg stated that in the summer of 1942 discussion had occurred among technical people specializing in issues of heat. This discussion concerning the handling of technical questions about the efficiency of conversion of heat from uranium to determined materials, for example, water or steam (25). It is hoped the reader would recall Dr. Giuseppe Belluzzo's specialties (materials and steam turbines) in connection to this discussion.

Further evidence can be gleaned from British Intelligence Objectives Sub-Committee Report. This report seems to follow a pattern we will see used again twice. The report does its best to discredit the informant in question, in this case a physicist and chemist, Josef Ernst, on one hand, while on the other hand the British thought it had enough merit to include this testimony concerning German research in some detail. Evidently, the intelligence agency in question is trying to cover all the bases in the event of any contingency. No matter if the scientist in question were to be cited or discredited, there would be language in the report substantiating both.

The report describes several areas of totally new German technology but what is of most importance to us here is Ernst's report of a new high speed fighter. The project designation is P-1073, and it was being developed by Messerschmitt. Three different engines were to be employed. The first was a B.M.W. 003 engine using petrol as fuel. The second engine was to use crude oil. The third aircraft was to use an atomic engine. This engine was described as 60 cms. long and 20 cms. in diameter. Ernst said it produced about 2,000 horse power! This aircraft was supposed to have a speed of 2,000 kilometers per hour (about 1250 m.p.h.) and a ceiling of 18,000 meters (over 54,000 feet). It was made at a Camp Mecklenburg. Only one model was ever made and it was destroyed, as was Camp Mecklenburg, by the SS before being taken by the Allies (26).

Establishment historians have all told us that the German atomic program was inept and disorganized. There may be some evidence for the charge that they did not share information between themselves due to strong rivalry (27) but the real facts are

British Intelligence Objectives Sub-Committee Report Number 142

C. Interrogation of Josef Ernst

In the course of interrogation it became clear, that Ernst was not at all reliable, and though there may in some cases be a factual basis for some of his claims, they are as a whole inaccurate and of doubtful value.

(a) Personal history of J. Ernst

Ernst's own account of his life did not agree with the details which were extracted from a file in his possession, and which are given below. He was born at Malsch, near Ettlingen in 1899, and claims to be a physicist and chemist. He became a teacher, but was removed from his position in 1923 for dishonesty and then tried to make a living by obtaining financial backing for various inventions which he claimed to be capable of developing. He was eventually charged with obtaining money by false pretences and imprisoned at Mannheim in 1944. Here he claimed that he had a process of obtaining petrol from oil, and was brought to Berlin by the S.S. Hauptamt under the charge of Kreutzfeld. After spending some time in hospital, he was ready to begin work, and in April 1945 was brought to Hinterstein, near Sonthofen, again under the charge of Kreutzfeld.

(e) High speed fighter aircraft

Ernst said that while he was in Camp Meclenburg, he found out that there were three new types of high speed fighter aircraft. One of these was the P 1073, made by Messerschmidt with a B.M.W. 003 engine using petrol as fuel; and the second was a similar aircraft using crude oil as a fuel. The third was alleged to be powered with an atomic engine. The fuselage, which was the same as the P 1073, was of wooden construction and was fitted with skid landing gear. The engine was 60 cms. long and 20 cms in diameter, and produced about 2,000 h.p. This aircraft was supposed to have a speed of 2,000 km./hr. and a ceiling of 18,000 m. The engines were made by the prisoners at Camp Mecklenburg. Only one model was ever in existence, and that was completely destroyed, as was the whole camp, by the S.S. during the Allied advance.

Top: British efforts to accredit and discredit their informant, Josef Ernst. This theme appears repeatedly in Allied documents in association with German informants. The intelligence people were merely covering themselves for all eventualities. Bottom: A German atomic airplane built at Mecklenburg. The Mecklenburg facility utilized some personnel which were considered to be a security risk.

quite different than heretofore publicly disclosed (28). The overwhelming fact is that until now establishment historians have not had enough information to reach final conclusions about the German atomic program. Many facts have been concealed and these facts are only now being brought into the open. One fact is that there were even more German atomic programs than previously known, and the fact is that one of these programs was run by the SS (28).

One establishment historian, Thomas Powers (29), perhaps unwittingly gives us some insight into the discussion at hand, Powers concentrates on the historical sequence of the German atomic program and with the people involved and their relationships with one another. He also follows the progress of the many organizations researching atomic physics for the purposes of energy production and bomb making. Powers documents six such groups.

One group concerns this discussion. It was run by the Heereswaffenamt or Army Weapons Department. Its Director of Research was Dr. Erich Schumann who was also the scientific advisor to Field Marshal Wilhelm Keitel. Schumann was a professor of military physics at the University of Berlin. He also held a commission in the army so with these credentials he was able to move comfortably in both academic and military circles. Schumann should be thought of as an administrator rather than a research scientist (30).

The field of research was left to Dr. Kurt Diebner (31). Diebner was a physicist for the Heereswaffenamt since 1934 and headed his own atomic research project. German physics during the war years was geared towards practical results. During the early phases of the war it was thought that nuclear weapons were unnecessary. The thinking at the time was that the war could be won without an atomic bomb using conventional weaponry. Therefore, work on atomic weapons was de-emphasized in the early years of the war. Work on atomic means of energy production was always a high priority, a priority which only got higher as the war drug to a conclusion.

Germany always felt more threatened by dependence upon foreign sources for energy. Therefore, harnessing the energy potential of the atom for an ongoing source of energy was always a concern for German atomic scientists, much more so than for the Americans. This aim is clearly mentioned in discussion among the scientists involved in the work.

In early 1942 the success of Diebner's reactor experiments lead him to propose a full-scale effort to develop both power-producing machines and atomic bombs. He continued to pressure Schumann who was more pessimistic about the possibilities of bringing this research to a practical result. Schumann finally became convinced and agreed to give a presentation to top Nazi officials of their findings. The text of Schumann's speech was

to stress the more conservative energy production aspect of atomic research rather than the building of a bomb. This was considered more feasible and so gives us an insight into the German atomic program and its thinking (32).

One example of their optimism was the participation of Diebner in plans for building an atomic power plant for Germany's submarine fleet. The year 1945 was mentioned as a target date for this to happen (33)(34).

Diebner's relationship to Schumann is made clear by Powers. Powers also introduces us to two additional players who were not officially involved with this project but who somehow interject themselves into things making their view heard.

The first is industrial physicist, Carl Ramsauer. Ramsauer was the head of the German Physical Society and a leading researcher for the electrical firm Allgemeine Elektrizitaetsgesellschaft. Ramsauer urged the German research establishment to rid itself of ethnic physics and get down to the business of using science to win a war (35).

A second scientist interjected himself into the fray in support of Ramsauer. This was none other than Ludwig Prandtl whom we have met earlier (36). Prandtl was familiar with the potential of fission's use in the war effort and insisted that the Nazis let scientists do science without reference to ethnic background or politics. Why was German atomic research so important to an a scientist involved in aeronautics? What aims did Prandtl have in common with these other individuals which linked them together? What was the urgency that compelled Ramsauer and Prandtl to intervene in a matter outside their areas of expertise and in opposition to the will of Nazi officials?

To answer those questions, let us look at each individual involved and his major area of interest. Professor Erich Schumann's interest was the military application of atomic energy. Dr. Kurt Diebner's interest was the development of atomic energy for nuclear weaponry as well as for a variety of other applications. As an industrialist, Karl Ramsauer's expertise was putting technology into large-scale, practical, production. In this time and place that meant military production. We already know that Professor Ludwig Prandl's interests were round-wing, suction aircraft. The interests of these four could only coincide if we were discussing tha military-industrial production of a nuclear powered, round-wing, suction aircraft.

In addition, it is now known that Dr. Diebner, more than any other well known German scientist, was at the heart of the German atomic bomb development. It was Dr. Diebner who participated in the development of a German uranium bomb which was being prepared in one of the underground facilities at Jonastal, specifically at a facility "Burg". Not only did Dr. Diebner do this but he did

NAZIS HAD 10,000 mph ATOM PLANE—IN THEORY

MANY of Germany's inner secrets had been unlocked by the United States and Britain and were being adapted for the war in the Far East when the Japanese *surrendered.*

MORE THAN 300 BRITISH AND AMERICAN TECHNICAL EXPERTS FOLLOWED HARD ON THE HEELS OF THE INVADING ARMIES IN EUROPE TO TRACK DOWN SECRETS, HOWEVER WELL HIDDEN, BY THE GERMANS.

The thoroughness of the search in Germany foreshadows a similar probing for secrets now locked in Japan.

This is revealed in a statement issued on behalf of the Combined Intelligence Objectives Sub-Committee and the Technical Industrial Intelligence Committee — agencies authorized by the British and United States Chiefs of Staff — and published by the British Ministry of Information and United States Office of War Information.

Discoveries show that German invention was far ahead of her capacity to translate theory into industry.

Not only had the Germans made significant progress in the development of the atomic bomb and on the production of "heavy water," but they had contemplated a piloted missile with a possible range of 5,000 miles.

The designer envisaged commercial applications for trans-Atlantic passenger transport in 17 minutes.

The Germans were working on a formula for new war gases which they hoped would prove more deadly than any chemical agent yet developed.

DETAILS FOR NEWER NAVAL VESSELS

They had specifications and construction details for naval vessels of advanced design, including submarines with high underwater speeds and apparatus for sustained underwater operations.

They had developed a system of Radar camouflage, consisting of anti-Radar coverings and coatings to be employed on submarines and other weapons and had highly advanced jet engine, rocket-assisted take-off, and aero dynamics designs.

New uses had been found for many staples and from coal the Germans were making synthetic butter as well as alcohol of both beverage and industrial types, aviation lubricants, soap and petrol, and they had designs for various secret types of guns and gunsights.

Other German war secrets ranged from records on the location of German capital in neutral countries and the status and composition of German cartels, speed-fications of long-range rocket developments which scientists described as "sensational."

The information gathered is not only valuable in the shaping of the policy for control of Germany but *is expected* to influence post-war scientific and industrial developments.

BOMBER CHIEF RETIRING

Air Chief Marshal Sir Arthur T. Harris, Air Officer Commanding-in-Chief Bomber Command since February, 1942, will relinquish his appointment next month, and shortly afterwards retire from the Royal Air Force, announces the Air Ministry.

He will be succeeded by Air Marshal Sir Norman Bottomley, at present Deputy Chief of Air Staff.

999 Was His Unlucky Number

THE unluckiest crook in London is now serving six months in Wandsworth Jail and still finds it difficult to understand how he landed there.

When he left a Peckham woman by the back window carrying a suitcase filled with silverware, jewellery and clocks, police met him at the end of the road.

His capture was a result of the new radio - telephony system — calling all cars — which is being introduced by Scotland Yard. The snag was caught during a "dummy" run in South London.

A housewife dialled 999 and found herself speaking to the information room at Scotland Yard. The quick-witted inspector switched a police car which was on the testing trip in the area to the road and the burglar was under arrest then, minutes and twenty-five seconds later.

Scotland Yard hope for a big increase in London crime through the introduction of the new system.

Although all of London will not be covered at first, supplies of the necessary radio parts are now coming in, and Chief Inspector Bowman of the Yard's Communications Branch, can complete the work he began in 1939.

Every patrol car, flying-squad car and "Q" car—lash and removal vans disguised—will soon be in radiotelephonic communication with the Yard's control information control room.

Poison Gas Bomb Panics VJ Crowd

Hundreds of people celebrating victory in Strasbourg, Northern Ireland, were affected when a police gas bomb was released in the crowd.

Women and children panicked and within a few moments of the explosion the street was littered with people lying ill.

Taxis and private cars drove the affected people to their homes and doctors were kept busy throughout the night attending to them.

The symptoms were those of a lung irritant gas containing chlorine.

Police believe that the bomb was let off by one of the celebrators who did not realise the seriousness of what he was doing.

MONTY STARTS SAVINGS DRIVE

Field-Marshal Sir Bernard Montgomery and Air Chief Marshal Sir Hugh Dowding, commanding the RAF in the British zone in Germany, are personally directing a drive against heavy spending by British occupation forces.

With nothing to buy locally,

Gen. McCreery Arrives For Vienna Talks

The Allied Commanders in Austria met recently in Vienna. The BTA Commander, Lt.-Gen. Sir Richard McCreery, is seen, at the British airfield at Vienna, above, with (left to right) Wing Commander East (orderly Commander), Lt.-Gen. Betrovsky (representing Marshal Koniev) and Air Commodore Epstein (Commander of the Air Division, Vienna).

Below, the BTA Commander steps to shake with one of the RAF Regt. crowd of honour at the airfield.

The Russians Are To Quit Manchuria In 3 Months

UNDER the terms of the treaty between China and the Soviet, published simultaneously in Chungking and Moscow during the week-end, Russia is to render military and material assistance to the Chungking central government of China in a plan of collaboration to prevent a repetition of Japanese aggression.

Reaffirming respect for China's full sovereignty in her three eastern provinces, Stalin has given an assurance that after the Japanese capitulation the Russian forces will withdraw from Manchuria within three months.

In the case of Sinkang, Russia reiterates that she has no intention of interfering in Chinese internal affairs while China is to recognise the independence of Outer Mongolia if the plebiscite proves that the people so desire.

The trunk line of the Chinese eastern and south Manchurian railways will be combined into one jointly-owned and operated line known as the Chinese Changchun railway *for a period of 30 years* after which it is to revert to China.

Dairen has been declared a free port by the Chinese Government and for 30 years Port Arthur will be a joint Chinese-Russian naval base.

Although the Chinese Communists are not specifically mentioned, the treaty is regarded in Chungking as a political defeat for them at a particularly difficult time.

NO CIVIL WAR?

It is the impression in London political circles that the recent conversations between the Chinese Prime Minister, Dr. T. V. Soong, and Generalissimo Stalin have notably reduced the risk of civil war in China.

THREAT OF 'UNBEATEN JAP ARMY'

FEARS of a Japan still believing, in spite of defeat, in its glorious destiny and the invincibility of its army, with the Japanese General Staff "going to ground", as did the German staff in 1918, were expressed by *The Times* yesterday.

In the demilitarisation of the Japanese people the paper urged the honest application to Southeast Asia of the principles of San Francisco.

"The circumstances of the Japanese surrender, the paper observes, imposes upon the Allies the necessity for extreme caution.

"ARMY DEFEATED IN . . .

"REMOTE" AREAS

"While the Japanese naval and air forces have been almost annihilated and the civil population has been shattering demonstrations of Allied might, the land forces have sustained likely much defeats in areas remote from public observation," *The Times* adds.

"Large bodies of Japanese troops will return home with no other experience than that of victory and many Japanese commanders of overseas territories will bend with truth that they surrendered not to Allied armies, but in deference to Imperial rescript.

"The way is thus open for the propagation of the myth which proved so formidable a feeder in the rise of the Third Reich—that the Army had never been conquered and that the war was lost by poor civilian morale caused by the Allies employing unfair weapons.

"The Allies can expect little aid from civil authorities in opposing this dangerous myth.

"The governing class from the Emperor downwards is engaged in persuading the nation that the Imperial prerogative remains intact and the destiny of Japan glorious."

The Times claims that the road to be aimed at is the demilitarisation of the minds of the Japanese people.

"First is the most main instrument which may be expected to contribute powerfully to such conversion.

"First is Soviet application to South-east Asia of the principles of the San Francisco Charter and second a spectacle of unity among the United Nations in pursuit of their declared aims.

"One of the contributory motives of Japanese aggression has been a deep resentment at the disposition of the Western Powers to treat the Eastern peoples as their inferiors.

WISHED TO UNITE EAST AGAINST WEST

"Japan desired to unite the East against the West under her own leadership and let the Japanese invaders displayed even zeal in handling the newly-ac-

Peace In Long Buckby, Too

People in the Northamptonshire village of Long Buckby are speaking to each other again now that Japan has surrendered.

Their war started on VE-Day, when it was found that the parish council had not arranged any celebrations.

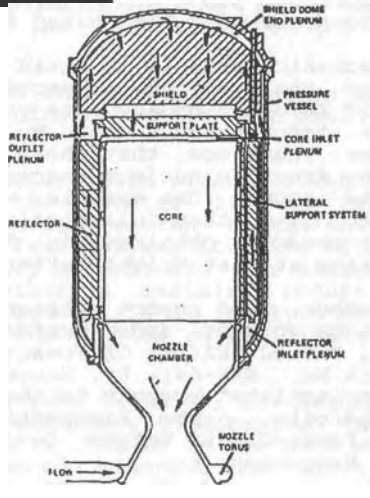
Jack Cooper, secretary of the local Comforts Fund, Frank Riddell, the village fishmonger and Home Guard, Bill Coleman, the ailment sweep and Bob Silcock, bootmaker, got together and with many more helpers arranged VE celebrations 25 days

The 8th Army News, Triest, August 28, 1945, page three. For a short period of time, before the Cold War started heating up, censorship, both military and civilian was lax. It is from this time period from which we get much valuable information

this within a working association with the SS atomic research team mentioned above (37). This SS connection runs back to Prag, the Skoda Works and the Kammler Group who held knowledge and control of every truly innovative weapons system being developed by the Third Reich including those at Peenemuende. As we know, this included the development of flying discs. The association of the facilities in and around Prag, the Kammler Group, atomic energy and German flying discs has been made by other researchers using other evidence (38). This connection seems very strong.

The Germans were planning an nuclear powered flying saucer just as they were planning a nuclear powered submarine. The proof for both of these claims is the fact that the Americans discovered such plans, further developed them with captured German scientists, and built them in America after the war. We already know about the nuclear submarine and proof of American plans to build a nuclear flying saucer based upon German ideas has just been reveled.

Jim Wilson, writing in the November, 2000 edition of Popular Mechanics discloses something of major importance. Wilson tells of the days following the collapse of the 3rd Reich and a rumor which had begun circulating in Allied military intelligence circles. Interrogations of captured German aircraft engineers pointed to the development of a super-fast German rocket fighter at a secret base in Bavaria (the reader will recall the research aircraft 8-346 and P-073 mentioned earlier). This aircraft, according to Wilson's article, featured odd looking curved wings which blended into the fuselage.



Documents obtained by Wilson point to an American secret saucer project, separate and parallel to Project Silver Bug, of German inspiration and involving captured German personnel. This project, called the Lenticular Reentry Vehicle (LRV), was a flying saucer designed to carry four nuclear tipped missiles into earth orbit for a mission duration of six weeks at a time. The saucer had a four man crew, was forty feet in diameter and was powered by a combination of chemical rocket engines and nuclear power (39).

The chemical engines were the hypergolic rocket engines of the same type as employed by the Germans during the war in the Me-162 rocket interceptor and referred to earlier.

Besides the chemical rocket engine, two atomic engines were employed as atomic rockets. In this type of engine a liquid gas (perhaps liquid air as described above) which is very cold, is passed through the atomic reactor or passed through a radiator of molten metal heated by the reactor. The liquid gas turns to vapor instantly and is accelerated out the rear of the rocket at a greater velocity than can be obtained by burning two liquid gases, for instance, hydrogen and oxygen. Although a shielded nuclear reactor is certainly heavier than an air-cooled aero-engine, there might an overall weight savings as compared to a

Nuclear Gas Core Reactor

TYPICAL ROCKET PROPULSION REACTOR

Top: The simple story is that hydrogen is passed through or by an atomic reactor. The very cold liquid hydrogen in instantly heated and greatly expands, providing thrust for the rocket. No actual combustion occurs and no oxidizer is needed. Bottom: A detailed look at the reactor itself.

conventional liquid rocket system since a liquid oxidizer, such as liquid oxygen, need not be carried on the vehicle. The atomic engine would also produce electricity for the saucer using this expansive output coupled to a turbine generator.

Wilson cites some evidence that this saucer was built and actually flew (40). Orbiting at an altitude of 300 miles and with a six week mission, this saucer was in reality an orbiting space station capable of raining destruction down upon any country or countries deemed an enemy. One can extrapolate a rotation system by which such a dreadnought was always kept on station for such a contingency. Klaus-Peter Rothkugel has suggested that an orbiting doomsday space station such as this was to be called the "Gatland Space Station" and that it was part of a strategic military joint-effort between the United States, Britain, Canada and perhaps Australia. Before the Popular Mechanics revelation, this assertion might have been dismissed as lacking in proof but now this idea must be given a hearing.

Wilson states that project's general contractor was North American Aviation in California but the project was managed out of Wright-Patterson Air Force Base in Ohio where German engineers who worked on rocket plane and flying disc projects were housed under secret contract with the United States government (41).

The Popular Mechanics article is based upon information obtained from working on the American perspective and going back in time. The Freedom Of Information Act was very skillfully employed in obtaining this information. What Mr. Wilson did not know was what the reader knows now, that there is a trail of information leading to the American nuclear saucer project which started in Germany in the 1930s. One example which links both lines of evidence and bringing them full-circle back to the German origin is one report recently obtained via FOIA on a particular German scientist working at that Wright-Patterson facility.

This is a December, 1946 report written by one of those captured German scientists working under contract for the USA, Dr. Franz J. Neugebauer, titled "Effect Of Power-Plant Weight On Economy Of Flight (Project No. NFE-64). Dr. Neugebauer was, in fact, one of those "booty scientists" brought to the USA under the auspices of Operation Paperclip. The Biographical Note in the report, "Effects Of Power-Plant Weight On the Economy Of Flight", describes Dr. Neugebauer as:

"Dr. Franz J. Neugebauer is the foremost German authority on this subject. An Expert on internal-combustion engines and a specialist for Diesel compound aircraft engines, he held leading positions at Junkers in Dessau and Munich from 1924 to 1943, and was director of the engineering department of the Institute for Aeronautical Research at Munich from 1943 to 1945.

Dr. Neugebauer is employed at present in the Propulsion Section, Analysis Division, Intelligence (T-2), AMC, Wright

field, Dayton, Ohio" (42).

Two comments are in order. The first is that Junkers-Dessau is associated with a possible German saucer project designated "Schildkroete" which will be discussed later. The second comment is that Dr. Neugebauer was not brought to the USA to build diesel-powered aircraft. Diesel engines are much heavier than piston type aero-engines of those times. Dr. Neugebauer's relevant expertise is, in reality, his knowledge of the effects of heavy engines on aircraft performance and economy.

Nowhere in this report are the words "atomic rocket" mentioned but the implications are clear. As touched upon above, an atomic rocket's weight distribution would be somewhat different from that of a conventional rocket or aircraft. The nuclear reactor would be weighty but the fuel load would be lighter because no oxidizer, such as liquid oxygen, would be necessary. Also, the power output would be somewhat greater than an ordinary liquid fuel chemical rocket. The three variables as opposed to the already known figures for piston, jet or chemical rocket engines are greater engine weight, lesser fuel weight, and greater power output. A new equation was necessary if atomic rockets were to be fitted into an aircraft design calling for a certain speed, payload or range. It was Dr. Neugebauer's job to do this computation.

The following is a paragraph from the introduction of this report (43). It seems to say nothing but state the obvious until one thinks "atomic engine":

"Power-plant weight is a factor which affects flight performance; the greater the weight, the greater is that portion of the airplane and the drag which is affected by the power plant. In contrast to the effect of fuel consumption, the effect of power-plant weight cannot be easily determined. For example, it cannot be easily determined whether a certain reduction of fuel consumption is still advantageous if it involves an increase in power plant weight. This report aims to facilitate insight into these and similar questions."

Without ever mentioning the word "atomic", Dr. Neugebauer did the mathematical computations necessary to establish the feasibility of an atomic powered aircraft. Thanks to the work of Mr. Wilson, we know that at least advanced planning was undertaken with the goal of building an atomic powered flying saucer. There is no doubt that the Americans would not have involved captured German scientists in this project unless it was absolutely necessary to do so. The reason it was necessary was the same reason which other German scientists were employed in America's ballistic missile program. It was because both groups of German scientists has previous experience. Both groups worked on very similar projects in Germany during the war. These scientists and their projects were far ahead of the Americans in both these areas. The input of these scientists was absolutely essential if these

projects were to succeed in a timely matter, meaning, ahead of the Soviets.

Two final points or comments should be added to this discussion. First, while the Peenemuende saucer project was run in and around Peenemuende, research and component work were probably also done in other facilities elsewhere within the Greater Reich. References to saucer research at some of these other sites by this or other writers may be, in fact, part of the overall Peenemuende project.

Second, historically speaking, the German atomic projects have always been minimized to say the least. For whatever reason, there seems to have been a concerted effort to deny German expertise in the field of atomic energy. Originally, this may have been government inspired. Now, however, it seems to be a mantra taken up as part of some agenda whose specifics remain clouded. "Nay-saying" regarding German atomic projects has become sheik and those who expound it imply knowledge and sophistication in their opinions. Anyone doubting the high degree of understanding possessed within the Third Reich concerning matters "atomic" should take a look at the evidence being put forth by on-site investigators and German language researchers which have arisen since the fall of the Berlin Wall. Much of this information is in book form available from Anum Verlag. Anyone with the interest and ability to read German language is urged to contact this publisher for a list of publications. After reviewing the evidence, German wartime expertise in atomic research sounds much less far-fetched than the nay-sayers would have you believe.

The Peenemuende Project

Section Summary

It can be said that the German flying disc program built upon itself, each innovation retaining something from a previous design yet incorporating a new innovation. This progressed through several steps until the original had seemingly nothing in common with final design. At each step a saucer project or at least a saucer design, seems to have been spun off. Each of these spin-offs was not an independent, stand-alone project but remained under the guidance and direction of an overall controlling authority. If viewed out-of-context, the multiplicity of designs and spin-offs have led to confusion concerning the whole. Proponents of each design or spin-off have championed the project with which they were familiar as "the" German saucer project. Let us try to keep idea in mind when discussing the next group of saucers which may or may not have had a relationship to those already discussed.

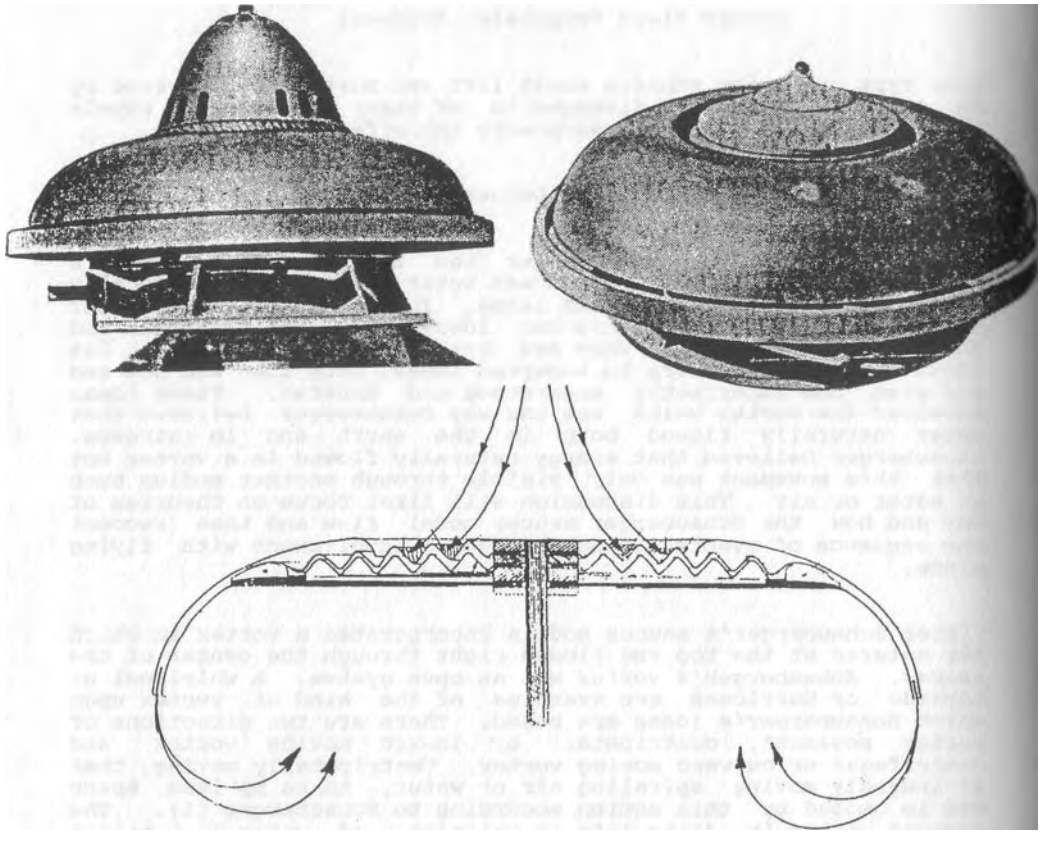
CHAPTER FOUR

German Field Propulsion Projects



This type of flying vehicle would lift and move itself powered by an electric, magnetic, diamagnetic or ether field which repels earth's magnetic field or overpowers the effects of gravity.

The Viktor Schauberger Models

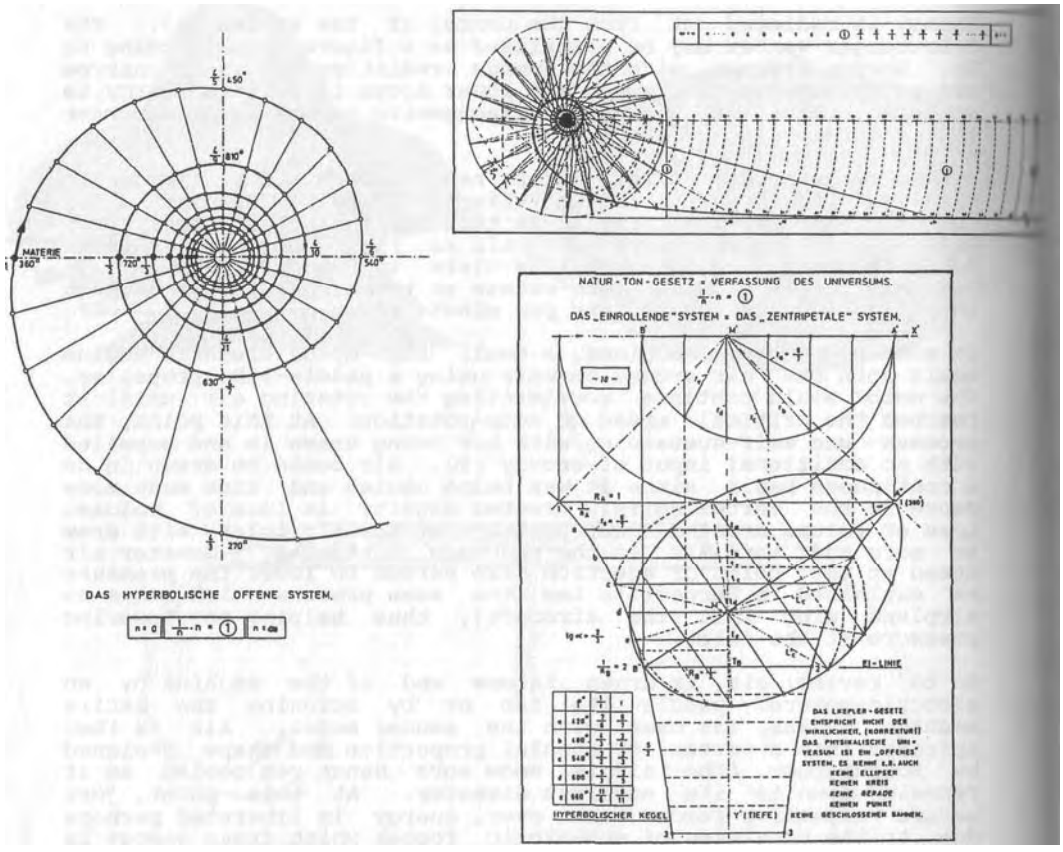
An Austrian, Viktor Schauberger was first and foremost a naturalist. His primary focus was water as found in naturally occurring streams, rivers and lakes. In observing the movement of water he formulated his own ideas about its movement and energetic properties. They are applicable in air also. His ideas are guite contrary to accepted ideas, both then and now and are even now imperfectly understood and debated. These ideas involved the vortex which was the way Schauberger believed that water naturally flowed both in the earth and in streams. Schauberger believed that energy naturally flowed in a vortex but that this movement was only visible through another medium such as water or air. This discussion will first focus on theories of why and how the Schauberger saucer model flew and then recount the sequence of events in Schauberger's involvement with flying discs.

Viktor Schauberger's saucer models incorporated a vortex in which air entered at the top and flowed right through the center of the saucer. Schauberger's vortex was an open system. A whirlpool or tornado or hurricane are examples of the kind of vortex upon which Schauberger's ideas are based. There are two directions of vortex movement, centripetal or inward moving vortex and centrifugal or outward moving vortex. Centripetally moving, that is inwardly moving spiraling air or water, takes up less space and is cooled by this motion according to Schauberger (1). The example we see in daily life is the motion of water in a toilet after flushing. He called this centripetal movement "implosion". Implosion was always accompanied by explosion as the fluid expanded again in an outward, centrifugal spiral. The process is first centripetal then centrifugal. The form this vortex took is really dictated by function according to Schauberger. The "function" is the energy flow. The spiral vortex is the shape the energy flow takes in its movement (2). Energy flows in at the top of the vortex in the characteristic double-spiral manner. These air molecules are imploded, that is, they are made more dense and they yield heat as they progress (3). Air molecules are squeezed tighter and tighter together as they move down the vortex until the sub-atomic particles themselves become unglued transforming into new and unrecognized forms of energy (4). As the vortex itself decreases in diameter implosion and speed are

Viktor Schauberger's Saucer Models

Top: Schauberger models. Bottom: Sectional diagram. The zig-zag is the air passage. The passage is a hollow space between two plates. As the saucer spins on its axis, the air enters and moves away from the center toward the rim following the up and down flow of the zig-zag. The spin causes individual tornado-like vortices to form as the spin causes the air flow to fold over on itself as it moves outward. Vortices become smaller in diameter and more "densified" until they reach the rim where they are released into the atmosphere, rapidly expand, and yield energy. Model is multi-section, copper. Courtesy Klaus-Peter Rothkugel

increased until they reach the point within the vortex where centripetal forces stop and centrifugal forces take over.



Energy is radiated out from the center of the vortex (5). The Schauberger vortex may be visualized as a figure "8" according to Dr. Gordon Freeman, with the energy radiating out at the narrow mid-point between the upper and lower loops (6). This energy is produces levitation. It may be diamagnetic energy as Schauberger believed (7).

Viktor Schauberger first built new designs for flumes to transport logs. He then built water purification machines using the principle of the vortex. He then built electric generators, heaters and coolers using only air as fuel. The breakthrough using machines was Schauberger's claim to have found a way to make his vortex machines auto-rotate at rotational speeds between 10,000 and 20,000 revolutions per minute (8).

In some Schauberger machines, a small high-speed electric engine would spin the air around an axis using a paddle-like propeller. The motor would continue accelerating the rotating air until it reached the critical speed of auto-rotation. At this point, the process was self-sustaining with air being drawn in and expelled with no additional input of energy (9). Air could be drawn in on a continuous basis since it was being cooled and thus made more dense in the vortex spiral. Greater density is loss of volume. Loss of volume created lower pressure at the air inlet with drew in more and more air as the reaction continued. Greater air speed at the point of ejection also served to lower the pressure as explained in Bernouli's Law (the same process which makes an airplane wing lift the aircraft), thus helping to lowering pressure at the inlet.

So to review: air is drawn in one end of the machine by an electric-powered, paddle-like fan or by spinning the entire machine as was the case with the saucer model. Air is then spiraled into a vortex of special proportion and shape designed by Schauberger. The air is made more dense yet cooled as it funnels down to its smallest diameter. At this point, just before expansive forces take over, energy is liberated perhaps due to the un-gluing of sub-atomic forces which frees energy in some manner currently imperfectly understood. The air begins to expand in a centrifugal motion as it warms. It is at this midway point that the air exits the saucer model at its periphery or lip of the saucer to expand centrifugally in the open atmosphere. Once a speed of 10,000 to 20,000 revolutions per minute is attained, the machine auto-rotates without need of the small electric-powered starter motor.

The exact proportions for the Schauberger pipes are designed geometrically. This geometry is of a rather esoteric nature. For instance, the bend of the spiral pipe is calculated using the Golden Section. For some time a true engineering genius, Dr. Gordon Freeman, has been writing to some interested parties and

Top Left : The Hyperbolic Open System. The movement could be centripetal or centrifugal. Top Right: Law of Natural Tones resulting from the hyperbolic spiral. Bottom: The egg-shape, built according to the non-Euclidian Law of Natural Tones, correct some of the planetary motion laws of Kepler according to Schauberger.

explaining how certain shapes or wave patterns can impact conventional physics. He believes one needs to understand known science as well as a more esoteric doctrine in order to appreciate the nature of free-energy and some types of field propulsion UFO craft. The work of Viktor Schauberger is an example of this. In this work there remains a world of knowledge imperfectly understood by most of us.

Returning to the mechanism by which these models flew, Schauberger himself always made the point of the fact that his saucer models were constructed of diamagnetic materials. Diamagnetic materials are those which are repel a magnetic field. Schauberger considered copper diamagnetic (10) and the surfaces of the saucer models coming in contact with air were made of copper.

As mentioned above, the very atomic structure of these atoms may have altered by this process. Coats tells us that electrons, protons and neutron may have been separated from one another (11). It has been suggested that the electrons and protons of these atoms were stripped from their nuclei. Their opposing charges were free and attracted one another resulting in their mutual annihilation of one another yielding a release of energy (12). This would occur exactly at the point where centripetal forces ceased and centrifugal forces began, these air particles reversed their spin and altered their rotation.

Further, Coats explains that the neutrons, which were left over in the process described above, and contrary to accepted views, are themselves magnetic (13). These neutrons were expelled from the saucer centrifugally along with water, water vapor and air which had not reacted as stated above. These "magnetic" neutrons, on the outside of the saucer body may serve to increase the diamagnetic reaction of the copper saucer which would be both pushing away from the earth and the cloud of surrounding "magnetically charged" neutrons. In other words, the Schauberger disc may have been repelling away from the magnetically charged atmosphere which it itself had just created.

Dr. Richard LeFors Clark proposes a more detailed description of similar ideas involving the mechanism of the Bloch Wall (14). This will be discussed in the section involving Karl Schappeller but it should be kept in mind while reading these ideas that Dr. Clark had Schauberger in mind. These ideas and others pertaining to both Schauberger and Karl Schappeller will be presented in the Schappeller section to follow.

The history of the Schauberger flying disc models is as follows. According to Alexandersson, Aloys Kokaly, a German, began work for Viktor Schauberger in the early days of the Second World War producing certain parts for a "flying object" which were hard to obtain in Austria. The parts were to be delivered to the Kertl Works in Vienna which was the site of this work at the time. The Kertl Works were operating "on higher authority" in association

with Schauberger. Kokaly was received at Kertl by its chief and told by this individual, somewhat bitterly, that one of these strange contraptions had already flown. As a matter of fact it had gone right through the roof of the Kertl plant (15). The year was 1940.

Coats tells us that the purpose of this device was twofold. First, it was to investigate free energy production. This could be done by running a shaft to the rapidly rotating wheel-like component which was auto-rotating at between 10,000 and 20,000 rpm. Using reduction gearing, some of that energy could be mechanically coupled to an electric generator producing electricity at no cost. The second purpose of these experiments was to test Schauberger's theories on levitation and flight (16).

Two prototypes were said to have been built at Kertl. The test flight was done without Schauberger's presence or even his permission to do the test. The model flew as described above but it did considerable destruction to the Kertl Works so there were mixed feels concerning the success of this flight. The force of levitation was so strong that it sheared six 1/4 inch diameter high-tensile steel anchor bolts on its way to the roof. Coats reports that according to Schauberger's calculations based upon previous tests, a 20 centimeter diameter device of this sort, with a rotational velocity of 20,000 rpm, would have lifted a weight of 228 tons (17).

A few years earlier in 1934 Schauberger had met with Hitler to discuss alternative energy ideas (18). Nothing come of this meeting immediately but after Germany annexed Austria in 1938, Schauberger became involved in research at Professor Kotschau's laboratory in Nuremberg. Assisted by his son, Walter, who had just completed engineering studies at a technical college in Dresden, Viktor Schauberger went to work with a Dr. Winter on a plan to extract electrical energy directly form a water flow. Some success was achieved. Alexandersson reports that a potential of 50,000 volts was achieved but that no practical results came from this at that time (19).

Probably based upon the fact that Viktor Schauberger was a veteran of the Great War, he was inducted into the Waffen-SS in 1943. This put him under the direct control of SS chief Heinrich Himmler. Schauberger was ordered to castle Schoenbrunn near the Mauthausen concentration camp in Austria. There he was to select qualified prisoners, twenty to thirty craftsmen, technicians and engineers, and begin work on a new, secret weapon. Schauberger arranged improved conditions for his team and produced another flying saucer model (20).

In May, 1945, because of the deteriorating circumstances of the war, Schauberger was re-located to Leonstein in Upper Austria by the SS. There, just after a successful test flight of his latest device, it was seized by an American intelligence unit which appeared to be well informed about it. Schauberger was de-

briefed by American intelligence, according to Coats, detained, and told not to participate in further research (21).

Coats was actually able to locate a surviving example of a Schauberger saucer model. Excellent photographs of this device are to be found in his book, Living Energies, as well as a dissection of it into its various components. It is unclear if this device was one of the earlier (1940) or later (1945) projects.

After the war, Schauberger worked on agricultural projects in Austria until one day in the late 1957 when he was contacted by two Americans. They promised Viktor almost unlimited resources if he and his son Walter would work for them in the United States (22). Discussion concerning the exact source and motives for this offer are beyond the scope of this discussion but suffice it to say that they were powerful interests. The Schaubergers were sent to Texas, near the Red River, where Viktor was asked to disclose everything he knew and Walter was asked to set Viktor's terminology into the standard language of physics and engineering. This whole episode proved extremely unsatisfactory for both Schaubergers and they returned to Austria after about three months. As a condition for their return, Viktor was asked to sign away his knowledge to this powerful concern. Viktor was given a contract in English, which he did not read. Nevertheless, the deal was done and the Schaubergers returned to Austria (23). Viktor, already in poor health, died five days later on September 25, 1958. Walter continued advancing his father's research in Austria until his death in 1997.

Coats provides us with pictures of one of the Schauberger saucers in question and an explanation of its workings (24). This saucer was composed of a number of copper plates bolted together. Air was drawn in at the to and into the rapidly spinning saucer which was set into motion by an electric motor. In this machine no paddles pushed upon the air to start it. Instead, a motor was used to spin the whole saucer model to the desired number of revolutions per minute. The air was thus spun rapid over channels formed by the upper and lower surfaces of two copper plates. On these plates alternate ridges and depressions on both plates kept the air moving in snake-like wave forms and it moved toward the periphery of the saucer. Because the saucer was rapidly spinning, the air was folded over upon itself as it moved laterally into many individual vortices. The air was rotating in these vortices and moving up and down between the ridged plates. It was also moving around as the saucer spun on its axis. This is a double-spiral motion which additionally duplicates the undulating motion seen on the Schauberger log flumes. The air was cooled and made more dense as it progressed towards the periphery. At and around the saucer the periphery, it was ejected into the atmosphere at great speed.

In this machine, centripetal air flow changes to centrifugal air flow at this periphery. The air, once outside the saucer,

spirals away in a centrifugal motion. It is at this periphery, at the midline of the saucer, where the change of motion takes place. It is here that energy is liberated. It is this energy which gives the saucer its quality of levitation.

Sometimes the Coanda Effect is cited as a reason this saucer flew (25). Coanda effects, if present at all, are only a secondary force if Viktor Schauberger's calculations are correct. Coanda effects alone could never be powerful enough to generate the lifting force equal to 228 tons which Schauberger estimated his small model produced.

The important factual points to keep in mind are these: First, this saucer-model, probably in more than one version, actually flew. Second, one model still exists today. Therefore this "flying saucer" is a physical reality which can be photographed, touched and studied. Third, explanations of the mysterious energetic forces causing lift in this device should not be forgotten. The German scientific leadership was interested in implosion and in what Schauberger had to teach them but they did not necessarily want to be limited by the use of air to achieve these results. Instead, they may have wanted to use Schauberger ideas but actuating these principles with electronic components. We will see some ideas relating to Schauberger in a future example.

The Viktor Schauberger Models

A shred of evidence comes down to us though the years in the form of a newspaper article by Lionel Shapiro in the Denver Post, dated November 9, 1947, and titled "Spies Bid for Franco's Weapons". (Please refer to a copy of that article). It should be noted that this was a few months after the summer of 1947, the first and largest UFO flap in history, which included the Kenneth Arnold sighting and the flying saucer activity of Roswell. It should also be noted that the Denver Post was nor is not a tabloid publication.

In doing research, this newspaper was contacted in an attempt to learn the whereabouts of the author, Lionel Shapiro. Unlike so many newspapers in the United States which have been purchased and merged by conglomerates, this newspaper is still intact and in existence. Unfortunately, no record could be found of Mr. Shapiro in their personnel files although they did maintain files going back that far. Also, no record could be found in their sister publication, The Rocky Mountain News. It was suggested that Mr. Shapiro was "a stringer", that is, a writer who did not work directly for the newspaper and whose work was purchased on a piece by piece basis. His work seems to have been channeled through the North American Newspaper Alliance. More of Mr. Shapiro's history and connections will unfold as the tale progresses.

This article describes two devices. The first is an "electromagnetic rocket", sometimes referred to later as the "KM-2 rocket" in other literature. The second is a nuclear warhead small enough to be fired by an artillery piece. The nuclear, warhead which is affixed to a cannon projectile, is novel at this time and is interesting since such devices were built and fired shortly thereafter by the United States military. The article's description of the nuclear cannon is correct. This was a German invention and was under development in Germany during the latter stages of the war. A prototype was even built and it carried the German designation of DKM 44 (1). This very cannon was copied by the Americans and became the T-131 which fired a nuclear warhead (2).

The discussion of the nuclear cannon is really beyond the scope of this book but what is important to bear in mind concerning this discussion is that if fifty percent of this article has proven to be accurate. The nuclear cannon was built and it stemmed from a German prototype. Does this not at least raise the possibility that the other fifty percent is accurate also?

Returning to the electromagnetic rocket itself, this device is right on point for the discussion of field propulsion. Some points are ascertained in reading this article. Its description as a "rocket" would lead one to believe it was cylindrical in shape rather than saucer-shaped. It is suggested that this

Spies Bid for Franco's Weapons

Agents Ascribe 'Flying Saucers' to New Rocket

By LIONEL SHAPIRO.

GENEVA.—Three German scientists working under the personal sponsorship of Generalissimo Francisco Franco have developed two highly advanced weapons of war, according to specifications and blueprints smuggled out of Spain by the agent of an independent European spy organization.

The first weapon is an electromagnetic rocket which, it is claimed, is responsible for the "flying saucers" seen over the North American continent last summer and for at least one and perhaps two hitherto unexplained accidents to transport aircraft.

The second weapon is an artillery warhead employing the principle of nuclear energy and described as having a startling disintegrating power.

Blueprints of the weapons have been offered for sale to at least three of the great powers. The degree of credence placed in them by the military intelligence sections of these powers is indicated by the fact that two of them—of whom this correspondent has certain knowledge—have made strenuous and, indeed, dramatic efforts to acquire the blueprints.

Big Sums Offered

The disclosure that these plans were available has touched off the most intense activity among secret agents in European capitals since the end of the war. Huge sums of money and even threats of death have been involved in negotiations.

The nation which coupled a threat of death to its bid is Soviet Russia.

I came upon the story three weeks ago by accidental interception of a document cataloging the weapons. This was being circularized through Europe's intricate network of secret agents. Since then, careful checking among agents and military intelligence organizations in several countries has disclosed:

That the principal powers fully believe Franco has been developing new weapons.

That the weapons (particularly the electro-magnetic rocket) do actually exist and are now being manufactured in Spain.

According to the information available, the weapons were developed in secret laboratories located near Marbella on the south coast of Spain just east of Gibraltar. They were tested in Franco's presence early last summer. The rocket, known as KM2 after its inventors, Professors Knoh and Mueller—was tested off Malaga while Franco watched from the deck of his yacht.

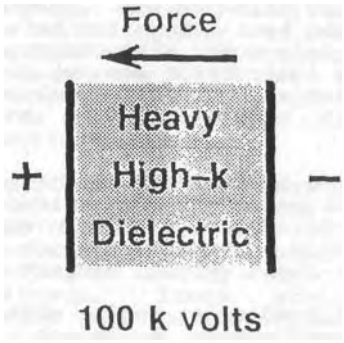
The rocket is described as having a range of 16,000 kilometers (9,942 miles) traveling in a given direction. Its flight can be controlled by radio for at least the first 5,000 kilometers (3,107 miles) and when the control is removed the rocket is attracted by electric vibrations of flying planes or the magnetism of the nearest mass of metal. It explodes when it reaches the attracting element.

The agent who smuggled the blueprints out of Spain, and who presumably was present at the tests, claims that the rockets were directed over North America and that they were responsible for at least one and probably two transport-plane accidents which, for want of better explanation, were attributed to structural defects.

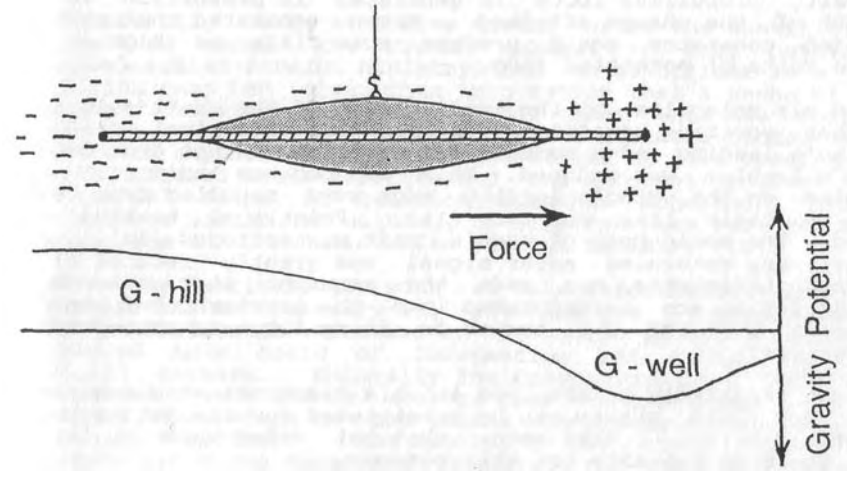
The nuclear-energy projectile is credited to a Professor Halkmann. It is described as twenty-two centimeters (8.7 inches) long and is used as a warhead for artillery shells. The agent claims that Franco is already mass-producing automatic guns to fire these new shells and that the first tests of the projectiles show them to have unprecedented explosive qualities.

Copyright, 1947, North American Newspaper Alliance, Inc.

Post-War German science for Generalissimo Francisco Franco. This is from the Denver Post, November 9, 1947, four months after flying saucers were seen all over the USA.



device was responsible for the flying saucer sightings over the USA that previous summer. This speaks for its operational range. It was said to have been tested off Malaga while Franco watched. The device was constructed in the town of Marbella, east of Gibraltar. Finally, it was said to have been of German origin, even naming the German scientists who built it.



Even Spain itself is of some interest here since this country's ruler, Generalissimo Francisco Franco, was openly sympathetic to the Nazis. The Nazis had assisted Franco militarily in the Spanish Civil War during the 1930s and were instrumental in his retention of power. During the final stages of the Second World War and afterward Spain was seen, by the Germans as a safe haven for all those things they wished to keep out of Allied hands, including secret weapons. Many shipments of gold, secret blueprints, specialty steel, machine tools, scientists and high ranking Nazis were sent to Spain (3). Colonel Otto Skorzeny, head of several SS post-war, self-help organizations even set up his headquarters in Madrid (4). Spain served as a home-away-from-home for the SS after the war.

In analyzing the means by which the KM-2 device flew, it must be noted that gravitational force can be overcome through the use of a strong electrostatic charge as shown by the work of T. Townsend Brown beginning in the 1920s. This is sometimes referred to as the Biefield-Brown Effect. Imagine a torpedo-shaped model with a dielectric center section suspended by a string from the ceiling. If this model were charged with high voltage, one end would become positive and the other end would become negative. Movement would occur toward the positively charged direction if the voltage was sufficient and the charged ends remained separated by the dielectric (5).

This dielectric is an insulating material which can keep positive and negative charges from interacting with each other and so canceling each other out. They are commonly used in capacitors or condensers which have a positive charge on one side while retaining a negative charge on the other. If the charge can be contained by the non-conducting dielectric, a force is exerted in the direction of the positive side with the application of 75,000 to 300,000 volts. One way to conceive of this action is to imagine a gravity hill whose slope increases with the intensity of the ion charge. The craft being powered simply slides down the gravity gradient like a surfboard on a wave (6).

This concept is a new, non-conventional form of flight. It is non-aerodynamic method of flight. All previous conventional flight had either been through the use of lighter than air balloons, winged craft powered by propellers, jets or rockets or the brute force of rockets themselves. Using this method, Brown advocated defeating gravity by generating another form of energy over which gravity could be surfed. It is a form of field propulsion.

T.T. Brown found that when strong electric charges are separated by a dielectric, movement occurs towards the positive charge as if gravity were reduced on the positive side or as if the charged object were sliding down a hill.

T. Townsend Brown demonstrated this means of propulsion to the American military during the 1950s. He used a saucer-shaped model tethered only by a high voltage line supplying the charge to the model (7). During that decade Brown built increasingly larger, faster models using this method. Brown found that a saucer or a triangle was the best shape for this type of flying craft. A secret proposal, code-named Winterhaven, was to develop a Mach 3 antigravity saucer interceptor was put forth to the U.S. Air Force (8). This project was further developed through the 1960s but after this all traces of this concept seem to disappear.

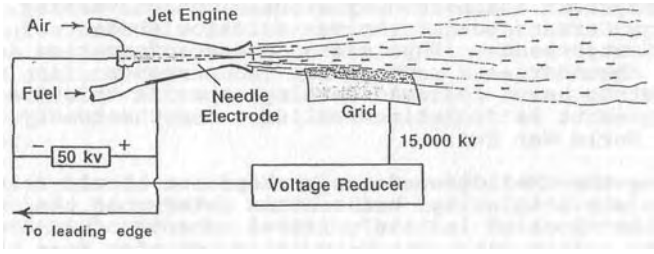
But where Brown is overlooked is not only did he have a method of electrostatic propulsion but he also had a self-contained method to impart this charge to a flying craft. He invented a flame-jet generator or electrokenetic generator which supplied the necessary high voltage in a light weight, compact manner (9).

The flame-jet generator utilized a jet engine with an electrified needle mounted in the exhaust nozzle to inject negative ions in the jet's exhaust stream. A corresponding but positive charge is automatically built up upon the leading front edge of the craft. As long as there is no leakage through the dielectric or insulating material, in this case through the wings and body of the craft, propulsive force is generated in proportion to the strength of the charge attained. Brown estimated that such a flame-jet generator could produce potentials as high as 15 million volts of potential (10).

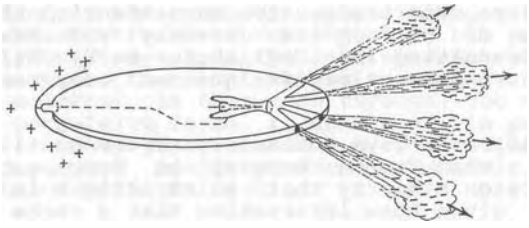
Ionized air molecules on the leading edge of the craft's surface had other positive benefits. The positive electrical field on the wing's leading edge reduced air friction so that drag caused by air molecules was reduced. This was because individual air molecules on the wing's leading edge were repelled from each other by their like charges (11). Frictional heating was reduced. The sonic boom of such a craft was softened (12). And finally, any returning radar signal was greatly reduced (13). Dr. Paul LaViolette has made the argument that all these characteristics are incorporated into the American B-2 bomber, concluding that the B-2 bomber is in reality an anti-gravity aircraft (14).

As Brown repeatedly points out in his Electrokinetic Generator patent, any fluid stream can be substituted for the jet engine's fuel and air (15). This means that hot water vapor or steam itself would be suitable for this purpose.

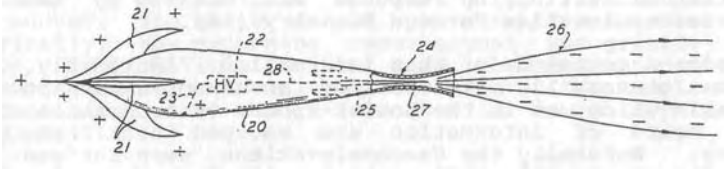
If T. Townsend Brown had been working on this form of flight since the 1920s, is it not conceivable that others were also? Remember that the KM-2 device is described as an "electromagnetic rocket". If a combination design is considered, one which combines the electrokinetic apparatus with the electrokinetic generator, a picture emerges which would seem to fulfill the description given to the KM-2 "electromagnetic rocket".



The real question may be if the flow of this knowledge went from Brown to the Germans or from the Germans to Brown as was the case with so much high technology in the post-war years. T. T. Brown's early collaborator and mentor was a Dr. Paul Biefield a Professor of Physics and Astronomy at Dennison University. Dr. Biefield was a German speaker who was a fellow student of Albert Einstein in Switzerland. Physicists share information across international boundaries. There is no reason for German scientists not to have followed developments in this Biefield-Brown Effect, as it is sometimes called, for the twenty years leading up to World War Two.



Before leaving the KM-2 discussion, perhaps we should return to the reporter who originally broke this story of the German "Electromagnetic Rocket" in 1947, Lionel Shapiro for a closer look at who he really was. It seems this reporter does have a history of breaking or leaking stories through the North American Newspaper Alliance. These stories which, prior to his involvement, could only be classified as "secret". The point in question is a 1946 report, brought to our attention though the extensive research of Dr. Milos Jesensky and Mr. Robert Lesniakiewicz and translated into English for me by Milos Vnenk. This account is of post-wartime intrigue can only be outlined here.



On October 13, 1945, over five months after the hostilities in Europe had ended, the French embassy in Prag notified the Czechoslovakian Foreign Ministry that an SS officer in a French detention camp had given them information that a cache of secret documents existed near Prag. This cache took the form of a tunnel in which 32 boxes of secret documents were hidden and were wired with explosives before being sealed at its opening. The French offered their services and the information given to them by the SS officer in question, Guenther Achenbach. But even after three months of waiting, no response was received by the French from the Czechoslovakian Foreign Ministry (16).

Somehow the Americans got wind of this information. Incredibly, the Americans on February 13, 1946 mounted an armed incursion into Czechoslovakia which was in the Soviet sphere of occupation, retrieved this hoard of information and escaped back into occupied Germany. Naturally the Czechoslovakians were furious and demanded and got an apology from the Americans. They also demanded the return of the German documents stolen from their sovereign territory. The Americans did return documents but probably not those sensitive documents for which the expedition was mounted (17).

Dr. Jesensky and Mr. Lesniakiewicz have made an extensive study of the German technical facilities surrounding Prag and the purposes for these facilities. It is their conclusion that the sensitive technical information recovered and which prompted this dangerous action was nothing other than plans of the German disc airplane, the "V-7" (18).

Top: T.T. Brown's flame-jet generator, capable of supplying millions of volts. Middle: Brown's saucer design which is definitely food for thought. Bottom: Brown's electric rocket incorporating flame-jet generator. The KM-2 rocket must have been a very similar device.

It was Lionel Shapiro, writing under the name Lionel S. B. Shapiro who broke this story for the North American Newspaper Alliance (19). As confirmation, it can be added that the story was also covered by Ms. Lux Taub in the Swedish publication "Expressen" with stories on 2/19/46, 2/22/46 and 2/24/46 (20).

In the immediate post-war world there seems to have been a relaxation on the release German technical information. Not the detailed analytic work done by the various Allied intelligence teams combing the carcass of the dead Reich, but the popular reporting by Shapiro and others who received the "o.k." to publish brief stories recounting Nazi technology which would be squelched later as the cold war got underway.

But even given this relaxation, what are the chances of one reporter stumbling upon both the stories of the electromagnetic rocket and the U.S. incursion into Czechoslovakia, first, and on his own? It is also noteworthy that both of these stories dealt with the topic of this book, or at least one which is related to that theme. Mr. Shapiro must have been a very well connected reporter indeed! He is also an excellent source of information.

A point of speculation should be made concerning the KM-2 device. As stated above, T. T. Brown believed that water vapor or steam was a suitable medium for his electrokenetic generator. Water vapor is present in the atmosphere, as we all know. A small atomic engine, such as was mentioned earlier in connection with the Messerschmitt P-1073, burning and being cooled by atmospheric gasses, might provide enough water vapor to enable the electrokenetic generator to produce the high voltage required. This would be an atomic powered field propulsion device. Further, Friedrich Georg gives us details on an atomic steam engine with the Germans were designing to power a propeller driven aircraft (21). An easy substitution of a device similar to the Brown electrokenetic generator for the propellers could have been made enabling a device with all the characteristics given for the KM-2 electromagnetic rocket to have been born. And of course Dr. Giuseppe Belluzzo would have been waiting and willing to do the plumbing.

Field Propulsion Saucers

The existence of World War Two German field propulsion flying saucers is a topic which is denied by virtually every reputable authority in aviation history. It is also denied by many researchers studying German saucers. The problem is that in the years immediately following the Second World War the earth's skies suddenly began to be populated by flying craft which did some remarkable things. They flew at unheard of speeds. They made very sharp turns, seemingly non-aerodynamic turns, even at this extreme speed. They lacked the glowing tail of jets or rockets but they glowed or gave off light at night from their periphery or from the whole craft. They were silent or almost silent. Sometimes they gave off sounds that an electric generator or motor might make. Sometimes vehicles with electrically based ignition systems ceased to operate in the presence of these saucers. No government claimed these flying craft, yet they were seen all over the world.

The press and popular culture attributed these unusual craft to an extraterrestrial source. Yet, after over fifty years, no real proof for this assertion has ever come forth. Let's come back down to earth. By all accounts these saucer were solid and material in nature. Perhaps it is time to attribute their origin to a solid, material source.

It seems only proper to begin searching for an explanation for field propulsion saucers with the very sources which we now know built conventional flying saucers, the Germans of the Third Reich. The earliest reference to a field propulsion saucer being a German invention is from a 1960 book by Michael X in which it is described as a "flying egg" (1). Michael X., under the name Michael X. Barton, is also the author who, in 1968, wrote The German Saucer Story. In the second book returns to the theme again (2). This time he cites a source. His primary informant, Hermann Klaas, describes twelve secret weapons to Barton. They are:

1. The flying disc
2. A tank made entirely of one piece of metal
3. The sound wave weapon
4. A laser beam weapon
5. A flaming artificial cloud
6. A robot bomb
7. A charged cloud weapon
8. An armor piercing projectile
9. The electromagnetic KM-2 rocket
10. A paralyzing ray
11. Electronic ball lighting
12. The flying bottle, tube, sphere, etc.

Thirty-two years later we certainly know that some of these weapons did exist. It has been confirmed that the Germans were

working on weapons numbered 1, 2, 3, 6, and 8 for instance. It has been confirmed that the Germans were working on x-ray or gamma ray weapons as well as another type, possible laser weapons. It has been confirmed that the Germans were working on a gaseous cloud as a means of combating enemy bombers. So in view of this track record, his claim of research on a "flying bottle" should be given serious consideration.

But what is the specific evidence which would cause us to believe that the Germans were working on a field propulsion saucer? As one paws through the literature on German saucers, some evidence is encountered which could indicate field propulsion vehicles. There are the still pictures which will be discussed later on. Here, we will focus on just three pieces of evidence, that of an eyewitness, a German pilot, who saw such things on the ground, a Combined Intelligence Objectives Sub-Committee report and an F.B.I. report. The F.B.I. report was taken years after the war but for reasons which will be discussed, there is reason to conclude this report has merit.

German Eye Witnesses

The first report comes to us courtesy of researcher Horst Schuppmann. A friend of Mr. Schuppmann's interviewed an eyewitness to German saucers during the Second World War. This report first appeared in the 1998 Geheimtechnologien. Wunderwaffen Und Irdischen Facetten Des UFO-Phaenomens by Karl-Heinz Zunneck (3).

The subject of this interview was a German pilot who flew many missions in a JU-52, taking off and touching down in rough, presumably outlying airfields. The Junkers JU-52 was an aircraft used by the Luftwaffe for many roles and could be described as a mainstay or a workhorse. It was a transport airplane, a troop carrier and even had been used as a bomber. It resembled and was used in a similar way to the American Douglas Dakota or DC-3. The main difference between the two aircraft was that the JU-52 had three engines as opposed to the Dakota's two and the JU-52 lacked a traditional airframe, instead deriving structural strength from a unique corrugated metal shell, which also made the appearance of the JU-52 distinctive.

The sighting in question was reported to the author, Mr. Zunneck, by Horst Schuppmann whose friend knew the pilot of the JU-52 in question. The date was July, 1944. Accompanying the pilot on this three and one-half hour flight was a co-pilot, a mechanic, and the radio man. The airplane took off from Brest-Deblin and flew on a westerly course to Lublin. The flight was unfolding smoothly which was somewhat abnormal for the particular time and stage of the war. Over Stettin Lagoon preparations were made to land. A large white cross was sighted which was the marker for their goal, a meadow landing strip. The aircraft descended,

landed normally and rolled toward a group of bushes which would hide the aircraft from view.

Then things took a decided turn to the abnormal. Harsh orders were received that the pilot, co-pilot and mechanic were not to exit the airplane. Suddenly, the radio man had vanished. The others waited an hour in vain for his return. Finally, the pilot decided to get out of the airplane and find his missing crewman, without orders, and on his own.

On the airfield itself nobody was to be seen. There was only one building visible which was a lonely hanger. The pilot, ever concerned with maintaining cover, headed straight for this hanger. Upon arrival he opened an narrow, high sliding door and entered, hoping to receive some information. No person was to be seen but what the pilot did see bewildered him so that the image was deeply ingrained in his mind.

There in the hanger stood three or four very large, round, dark dish shaped metal constructions on telescope-like leg stands. The objects were about 6 meters off the ground and the objects themselves were 12 to 15 meters in diameter. The pilot compared the shape of the objects to a giant soup dish or soup plate.

Suddenly, out of the half darkness a military guard emerged. The guard let the pilot know that he was in an area which was strictly off limits. In fact, the pilot was told, on no uncertain terms, to disappear immediately or this would be his last day on earth.

This day had started as a routine flight connecting two outlying airfields. This pilot had no expectations of seeing something so unusual that he barley had context in which to place it. Further, even as his mind was transfixed and in a process of trying to give understanding to what he was seeing, he was suddenly. jolted out of this tableau by a guard threatening his very life and ordering him to leave.

Of course the question of what those objects in the hanger really were comes back to this pilot even after almost 55 years. The pilot personally attributes it to the so called "Magnetscheibe", literally, "magnet-disk". According to the pilot rumors of these objects circulated in pilot circles since the summer of 1944 (4).

Two things can definitely be said of this sighting. First, it can be said is that this sighting seems to be of the smaller type of German field propulsion saucer as opposed to a larger version. Second, these saucers can definitely be ascribed to belonging to and in the possession of German military forces during the Second World War. At no time in this report has the word "alien" or "extraterrestrial" ever been mentioned or even considered.

Beyond that it can be said that the pilot personally believed these to be of the "Magnetscheibe" type, that is to say not

powered by chemical combustion. There reasons to believe this is correct. These saucers were found on a remote and rather primitive airfield. They were in the only building present. This means that they did not need an extensive support system.

The chemically powered jet or rocket engines needed an extensive field support structure. They needed to be refueled after every flight. The two liquid fuels used by the Me-163 rocket-fighter, for instance, ignited immediately when they came into contact with each other with explosive intensity. The fuel tanks had to be washed out after each flight and separate ground crews were responsible for each type of liquid fuel. It is noteworthy that no such support ground support structure or personnel was in evidence on this occasion. All that was observed was a large structure filled with saucers and a guard. The ground support necessary for launch of these craft must have been minimal and argues for the field propulsion hypothesis.

Of course the weakness in this report is the lack of the name of the pilot. Even if this report is taken at a minimal level of credulity, it constitutes a rumor of German involvement with field propulsion vehicles.

The reader will recall that the research paradigm being followed is that once mention was made by a German source of a particular thing, then (and only then) corroborating information should be sought from U.S. governmental agencies using FOIA.

A Combined Intelligence Objectives Sub-Committee Report

Since we have a German claiming field propulsion saucers we can now follow our research paradigm and search governmental records for corroboration. The Combined Intelligence Objectives Sub-Committee reports are a series of reports compiled by agents of the United States and Great Britain. Most were written immediately after the field work was done. The agents targeted specific things such as sites, people, specific technology or other aspects of specific interest. The agents then wrote a summary report which is what is entered into the record.

As with almost all summary reports at this level, the implications of what is being described are lacking. These reports do not set the particular technology into any context. That is, these reports doe not say how a specific technology under study was to be applied in the future in some, if not most, cases. Behind these reports must be a body of information and at least a few individuals intimately familiar with the technology in question. They were familiar with the technology and the context to which it was useful. If another government operative was interested in that topic or its implications, and if his security clearance sufficed, he would be shown the underlying material and presumably be directed to the particular individual

[redacted]
(Target No. CI/659, CIC/139)

Erb with his two assistants, Georg Buhler and Ulrich Lewitz are available at the above address and are known to Mil Gov Detachment at BORKUM.

To be investigated as early as possible. Suggest C.I.O.A.F. and C.R.A.D. (Fuzes) will be interested.

This man was interviewed by two members of the staff of D.D.O.S., and the attached report is compiled from their notes and a statement by Dr. ERB.

Dr. ERB was born in 1912. He is a doctor of Physics. At the outbreak of war he opened a small laboratory and had made a few inventions. In 1940 he was called up, but after a few weeks was released for research work and returned to Berlin to work for Physikalische Reichsanstalt. At this time he worked on acoustic heads for torpedoes. In 1941 he was again working in his own laboratory - mainly on fuzes. He was arrested in Berlin by the Gestapo in Nov 1944 on a charge of "favouring the enemy and sabotage". Buhler was also jailed. They escaped on 22 Apr 45 as the Russians were advancing into Berlin.

It is felt that he is reliable and likely to be of value as a source of information about thelines on which German development was proceeding in the field of experiment in which he was concerned.

Statement of the work of Dr. Otto ERB

1. Before the war, Dr. Erb developed measuring instruments of all sorts. The following are examples of his work:

(i) Measuring apparatus for interference free determination of the hardness and temper of steel.
(ii) Electrical measuring apparatus for automatic control of storage temperature.
(iii) Apparatus for conversion of residual heat into electrical energy.
(iv) Electrical medical apparatus of various sorts.
(v) High tension apparatus.
(vi) Warning mechanisms for excessive temperatures.
(vii) Electric fire fighting apparatus.
(viii) Electric sources of energy of various kinds.
(ix) Apparatus for turning the energy of the sun's rays into electrical energy.
(x) Rearward impulse propulsion for vehs and aircraft.
(xi) Wood gas generator for high performance.

After outbreak of war he had to devote his research to armament work.

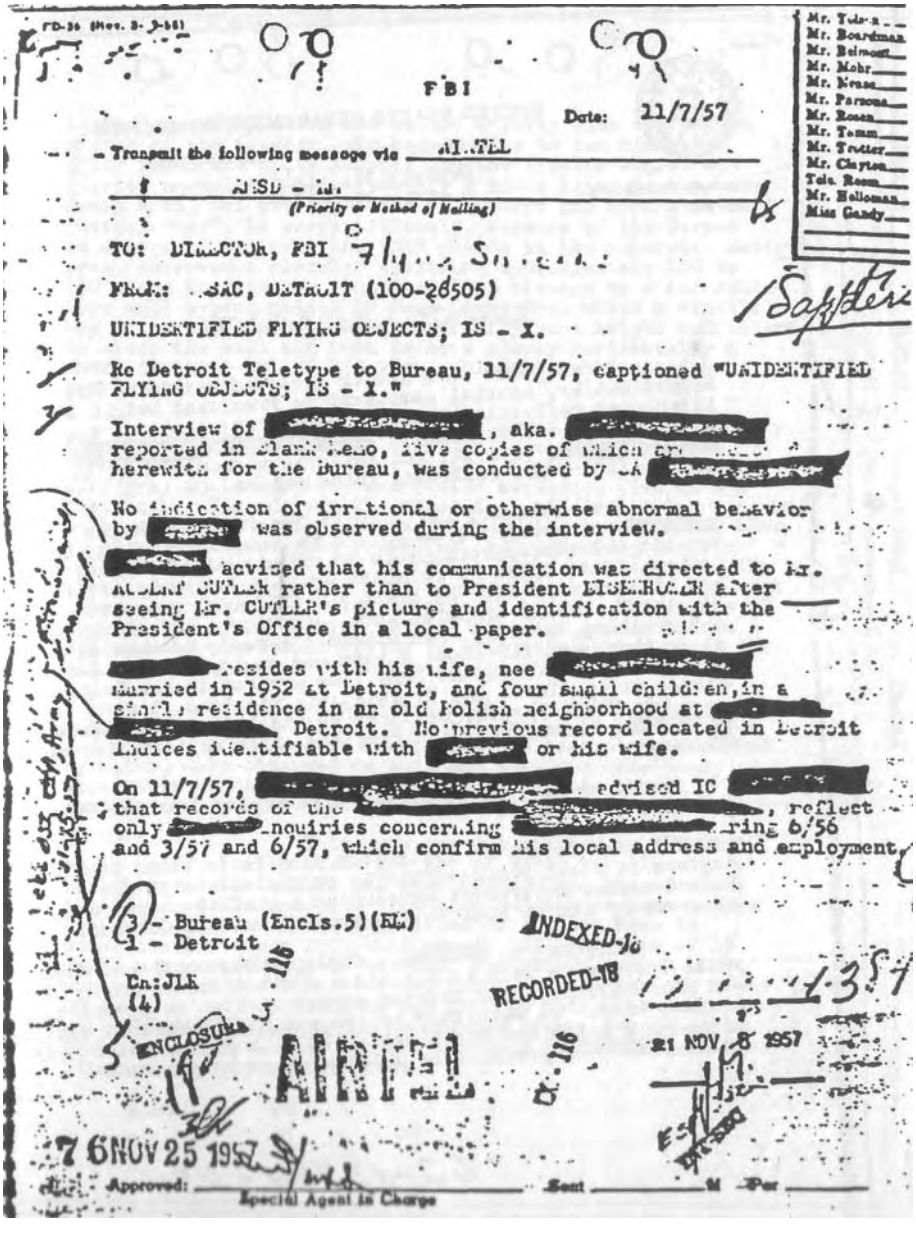
CIC 75/139 - 1 - Enclosure

who was its residing expert. Only slowly, if at all, was this secret science leaked or given to American industry and then only with an appropriate cover-story, one which may even supply a pseudo-inventor of that technology. This is conspiracy at its finest. This deception is beyond the scope of this book but what is important for us now is that sometimes a mistake or slip-up was made in writing or censoring these reports and hints of things of stupendous technological worth actually surfaces. Such is the case with Combined Intelligence Objectives Sub-Committee Report number 146 regarding Dr. Georg Otto Erb and his work which is reproduced here.



Dr. Erb was on the cutting edge of several technologies according to this report. None of these technologies was especially exciting in 1946, however. Jets, rockets and atomic energy where the hot-ticket items of the time. Nobody cared about new sources of electrical energy. The USA had plenty of electricity and plenty of oil to generate more. It was also known by then that atomic power could be applied to generate even more electricity. Nobody cared about Dr. Erb's experiments listed under item (iii) "Apparatus for conversion of residual heat into electrical energy" or item (viii) "Electrical sources of energy of various kinds" or even item (ix) "Apparatus for turning the energy of the sun's rays into electrical energy". Since nobody cared about these things, there was really no reason not to list them in the summary report. Their significance would only be realized a generation later during the "energy crisis" of the mid-1970s and by then it was too late to censor the report. One can only wonder where this research would have led if it funding had continued over the next thirty years. Or did it continue in secret?

Of course by now many readers will have already read number and grasped the significance of number (x) "Rearward impulse propulsion for vehs and aircraft". Given the nature of Dr. Erb's other work, it is a safe bet that this "impulse propulsion" was not of the jet or rocket nature. In fact there remains little doubt that this propulsion was, in fact, field propulsion. Dr. Erb was experimenting on means to apply forward motion using rearward impulse propulsion to aircraft and "vehs" (vehicles). If this is not the smoking gun for German experiments in field propulsion saucers, it is at least a hint that there is a gun.

The Smoking Gun: An F.B.I. Report

That is right, Fox Mulder was not the first F.B.I. agent to believe in UFOs. The files in question are F.B.I. file numbers 62-83894-383, 62-838994-384 and 62-83894-385. Their date is 11/7/57 to 11/8/57. They deal with a Polish immigrant, then living in the United States, who reported his wartime experience to the Bureau hoping it might throw some light on UFO sightings seen in Texas at about this time.

UNIDENTIFIED FLYING OBJECTS

In response to a letter directed by him to Mr. Robert Cutler, Special Assistant to President Dwight D. Eisenhower, reflecting that he might have some information about the rocket in Texas, [redacted] Detroit, was interviewed November 7, 1957, and furnished the following information:

Born February 19, 1926 in the State of Warsaw, Poland, [redacted] was brought from Poland as a prisoner of war to Gut Alt Golssen, approximately 30 miles east of Berlin, Germany, in May, 1942, where he remained until a few weeks after the end of World War II. He spent the following years at Displaced Persons Camps at Kork, Strasburg, Offenburg, Hilheim and Freiburg, Germany. He attended a radio technician school at Freiburg and for about a year was employed in a textile mill at Laurachbaden, Germany. He arrived in the United States at New York, May 2, 1951, via the "S.S. General Stewart" as a Displaced Person, destined to the Reverend [redacted], Hamtramck, Michigan; his alien registration number - [redacted]

Since May, 1951, he has been employed at the Gobel Brewery, Detroit.

News report of mysterious vehicle in Texas causing engines to stall prompted him to communicate with the United States Government concerning a similar phenomenon observed by him in 1944 in the area of Gut Alt Golssen.

According to [redacted], during 1944, month not recalled, while enroute to work in a field a short distance north of Gut Alt Golssen, their tractor engine stalled on a road through a swamp area. No machinery or other vehicle was then visible although a noise was heard described as a high-pitched whine similar to that produced by a large electric generator.

62-83394-284

An "SS" guard appeared and talked briefly with the German driver of the tractor, who waited five to ten minutes, after which the noise stopped and the tractor engine was started normally. Approximately 3 hours later in the same swamp area, but away from the road where the work crew was cutting "hay", he surreptitiously, because of the German in charge of the crew and "SS" guards in the otherwise deserted area, observed a circular enclosure approximately 100 to 150 yards in diameter protected from viewers by a tarpaulin-type wall approximately 50 feet high, from which a vehicle was observed to slowly rise vertically to a height sufficient to clear the wall and then to move slowly horizontally a short distance out of his view, which was obstructed by nearby trees.

This vehicle, observed from approximately 500 feet, was described as circular in shape, 75 to 100 yards in diameter, and about 14 feet high, consisting of dark gray stationary top and bottom sections, five to six feet high. The approximate three foot middle section appeared to be a rapidly moving component producing a continuous blur similar to an aeroplane propeller, but extending the circumference of the vehicle so far as could be observed. The noise emanating from the vehicle was similar but of somewhat lower pitch than the noise previously heard. The engine of the tractor again stalled on this occasion and no effort was made by the German driver to start the engine until the noise stopped, after which the engine started normally.

Uninsulated metal, possibly copper, cables one and one-half inch to two inches in diameter, on and under the surface of the ground, in some places covered by water, were observed on this and previous occasions, apparently running between the enclosure and a small concrete column-like structure between the road and enclosure.

This area was not visited by [redacted] again until shortly after the end of World War II, when it was observed the cables had been removed and the previous locations of the concrete structure and the enclosure were covered by water. [redacted] stated he has not been in communication since 1945 with any of the work crew of 16 or 18 men, consisting of Russian, French and Polish POWs, who had discussed this incident among themselves many times. However, of these, [redacted] was able to recall by name only [redacted] no address known, described as [redacted] then about 50 years of age and presumed by [redacted] to have returned to Poland after 1945.

[redacted] 74

Mr. J. Patrick Coyne

You will be advised of any further information which may be received regarding [redacted] and the information furnished by him.

b7d
1

Pursuant to your request, [redacted] letter is returned herewith.

Sincerely yours,

John Edgar Hoover

RECORDED-84 INDEXED-84

Dear Pat:

Reference is made to the letter addressed to "Mr. Robert Cutler, Washington 25, D. C.," by Mr. [redacted] Detroit 11, Michigan, in which [redacted] advised that he might have some information "about the rocket in Texas." He desired to know to whom he could speak in this regard. b7c, d

EX 105

Mr. [redacted] was interviewed on November 7, 1957 at which time he advised that his name is [redacted] that he is also known as [redacted] that he was born on February 19, 1926, in Warsaw, Poland, and that he was a German prisoner of war from May, 1942, until the Summer of 1945. [redacted] advised that he arrived in New York on May 2, 1951, as a displaced person, Alien Registration [redacted] He advised that during 1944, while he was a German prisoner of war, he observed a vehicle described as circular in shape, seventy-five to one hundred yards in diameter, and approximately fourteen feet high. He stated the vehicle was observed to rise vertically to a height sufficient to clear a fifty-foot wall and that it moved slowly horizontally a short distance out of view which was obstructed by trees. He stated that the engine of a tractor failed to operate during this period and that the engine failed on one other occasion when a high-pitched whining noise was heard in the area. During the interview, [redacted] spoke in a rational manner with no indication of mental instability.

The time of the sighting was in 1944, the place was Gut Alt Golssen, approximately 30 miles east of Berlin. The informant, whose name has been deleted, states that while he was a prisoner of war working for the Germans, a flying object arose nearby from behind an enclosure hidden from view by a 50 foot high tarpaulin-type wall. It rose about 500 feet then moved away horizontally. The only noise the object made was a high-pitched whine. The object was described as being 75 to 100 feet in diameter and 14 feet high. It was composed of a dark grey stationary top and bottom sections five to six feet high with a rapidly moving center section producing only a blur and extending the circumference of the vehicle. Notably, the engine of their farm tractor stalled during this event and the SS guards told the driver not to attempt a restart until the whine could no longer be heard.

Because of what I believe is their importance, these files have been reproduced here in their entirety. One of the most compelling reasons for taking this report so seriously is that the government of the United States of America took this report so seriously. It is hard to believe that an agency such as the F.B.I. would take and retain reports of flying saucers which had no special meaning for them. Add to this the fact that this report was over ten years old at the time it was taken and that it concerns a report originating in another country.

The F.B.I. operates within the USA and usually does not concern itself with foreign matters unless they have meaning for the internal security of the United States. Could the reason that this report was taken and retained for so many years be that it did, in fact, have meaning for the internal security of the United States? Did it have something to do with the flying saucers seen over Texas at the time which also stopped motor vehicles?

As an alternative to the security issues, could there have been another reason that the F.B.I. was so interested in flying saucers? Did the F.B.I. desperately want information on UFOs which was held by the military and other branches of the intelligence community which was not shared with the F.B.I.? It has been rumored that J. Edgar Hoover, head of the F.B.I. at the time, was very interested in learning these secrets but was held "out of the loop". It could be that the F.B.I. was already aware of German saucers through security clearances done on German scientists coming to the USA under Operation Paperclip? The ego of J. Edgar Hoover may have been a factor in the Bureau's guest to learn more on this subject. Hoover may have wanted to be on an equal footing with other intelligence chiefs.

For whatever reason, something in these reports resonated with the F.B.I. The report was taken seriously, investigated and kept. This fact alone speaks volumes for the existence of UFOs in general and German saucers in particular.

Some explanation has been attempted regarding the Schauberger models and the KM-2 rocket. From this point on, the discussion of German field propulsion saucers will move away from the areas centering around observed evidence and into areas of interpretation. Some of the German flying craft described are flying saucers in the classic sense. The F.B.I. report describes something which moves by non-aerodynamic means and which remains the source of speculation.

At this point, mention should be made of the ideas of some prominent writers in this field. The first of these is Mr. William Lyne of Lamy, New Mexico. Mr. Lyne has written two books concerning German saucers and field propulsion, Pentagon Aliens and Occult Ether Physics. His ideas on the mechanisms of field propulsion remain the best thought out and the most detailed on the subject.

Mr. Lyne lives near the secret weapons testing facilities of Los Alamos and White Sands. These were the places where German weaponry was brought for testing after the war and where the United States tested its first atomic bomb. It is still an area Of secret military research and secret military projects. Then as now, aspects of atomic energy figure in this setting. It is also an area which attracted much flying saucer activity in the late 1940s and 1950s. Mr. Lyne was a child during this period of time and personally witnessed flying saucers as did his family and friends. Later, as an adult, he went about trying to explain mechanisms for the type of flight he had witnessed.

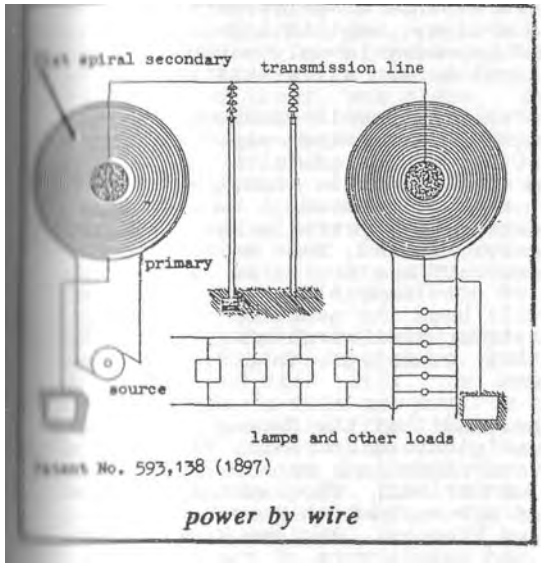
Lyne worked within certain parameters. He rejected the alien hypothesis outright. He realized that flying saucers had to have been made by humans. Since he observed the saucers in the 1940s and 1950s, he knew that any explanation of their workings must be limited to the technology present in the 1940s or earlier. He connected UFO technology to other recently imported technology from Germany while believing both had their origins with Nikola Tesla (5).

Further, there is no mention of intangibles by Mr. Lyne. There are no unknown energies or mystical forces at work. Mr. Lyne stands with both feet on the ground. Things are concrete. Machinery is diagramed. Matter and energy function as they always have. In reading Mr. Lyne's work one can almost smell the machine oil and the ozone.

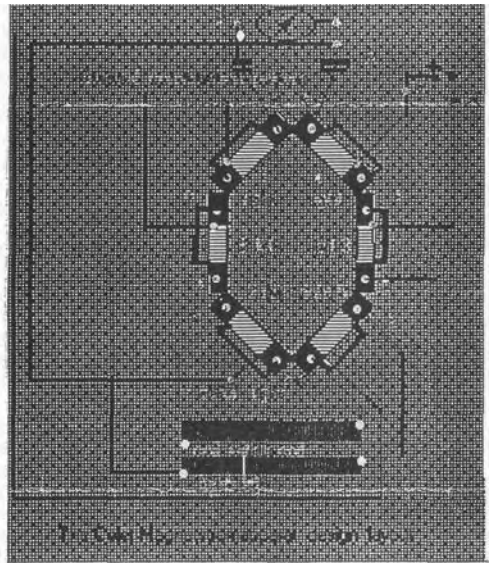
Mr. Lyne builds upon the work of Nikola Tesla who developed his unique ideas over many years of experimentation and invention. This basis built upon real world experimentation, testing and application separates Tesla's ether theory ideas from those which will be explored later. Mr. Lyne presents us with an ether theory in which ether is super-fine matter which exists everywhere. It is so fine that it will go through the holes left

in ordinary matter (6).

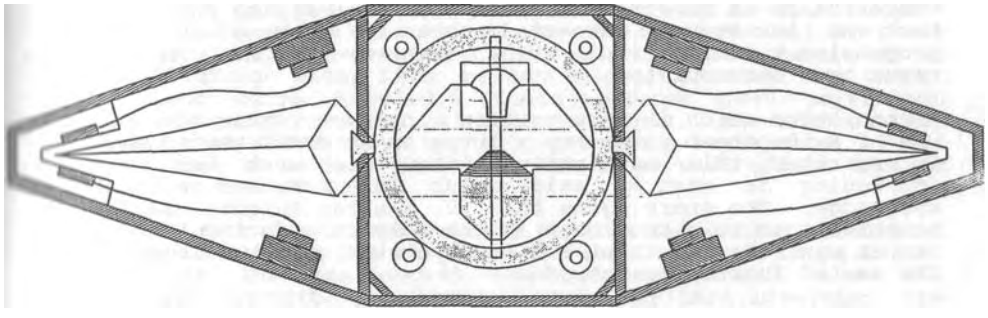
A few words about Mr. Lyne's ideas are necessary to set a context for this discussion. Just as an internal combustion engine can be described as a "heat pump" so can the flying saucer drive of Mr. Lyne be described as an "ether pump". Ether (very fine matter) is attracted to the saucer via an electric field, then pumped through the saucer and out again using the principle of magneto-hydro-dynamic pumping (7). This magneto-hydro-dynamic pumping is related to the Hall Effect. Edwin Hall placed a gold leaf strip in which an electric current was flowing into a gap in a magnetic field. An electromotive force was produced at right angles to the magnetic field and the electric current. This electromotive force was proportional to the product of the electric current and the magnetic field (8).



According to experimentation by Tesla, ether is made rigid with high voltage, high frequency electrical energy (9). The convex shape of the upper half of the saucer projects the electrical attractive force, generated by a specific electronic component, in an ever expanding arch over the saucer. Ether is made rigid and anchors the saucer. This is possible since the total mass of the ether caught in the electric field is far greater than the mass of the saucer. Near the surface of the saucer, the "rigified" ether is pulled into the saucer in what Mr. Lyne calls "tubes of force". These tubes of force would be pulled right through the opposite side of the saucer and out if it were not for the blocking force of a second apparatus which nullifies the tubes of force and prevents this from happening. This imbalance is the reason the saucer is able to move (10).



The electrical components necessary for this to take place are, according to Mr. Lyne, a Tesla turbine to supply electrical power and two types of Tesla pancake coils (11).



The Tesla turbine is a wheel-like device which is described in Mr. Lyne's book (12) and elsewhere (13). Mr. Lyne orients this turbine vertically in his drawings but oriented with its flat spinning surface horizontally, this might, perhaps, account for the spinning disc witnessed on some saucers.

The Tesla pancake coils are also described in both sources cited. Mr. Lyne goes further and gives instructions as to their manufacture. One type of pancake coil insures forth a negative discharge of DC energy, tuned to a one-fourth wave length, and is oriented in the desired direction of flight (14). The other type of pancake coil is mounted exactly opposite the first and emits a positive AC discharge which is used to dissolve the ether flow or tubes of force.

Dr. Gordon Freeman, a Fucannelli-like scientist who knows about such matters, has been curious about the abbreviated wave-cycle of the first pancake coil. His position is that one must not only understand conventional scientific theory in order to

Top Left: Pancake Tesla coil with the secondary coil inside the primary. Top Right: The smaller of the Hans Coler free-energy machines. Bottom: Cut away showing Vril power plant. Was this related to the Schappeller device?

understand the way a field propulsion saucer flies but one must also understand some concepts which are sometimes labeled "occult". Dr. Freeman has worked out a "common denominator" for some field propulsion vehicles the essence of which he has shared (15). Dr. Freeman's ability to analyze, explain and interrelate physics, engineering and "occult" geometry is only matched by his ability to explain it all on a level we can all understand.

Some individuals see hidden, esoteric or occult knowledge as the inspiration for the breakthroughs the Germans made in field propulsion flying vehicles. Usually coupled with an exotic-theory of UFO origin, it is an egually exotic local from which this exotic theory is said to have originated. We have been presented with this line of reasoning for years in the "UFOs are of extraterrestrial origin" theory. Indeed, some writers see an extraterrestrial origin for German UFOs also as we shall see. But just stating that UFOs are of occult or alien origin is not an explanation in itself. It still begs the question of how they operate. Their method of operation, their technology, must be explained regardless of where they came from in order for the explanation to be a satisfying one.

Returning to earth, another theory is that the German scientists were influenced by some ideas originating in Asia. Tibet and India are the suspects in question. UFOs have been reported over Mongolia, Tibet and India for centuries. The ancient Indians even claimed to have constructed aircraft which resemble flying saucers. These saucers are called Vimanas. Ancient Indian texts in Sanskrit speak of the flight and manufacture of these saucers. The German "Ahnenerbe", an organization whose purpose is associated with researching Germanic ancestry, sent out expeditions to the East with the express purpose of acquiring ancient, hidden knowledge. This is precisely what Heinrich Haarer was doing, whose book served as the basis for the film "Seven Years in Tibet". This link between flying saucers of the East and the West is suspected as an influence on German field propulsion vehicles (16). The exact connection, though, has never been demonstrated.

A connection which is more certain involves Viktor Schauberger's use of Pythagorean geometry. There is no doubt that Schauberger incorporated this mathematics into his work but what is intriguing is what is said about this body of mathematical knowledge. The story goes that it was the Knights Templar who stumbled upon this knowledge in the Holy Land during the Crusades and it was they who kept and incorporated this knowledge through the use of "sacred geometry".

Both the above mentioned schools of thought lead far beyond the parameters of this book but the reader should be aware of what is said about them and their relationship to German flying discs.

Whether it is called "occult technology" or "conventional technology", in the end, it is just simply technology. And in

the end, as Dr. Freeman says, "all machines can be reduced to numbers". What is called by some "occult" might be better called "arcane". This is because this technology, which seems to be the basis of field propulsion, is taught only to certain individuals, technological initiates, who use and need this knowledge for their work on government sponsored black projects. These scientist utilize a technology and understanding which are reserved for their use alone. This knowledge is not taught and not made available to the rest of us. We, the great unwashed masses, are given Einstein and the Theory of Relativity and told that this is the pinnacle of learning. As with all secret information, this arcane knowledge is held on a "need to know" basis. Our government believes that we simply don't need to know. It takes a true genius like Dr. Freeman to recognize this knowledge and set it before us in language that we can understand. It is hoped that Dr. Freeman will publish a book sooner rather than later.

Mention of the "occult" brings us to another line of evidence concerning field propulsion, that put forth by Norbert Juergen-Ratthofer and Ralf Ettl. Mr. Ettl became involved while doing research for a film project on Dr. Wernher von Braun. A film company was paying for this research. A package or several packages of information were obtained by the production company which had more to do with UFOs than rocketry. This information was laid aside by Mr. Ettl but he returned to it after enlisting the help of Norbert Juergen-Ratthofer who had a special interest in that subject (17).

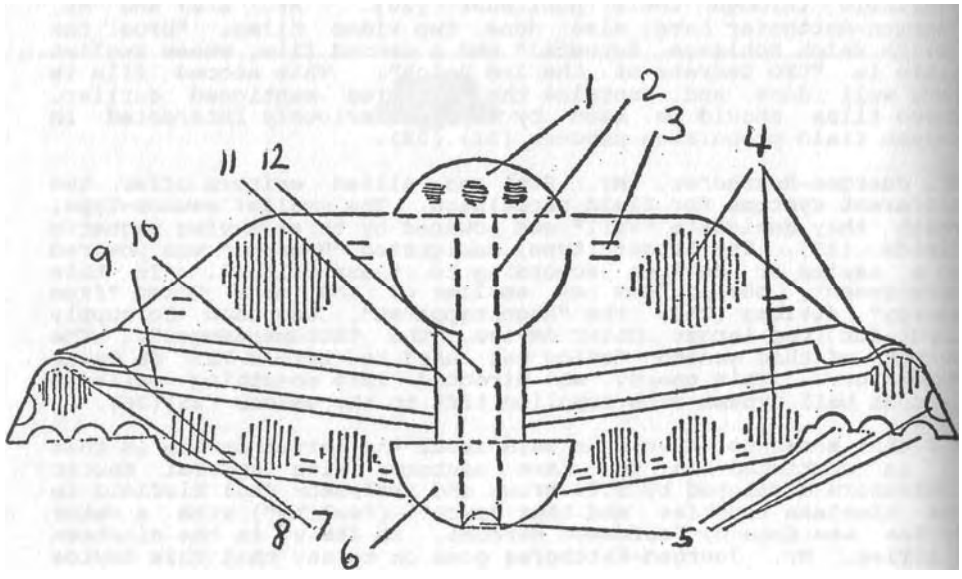
The packages contained breathtakingly clear photographs of German saucers in flight. Some of these pictures may be just models but some look authentic and are posed against a landscape. Nowadays, pictures can be generated via computer and these pictures surfaced within modern times. At least one negative from these pictures which was given to Mr. Vladimir Terziski by Mr. Juergen-Ratthofer and seen by this writer, so at least not all of these pictures were computer generated. The pictures have been seen in public and through video film presentation, for about ten years. To the best of my knowledge these pictures have never been debunked using modern technical photo-analysis. Therefore, they have never been shown to be anything less than legitimate. Until they are shown to be less than legitimate, we must accept them as they are represented to us.

Besides the pictures, these writers provide an entire historical and cultural context for these saucers within the Third Reich, This contest involves secret organizations within the SS. Further, the context provided by these writers involving the occult, channeling, and extraterrestrials. This is the weak point of their presentation since the case for these latter connections is really not strong enough to be "in evidence".

Besides the books of Mr. Ettl and Mr. Juergen-Ratthofer, several other German language writers contribute books on a similar or

Ghostly image of a saucer, said to be a Haunebu 2, on a test flight. Photograph originally from collection of Norbert-Juergen Ratthofer, courtesy of Vladimir Terziski

related theme. The more notable are D.H. Haarmann (18) and 0. Bergmann (19). Mr. Ettl and Mr. Juergen-Ratthofer themselves have written several books which are all in German language and available through their publisher (20). Mr. Ettl and Mr. Juergen-Ratthofer have also done two video films, "UFOs Das Dritte Reich Schlaege Zurueck?" and a second film, whose English title is "UFO Secrets of the 3rd Reich". This second film is very well done and contains the pictures mentioned earlier. These films should be seen by anyone seriously interested in German field propulsion saucers (21) (22).



Mr. Juergen-Ratthofer, Mr. Ettl and allied writers offer two different systems for field propulsion. The smaller saucer-type, which they designate "Vril" was powered by three moving magnetic
fields (23). The larger type, designated "Haunebu" was powered by a series of devices according to these writers. In this arrangement, the output of smaller of the Hans Coler "free energy" devices (24), the "Magnetapparat", was used to supply input for the larger Coler device, the "Stromerzeuger". The output of this second device was used to turn a Van de Graaf generator. This energy was directed into something called a Marconi ball dynamo with supplied lift to the saucer (25)(26).

All that seems to have been said about the latter device is that it is mentioned in the same sentence with special saucer condensers developed by T.T. Brown and Professor Paul Biefield in the nineteen twenties and that "such" ("solche") with a rotor system was done by Professor Marconi, in Italy, in the nineteen thirties. Mr. Juergen-Ratthofer goes on to say that this device is to be considered, in principle, a forerunner to the Searl system (27).

The Haunebu pictures strongly resemble the Adamski saucer pictures of the early 1950s. These saucers were seen and pictures of them taken world-wide. There were many different sources for both sighting of Adamski saucers and pictures of them. There were so many in the early 1950s that it is hard to believe that all of them are fakes. Mr. Ettl and Mr. Juergen-Ratthofer maintain that these "Adamski saucers" are really the German-designed Haunebu type saucers (28). Since they were flown after the war, certain questions as to their origin arise. These questions will be treated in an upcoming section of this book.

Besides the Vril and Haunebu designs mention is made by Mr. Juergen-Ratthofer of another type of field propulsion vehicle. This saucer uses a chemical engine to drive a field propulsion generator (29). The type of chemical engine involved is similar to the famous Walter (Walther) engine, which were to be installed on some types of German submarines.

The Walter process involved a closed circuit system activated by the thermal energy produced by the decomposition of a high concentration of hydrogen peroxide. This reaction occurred in the presence of a catalyst, potassium permanganate, in a

Chemical/Field Propulsion Saucer (N. Juergen-Ratthofer). 1. Plexiglass pilot's cabin. 2. Crew rooms. 3. Intake air slots (hermetically sealed in space). 4. Vacuum ring retainers with high-performance vacuum pumps. 5. Lifting and steering jets connected to the Walter turbine system. 6. Walter turbines and electric generators with connected machine maintenance rooms. 7. Disc rotor wheel, rotating clockwise. 8. Electromagnet outer ring rotating counter-clockwise. 9. Disc wheel, inner part of the electromagnet outer ring. 10. Segmented disc-rotor and wing screw with adjustable flight blades. 11. Axis of saucer with (a) two electric motors to drive the counter rotating disc motors: electro-gravitation plant, (b) various electrical connections, (c) fuel and water tanks. 12. Connection shaft between pilot's cabin and machine room.

decomposition chamber. This resulted in a 600 to 700 degree gas composed of steam and oxygen, under natural pressure sufficient to drive a turbine. After the gas had done its work if was fed into a reclamation chamber which recycled at least part of the gas back into the engine. Additional fuel, Juergen-Ratthofer mentions methanol, could be fed into the system for more heat. The system without additional fuel is called the "cold" system while with added fuel it is called the "hot" system. In fact, the cold system was used on the V-2 rocket to drive the turbo-fuel pumps since known pumps could not handle the volume of liquid necessary to feed this new type of rocket.

In the hybrid saucer Mr. Juergen-Ratthofer describes, the cold system drives a rotor-stator arrangement which doubles as a blade lifting wing similar to that of a helicopter. The rotor-stator-blade is internally housed in the cowling of the saucer. The output of the rotor-stator is a strong magnetic field which presumably frees the saucer of the constraints of gravity as claimed for the other field propulsion saucers (30). In addition, spaces within the saucer have all air removed by special vacuum pumps with increase the buoyancy of the craft within the atmosphere. Further, some of the hot oxygen-steam mixture is jetted out at the periphery of the saucer while being mixed with methanal for additional heat and therefore thrust. Again, we are reminded of Dr. Belluzzo. We are also reminded of Vesco since he hints at a similar engine (31) which he even vaguely links with "electromagnetic waves" (32). Have we come full-circle?

In the same vane, would be negligent not to mention that an atomic engine might easily be substituted for the Walter engine. The atomic engine might be one of three types. It might be the type which burned the atmosphere itself. This burning would produce hot air and steam from the water contained in the atmosphere. It might be one which produced steam using water carried in tanks. It might be one which super-heats and ejects a gas such as hydrogen or helium. Any of these mediums could be ejected through the rotor blades yielding the desired result. A device of this type would tie together many of the German saucers-plans so far discussed.

Dr. Freeman points out that Marconi "stole" Tesla's inventions. Tesla also built a power-plant of spherical construction which contained vacuum tubes and so may have been superior to the device of Schappeller which we shall look at next. Surprisingly, some detail exists about this Tesla free energy device (33). Tesla used his engine to successfully power a Pierce Arrow automobile. This means that a spherical, working field propulsion device existed in the USA powering, not a flying saucer but an automobile. Dr. Freeman warns not to be confused by many spherical devices, all of which seem different. The fact is that they all work on the same principles (34).

Atomic Saucers Again?

It is possible that all of the options for the field propulsion of German flying discs have not been presented or had a fair hearing. Two of these other possibilities are reviewed below. The first is the possibility that a world-shattering breakthrough in field propulsion occurred during the Third Reich involving atomic energy. This is plausible given the extensive and mostly still-secret atomic research done by the Germans coupled with the government's attempt to down play UFO sightings immediately following the war. The second possibility is that a field propulsion device was developed out of the early work of the Austrian inventor, Karl Schappeller. This possibility is strengthened by the fact that individuals and organizations involved in this research openly acknowledged that one of their aims was to build an "ether ship".

The German conventional saucer program culminating with atomic propulsion has been discussed. Evidence of German field propulsion saucers has been reviewed. We already know that each step in the conventional German saucer program was a logical development of the previous saucer design. The question is: did the power utilized in the German field propulsion saucers arise from nuclear power? Was there a breakthrough which has been kept secret for almost sixty years?

We have discussed the link between nuclear facilities and flying saucers. Is this evidence, in itself, that an association exists? The association could be for one of two reasons. First, these areas may simply have been the most secure facilities available. The two projects may not have been connected at all. For security reasons, both projects were simply run out of the same area.

The second possibility is that the two projects were run out of the same facility because they are connected somehow. If there is a connection between nuclear energy and field propulsion, what type of connection is this? The connection under discussion is a direct conversion from nuclear energy to field energy. This connection is on the order of the connection between electricity and magnetism or heat and electricity or nuclear energy and heat. Does such a connection exist?

The answer I got from everyone asked was a resounding "no". The consensus seemed to be that the closest we could come to this was to convert nuclear energy to heat energy and then to electrical energy though the medium of a steam turbine. This is how nuclear power plants and atomic submarines work. This method seemed to have nothing to do with flight since the hardware involved is much too bulky and heavy.

We have already reviewed some other options for nuclear powered saucers. Klaus-Peter Rothkugel suggests that the atmosphere itself could be burnt using liquid air as a fuel and a nuclear reactor as a heat source. Friedrich Georg has documented some aircraft engine designs, apparently left on the drawing board, involving a propeller engine driven by steam heated by nuclear power. We have seen the enigmatic Messerschmitt design involving a small nuclear engine on a high-speed aircraft. We have also discussed the atomic rocket approach which involves heating and ejecting of liquid hydrogen using a nuclear reactor in the Lenticular Reentry Vehicle.

While there is no known direct connection between nuclear energy and field propulsion, Dr. Gordon Freeman has made me aware of an alternate method of production of electrical energy through the use of nuclear decay. This is important because with enough electrical energy both electrostatic and electromagnetic field propulsion are possible. Let me relate to you what Dr. Freeman told me as to how this process works. It is amazingly simple.

The simplest method involves the use of two solar cells which are the same size. A piece of paper, the thickness of a business card is cut to the same size as the solar cells. Radium chloride is painted onto both sides of the paper. The paper is then fitted between the solar cells. The radium chloride emits alpha and beta particles which activate the solar cell. The reader might ask, if this method works, why has it not been patented? The answer is, that in a slightly more efficient configuration, it has been patented (1).

There are other forms of this simple example. Imagine a simple circuit used for purposes of generating electromagnetic waves. This circuit would consist of a wire connecting a capacitor and then to a coil. An electrical input is given to this circuit whereby the capacitor is sufficiently charged in order for it to discharge. The electrical energy is carried by the wire to the coil where it is charged. Electrical energy is then carried back from the coil to the capacitor by another wire completing the circuit. Alternately, the capacitor (electrical field) and the coil (magnetic field) are charged and discharged. The output of this circuit are electromagnetic waves, such as fill the electromagnetic spectrum. The system works until electrical resistance in the three components converts enough electrical energy into heat to sufficiently degrade its output.

What is done using the new atomic decay system is to paint the capacitors with radium chloride. This unstable compound emits alpha and beta particles when magnetically or electrostatically pulsed. These particles are absorbed by the capacitors (as well as the other components), the end result of which is an increase in electrical energy in the circuit. If enough capacitors can be wired into the circuit in series to produce enough energy to offset the ohmic degradation, then the output can be maintained for a long time. Radium chloride has a half-life of 800 years.

Of course, if an extra capacitor were wired in to the circuit, an excess of energy would result. Even if this excess energy is small, it can be very important. Devices using a similar method have also been patented (2) (3).

In the next step, the circuit described above is given an antenna and a tesla coil. The radium chloride doped capacitors are turned to one of the resonant frequencies for the tesla coil. An antenna is used which is suitable for receiving this same frequency output. A feed back loop is set up whereby energy is being pulsed into the system in these resonant frequencies. It is estimated that an output of three thousand watts can be obtained from this "lifetime battery" with an input of only fifty watts (4). A transformer and other devices can be used to tailor the electrical output produced by this device according to the need. Details for construction and tuning of this "battery" are available commercially (4).

This whole device can be held in one's hand. Imagine the power of one hundred or one thousand such units. Certainly a U-boat or a field propulsion saucer could be powered using this system.

Dr. Freeman believes this nuclear doping might be the missing link in several free energy devices. Dr. Freeman has evidence that both the Hubbard and Hendershot generators were doped with nuclear material. He has evidence that Hubbard actually worked for the Radium Company of America. Further, he has found evidence that it was radioactive material which was used to dope Moray's germanium valve (5).

Even further, he has suggested that the initial starting energy necessary for the operation of the Schappeller device, which will be discussed shortly, was supplied by a radioactively doped electret (5). Bolstering Dr. Freeman's claim is a U.S. patent using such a radioactive electret to maintain its charge (6). This is not the approach favored in this book, but the use of something like the "lifetime battery" to start the Schappeller device is not beyond the real of reason. In fact, there is some evidence that a very strange battery was being produced in wartime Germany.

During the war years, at least until 1943, none other than Professor. W. 0. Schumann was engaged in building something called a "battery" at the Technical Institute at Munich. This battery was a project to itself and funded by the Deutschen Forschungsgemeinschaft, forerunner of the Reichsforschungrates, the Reich Research Council (7). The Reich Research Council coordinated high-priority war research between academic, industrial and military facilities.

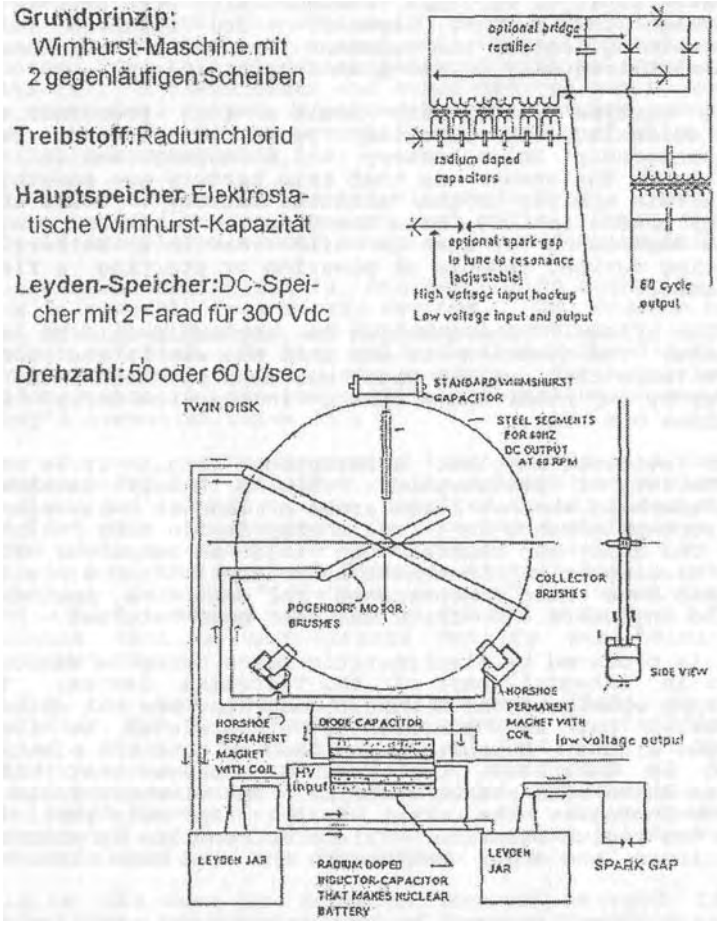
This is the same Dr. Schumann who was brought to the United States after the war as part of Project Paperclip (8). This is also the same Dr. Schumann noted for the discovery of the Schumann Resonance. Dr. Schumann was no stranger to free energy

devices since it was he who evaluated a working Hans Coler device in 1926 and could find no fault, hoax or bad faith, on the part of its inventor (9).

Rumor has it that Dr. Schumann's specialty was antennas and that he was responsible for building or improving American submarine communication after the war. It is said this was done by employing extra low frequency radio equipment and mile-long antennae which were towed behind the submarines themselves. The radio waves employed for this communication were said to go directly through the earth's center. Dr. Schumann also discovered something called the Schumann Resonance which deals with the resonant frequency of the planet earth itself.

Returning to wartime Munich, why would a full professor and world-class scientist be devoting years of research and government sponsorship to a battery while Germany was in the middle of a war? The answer is that this battery was something special. Was this similar to the "lifetime battery"? Could this type of energy production have been the promised means of freeing Germany from dependence of foreign oil? Was this battery an energy producing device, capable of powering or starting a field propulsion saucer?

The old problem arises. The question is not could this be the way it was done. The question is was this the way it was done, What proof is there that nuclear decay was used by the Germans to produce energy by any other means than is in practice today? Dr. Freeman provides one hint.



This scrap of evidence involves a religious sect. It is the Methernita Society of Switzerland. This is a self-contained, Christian brotherhood who own large areas of land in Switzerland. Among their accomplishments is a free energy device they call the Testatika. One desk top machine can yield an output of 3000 watts. This machine or machines have been in existence since the late 1970s and have been demonstrated for outsiders, including scientists and engineers. No fraud has ever been detected.

High voltage is produced by electrostatic means using a Wimhurst generator as in integral part of the Testatika device. The counter-rotating wheels of the Wimhurst generator are not allowed to spin freely, but are purposefully restricted to lower revolutions per minute. Capacitors are used to hold the electric charge which is generated. Dr. Freeman believes that these capacitors are doped with radium chloride. The electric field of the capacitors increases the output of alpha and beta particles derived from the radium chloride. This electron flow is absorbed by the capacitors and other components and fed back into the system.

The Methernita Society has never been forthcoming concerning the workings of this device. The machine itself seems to be the brainchild of one person, Paul Baumann, who is described as a

Der Testatika-Generator

Der erste wissenschaftliche Konverter zur Umwandiung elektrostatischer Energie in elektrodynamische Energie

Dr. Freeman's drawing of the Testatika.

"technician". Even in the old films of the Testatika, Mr. Baumann does not look like a young man. Germany is Switzerland's neighbor and what better place to utilize secret wartime technology than in a closed religious order. Dr. Freeman informs me that one of the builder's assistants talks of radioactive and non-radioactive forces in conjunction with this machine. Dr. Freeman has put these scraps of evidence together and made a drawing which is reproduced here.

Let's try reversing an equation. What if the T. T. Brown relationship between a highly charged capacitor, gravity and movement were altered? What if the highly charged capacitor were fixed and unable to move in a gravitational field? Would not the energy evidenced in the movement of the capacitor in T.T. Brown's work be translated into electrical energy and contained in this fixed machine? Would this not be a generator?

Let's flip it around again. Could not a flying version of T. T. Brown's charged capacitor have gotten charged via decay of radioactive material with accompanying hardware similar to what has been described above?

One more point should be made concerning the possible relationship between atomic energy and field propulsion. We do know that electromagnetic radiation can be generated by atomic fission or fusion. This is done whenever nuclear weapons are detonated. It is called an electromagnetic pulse. This is a well-recognized phenomena and the military's communications and sensitive electronics have to be "hardened" against this electromagnetic pulse as a battlefield necessity. So the relationship between electromagnetic and atomic energy does exist. The question still remains as to a technological breakthrough in the application of this phenomena and to whether the Germans pioneered this effort involving flying craft.

Atomic/Field Propulsion Sources

1. United States Patent, Patent Number 5,443,857, August 22, 1995, granted to Howard C. Rivenburg, "Power Source Using A Photovoltaic Array And Self-Luminous Microspheres".

2. United States Patent, Patent Number 5,642,014, June 24, 1997, granted to Steven J. Hillinlus, assigned to Lucent Technologies, Inc., "Self-Powered Device".

3. United States Patent, Patent Number 4,835,433, May 30, 1989, granted to Paul M. Brown, assigned to Nucll, Inc., "Apparatus For Direct Conversion Of Radioactive Decay Energy To Electrical Energy".

The Karl Schappeller Device

Was the Schappeller device an engine used in German field propulsion saucers? This is a possibility. Because so little has been reported about this device in the English language, the following is a report describing Karl Schappeller and his device in some detail.

Karl Schappeller (1875-1947) literally went from being born in poor house to owning a castle during his lifetime. His economic success was mirrored in his experiments in energy as a lay-scientist, culminating in the invention of a free-energy device which attracted considerable attention around 1930. Schappeller made no secret of his invention and actively sought private financing to manufacture and distribute the results of his research. He was in touch with financial concerns and even spoke with a representative of the British Admiralty concerning the utilization of his device to power the Royal Navy's ships (1).

At this time, 1930, the device was somehow appropriated and further worked upon by a governmental organization of the German Weimar Republic, the Reichsarbeitsgemeinschaft or Reich Works Association (RAG). At least one aim of the RAG was to make Germany self-sufficient in energy production. Specifically, they published their intentions to utilize many Schappeller devices in a system of broadcast energy distribution throughout Germany which would result in the entire elimination of the electrical grid (2). As we know, Adolf Hitler assumed power three years later and was also very interested in making Germany independent of foreign sources of energy for strategic reasons. It is known that political and scientific structure was set up to work on the energy problem as evidenced later by the synthesizing of gasoline and oil products from coal by the 3rd Reich. One of these

Left: Inventor Karl Schappeller Right: Karl Schappeller's Device. A. Steel outer casing. B. Special ceramic lining in which tubes are embedded. C. Hollow center, filled by glowing magnetism when in operation. D. Tubes, circuit and earthling.

political and scientific structures was contained within the SS and it is known that Karl Schappeller actually met with SS Reichsfueher Heinrich Himmler in Vienna in 1933 (3).

Fortunately, there are good descriptions of the Schappeller device in both German and English languages upon which to draw. Per Vril-Mythos is a complete discussion of Schappeller, his device, the history and the controversy surrounding it. "Vril" Die Kosmische Urkraft Wiedergeburt von Atlantis and Weltdynamismus Streifzuege durch technisches Neuland an Hand von biologischen Symbolen represent an attempt by the RAG to popularize their ideas in booklet form. Finally, British electrical and mechanical engineer, Cyril W. Davson, visited Karl Schappeller in Austria and spent three years learning of his device and his theory before the Second World War. Davson's descriptive book, The Physics of the Primary State of Matter, was written in 1955, after the war and the death of Schappeller.

Before describing the device itself it should be understood that Schappeller and all writing about his device do so believing that the energy-source being tapped is ether energy, sometimes called "Raumkraft" or "Raumenergie", that is space energy (4)(5)(6). This device was also said capable, perhaps with some tuning, of emitting ether as a radiant energy (7). The physics of ether energy is described by Davson as a primary physics as opposed to conventional physics which he believed could only be considered a secondary, derivative understanding.

Ether Theory

For readers who have never heard of "ether", perhaps the simplest explanation for ether physics is that of the late Dr. Hans A. Nieper (7) titled Revolution in Technology, Medicine and Society. Ether could be thought of as an energy source emanating from everywhere equally at once. The universe could be considered, as often said, "a sea of energy". It forms a background of energy everywhere, and since it is everywhere all the time, it is difficult make independent measurement of it. This ether energy is in constant motion. All energy is radiant energy, according to this theory. This can easily be appreciated as to electromagnetic radiation but it is also true of that very elusive thing called gravity. Newton described the effects of gravity but he never told us exactly what it was. Dr. Nieper tells us that gravity is really a push, not a pull. Gravity is acceleration and is caused by the ether field. Again, all energy is radiant energy whose fundamental basis is ether radiation.

From the aforementioned book by Dr. Nieper:

"In addition, Nieper established the axiom that all natural accelerations can be attributed to a single unified basic principle, namely, the interception (or braking) of a field energy penetrating from the outside (gravity acceleration, magnetic, electromagnetic, electrostatic and radiesthesic

acceleration). "

In trying to explain ether, it might be thought of as an all pervasive liquid occupying all of space. This liquid concept is useful because a liquid can not be compressed but can only transfer the energy attempting to compress it from one location to another. This is how an automobile's brakes work. The driver pushes in the break pedal when he wants to stop. The plunger of the break pedal attempts to compress fluid in the master cylinder. The master cylinder is connected by metal tubes full of fluid to each wheel. When force is put on the master cylinder by the driver it is transmitted to each of the four wheel cylinders full of the same fluid which transmit the force, moving the break shoes or stopping the disc which stops the wheels of the car.

Likewise, ether serves to transmit energy through this "non-compressibility" quality. In a primary electric coil and secondary electric coil, for instance, induction in the secondary does not take place directly from the primary as is new held by physics, but though and between the two via the ether field. This concept, that of the stimulation of the ether field as means of energy transport, is also expressed by Davson.

Using this perspective, that all energy is radiation, the braking of ether radiation, that is the slowing down or stopping of this radiation, can cause or generate other forms of energy. This word "energy" means the entire electromagnetic spectrum. This means electric, magnetic and electrostatic fields. This means heat. This also means gravity. Again, gravity is the primary radiation of the ether field. It radiates from every point in the universe equally.

This concept seems ridiculous until it is given some thought- One might ask: How can gravity be a push when we know better? After all, things fall to earth don't they? The answer is that the effects we feel and call gravity are due to gravity shielding. Ether radiation can be braked, that is slowed down and absorbed by mass. It is then re-radiated or turned into mass. It is re-emitted as slower ether radiation or even as heat. Some of it can is converted into mass inside a planet. If there is a loss of ether radiation, then there is shielding. Thus, a planet would shield from this radiation in one direction. That direction is always toward its center which is the direction of greatest mass and that is what we describe as "down". This is simply the area which contains the maximum amount of shielding. In all other directions the ether radiation continues to exert its push on us. The area of minimum shielding is directly opposite the area of maximum shielding, so things fall (or more correctly are accelerated or "pushed") to earth.

Think about this for a minute. Being in deep space is a little like being underwater. Underwater, all pressure from all points are so similar that we feel weightless. We are weightless in

deep space because the ether field exerts a push on us from all directions equally. In space, the nearer one gets to a large body the stronger the push is from the opposite direction since the body shields or converts the ether radiation. The result of this thinking is a mechanism totally different from "gravity" as we know it but appearing as exactly the same observed phenomena.

The beauty of this ether theory of gravity is that gravity functions like every other form of radiation. Its underlying cause, ether radiation, can be converted to mass or, in certain circumstances, re-radiated or converted to other forms of energy. No Unified Field Theory is necessary. The ether field is the unified field. Further, there is no need to look for something separate called "anti-gravity". If gravity is a push then it is all anti-gravity. All we have to do to make a UFO is to find this particular gravity frequency and find out how to generate it.

Ether physics was a lost physics. Physics was hijacked early in the 20th Century by alleged results of the Michelson-Morley experiment. The Michelson-Morley experiment assumed "ether" was matter. There is some confusion here. We know now that particles moving near the speed of light are measured as waves, that is energy, rather than as matter. Nevertheless, ether theory has been discredited among physicists who, in turn, discredit others who raise the subject. It is only through the efforts of "free energy devices" and free energy researchers that this knowledge is being returned to us. Without this ether theory, the reason these devices work cannot be explained at all. Rejection of ether theory allows these devices to be dismissed as "theoretically impossible" and so fraudulent by simple deduction. They are marginalized and dismissed as "perpetual motion devices". According to established physics, perpetual motion devices violate physical laws of conservation of energy. Without an ether theory as an explanation, they do violate laws of conservation of energy and so their detractors are able to simply dismiss them out of hand. The simple fact that some of these free energy devices actually work does not seem to bother these scientists in the least. Rather than change the theory to accommodate the observed facts, the facts are ignored and substituted by dogma. Whether we like it or not, we are living in an energy Dark Age.

Instead of ether theory, we have all been led to focus upon Einstein and his Theories of Relativity. Two or three generations of scientists have wasted themselves on "trying to prove Einstein right". This misguided thinking has resulted in stagnation. One need go no further than the many "free energy" devices which have arisen to the level of notice in spite of accepted scientific theory to see that this statement is true.

Needless to say, German scientists of the Nazi period labored under no such illusions. They never abandoned ether physics. This was the fundamental reason why field propulsion UFOs were

first developed in Germany. After the Second World War two different sciences developed called "Physics". One was the relativism taught in schools. The second more esoteric type was utilized only secretly, by the secret government, for deep black projects.

Structure of the Schappeller Device

According to Davson's description upon which we will rely, the Schappeller device is really composed of two separate units, the rotor and the stator. The stator is constructed as follows: Its surface is round or ball-shaped, being composed of two half-shells of steel. These half-shells contain the internal structure and are air tight. Attached at each "pole" of each half-shell is an iron bar magnet, most of whose structure is internal. This means that the bulk of the magnet is inside the steel ball, one opposite the other. There is a space between the two bar magnets at the very center of the sphere.

Insulation, a ceramic material, is placed on the inside of the steel ball leaving a hollow central area. Within this hollow area and around the space between the magnets are wound two internal coils. These originate at the bar magnet poles and each terminates at the center of the sphere with a connection leading out of the sphere to the rotor. These coils are composed of a hollow copper tube filled with a special and secret substance called the "electret". Upon leaving the sphere the electret filled copper tubes are replaced by conventional copper wire. An electrical connection is made from the outside surface of one pole to one pole of a special type of battery which is grounded at the other pole or, as an alternative, to a special device called an "Ur-machine" which will be discussed.

This electret is a permanent magnet within the sphere. This type of magnetism is not identical with ferro-magnetism or electromagnetism, it is much stronger (8). The actual composition of Schappeller's electret remains a secret but another electret has been made by Professor Mototaro Eguchi. It consists of carnauba wax and resin, perhaps also containing some beeswax. It was kept in a strong electric field while baking slowly until it solidified. For purposes of production of Schappeller spheres, a complete electret manufacturing plant would have to be set up which had no parallel in present science (9).

Before being set into operation, all the air is pumped from the hollow core of the sphere. This whole ball is mounted on a swivel mechanism so that the poles can be moved from the vertical to the horizontal. The stator is completely unattached from the rotor. The stator can function without the rotor and the stator is capable of producing electrical energy without the rotor. The rotor could also be used to generate additional electrical energy.

The rotor consists of: A steel wheel of special design fixed on

the shaft to be driven and surrounded on its outer surface by magnets which are attracted and repelled by the force of the stator. The copper wire attached to the internal copper tubing filled with electret runs through this wheel and supplies electric power to the magnets. The magnets are hollow and filled with the same electret. There are always an odd number of magnets.

A variant of this rotor comes to us from Taeufer, who refers to this further development as the "Ur-Machine". This machine is composed of six sphere units as described above, five revolving around a sixth set above or below the plane of the other revolving spheres. A seventh unit would be employed to rotate the rotating five spheres and so would be offset, and not attached to the others. The five rotating spheres would charge the sixth stationary sphere. The sixth and seventh spheres would function as an anode and cathode and so ground the unit. The Ur-machine could be used to activate other spheres instead of a battery-earthing procedure (10).

As a prime mover, an engine, the rotor would be employed turning a driven shaft. The stator would be offset, that is, moved off center in relation to the rotor. Schappeller worked out various angles of efficiency (11). The driven shaft could be used to power any number of machine applications such as, for instance, the propellers of a ship.

Means of Operation

The device is started through totally unique battery and a connection to the earth (12). A specific excitation impulse must be given to the device (13). This electric impulse was conducted through the iron magnet and jumped the gap in the center of the sphere to the other iron magnet.

What occurred then sets this device apart from all others. In the vacuum of the sphere, in the center space between the two bar magnets a field of "glowing magnetism" was set up. This glowing magnetism was something entirely unique. It is recognized as a magnetic field but much more powerful and unlike any magnetic field of an iron bar or an electric coil. Once the initial input had been made to start the device, the battery and ground could be disconnected. The device would continue of operate on its own (14).

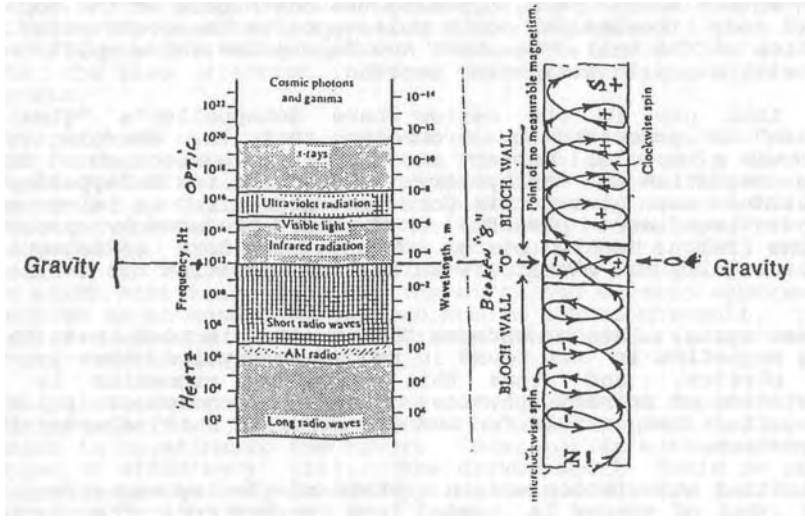
For an understanding of what is really happening here we have to consider the bar magnet. We think of a bar of iron with two poles, one positive and one negative or perhaps one north and one south pole. But there are really three components to the bar magnet. There are the two poles and the neutral zone between the poles If we cut the magnet in half we get two new poles. For the Schappeller this neutral area is very important. Imagine a bar magnet running through the vertical axis of the ball. Then imagine the center section cut out. We now have a north pole at

the top of the ball, a south pole at the bottom of the ball just as we do with the planet Earth. In the center we have a missing section with a south pole, opposing the north pole at the top of the ball and, likewise, a north pole opposite the south pole at the bottom of the ball. We have now four poles and a split bar magnet with a gap in its center section.

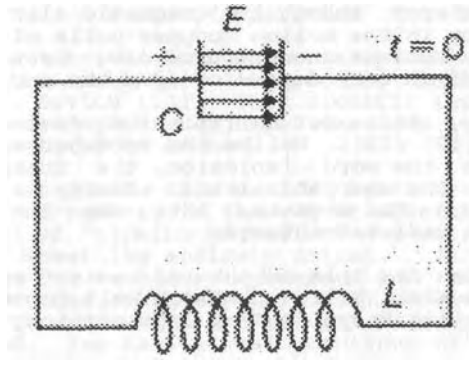
It is this gap in the center where Schappeller's "glowing magnetism" is generated by grounding, that is, charging the device via a special battery and an earth connection. This glowing magnetism is the mystery. Davson cites Schappeller's calculations and gives this form of magnetism as being one thousand times more powerful than that produced by present magnetism (15). He also states that in this form of magnetism the electricity is stationary while the magnetism is radiated (16).

To repeat again, Davson contends throughout his book that this glowing magnetism is not found in secondary physics, that is, in modern physics, and that this glowing magnetism is a manifestation of primary physics. As a phenomenon of primary physics, it is responsible for and can generate heat, electricity and magnetism.

After initial stimulation and in a state of glowing magnetism, no further input of energy is needed from the battery. The device is able to draw in energy to it directly from the surrounding ether, bind this energy though its magnetic electret material, that is the filling in the hollow copper coils of the internal coil, and then re-radiate energy producing heat, electricity, magnetism or mechanical work depending upon the application.



Stated another way, this is an implosion device and it is described as such (17) (18). Unlike the Schauberger device which is associated with the word implosion, the Schappeller device operates purely at the energetic level. Energy is drawn towards the center, through the magnets, into the field of glowing magnetism, and then radiated outward.



My first explanation for this output of radiant energy involves the concept of the Bloch Wall. A Bloch Wall is defined by Van Norstrand's Scientific Encyclopedia, 1958 edition, pages 201 and 202, as follows:

"This is a transition layer between adjacent ferromagnetic domains magnetized in different directions. The wall has a finite thickness of a few hundred lattice constants, as it is energetically preferable for the spin directions to change slowly from one orientation to another, going through the wall rather than to have an abrupt discontinuity" (18).

In electromagnetics the Bloch Wall is external to the hardware itself. It is the point of division of the circling vortex, or spin, of the electronic magnetic energies of the north and south

Bloch Wall And Oscillating Circuit

Top: Bloch Wall, a gravity wave source as a function of the electromagnetic spectrum? (Dr. Richard LeFors Clark)
Bottom: Oscillating circuit. Charged capacitor (electric field) discharges, current carried through insulated wire to charge coil (magnetic field) which discharges, charging capacitor. Oscillating electric and magnetic fields yield electromagnetic waves.

poles. The negative north pole magnetism spins to the left while the positive south pole spins to the right. Energy is being conducted into the Schappeller device through the un-insulated poles and being conducted and spun on its way to the center of the unit. The point of zero magnetism, no spin and magnetic reversal, where the two spin fields join, is the Bloch Wall (19).

The Block Wall radiates energy. Remember, if energy is coming in then it must be going out. The Bloch Wall may generate radio, radar and other electromagnet frequencies but what is most interesting is that it is actually able to radiate gravity as according to Dr. Richard Lefores Clark. According to this interpretation, the conjunction of two dipolar generated force field vectors, a quadropole force field or gravity is generated according to Dr. Clark. Gravity being a quadropole source, radiates in a circular, 360 degree, pattern of two cycles. Dr. Clark has fixed the point of emission as below that of radar and above infrared at 10 to the twelfth power Hertz (20). Dr. Richard Lefors Clark believes gravity is a radiation (21) and so a "push".

Another Opinion

In late 2001, I wrote a magazine article on the Schappeller device (22) which contained most of the material described above. In that article a request for alternative explanations for the Schappeller device was made. I received a letter from Mr. Michael Watson, BSc, Charted Physicist and Member of the Institute of Physics in the United Kingdom. But there was something in Mr. Watson's background even more impressive than his professional credentials. Cyril W. Davson was a family friend whom Mr. Watson knew well in his youth and with whom he had discussed Schappeller and his ideas at length, many times. In Mr. Watson's letter was a brief summary of Schappeller's theory in which he cut through most of the confusing terminology.

This summary is important for a couple of reasons. Mr. Watson's summary of Schappeller's ether theory as described by Davson dovetails nicely into the ideas of Schauberger yet seems to allow for Tesla's experimental results on ether as explained by Bill Lyne. The following is what I learned from Mr. Watson's letter:

Most of us have heard of the two Thermodynamic Laws. These are laws of heat. The First Law of Thermodynamics states that energy is conserved, meaning that the total amount of energy in the universe always remains the same. This is no surprise for most of us and it is not the real concern here.

What is of concern is the Second Law of Thermodynamics which discusses heat and entropy. The word entropy might be thought of as a state of randomness or chaos. Negative entropy would then mean movement toward the less random or the more ordered in any particular thing. If we apply this to a system, then entropy tends to increase until the system breaks down in utter chaos

This will occur unless the system is re-charged with additional outside energy. A concrete example is less confusing.

Imagine a new automobile just coming off the assembly line. It has taken a great deal of energy to find, refine, forge, weld, and paint the metal parts of this car alone. This same concept also applies to all the other components of the car. This energy and organization constitute a highly organized state, or, said another way, a state of negative entropy.

What happens next illustrates entropy. The car is purchased. Whether it is driven hard or just sits in the garage does not matter in the long run because what happens to the car is that it starts to fall apart. This change may be small at first and may only occur at the molecular level, but it occurs nevertheless. The engine, transmission, paint, rubber, electronics, etc. all will fail with time. Even it the car just sits in the garage, in a thousand years the metal will eventually oxidize. Finally, the car rusts away forming a reddish brown heap. This is exactly the opposite of the organization and energy used to put the car together. This disorganization is entropy. The only thing which will reverse this, as we all know, are additional inputs of energy by the owner in the form of maintenance and repairs.

All things in a relative state of relative order move toward a state of disorder. In terms of heat, heat will always flow into a colder place from a warmer place. When something is heated there is a rise in its entropy. With increasing heat its molecules move faster and faster in random chaos as a bomb does when it explodes. Increasing heat means increasing randomness and chaos which is entropy. Cold, then, can be seen in terms of negative entropy. Any cold object is simply more organized and less random than the same object once it is heated.

Schappeller had something to say about the Second Law of Thermodynamics. He said there was another and unknown thermodynamic cycle which runs opposite the Second Law. To name this idea we will call it "Reverse Thermodynamics". It is the reverse of the Second Law of Thermodynamics in that it leads to an increase in entropy. Not only is there an increase in order but there is an increase in cold! Schappeller, according to Mr. Watson's letter, built his spherical device primarily to demonstrate the principles behind this Reverse Thermodynamics. It was not designed as a practical machine.

To demonstrate the difference between the Second Law of Thermodynamics and Reverse Thermodynamics two theoretical machines shall be examined. Actually, a machine running according to the Second Law of Thermodynamics is not theoretical at all. Combustion machines are of this type. For simplicity sake we will use a wood burning stove such as the type invented by Benjamin Franklin for the heating of a house.

Wood is put in a hollow iron vessel with an adjustable hole at

one end. The adjustable hole admits atmospheric oxygen. An initial small input of heat is added to the wood and oxygen until burning occurs. A great deal of heat is produced once the wood begins to burn. We know heat expands. Carbon, carbon dioxide and water vapor are also produced as byproducts of the combustion. Entropy is increased. Since entropy is increased, so is pollution so perhaps we all can agree that this is a good example of the destructive technology so characteristic of the world in which we live.

In our example of a theoretical Reverse Thermodynamic machine the byproducts of the previous example can be used as fuel. But Schappeller's machine has the additional property of being creative, that is, negatively entropic. Schappeller believed this creative process to be individualistic, so we need a specific template to use as a pattern for this creation. Heat, water, and carbon dioxide are imputed into this machine. Quite amazingly, oxygen is yielded as a byproduct of this reaction! The heat is also absorbed in Schappeller's Reverse Thermodynamic machine! This absorption of heat is another way of saying that the machine is implosive in nature rather than expansive or explosive as was the heat producing machine. What is most amazing, however, is that entropy is actually reduced yielding, something which has been created - wood!

Actually, this machine is not theoretical either. It exists and works as we speak. These machines are all around us. We call these machine "life". In this case our machine is a tree. In the tree, energy, sunlight, is absorbed and combined in a cold process with water and carbon dioxide to form wood. The template used as a pattern for this seemingly intelligent, creative, process is simply a seed. In this type of reaction the "cold" force is something other than the absence of heat. This cold is an active cold. It is a "densifying", implosive cold. It is a life-giving cold. This is a cold, life giving force. To quote Watson:

"This process is life force and the reverse of the second law of thermodynamics; it is the vital force: Vril."

This is one huge difference between the physics of Schappeller and Schauberger and the physics of the Nineteenth Century. The physics of the Nineteenth Century explain everything in terms of the inanimate. Laws of physics are written using inanimate examples. Chemical reactions are described which stem from inanimate models. Animate models are simply made to conform with the inanimate assuming that life is just a special case which eventually will be shown to be nothing but chemistry and so subject to the same Second Thermodynamic Law as the inanimate. Schappeller and Schauberger both say in their own ways that this is not so. They say, each in their own ways, that a new and different law of thermodynamics applies to living forces. They say that this more akin to a life process than previous theories allow. They say this force is creative. Those that subscribed

to these new ideas claim it was not only a new physical law but a new science and that Germany would lead the way to this new science. Let us take a closer look at what is claimed to be the physics behind this new science.

The first concept to be considered is cold. Cold in this sense does not mean the mere absence of heat. This is interstellar cold, the cold found in the vacuum of space. In this relative vacuum, matter is not found in sufficient quantity to use to measure this cold. Think about how we measure cold. We measure matter which is cold. We measure the heat in air or water for instance. In the absence of matter how would cold be measured? There is no doubt that if we could, for instance, place a thermometer in a glass of water in deep space, the temperature recorded would be at or very near absolute zero, 0 Kelvin or -273 degrees Centigrade or -460 degrees Fahrenheit.

The presence or absence of matter in deep space may be the subject of conjecture. The presence or absence of energy in deep space is something universally accepted. For instance, we all know that light passes through interstellar space. We see the proof when we look up at the stars, planets or the moon. Besides visible light, other electromagnetic radiations freely pass through space. These include x-ray, gamma and cosmic rays. Yet besides electromagnetic radiation many people now believe that in the depths of space there resides another form of energy with is found there as well as everywhere else all around us. This energy sometime goes by the name of "zero point energy" but for our purposes we can simply call it "ether energy". It is sometimes argued that this energy is really the result of ether rather than ether itself and that ether really is matter. For a moment, let us postpone this discussion and focus on the vast, stretches of interstellar space which are filled with ether energy, near or at absolute zero.

Mr. Watson points out Dawson's words on page 83 of The Physics Of The Primary State Of Matter where he says:

> "Cold is not therefore the absence of heat, primary heat and cold having nothing to do with molecular action (in the cosmos) there are no molecules available".

The reader may recall that something strange happens to electrical energy at absolute zero. For instance, if a disc of conducting material is held at absolute zero and the disc is given an electric charge, the electric current will circulate around and around the disc forever, never loosing its energy as it would if the disc were sitting on an office desk at room temperature. This property of cold is instrumental in the storage of at least one form of energy. The vast stretches of cold interstellar vacuum must be seen as a vast energy storage sea in a state of heightened negative entropy. Schappeller called this undirected matter-energy reserve potential "latent magnetism.

Out of this latent magnetism, both energy and matter could be produced with the corresponding stimulation. The non-excited electromagnetic field was viewed by Schappeller as simply latent magnetism. Matter is a condensation out of bipolar ether. Therefore, electromagnetism is a product of matter and is nothing more than bipolar ether in a different condition. Latent magnetism could be, then, excited into matter. Latent magnetism could be influenced by either of the thermodynamic principles discussed, the Second Law of Thermodynamics or by Reverse Thermodynamics. This vast ether field, whose most notable characteristic is the property of cold, latent and awaiting stimulus, is the progenitor of both energy, as we know it, and of matter.

Since primary cold, this vast reserve of negative entropy potential, is responsible for both matter and energy and since all energy eventually degenerates into heat, it follows that, as navson puts it, again on page 83:

> "Primary heat, as may now be understood, is composed of cold energy".

This is seems like a surprising play on words, especially from a man of science, but this statement follows perfectly from Schappeller's reasoning nevertheless.

We turn now to Schappeller's concept of "stress". Both heat stress and cold stress can be applied to an electromagnetic field. Heat stress is the usual type of stress applied to electromagnetic fields in secondary physics. Secondary physics is the physics of our everyday world according to Schappeller. Primary physics is the physics dealing with the cold force and ether yielding matter and energy, which constitute the secondary reactions and so Schappeller uses the term "secondary physics" to describe our world as we know it.

An example of heat stressing of the electromagnetic field is the condenser and the coil. A charged condenser results in an electric field and a charged coil results in a magnetic field. A charged condenser and coil, connected by a wire circuit alternately charge and discharge each other, producing electromagnetic radiation unit the heat caused by the resistance of the wire degrades the whole process into heat. Heat stress on the electromagnetism is +/-.

Cold stress on the electromagnetic field is something totally new to our science and technology. It is also seen in terms of +/- but the machines used to produce it are not known in our world. Mr. Watson did not say this but if we return to our examples of heat stressed machines, the condemnor and the coil, the corresponding cold stressed machines might be the Schappeller sphere and the Schappeller coil electret. The sphere collects the charge through the magnets, holds and condenses it in its glowing center corresponding to the electric field of the

condenser. The internal coils filled with electret produce a magnetic field in the presence of the intense and pulsing electric field. According to my interpretation, the whole Schappeller sphere is a combined condenser/coil combined into one machine made possible through an initial input of cold stress.

As in our example of the condenser/coil interaction producing an electromagnetic wave, so an attraction exists between a machine obeying the Second Law of Thermodynamics and one obeying the law of Reverse Thermodynamics. This attraction can lead to interaction. For instance, an imploding or centripetal vortex can couple with an exploding or centrifugal vortex. The centripetal vortex is an example of a system following the law of Reverse Thermodynamics while the centrifugal vortex represents a system following the Second Law of Thermodynamics. We have all seen these two systems working together in everyday life. The common toilet is such a machine although the centrifugal side forms inside the drain pipe which is out of sight.

Perhaps there is another example which is more germane to our discussion. It is the diagram of the Vril power plant. (This engine diagram is used here as an example for discussion and is not a blind endorsement of the diagram's existence or accuracy.) In this interpretation of this diagram, we are really dealing with two separate devices. First, is the central spherical device which may be a refined version of the Schappeller sphere. An initial charge would be imputed into the sphere to start it after which the unit would continue to gather up the surrounding energy. This is a Reverse Thermodynamic machine. The sphere generates a magnetic field which could be offset by rotating as in the Schappeller device. The offset field would feed and so rotate the arms of the electric generator surrounding the sphere. The electric generator would gather electric energy, feeding the four large broadcasting fixtures on the walls of the saucer. These fixtures might be, for instance, Tesla pancake coils. The electric generator is an example of a machine complying with the Second Thermodynamic Law.

Both components of the power plant are bonded together in a single system since the output energy of the broadcasting fixtures on the walls of the saucer constitute additional input energy for the sphere. The two components attract one another and use and depend upon one another as they circulate and recirculate energy. As the energy level of one component increases so does the energy level of the other. Indeed, the biggest problem facing the use of such an engine may be employing a means to stop it.

The actual levitation might be the particular electromagnetic radiation coming out of the sphere. In this interpretation, the broadcast fixtures are used to steer the saucer. Davson gives output frequencies for the sphere as 10 to the sixth power (22).

Mr. Watson points out in his letter that one reason machines

utilizing the Reverse Thermodynamic principle have not been recognized is that a cold stressed magnetic field is a cold machine. Even a centripetal vortex cools rather than heats. All our devices of measurement ultimately measure heat in some form. Measurement of cold is more difficult. The example already given, the problem of measuring temperature in interstellar space in the absence of matter is an example of this problem.

Finally, the reader will recall that Mr. Watson points out that electromagnetism manifests itself bipolarity, yielding four components in all. These are +/- hot electromagnetism and +/- cold electromagnetism. The reader will recall that two hot electromagnetic components can be joined (the condenser and the coil) and set into a cycle producing an electromagnetic wave. Is it possible that two complementary hot electromagnetic and cold electromagnetic machines could be set into cycle producing not a bi-polar but a quadropolar, 360 degree radiation, such as the one described by Dr. Richard Lefores Clark, to produce gravity?

Planned Uses For The Schappeller Device

If the above discussion has any meaning at all in the quest for an answer to the UFO question, one use for which the Schappeller device must have been destined was that of a power plant for a flying machine. Was this so? The Schappeller device had many planned uses. In 1930 this device was planned as a source of broadcast energy, reminiscent of Tesla, for both German homes and industry. The device could also be used as a generator, battery, transformer, or antenna (23). It is reported that toward the end of the war the SS researched the possibility of using this device in the form of a death ray (24). But additionally, and in answer to our question, the Schappeller device was envisioned as a levitation device for a flying machine. Here is some of that discussion from our sources:

"The new dynamic technology will, in the future, be able to drive electric locomotives and automobiles without the manufacture of costly armatures and everywhere through connection to the atmospheric voltage network. Hypothetically, is certainly the installation of a sufficient number of central amplification facilities which transports from the Ur-Machine the specific magnetic impulse from the dynamic spherical element. New types of aircraft with magneto-static power devices and steering, which are completely crash and collision proof, could be built for a fraction of the cost of today's aircraft—and without the lengthy training of everyone who will be servicing these aircraft".

From "Vril" Die Kosmische Urkraft Wiedergeburt von Atlantis by Johannes Taeufer, page 48.

"Our problem must be to drive toward the space ship problem to new understanding of a realization! Here a definite postulate can be established: "Spherical space ship with its own atmosphere—also technical creation of small planets with world-

dynamic propulsion and buoyancy!".

Will this be possible? ---

Major powers in the world prepare themselves in any case presently, especially in Germany."

The above from Weltdynamismus Streifzuege durch technisches Neuland an Hand von biologischen Symbolen. pages 11 and 12. Please note the use of the words "spherical space ship" (Kugelraumschiff).

From Davson in The Physics Of The Primary State Of Matter, page 240:

"The Rotor is laminated to prevent eddying and the magnets do not project; the Rotor periphery is thus entirely equiradial. The Rotor is fixed to the shaft to be driven and the Stator is fixed about a metre above the earth's surface. The latter is, of course, flexible because the earth can include the sea or even the floor of an ether-ship."

From Davson, page 199:

"As has already been explained, the new Technique will not concern itself with the air as a supporting medium, but directly with the ether. Therefore, the body may be a vertical sealed cylinder with conic ends or any other suitable form. Such a body is obviously rigid and inelastic, and it must contain an ether stress of sufficient intensity to support its mass against the ether stress of the earth's stressfield, which means that the glowing magnetism core in the Stator, provided in the body to be lifted, must be able to vary its intensity according to the height at which the ether-ship is to be raised and supported whilst in transit, as the ether stress or field, itself, varies inversely as the square of the distance from the earth's surface. The actual design and solution of all the various problems in the production of such ships, the choice of methods of propulsion, whether independent or directional, belong to the new Technique, whereas here we are only interested in the principle as applied to the problem of Gravitation."

Finally, from Davson, page 177:

"Now the reason that an unsupported body falls to the ground is primarily because it has "no hold" on the medium. It was previously explained that any inert mass or body has only a latent stressfield which functions merely as the force of cohesion and has no mobility and thus only a latent internal stressfield and no external stressfield. This means that it has no "hold" on any elastic medium such as the ether or the air, therefore it must fall, and it falls towards the greater inductive energy.

If the inductive energy, through some exterior cause, could be made suddenly to increase enormously, there would come a point when the body would be supported, or rather suspended, before it reached the earth's surface.

The new Technique could accomplish this by placing a Schappeller Stator in the body in question, where the body is suitably constructed, thus setting up a glowing magnetic stressfield which would hold or keep the weight or mass of the unit body suspended, not in the air—the stressfield would have no reaction on the air—but only on the earth's magnetic stressfield.

This is the basis of the new principle for "ether ships""

Employing the Schappeller mechanism is only half the total explanation. In a field propulsion saucer there are possible two types of "drive" needed. The first is the "Auftrieb" or levitation. Employment of levitation makes the craft buoyant. It weighs nothing. If it weighs nothing it can be moved very easily. "Antrieb", impulse or motive power is the second drive involved. It moves the craft directionally. Levitation only would be supplied by the Schappeller system. Directional movement is so far best explained, in my mind, using the Tesla pancake coils as explained by Bill Lyne.

Concluding Thoughts on the Schappeller Device

In the end, what can be said of the Schappeller device? certainly, it did exist. It drew attention and funding from people within the German government of the time. It was studied by a qualified outsider, a British engineer, for a period of three years and was judged to be genuine.

There are some obvious problems, however. Exotic energies have been evoked which have not been explained satisfactorily. Therefore, the facts are not in evidence yet. Certainly more proof is required before the claims made for this device or the energies involved can be wholly accepted. For the time being we must put this discussion aside, awaiting further correlations.

There are some solutions connected with this device also. If we accept the idea that both the Schauberger and the Schappeller devices worked on the theory of implosion, then one explanation will serve to explain them both. It also allows for an ether-as-matter explanation. This may fit into the evidence gathered by Nikola Tesla. The commonality of these devices could then be sought and perhaps a more efficient device built as a result. We will pick up this theme again in the discussion section of this book.

It should be pointed out that the quest for this "new science" is not specific to Schappeller or Schauberger. Mr. Watson passed on

these words from Ehrenfried Pfeiffer, a scientist who collaborated with Dr. Rudolf Steiner around 1920. Although he is not happy with the translation he sent it as he found it which is as it is presented here:

"...the method of science, in a materialistic sense, is based on analysis splitting apart, disintegration, separation, dissecting and all the procedures which have to destroy and take apart, to work on the corpse rather than to grow, to develop, to synthesize. That the human mind was captured by these methods of braking apart: in that I saw the source of our present situation. My question therefore was: (to Rudolf Steiner) is it possible to find another force or energy in nature, with does not have in itself the ductus of atomizing and analysis but builds up, synthesizes. Would we discover that constructive force, which makes things alive and grow, develop adequate building up of methods investigation, eventually use this force for another type of technic, applied to drive machines, than because of the inner nature of this force or energy we might be able to create another technology, social structure, constructive thinking of man rather than destructive thinking. This force must have the impulse of life, of organization within itself as the so-called physical energies have the splitting, separating trend within themselves.

My question to Rudolf Steiner October 1920 and spring 1921 therefore was: does such a force or source of energy exist? Can it be demonstrated? Could an altruistic technic be build upon it?".

My questions were answered as follows: "Yes, such a force exists, but is not yet discovered. It is what is generally known the aether (not the physical ether) but the force which makes things grow, lives for instance in the seed as Samenkraft. Before you can work with this force you must demonstrate its presence. As we have reagents in chemistry, so you must find a reagent for the aetheric force. It is also called formative aetheric force because it is the force which relates the form, shape, pattern of a living thing, growth. You might try crystallization processes to which organic substrata are added. It is possible then to develop machines, which react upon and are driven by this force. Rudolf Steiner than outlined the principles of the application of this force as source of a new energy..."

Since this quest for a new science with the accompanying new machines had a relatively long history in Germany, certainly pre-dating the 3rd Reich, it is almost certain that the Schappeller device or others built along a similar understanding were further developed during the Nazi period. What became of it after the war is unknown. It can be assumed that this device did not escape the scrutiny of the numerous Allied intelligence units tasked with combing Germany for examples of German science. Perhaps someday a government report will be de-classified explaining all this as it was in the case of another free-energy machine, that being the Hans Coler device, which was declassified

by the British in 1978 (25) and which worked, according to Mr. Watson, using the same principles of cold magnetism. Until that final reckoning comes aspects of the Schappeller device will still remain a mystery. And until a more final reckoning comes, the question of if the Schappeller device was used as a source of field propulsion in German flying saucers must be deferred.

The Karl Schappeller Device

Chapter Summary

There is ample evidence that the Schauberger saucer model flew. The fact that the Schaubergers were brought to the United States to continue the work leads to the assessment that they worked on something of value to the government of the United States. The U.S. government was neither interested in his water research nor was it interested in his work on agriculture. We are left to conclude that it was his work on a new form of levitation, his saucer work, which brought Viktor Schauberger and his son Walter Schauberger to the United States. After learning all they could, the government of the United States dismissed the Schaubergers rather badly, foreshadowing the treatment of the German rocket scientists two decades later.

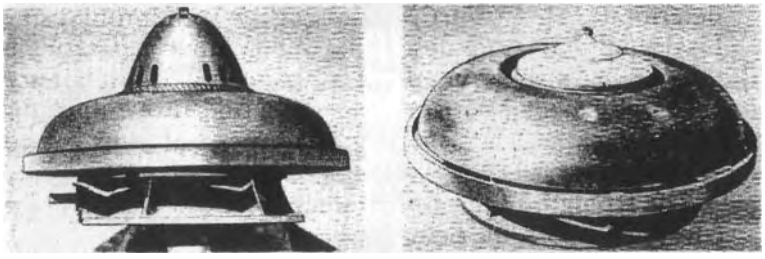
Lionel Shapiro was a credible and incredibly well connected reporter of the war and post-war years. The fact that he was able to break stories relating to secret weaponry in Czechoslovakia indicates that he had some connections within the U.S. military. With the war won, the years of 1946 and 1947 seen

to have been a period when the guard of censorship was relaxed. This noose would be re-tightened as the cold war got underway. No fault can be found with Mr. Shapiro's article or its content. The article on the KM-2 electromagnetic rocket and Mr. Shapiro's other stories appeared in a respect newspapers, not a tabloids. His post-war report of the KM-2 electromagnetic rocket must be taken on face value as legitimate.

The German eyewitness account of "Magnetscheibe" prompted investigation into U.S. governmental sources for corroboration. The CIOS report and the F.B.I. report provided corroboration. In the CIOS report we find a U.S. governmental admission of experiments in field propulsion for aircraft undertaken in wartime Germany by Dr. Erb. The F.B.I. report on a field propulsion German saucer must be taken seriously because the F.B.I took it seriously. The F.B.I. carefully took the report and investigated the veracity of their subject. The F.B.I. then sent copies of this report to other intelligence agencies within the U.S. government which is indicated on the F.B.I. report itself. The Bureau saved the report all these years. The fact that this report deals with German technology but was taken by a domestic law enforcement agency, one whose "spy" activities are geographically restricted to within the USA, is noteworthy. It may indicate that the F.B.I.'s Director, J. Edgar Hoover, was kept "in the dark" about the real nature of flying saucers and may have wanted to show the other intelligence agencies that he was not so easily cut out of the information loop.

If you do not believe this F.B.I. report does not constitute something special, ask yourself, if you had walked into an F.B.I. office and described a UFO sighting you had made over ten years previously, what do you suppose the Bureau's reaction would be? Would you be taken seriously? Would your background be investigated and would your story be the subject of such extensive treatment? Would your report be kept for forty years? Or, on the other hand, would you be politely shown the door by a condescending uniformed security officer. Something in this report really struck a nerve at the F.B.I.

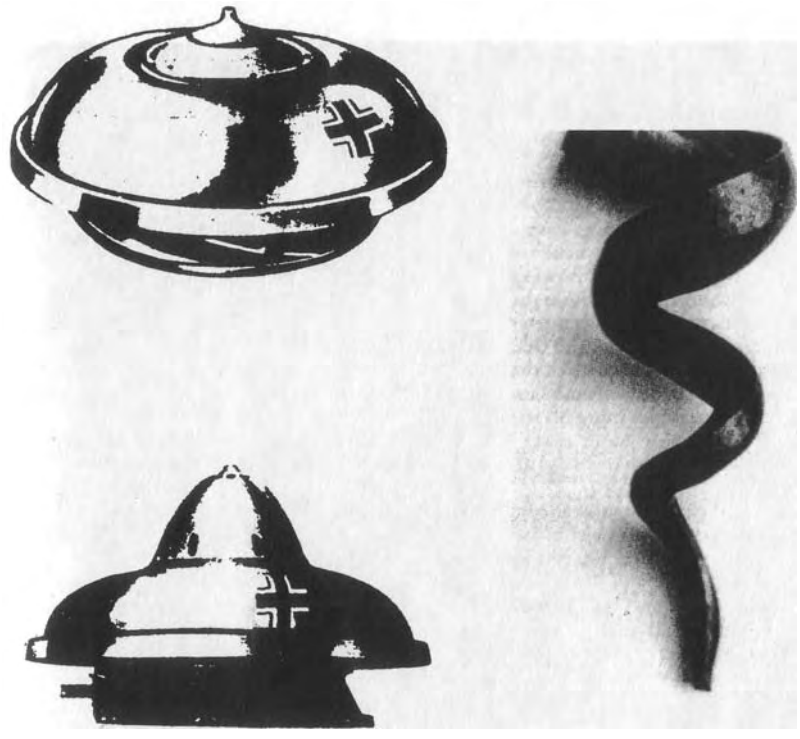
There is some suggestion that the Germans worked on a chemical engine which produced levitation. There is a possibility that electricity was produced by the Germans directly from atomic energy. There is some evidence, from both German and English language sources, that the Karl Schappeller device was being developed within Germany during the period of time in question. There is evidence that both the Schauberger and the Schappeller devices can be explained in terms of implosion and that implosion may have yielded the levitation force behind field propulsion vehicles. There is ample evidence that the Germans had access to the ideas of Nikola Tesla. The work of Tesla may be seen as an alternative method of propulsion or as a method of moving a field propulsion vehicle after it was made weightless by another method. There are wartime pictures along with many very similar

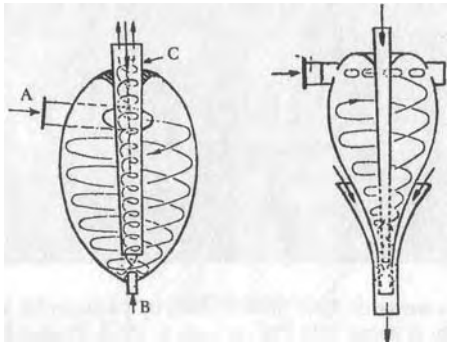


post-war pictures which indicate that the development of field propulsion vehicles took place at this time.

Concerning these pictures and related reports of flying saucers one is thrust up against the intelligence services of the government of the United States of America who see fit to involve themselves. As we will see, it is the latter's rather clumsy attempt to suppress and discredit the flying saucer phenomena which actually speaks volumes for its existence.

The exact methods pertaining to the propulsion of these saucers may be plausible but they can only be taken as provisional at this time. There may be hundreds of ways to power a field propulsion saucer. The question is not "how could it have been done" but "how was it done".





The brilliant Austrian scientist Victor Schauberger.

CHAPTER FIVE:

LORE AND LOOSE ENDS: A DISCUSSION OF GERMAN SAUCERS

CHAPTER FIVE

Lore And Loose Ends: A Discussion Of German Saucers

Some of the historical context for German flying discs has been discussed in the preliminary section of this presentation, "The Situation Within Nazi Germany". German saucers were not designed to generate the flying saucer mystery in the second half of the Twentieth Century. They were designed as a weapons system to do a specific job. The fast-moving wartime mind-set was a time when new aircraft designs and new propulsion technologies were coming on line with increasing frequency. The insertion of these saucer-craft into the wartime fabric did not seem as culture altering as the disclosure of these same craft might be to us today. But a simple recitation of the facts is not enough. Some things need to be said about the ideas on German saucers in order to put their study in a better context. Also, some strings have been left untied and some ideas need to be mentioned in order to round out the discussion on this topic.

No better place to start exists than with Renato Vesco. Vesco's insights for the reasons for German saucers were right on the money as were his descriptions of cultural conditions within wartime Germany with prompted this response. Vesco elucidated the foo fighter mystery as nobody else did. But he went on to describe another mystery craft which he called the "Kugleblitz" or "ball lightning" in English (1). This craft is not the same as the Schriever, Habermohl, Miethe or any other saucer design so far disclosed. Indeed, Vesco seems to know nothing of these other projects. His only descriptions were of the Feuerball (foo fighter) and the Kugelblitz.

Vesco described Kugelblitz as the big brother of the Feuerball, meaning that it was a further development of the Feuerball or foo fighter. A central cupola or cabin was surrounded by a free-spinning body or saucer which was turbine driven. Further stabilization was probably provided by a small but rapidly spinning centrally positioned flywheel, a gyroscope, set at ninety degrees from the axis of the saucer. The Kugelblitz was able to take-off vertically. Its method of destroying enemy aircraft was probably that described by Vesco (2) and confirmed in new U.S. government documents which included the description of the "Phoo Bomb" (3) under item six, "Gases Applicable To

Aircraft". In this system the Kugelblitz approached an enemy bomber formation and ejected one of two types of gas ahead of that formation. The engines of the bombers inhaled the gas and were either destroy by pre-ignition or engine seizure caused by loss of motor oil viscosity. It is not know if one or both methods were used.

The Kugelblitz was guided to the bomber formation by a homing device whose name may have caused Vesco and later UFO researchers some confusion. This is because there existed a homing device whose name was "Kuglelblitz". This may have caused Vesco to assume the entire project bore its name. This device was manufactured by the Patent Verwertungs Gesellschaft of Salzburg and we know quite a bit about it through a Freedom Of Information Act response (4).

Curiously enough, and for a second time, the file comes to us from the Federal Bureau of Investigation, a domestic spy agency which theoretically had no business investigating foreign technology in foreign lands.

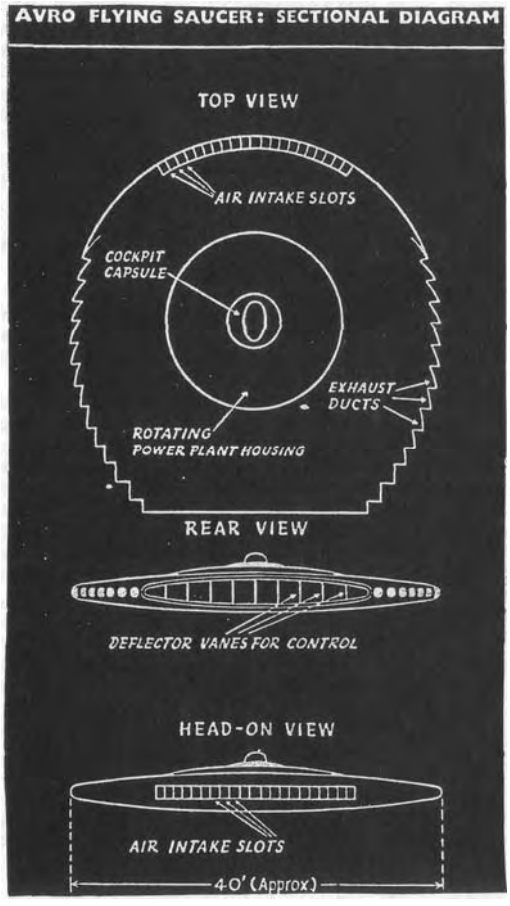
The Kugelblitz homing device was a proximity fuse which measured radio frequency waves bounced back from the target, reconciling the Doppler shift with measurement of standing waves to find the exact distance to the target. This homing device was the best of any produced by the Germans, according to the report, as was to be used on all varieties of flak rockets including the Schmettlerling and the Rheintochter. Examples were built at the Patent Verwertungs Gesellschaft plant but it never reached full assembly line production.

There are two interesting asides to this story. The first is that on May 1, 1945, one day after Hitler shot himself in the bunker and six days before Germany surrendered, two officers of the Reichsministerium fuer Rustungs und Kriegsproduktion (Albert Speer's ministry) arrived at the plant and took all existing examples of the Kugelbitz devices and the plans. Neither the two officers, the devices, nor the plans were ever seen again (5). Why was this done? Realistically, these officers must have had some post-war aspirations for this device. It must be added that at this point in the war, Speer's ministry, the Reichs Ministry for Armament and War Production referred to above was in fact being administered and run by the SS.

The second aside is another device in the conceptual stages at the Patent Verwertungs Gesellschaft called "Phantoscope". Phantoscope was to employ high frequency waves beamed to the ground then reflected and picked up on board a moving aircraft to image, in three dimensions, the contours of the earth's surface using a glass case filled with gas and tiny vertical wires. This could be done in any weather, day or night (6). One wonders if the German officers plucked this jewel also? If so, was this to be used on a manned saucer?

Vesco says the Kugelblitz saucer was flown once against enemy aircraft (7). It was destroyed by technical detachments of the SS after "a single lucky wartime mission" (8) in late March or April of 1945 (9) .

Another mystery is the post-war activities of Dr. Richard Miethe. Most all sources state that Dr. Miethe went to Canada after the war and worked on a joint Canadian-American saucer project at an aircraft facility near Toronto, Ontario. Unfortunately, all Freedom Of Information Act inquiries concerning Dr. Miethe run into the solid wall of "no record". Only one researcher ever claimed to have a document naming Dr. Miethe in association with this Avro Aircraft, Limited project, (also known as A.V. Roe, Limited), and that one researcher later admitted to being "a government asset" which throws a cloud of doubt on all his work (10).



There is no doubt, however, that by early 1955, work was commenced by Avro to build a mach 3 flying saucer which is reminiscent of some of the designs attributed to Dr. Miethe. Two designs were proposed, the difference being the engine used to power the saucer. One proposal was to use several axial-flow jet engines. The second and preferred proposal was to use one large radial-flow jet engine. The axial type is the type most commonly used in jet aircraft today. The radial type was similar to the first jet engine flown by the Germans in 1937. In fact, the radial engine actually under study in Canada may have had some similarities with the Rene Leduc engine used by Dr. Miethe.

Work continued until the early 1960s under various names including Project Silver Bug and Project 1794. Finally, a small hover-craft was unveiled by Avro as the final outcome of their saucer experimentation. This "Avrocar" had nothing to do with either Dr. Miethe's work or a mach three interceptor. The Avrocar was probably a cover project for something else. This "something else" was more advanced.

The Avro Aircraft, Limited experimentation with saucer-craft was always an open secret which was at times exploited by the government. Information regarding this project has been obtained via Freedom Of Information Act using their American partner, the United States Air Force at Wright-Patterson Air Force Base, by this researcher as well as other researchers.

There exists a sub-story to the Canadian involvement which should be mentioned. In an article in a British UFO magazine, writer Palmiro Campagna revealed a previously unknown connection between the Canadian government and the history of German saucers (11). It seems that an SS technical liaison officer, Count Rudolf von Meerscheidt-Huellessem, (erroneously spelled "Hullessem" in the article), contacted the Canadian government in March of 1952, offering technical information about a German saucer which could attain speeds "limited only by the strength of the metals used in the saucer's construction". According to the article, von

Avro Flying Saucer

This is a general diagram of the exterior of an Avro saucer. It is representative of how the Avro radial engine saucers worked. Within this outer hull an inner, flat radial-type engine of was situated. This is exactly the scheme designed by Dr. Richard Miethe it and has been copied from his designs. Dr. Frost and his engine designs were overblown, heavy, complicated frauds.

Meerscheidt-Huellessem wanted a large sum of money as down payment, a monthly salary and Canadian citizenship and police protection in exchange. Support for this claim comes in the form of copies of Canadian government documents describing this offer. Mr. Campagna states in the article that the Canadian government ultimately declined the offer but that the American government may have taken over negotiations and accepted.

Contact was made by this researcher with a daughter of Count Rudolf von Meerscheidt-Huellessem's who verified that her father was a technical liaison officer. She had little contact with her father since she was two years old since he had remarried and moved to Canada. She was able, however, to provide the address of another relative, Countess von Huellessem, who was Count Rudolf von Meerscheidt-Huellessem's widow.

Contact was made with Countess von Huellessem. Count von Meerscheidt-Huellessem died in 1988. But the Countess did know a little something about the story in question. Her late husband did discuss the flying saucer with her but only once. He told her that the "drawings" had been given to a representative of the Canadian government in 1952. After review of the drawings, the only comment from the representative was that they were "outdated". The drawings were never returned. The Canadians had succeeded in obtaining hard information concerning a real flying saucer and in paying for it with an insult. Count von Meerscheidt-Huellessem was somewhat despondent over the rejection. He never mentioned the subject to his wife again. At the time they were both making new lives for themselves in Canada and the subject never resurfaced.

In discussing these events with the Countess over the telephone, she told me that she herself had seen these drawings. She was asked if these were drawings or technical plans. She said they were technical drawings on rolls of paper. I said the word "blueprint" and she said "yes". She stated again that these drawings were given only to the Canadians and not to the Americans.

Countess von Huellessem was sent a copy of the aforementioned article. Her only comment was that her husband would not have asked for a large sum of money in exchange for this information. They already had means. He might have asked for a position, she said, since her husband would have enjoyed working on this project.

Returning to the Avro Aircraft, Limited - U. S. Air Force saucer project, we have to ask ourselves some questions. First, was this information, these plans, the real basis of the Avro saucer project? This would certainly explain the reason for the partnership between the two governments involved since the Americans would have needed the Canadians at that point and the Canadians would have insisted upon control of the project on their home soil. Second, did the technology brought to the

Canadians by von Meerscheidt-Huellessen have anything to do with the jet technology obtained the under Freedom Of Information Act? It certainly had nothing to do with a hover-craft which was the outcome of this project according to the government. How could a floppy hover-craft barely capable of 300 miles per hour under the best of estimates have had anything to do with a saucer whose speed was "only limited by the strength of metals used in the saucer's construction"? Could Project Silver Bug, Project 1794, and some of the other patents of John Frost attributed to this collaboration all be nothing more than an elaborate cover story?

Another point is that until recently, the only connection linking the German saucer projects to the Avro Project and to the Americans was the involvement of Dr. Richard Miethe. With the new evidence of the Peenemuende Project's connection to the American saucer projects run out of Wright Field, Ohio and the Count von Meerscheidt-Huellessem connections to the Canadians, the weak linkage of Dr. Miethe to these projects is superfluous. There is now more than enough evidence to make these connections with or without Dr. Miethe. Further, considering the Count von Meerscheidt-Huellessem evidence, there is now a direct link between German saucer technology and the Canadian government's saucer project at A.V., Roe Limited. That link turns out to be the SS in the form of an SS technical liaison officer.

There are differing opinions as to how known saucer-types were actually powered. Every researcher seems to have his own ideas about this subject. Could the answer to this dilemma be that there are more types of German saucers than we know about? For instance a device is depicted in a 1975 issue of Luftfahrt International, a well respected German aeronautical magazine, which shows a drawing of a "Flakmine" (12). Depicted are several rotor blades, some powered by ram-jets, making it essentially a jet-powered helicopter. This device may have been derived from design work done in Italy in which the propellant and the explosive were the same substance. This device was called the "Turboproietto" meaning in English, "turbine projectile" (13). It would have been able to carry large quantities of explosive to the altitude of a bomber formation. The device would have rotored up, vertically, to the level of a formation of bombers and then detonated, using the remaining fuel as a bomb, presumably inflicting heavy losses. Klaus-Peter Rothkugel refers to this very device as a "Drehfluegel" and will detail its development in his upcoming book.

In another instance of a possible saucer type, saucers shown to Bill Lyne in a movie clip while he was in Air Force Intelligence were described by him as "flying turtles" (14). This film was taken by B-17 flight personnel during World War Two as the two German saucers attacked a squadron of bombers. other writers including Michael X. Barton and Norbert Juergen-Ratthofer used these same descriptive words. Vesco describes the "Feuerball", the foo fighter, as "circular and armored, more or less resembling the shell of a tortoise". This description also

applies to his Kugelblitz (15). Turtle or tortoise is "Schildkroete" in German. Sometimes this device is referred to as a "flying turtle" in both languages. With so many writers using this term for flying craft which are apparently not all similar, there exists a certain amount of confusion about this name, "Schildkroete". Therefore, this saucer does not seem to fit neatly into any previously described saucer type. Perhaps this flying turtle is only another name for the Fireball or foo-fighter which seems to be the consensus among German writers, other writers seem to associate this word with a larger craft so perhaps this type of saucer is closer to what Vesco described as the Kugelblitz. "Schildkroete" seemed so nebulous that for many years this writer refused to accept the term at all.

This all changed when it was uncovered that the Germans were actually developing a flying weapon code-named Schildkroete. This researcher as well as another researchers have found references to an offensive air weapon, called by the Germans, "Schildkroete", and known to American intelligence. The exact nature of this device is, however, still kept secret. The government is uncooperative, even when presented with their own words on the subject and copies of their own reports. For instance in a Combined Intelligence Objectives Sub-Committee interrogation of Albert Speer, Reichminister of Armaments And War Production, report 53(b), Speer is specifically asked about "Schildkroete". Only Speer's reply is retained in the record, not the actual question. Line number 20 of that interrogation quoted here as the document from microfilm is difficult to read:

" 20. Schildkroete he was not sure about, but he thought is might, conceivably be a jet fighter. "

By the time Schildkroete had come about, Speer had lost much of his standing and duties to officials of the SS. In this same set of interrogations Speer deferred a question concerning V-weapons to Dr. Hans Kammler as the one the Allies should seek as the expert. Speer was the only one raising Kammler's name. There was no follow-up questioning by the Allied interrogators. It was almost as if Speer had uttered an obscenity, invoking the "K" word, which was a word simply too hot to be touched in that setting.

The next Allied reference to Schildkroete comes from the Combined Intelligence Objectives Sub-Committee, Evaluation Report 40, titled "Sonderausschus A-4". Sonderausschus was an organization whose job it was to prioritize resources toward projects most needed to defend the Reich. These high priority programs were the Vierjahresplan, Vulkanprogramm, Jaegerprogramm, Lokprogramm, and the Notprogramm. Each had projects within these headings. Even though under pressure of law in the form of a request under the auspices of the Freedom Of Information Act, the Federal Government of the United States of America has responded with a "No Record" when asked for their files on some of these programs. This is true even when confronted with their own documents naming

Production and Layout

The Mittelwerk and Nordwerk tunnel system had been in reasonabl full production up to the cessation of hostilities, the main production being:-

V1 and V2 components and assembly
Taifun - flak rocket components
Schildkrote - flak rocket components
Junkers Engines - Jumo 004 components and assembly
Jumo 213 components and assembly

SECRET

KO-13489

5. Arbeitsausschuss Kontingents under Dir. Russo was charged with cooperating with the various plants throughout Germany to insure that required raw materials were received at the proper times and places. Interrogation of Russo revealed that he had been instrumental in and/or had certain knowledge regarding the following programs:

Name or Designation	Remarks
Vierjahresplan	4 years plan
Vulkanprogramm	
Jägerprogramm	
Lokprogramm	
Notprogramm	
8-103	Necessity program V-1. Also known under code name "Kirschkern" or "cherry pit" and as "Vu 1". Sometimes known also as "Libelle". Was manufactured or was to be manufactured by Henschel, Schönefeld/Berlin. Final assembly in Mittelwerke at Heidersschwerfen.
8-117	Also known as Hs. 117 and "Schmetterlin" or "Butterfly".
8-152	
8-162	Also known as "Schildkröte" and "Salamander". Manufactured by Heinkel in Rostock, Junkers in Dessau; motors from Mittelwerke in Heidersschwerfen, Bayrische Motorenwerke in Eisensch, Berlin-Spandau and Zuhladorf-Wandlitz/Mark, Klöckner in Brünn and Walter-Motoren in Prag.
8-246	

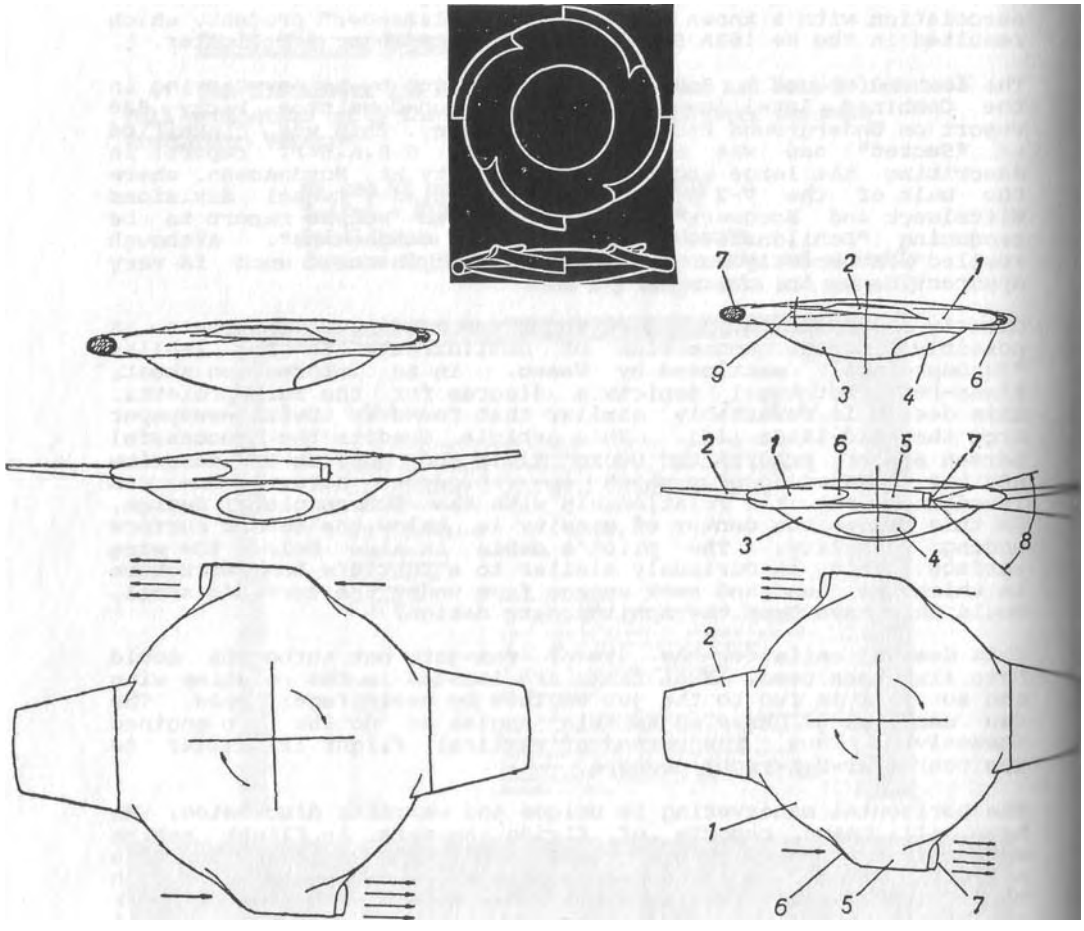
19. Mistel, he had explained yesterday as being pick-a-back aircraft.

20. Schildkröte he was not sure about, but he thought it might conceivably be a jet fighter.

21. Taiphun and Fiber he had not heard of.

Top: Combined Intelligence Objectives Subcommittee (CIOS) Report items 21, 22, 31, File# XXX111-38 Underground Factories In Germany, page 19. Middle: CIOS Report 40, Sonderausschus A-4, page 5. Bottom: CIOS Report 59(b) Interrogation Of Albert Speer Reich Minister Of Armaments And War, Page 3

these programs. One project, project 8-162, clearly names Schildkroete as the code-name of this project. It is listed in association with a known project, the "Salamander" project, which resulted in the He 162A Salamander or Volksjaeger jet fighter.



The last reference to Schildkroete was found by Heiner Gehring in the Combined Intelligence Objectives Sub-Committee Party 536 report on Underground Factories in Germany. This was classified as "Secret" and was a G-2 Division, S.H.A.E.F. report! In describing the large underground facility at Nordhausen, where the bulk of the V-2 production took place, tunnel divisions Mittelwerk and Nordwerk were said in this secret report to be producing "Schildhroete - flak rocket components". Although spelled incorrectly in the report, the intended word is very apparent.

Clearly something is going on under the heading Schildkroete. A possibly is the connection of Schildkroete to the Italian "Turboproietti" mentioned by Vesco. In an information sheet, Klaus-Peter Rothkugel depicts a diagram for the Turboproietti. This design is remarkably similar that found in Swiss newspaper from the mid-1950s (16). This article credits the successful German saucer program and Georg Klein and goes on to describe another related design which is reproduced here. One can immediately see the relationship with the Turboproietti design. In this design the center of gravity is below the saucer surface adding stability. The pilot's cabin is also below the wing surface. This is curiously similar to a turtle's bony structure in which the head and neck emerge from under the turtle's shell. Could this have been the Schildkroete design?

This design calls for the use of ram-jets but turbojets could have also been used. Fuel tanks are located in the rotating wing and so fuel is fed to the jet engines by centrifugal force. The two small wings have adjustable angles as do the jet engines themselves. Thus, the method of vertical flight is similar to the Schriever-Habermohl saucers.

The horizontal maneuvering is unique and warrants discussion. We have all heard reports of flying saucers in flight making seemingly non-aerodynamic turns instantaneously. In this article, Mr. Zollikofer proposes a simple method to accomplish this. It involves angular momentum. We all remember seeing a child's top spinning on a smooth floor. Perhaps the reader will recall that when the top nears a piece of furniture and hits it, the top shoots off instantly in the opposite direction. This happens because contact with the furniture caused a change in the top's angular momentum. The top's momentum was braked on one side. A sudden slow down on one side caused an imbalance whose force drove the top to the opposite direction.

In this same way the intentional slowing of one engine (on one side) on this saucer design would cause the rapidly spinning saucer to instantaneously change course, shooting to the other

Top: Italian designed "Turboproietti" an anti-aircraft design which used left-over fuel as its warhead. Bottom: Saucer design, 2/3/55, "Neue Zuercher Zeitung". 1. Hub of the rotating winged-wheel. 2. Adjustable wings 3. Non-rotating cabin. 4. Lookout for the pilots. 5. Ram-jets 6. Air intake. 7. Exhaust, direction changeable. 8. Angle of variation of the exhaust rudder. 9. Variable adjustment angle of the wings. Was this a Schildkroete? Kugelblitz?

side. Several of these course changes would resemble insect-like flight to the observer. The rapidity of the course changes is tied to the degree of slow-down or breaking of the saucer's angular momentum and to the degree (revolutions per minute) of that momentum. Even when stationary, increased spinning would serve as a "bank" of angular momentum to be drawn upon at a moment's notice.

Through out Vecso's Intercept UFO the words "circular wing" are mentioned. Looking at this design yields a possible new understanding to that term. It is possible that this basic design is to be found in the foo fighter, (Feuerball, Phoo Bomb), as well as the mysterious Kugelblitz. It was hinted above that this design may be the basis of the Schildkroete but it could also be the basis for other German saucer projects.

Many writer attribute field propulsion to the foo fighter. This is because of its luminosity, its flight pattern and its alleged disruption of ignition based aircraft engines. Another possibility is that it was a jet propelled flying machine but with one addition. It is possible that a T.T. Brown-type of flame-jet generator was attached to its exhaust nozzles and the appropriate insulation added on the surface of the craft. With this addition, the exhaust gasses would become enriched with negative ions. So would the air in the surrounding vicinity. This would have resulted in the short-circuiting of the target aircraft's engines should such variables as the wind have been just right. The fact that it apparently did not always work argues for the variables being in operation. More variables would have accompanied this means of disruption than a purely electromagnetic one since the electromagnetic field would have been present regardless of atmospheric conditions. It other words, the field propulsion vehicle should have always disrupted the bomber's engines.

Another item is submitted for your consideration under the heading of "loose ends". This is another F.B.I. report, Number 62-0-11328, which is reproduced here in total. A unique feature of this report is that it contains two "xerox" copies of a German saucer. These pictures were given to the F.B.I. but the negatives were retained by the informant whose name has been deleted. Also deleted is the last name of the German saucer designer. It is a remotely controlled device but the circular glass cockpit indicates a design ultimately intended for human pilots. Undulations on the saucer periphery resembling jet engines are noticeable in the picture. This report dates from July 8, 1967 but describes events from November, 1944. As with the other F.B.I. report, the fact that it was taken and kept so long attests to its worth.

There are some similarities between this report and Vesco's description of the Kugelblitz. The encounter described in the F.B.I. report resulting in the "downing" of a B-26. Vesco describes the same or a similar incident involving the Kugelblitz

UNITED STATES GOVERNMENT

Memorandum

TO : DIRECTOR, FBI

DATE: 6/8/67

FROM : SAC, MIAMI (62-0-11328)

SUBJECT: [redacted]
INFORMATION CONCERNING

Flying Saucers

A review of the Miami indices revealed information reflecting subject appeared at the Miami Office on July 24, 1959, and volunteered to return to Austria as an intelligence agent. His expressed motivation was to do something to repay the debt he felt he owed the United States. He was afforded the Washington, D. C. Headquarters address of the Central Intelligence Agency and told his inquiry should be directed there.

Also, on July 4, 1961, he appeared at the Miami Office and gave an incoherent story of recently meeting an individual who asked him to kill his mother. [redacted] appeared to be somewhat bewildered and continuously gazed away from the interviewing Agent.

During his most recent visit to the Miami Office, [redacted] seemed genuinely concerned about the existence of the object he allegedly photographed during November, 1944. He exhibited no emotional nor mental disorder and appeared to be rational.

In view of recent publicity afforded UFO sightings, some apparently by responsible sources, this information is submitted to the Bureau for consideration of transmittal to the U. S. Air Force.

RE: [redacted]
INFORMATION CONCERNING

On April 26, 1967, [redacted] Miami, Florida, appeared at the Miami Office and furnished the following information relating to an object, presently referred to as an unidentified flying object, he allegedly photographed during November, 1944:

Sometime during 1943, he graduated from the German Air Academy and was assigned as a member of the Luftwaffe on the Russian Front. Near the end of 1944, he was released from this duty and was assigned as a test pilot to a top secret project in the Black Forest of Austria. During this period he observed the aircraft described above. It was saucer shaped, about twenty-one feet in diameter, radio controlled, and mounted several jet engines around the exterior portion of the craft. He further described the exterior portion as revolving around the dome in the center which remained stationary. It was [redacted] responsibility to photograph the object while in flight. He asserted he was able to retain a negative of a photograph he made at 7,000 meters (20,000 feet). A Xerox copy of the negative, as furnished by [redacted], appears on the last page of this communication. Also, a still photograph he allegedly made "at the risk of my life", illustrating the object parked in a hanger, appears on the last page.

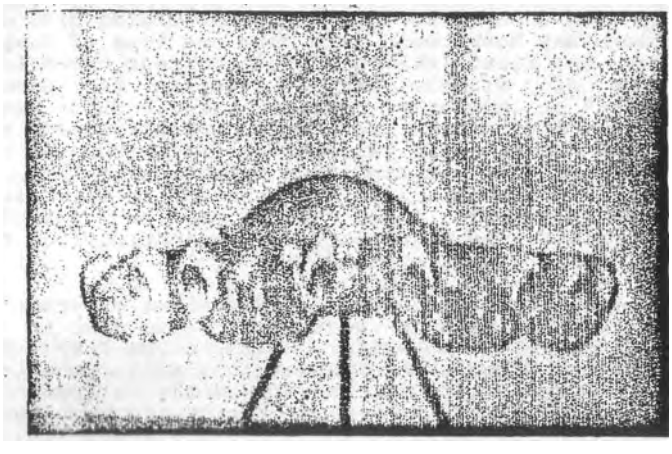
According to [redacted] the above aircraft was designed and engineered by (First Name Unknown) [redacted], a German engineer whose present whereabouts is unknown to him. He assumed [redacted] was taken into custody by Allied Forces upon the termination of hostilities. [redacted] stated [redacted] unsuccessfully attempted to avoid the German draft, but was apprehended by the Gestapo

RE: [redacted]
INFORMATION CONCERNING

in Vienna, Austria, sometime during late 1943 or early 1944. [redacted] also assumed the secrets pertaining to this aircraft were captured by Allied Forces. He said this type of aircraft was responsible for the downing of at least one American B-26 airplane. He furnished the following fuel and engine data:

"....Fuel mixture of N_2H_4O in Methyl Alcohol (CH_3OH) rather than 'oxygen-holding' mixture of hydrogen peroxide H_2O_2 in water. 7m 1,3m high two rocket motors; smooth flow, rotary drive over 2,000 meters per second...."

[redacted] said he copied this data from a board located in the hanger area.



[redacted] asserted he was shot down by the British on March 14, 1945, after having been reassigned to the Western Front. He was held prisoner by the British in London and later in Brussels until his release in 1946. He departed for the United States from Bremerhaven, Germany, on December 26, 1951; entering the United States in New Jersey on January 7, 1952, and was subsequently naturalized in Miami during 1958. He is presently employed as a mechanic at Eastern Airlines, Miami, Florida. He related he was born May 3, 1924, in Austria.

[redacted] stated he has withheld this information because he assumed the United States possessed it. He has become increasingly concerned because of the unconfirmed reports concerning a similar object and denials the United States has such an aircraft. He feels such a weapon would be beneficial in Vietnam and would prevent the further loss of American lives which was his paramount purpose in contacting the Federal Bureau of Investigation (FBI).

[redacted] reiterated he has the original negatives of both photographs. He said the shots were taken at a thirty second time exposure.

This document contains neither recommendations nor conclusions of the FBI. It is the property of the FBI and is loaned to your agency; it and its contents are not to be distributed outside your agency.

and an American "Liberator" (17). Both saucers are surprisingly identical in description. In the F.B.I. report this secret project was set in the "Black Forest of Austria". The Schwarzwald, the Black Forest, is in Southern Germany. Vesco says that toward the end of the war the Germans dispersed their remaining aircraft to improved air field hidden in thick pine forests (18).

Vesco specifically mentions the Schwaebischerwald and the BubesheimerwaId (19). Vesco goes on to say:

> "It was from one of these improved fields that the first Kugelblitz fighter took off on its fantastic flight" (20).

The general description of the airfield hidden in a forest does seem to correspond with what Vesco described. Finally, the fuel used on this saucer was unlike that of the Me-163 or any other fuel known. Is this a variant of the exotic fuels Vesco says were considered for German saucers? (21).

Is this report confirmation of Vesco? Is the informant in the F.B.I. report describing a Kugelblitz? Is this fuzzy "xerox" copy really a picture of the Kugelblitz? It is not proof positive, but it is intriguing.

A request was made to the F.B.I. for a clear picture. The Bureau responded on March 22, 2001 saying that the Miami Field Office may have had a clearer picture but that the file was destroyed.

Here we have a real X-File, yet nobody saved the picture? Fox Mulder, where are you when we need you most? The F.B.I. did provide a somewhat clearer picture which is reproduced here.

Sometimes blind luck in needed when dealing with the government. This has proven to be the case regarding a very special compass developed by the Germans to use in their flying disc program. Actually, there may have been more than one type of compass for this purpose. The first inkling of this compass comes to us from the writings of Wilhelm Landig wherein he describes a "Himmelskompass" or heavenly compass (22). This device was mounted upon a flying disc and could orient itself using the position of the sun even in twilight or if the sun was below the horizon. The method given for its operation is that sunlight striking the earth is polarized and that this direction has a stronger electromagnetic field which can be detected with instruments (ibid). The magnetic fields emanating from the north and south poles are a similar situation.

William Lyne discloses, pictures and describes a German compass which he states was used on a German flying disc in his book Pentagon Aliens, the first edition which circa 1990. He bought the device as junk from a New Mexican junk dealer who got it on an Air Force base after it had apparently slipped though a security check.

(e) Artificial horizon

A self regulating artificial horizon for use in aircraft was invented by Dr. Knappstein, who had a factory in Berlin-Schoneberg. He worked in collaboration with Henschel, Berlin-Konigswusterhausen. The horizon was not affected by any aerobatic manoeuvres.

PAGE NO. 2

NO.	TO	FROM	DATE	
				1174 - RESTRICTED - 9 June 1945 Subject: "Mother Horizon" Request received from Technical Data for one (1) "Mother Horizon", as the Germans called it. It's a remote indicating gyro horizon device. Equipment Lab seems to be the interested agency. D. L. PUTT, Colonel, A.C. Director of Technical Services.

"Mother Horizon" was possibly a device used on a German flying disc. Top: "Information Obtaind From Targets Of Opportunity In The Sonthofen Area" BIOS Report # 142. Bottom: Entry in microfilm obtained via FOIA.

Recently, mention of a German compass was encountered while searching for something else in a Freedom Of Information Act response. Called a "Mother Horizon", the device recalls and may confirm the device first described by Landig. On the other hand, it may simply be a device showing the pilot the attitude of the aircraft in relation to that of the horizon. Whether or not this is the same device in the possession of William Lyne is not known at this time.

Turning to field propulsion saucers and pictures of them, it should be pointed out that the saucer pictures of Ralf Ettl and Norbert Juergen-Ratthofer are unique to them, that is, no pictures of saucers specifically identified as "Haunebu", "Vril" exist outside of their presentation to my knowledge. As if preempting criticism, these writers counter with the proposal that all Adamski saucers are really German field propulsion saucers or originated from German wartime designs. Adamski saucers were photographed and witnessed world-wide in the early 1950s. In fairness, it should be pointed out that there also exists at least one source of confirmation of their thesis.

Confirmation of sorts comes from a new book by a conspiracy writer, George Piccard, who cites similar information to that of Ettl and Juergen-Ratthofer as coming from his informant, a man calling himself "Kilder" (24). Piccard states that he believed the name "Kilder" to be an alias. Kilder was a clerk working in British intelligence and allegedly came to Piccard through a mutual contact shortly before Kilder died of lung cancer. During his years of service, Kilder had allegedly filed away many classified documents which he committed to memory. This book is interesting reading, of that there is no doubt. It is too bad, though, that Piccard could not elicit the real name of the dying Kilder, because, as has already been pointed out, there is nothing reliable about an unnamed, secret government source and, hence, there is no reason to spill much ink in discussing the matter.

More evidence that the Germans produced something truly strange comes from the Polish researcher Igor Witkowski. Mr. Witkowski is considered by the Eastern European sources already cited, the engineer Mr. Robert Leiakiewicz and Dr. Milos Jesensky, to be the foremost authority on German saucers in Poland. This is no small title considering the mountains of research through which they have tunneled, both figuratively and in reality. According to his interviewer, Nick Cook, the Aviation Editor of "Janes Defense Weekly", Mr. Witkowski was shown classified Russian documents through an unnamed contact. In them it described German research on a device called "die Glocke" (the bell). This device was tested underground, at Der Riese, at the Wenceslas mine near Ludwigsdorf(25) under the German code-names of "Laternentraeger" ("lantern carrier") and "Chronos" which obviously refers to time. This was done under the auspices of a heretofore unknown SS organization, the Forschungen, Entwicklungen and Patente (Research, Development and Patents) or FEP. This was Kammler's

group according to Mr. Witkowski (26). Could this be the true name of what has been referred to up until now simply as the "Kammler Group"? Mr. Witkowski maintains that this group was independent of the Reichsforschungsrat, the Reich Research Council, which is significant. Heading the research on the Bell was none other than Professor Walther Gerlach (27) who was among the very top tier of German nuclear scientists. A metallic liquid, violet in color and resembling mercury, was stored within the bell in two cylinders. These cylinders were spun in opposite directions for test lasting for a minute. The effects included.a pale blue light emitted from the bell, electrical equipment failures, as well as deleterious effects on animals and people (28). To his credit, Mr. Witkowski did not try make more out of this than is in evidence. He is of the opinion, however, that the bell was a very powerful engine (29). Of course, we all can jump ahead of the facts slightly and wonder if this engine was not to be used on a very large German atomic saucer or field propulsion saucer, the very kind described by Mr. Norbert Juergen-Ratthofer.

Weighing into the German field propulsion controversy is Dr. Axel Stoll. Dr. Stoll is a Geophysicist, that is, a real scientist. Dr. Stoll names no sources in his book but states that they exist and must be protected for the common need as opposed to that of serving an individual purpose as a citation (25). Dr. Stoll supports the assertion that field propulsion vehicles were being developed during the Third Reich. But unlike what has transpired before. Dr. Stoll gives us the theory and the mathematics behind the theory, citing and translating Maxwell and Bearden. Besides the mathematical support for his thesis that the Germans built field propulsion vehicles, he states something about his suspicion concerning a spin-off of this technology which may have been further developed by the Germans (26). It is what was stated by Mr. Juergen-Ratthofer over ten years ago in his video films. It is what was indicated by circumstantial evidence at Jonastal and recognized as such for at least five years by some of the researchers there. It is that the Germans were interested in the manipulation space and time itself. It is said that time and space can be manipulated or time and space can be created or obliterated through the use of am electromagnetic longitudinal wave (32). Normal electromagnetic waves, such as light waves, are transverse. This brings us right back to the production of quadropolar waves (transverse and longitudinal waves in cycle) as discussed in connection with the Schappeller device. Could this lost technology provide us with a window into time or into another dimension? Would our scientists of today be able to unlock this technology given their restricted scientific outlook? Has the reconstruction and piecing together of this puzzle occupied our scientists since the end of the Second World War?

Turning aside for a moment, as stated, this book was written as a guide to German flying discs. As such, the reader should be cautioned about at least one pitfall. This pitfall consists of a series of technical diagrams of alleged German field propulsion

saucers, prominently displaying a date of November, 1944. In some of these drawings mention is made of a "Thule-Tachyonator". This word "Tachyonator" obviously has its origins in the word tachyon. This word bothered me for years but I loved those "old" drawings so much that my nagging doubts were put aside. What bothered me was the fact that this word never arose in my introductory physics course in the 1960s. This ate at me until I called the Physics Department at the University of California at Los Angeles for their opinion as to the origin of this word. An old physicist said from his memory the word was not even coined until the mid-1960s, thus casting doubt on the technical drawings. He gave me a reference and his memory proved correct. The word "tachyon" was coined by Dr. Gerald Feinberg in 1966 (33). This means that there was no word "Tachyonator" in 1944. Unless better evidence surfaces, the veracity of these documents must be questioned. It hurts to admit that I count myself as one of the people taken in by this deception.

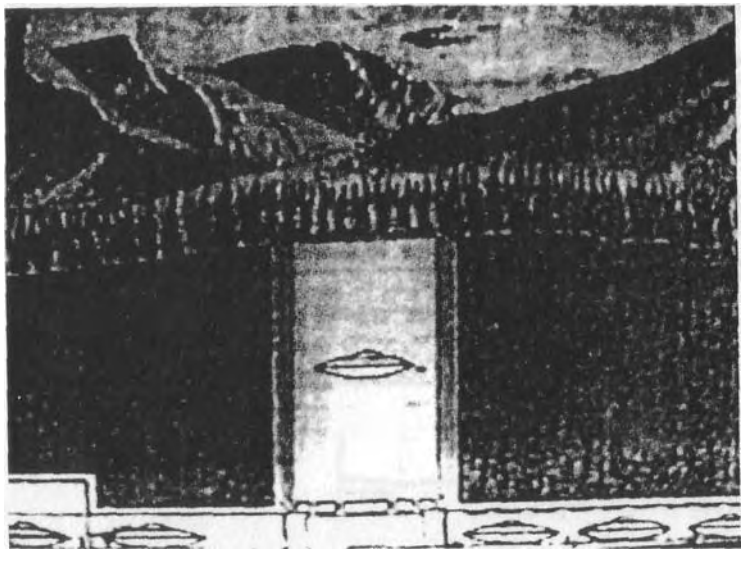
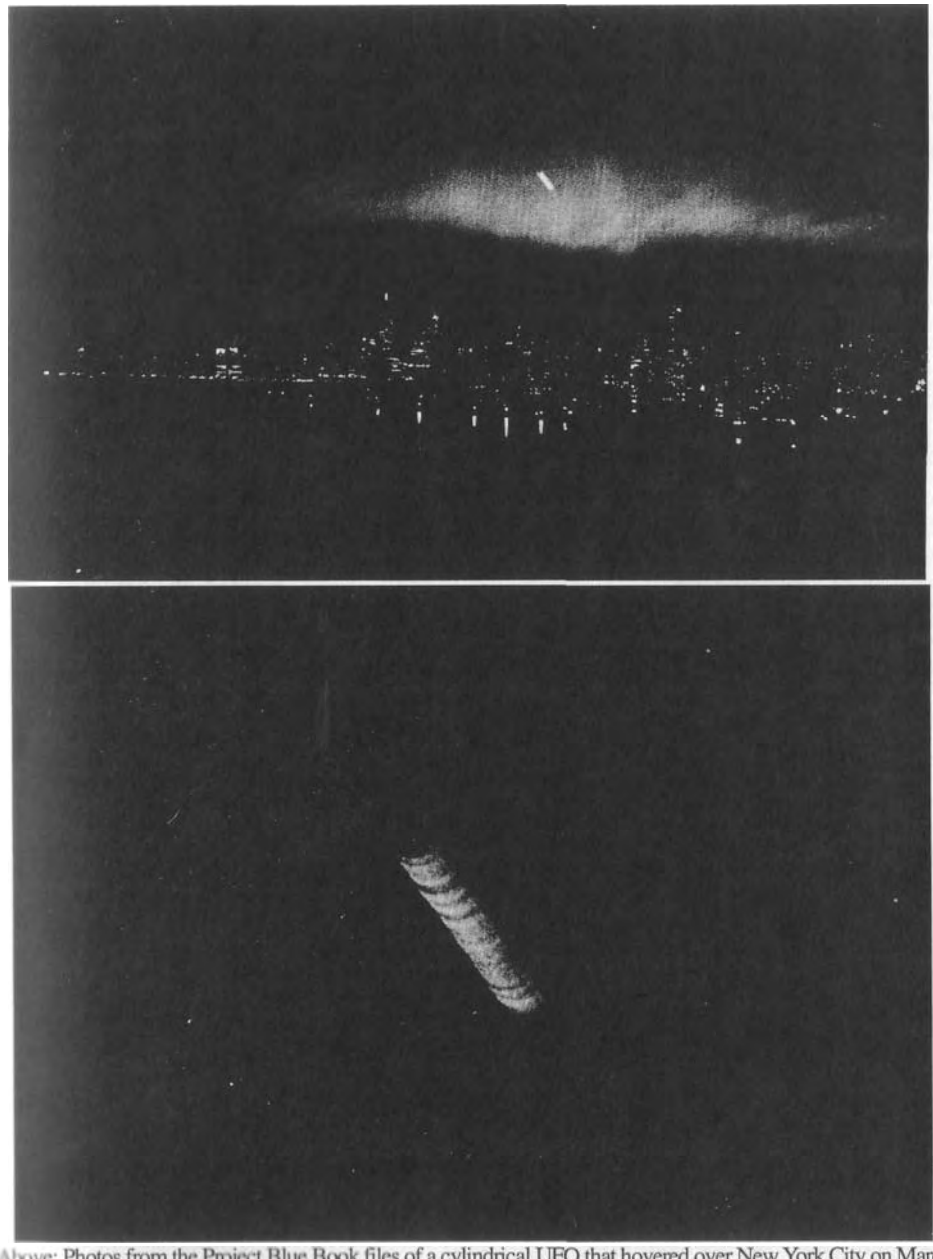
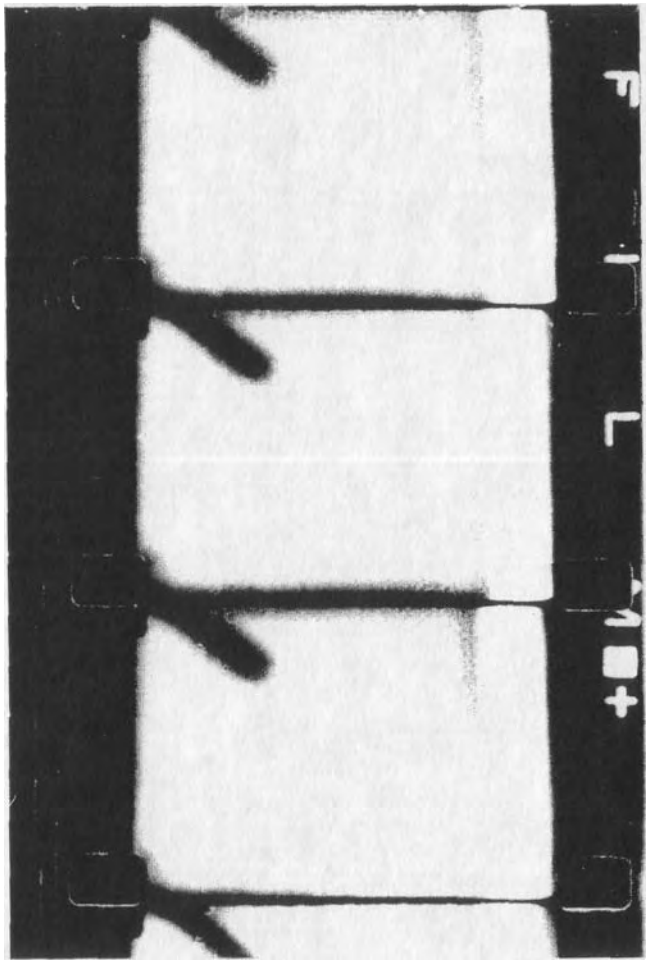
Alleged photocopy of SS plans for a Haunebu II being designed in 1943. From the German book Die Dunkle Seite Des Mondes (The Dark Side of the Moon) by Brad Harris (1996, Pandora Books, Germany).



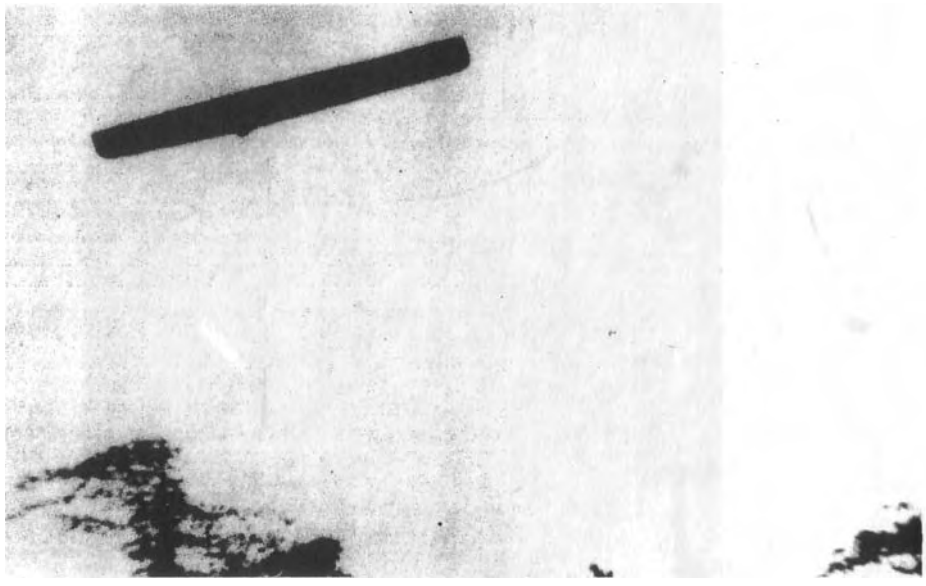
SS-Grupenfuhrer Hans Kammler circa 1944. He was alledgedly in charge of the Polish saucer bases.



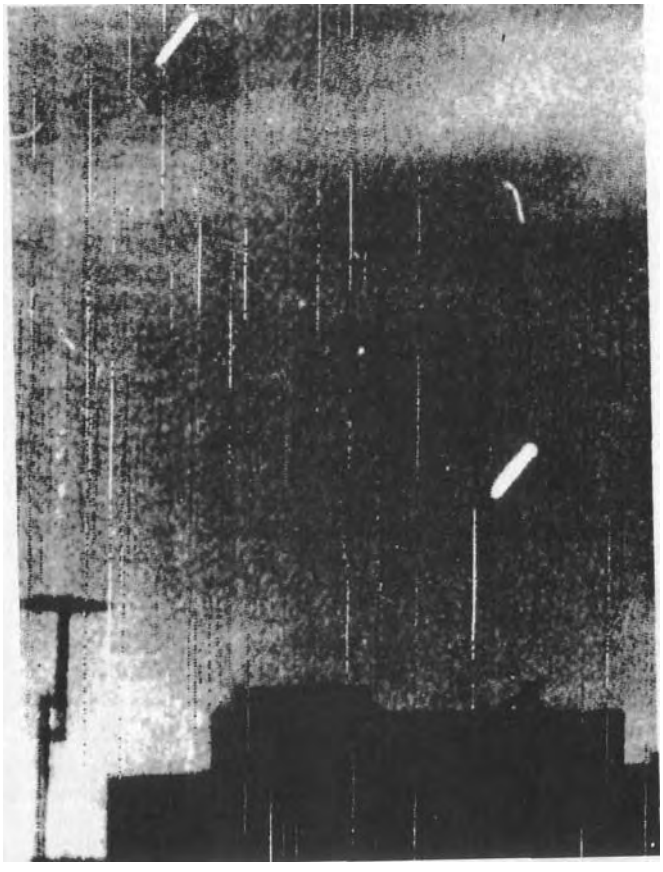
Internal plans for a "mothership" craft called "Andromeda," according to Polish historian Igor Witkowski.



One of the books on "Hitler's Super Weapons" by Polish military historian Igor Witkowski.



German plans for an underground saucer base, according to Polish historian Igor Witkowski.



Above: Photos from the Project Blue Book files of a cylindrical UFO that hovered over New York City on March 20, 1950. The military suggested that it was possibly "the Moon." The photographer's name was deleted from the Project's files, as were most of the names when the material was finally declassified and released. These are some of the best photographs of a cylindrical UFO, thought to be a "Mothership" that would launch flying saucers.

Above: Project Blue Book examined this gun-camera film footage from Victorville, California taken on February 2, 1953. It apparently shows a cylindrical "Mothership" in flight.

A classic cigar-shaped UFO allegedly seen by Joe Ferriere near Woonsocket, Rhode Island in the early 1950s. Ferriere claimed that a dome-shaped object, which he also photographed, emerged from the creaft. Observers have pointed out that craft is remarkable for its ability to absorb light, being almost completely non-reflective.

Above: Two cylindrical objects were photographed in a one-minute exposure hovering over Buenos Aires, Argentina in 1965. They remained stationary over the city for 10 minutes and then departed at very high speed according to witnesses.

CHAPTER SIX:

"SONDERBUERO"

CHAPTER SIX

"Sonderbuero"

A topic worthy of discussion is the alleged German agency called "Sonderbuero" or Special Bureau. Sonderbuero is sometimes also referenced by a sub-bureau working within it called "Operation Uranus" or "U-13". In the past, debate has centered around the reality of Sonderbuero. Discussion of Sonderbuero or Sonderbuero-13 have been made recently by Juergen-Ratthofer (1), and Zunneck (2).

There is no real record of Sonderbuero in official sources. Searches have been made in Germany as well as in the U.S.A. under provisions of the Freedom Of Information Act. All inquiries came back with negative results. This, however, may not be the final word on the subject. German sources may be classified or buried within another designation. The American Freedom Of Information Act is something less than advertised as anyone ever attempting to use these provisions knows full well.

Rather than get "official" about Sonderbuero, please let me relate what is said about it, its relation to this story and to the history of UFOs as a whole. With this information the reader can make up his or her own mind about the subject.

It is said that in Germany during the war there was a quest to make Germany independent of outside energy sources. An organization was formed to investigate things we would now call "alternative energy". This included, among other things, the making of synthetic fuel and lubricants out of coal using a special process which was perfected by the Germans during the war. But it may have, and probably did, included other, more exotic, research encompassing into such topics as nuclear energy and possibly even "free energy" or "new energy".

A spin off of this research was said by Juergen-Ratthofer to have yielded field propulsion. Research toward this end was said to have been conducted by Sonderbuero. About this time strange things were taking to the skies in Germany. To keep a lid on publicity, the following scenario is cited by Juergen-Ratthofer to have been employed (3).

Germany was surrounded by enemies and their agents permeated much of the German war effort. The Germans needed to get control over what was accidently seen by spies. To do this they enlisted the help of an unwitting German civilian population. An attempt was consciously made by Sonderbuero to "spin" reports of these sightings as they came in from civilian sources. A sub-department was set up within Special Bureau which sent out orders, countrywide, that all sightings of unusual flying craft be reported directly to that office and not discussed or publicized.

So while a German governmental agency is doing research and testing on unconventional aircraft, at this same time the same agency is gathering reports from the citizenry on sightings of unconventional aircraft. In order to confuse and disguise real testing from the Allies or their agents in Germany, a spin could be put on those sightings describing them as something other than what they were. Of course, all this time, the German civilians are believing the point is to observe and report Allied secret spy aircraft or other Allied secret weaponry. The Allied intelligence agencies may have even bought into this ruse. Remember, this was a German operation to fool its own people and so envelope Allied intelligence gathering organizations in this deception. This was done very subtly and very cleverly.

But what evidence do we really have that this actually occurred? After all, there is no official mention on Sonderbuero. Perhaps there is an overall picture. Let us see if we can find a pattern. After cessation of hostilities the Allies, especially the Americans, seized every piece of German technology they could lay their hands on. They also seized every scientist, manager, and technician having anything to do with the German scientific community, military, or intelligence service. The hardware was analyzed and the personnel interviewed. In some cases both were taken to America for further study.

The technology was reconstructed and further developed. In America the latest German jet technology made its appearance five years later in the Korean War. America got its hands on the V-l which was further developed into the cruise missile. America got the v-2 which was further developed into intercontinental ballistic missiles and into our space program culminating in our landing on the moon. America got the V-3, the high pressure cannon, further developed by Dr. Gerald Bull into Iraq's super cannon, which, after being pointed at Israel was the real trigger for the Gulf War. And America got at least part of the German saucer program, the outcome of which was the Silver Bug Program, the Lenticular Reentry Vehicle project recently disclosed under pressure of the Freedom Of Information Act, and the UFO activity reported at Area 51. There are probably other examples which are, as of yet, undisclosed. Many other examples of technology transfer exist but the point need not be belabored.

America received more than just technical assistance from the

Germans. For example, they received the services of General Reinhard Gehlen, former intelligence chief of the German Army General Staff on the eastern front. Gehlen turned over to the Americans his entire spy apparatus, giving a then blinded America an eye into Soviet military objectives. Further, he set up and modernized our intelligence apparatus, culminating in the C.I.A., as a means to counter the Soviet threat. This spy effort was massive but please keep it in mind as we turn our attention to something smaller and seemingly less significant.

As mentioned, in the 1950s the United States Air Force was busy developing and testing flying saucers derived from captured German technology. Of course, the Air Force wanted it to remain a secret project, after all, we were involved in a Cold War. Given this problem might the Americans have asked the question as they always did: How did the Germans do this? If they did they would have formed, as an adjunct to the secret saucer programs, a program to gather material on all civilian sightings of strange unidentified flying objects, under the cover of national security, as if an external threat existed. This agency would have then been in a position to "explain" or spin the data so as not to alarm the populace while still maintaining secrecy concerning its own projects.

As the reader may have surmised by now, this is exactly what the united States Air Force did so successfully in the form of Project Blue Book and its predecessors. The Air Force experimented on flying saucers on one hand while gathering reported sightings from civilians on the other hand, spinning and manipulating the information according to dictates of their agenda.

When viewed in this perspective, the similarity between Sonderbuero and Project Blue Book is striking. Is not the greatest evidence for the existence of Sonderbuero the American pattern of imitation which infiltrated all post-war intelligence work? The only real guestion is whether the Germans originated the term "swamp gas" or if this was an American embellishment.

Although not central to our discussion, one might ask why, if it was successful, why was Project Blue Book suspended? Remember that the Americans tried to further develop German ideas. In this case the solution was so imaginative and uniquely American that the Pentagon must have resounded with the reverberation of back-slapping and belly laughs at its implementation.

Remember Mark Twain's tale of Tom Sawyer whitewashing the picket fence? Instead of being compelled to an afternoon of drudgery, Tom pretended to his friends that this work was play. Not only did he enlist them to do the painting, but his friends were so eanger to help paint that they paid Tom to do this work.

The United States Air Force followed this paradigm. They infiltrated an existing civilian intelligence gathering

organization researching UFOs. They did this at no cost to the United States Air Force or any other governmental intelligence service. There were no official records, and no accounting trail. And best of all those doing the work and volunteering the intelligence would pay for the privilege in the form of dues to maintain the organization. If there is any question in the reader's mind as to whether MUFON (Mutual UFO Network) has been co-opted, ask yourself this question: would the intelligence services of the United States government allow the largest civilian intelligence gathering agency in the world to operate within its purview without at least monitoring it? Of course the answer is a resounding "no". This is one reason why MUFON is allowed to remain in operation within the USA without attempts to discredit it.

Given this sophisticated government intervention, would it not be a simple matter not only to manipulate the incoming sightings data, but to spin and confuse the debate concerning the origins of UFOs, even setting the agenda for the entire inquiry? Perhaps this is the reason MUFON has taken such a negative view of terrestrially originating UFOs and of the German origin of UFOs in particular. In the early 1990s, this writer was told via telephone from his home in Texas by the head man of MUFON himself that: "We investigated that a long time ago and found nothing to it". The "that" referred to was German saucers.

As an aside, he further went on to say that the idea of a German origin would for UFOs would not even be on the table for discussion if it were not for one, Vladimir Terziski, who, "is the guy pushing it", to directly quote this individual. Mr. Terziski has formed his own ideas about German saucers which he has never been afraid to share, and, to his undying credit, he stood up and lectured on this topic to the faces of MUFON in the very temples of the alien world, UFO conferences, worldwide. Mr. Terziski, almost alone, forced these facts into those conferences and subsequently forced all those UFO magazines to deal with the subject of German flying discs. And although he never got credit for it, he also supplied the technical assistance for a world famous Japanese television producer to bring an hour of this German saucer story to Japan in prime-time. Mr. Terziski, almost single-handedly, opened up two continents to this UFO reality.

MUFON's successful existence is tied to their implicit and explicit assumptions of UFOs as alien machines. The greatest appeal the extraterrestrial hypothesis has for the government is that this hypothesis is simply not testable. MUFON does not even try to test anything. Instead, they chase sightings. They train their followers to take meaningless celestial measurements accompanying these sightings and then analyze this "data" into gibberish. MUFON then lends itself to endless rambling speculation involving increasingly more exotic alien scenarios.

It is not MUFON's rank and file membership which is to blame. The individuals I have met are honest and sincere as are 99% of

all the participants in the quest to understand these mysterious flying objects. Their methods may stimulate UFO interest and UFO enthusiasts but it utterly fails to advance our quest for knowledge about these devices. This is perfectly alright with the behind the scenes government manipulators, however, since this result is their real goal. It is unknown to what extent the Americans have succeeded in improving and further developing the original German saucers. The extent to which they have succeeded in further developing Sonderbuero, however, should be apparent to all.

Two photos taken by a barber named Ralph Ditter, in Zanesville, Ohio on November 13, 1966. Ditter was leaving home with his camera when he chanced to look back and saw the UFO over his house. He took two exposures within a short period of time of the helmet-like craft, with an apparent "canon" on the underside of the craft. Ditter did not seek publicity but put them in his shop window to stimulate business. Eventually a news service bought them and they were widely published. The object is similar to the "Heflin UFO" and is said to be an original German design with a Panzer Tank canon mounted beneath it. Such a craft at such a late date would tend to indicate that this was not a captured test craft but rather a "renegade craft" possibly from South America as late as 1966.

Above: Aerospace expert Stuart Nixon, executive director of the National Investigations Committee on Aerial Phenomena (NICAP), which was founded in Washington, DC, in 1956 to conduct a civilian study of UFOs. Note the apparent "cannon barrel" beneath the craft.

Alleged photos from SS files of a Haunebu II in flight circa 1944. Note the Panzer tank canon mounted underneath the craft. From the German book Die Dunkle Seite Des Mondes (The Dark Side of the Moon) by Brad Harris (1996, Pandora Books, Germany).

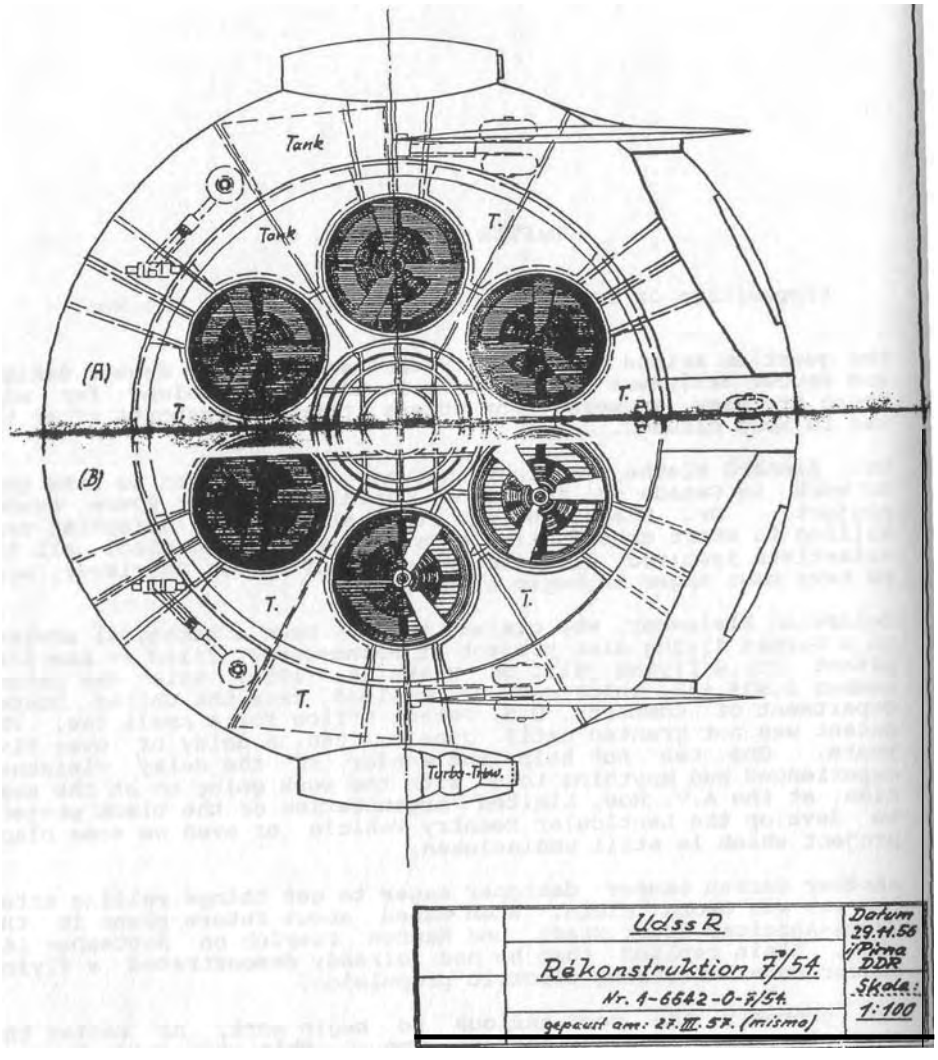
CHAPTER SEVEN:

DISPOSITION OF GERMAN SAUCER TECHNOLOGY AFTER THE WAR

CHAPTER SEVEN

Disposition of German Saucer Technology After the War

The question arises as to what ever became of the saucer designs and saucer designers referred to in this discussion? For some there are easy answers. For others, there whereabouts after the war is more clouded.



Dr. Richard Miethe, for instance, has been rumored to have gone to work in Canada on the joint Canadian-U.S. Air Force saucer project. Dr. Miethe is not the only German scientist very willing to start construction on a post-war flying disc. All the scientists involved, with the exception of Rudolf Schriever, seem to have been eager to begin at once.

Heinreich Fleissner, who claimed to have been a technical advisor on a German flying disc project at Peenemuende, filed an American patent for a flying disc on March 28, 1955. This was patent number 2,939,648 which can be obtained from the United States Department of Commerce, U.S. Patent Office for a small fee. The patent was not granted until June 7, 1960, a delay of over five years. One can not help but wonder if the delay Fleissner experienced had anything to do with the work going on at the same time at the A.V. Roe, Limited organization or the black project to develop the Lenticular Reentry Vehicle or even on some black project which is still undisclosed.

Another German saucer designer eager to get things rolling after the war was Georg Klein. When asked about future plans in the Tages-Anzeiger fuer Stadt und Kanton Zuerich on September 18, 1954, Klein replied that he had already demonstrated a flying saucer model utilizing electric propulsion.

But probably the most anxious to begin work, no matter the obstacles, was Joseph Andreas Epp. This is said because according to government files, which were first located by researcher Mark Kneipp, Epp went so far as to enlist in the Soviet flying saucer project which began immediately after the war in East Germany using former German scientists (1).

Post-War Soviet "German" Saucer

After the war J. Andreas Epp worked briefly for the Soviets along with other German experts on a flying saucer. This is a drawing he made of the Soviet saucer. It was to be used in the polar regions.

According to this F.B.I. file which was secluded by the National Archives, Epp became disenchanted with the Soviets after working for them for about a year. He then defected to the West. Epp re-drew their designs from his seemingly photographic memory. He provided detailed test and technical specifications, including his apparent area of specialty, the steering linkage system. His comments were that the type of flying craft being built for the Soviets was especially designed for polar conditions.

After settling in Bavaria, Epp continued design work on flying discs himself. He designed the "Omega Disc" which is remarkably similar to the Soviet design. Epp was very interested in working for Bell Aircraft, builders of the X-l which broke the sound barrier in 1947. Epp sent me copies of correspondence with Dr. Walter Dornberger, at this time executive of Bell Aircraft, who, at one time was Dr. Wernher von Braun's boss at Peenemuende. Epp did mention the flying saucer in this correspondence. Nothing came of it, however. To his death in 1997, Andreas Epp was still trying to realize this dream of building a flying saucer.

These are the stories of saucer designers of which we know something. There were others of which we have completely lost track. Otto Habermohl is one of these. Habermohl was presumed captured by the Soviets. This presumption seems to be solely based on the fact that he disappeared after the capture of Prag.

What about the post-war disposition of the flying saucers themselves? We know, for instance, that examples were destroyed by the Germans so the advancing Allies would not benefit from them. This very thing happened to saucers designed by the Schrlever-Habermohl team at Prag. The scorched earth policy was a standing solution and ruthlessly imposed by the SS, especially concerning German high technology. Yet we all know flying saucers did not disappear after the collapse of Germany, as a matter of fact quite the contrary. Michael X. Barton tells us that their earliest appearance was not over the State of Washington in 1947 as usually given but in South America. In fact, there were many sightings of UFOs in South America during this post-war time frame. Latin American sightings continue to this day.

South America is a long way from the USA. Even if the Americans were experimenting with captured German technology at that time, the sightings from other parts of the world can not be explained as originating from the USA. There must be more at work here.

Could die-hard Nazis have exported this technology to a stronghold in the Antarctic or Andes as some often claim? Or did these craft appear from "Beaver Dam", a secret German base on the east coast of Greenland as disclosed by Dr. Jesensky and Mr. Lesniakiewicz (2). Was part of this technology appropriated by the British and further developed in Canada as stated by Renato Vesco? Or was this technology completely absorbed by the USA in a secret deal with Admiral Karl Doenitz after Hitler's death as

stated by Bill Lyne (3)?

In the first of the aforementioned possibilities, these die-hard Nazis and their technology, including saucers, are sometimes called the "Third Power" by German writers on the subject. The Third Power is meant to signify a power besides the West (the First Power) or the East (the Second Power). The Third Power allegedly operates in secret as regards the general population of this planet but is very well known to the First and Second Powers. The sole reason the Third Power has survived is their high technology and high finance both of with resulted from picking clean the bones of the Third Reich. The story is as follows and at least some of it is factual.

It is known that the Germans made contingency plans for the war's loss. On August 10, 1944, nine months before the war in Europe ended, a meeting was called at the hotel Rotes Haus in Strassbourg. In attendance were representatives of all the major German industrial concerns including I.G. Farben, Thyssen, Siemens, Krupp, Daimler-Benz, Rheinmetall-Borsig, as well as representatives of the major German banks. Meeting with them were members of the SS. They were planning measures which would insure their survival after the coming German defeat (4).

Scientists, scientific plans, strategic materials, and money were to be taken from Germany and secured in secret hiding places. Long range cargo aircraft were to fly from Germany to Spain carrying the goods. From here items were to be loaded on to U-boats bound for South America. It is possible that other destinations were also planned such as Japan and the Antarctic base original established in 1938-1939 by the Ritcher Antarctic Expedition.

Surprisingly, the Ritcher Antarctic Expedition (1037-38) was set up and funded by Hermann Goering, head of the German Air Force. The ship Schwabenland, equipped with amphibious aircraft which could be launched via catapult explored, mapped and claimed a large portion of the Antarctic Continent for Germany during this expedition. Weighted metal flags were dropped from these aircraft clearly delineating the territory in which Germany was claiming. The territory included ice-free lakes which were naturally heated from below by geothermal means (5). Along the line of these lakes a huge fault line bisects "Neuschwabenland", as it was called, so presumably a permanent heat source was built into this new territory. One German writer has perused reports of Neuschwabenland and states that during the war repeated trips were made to this vicinity at which time a permanent base was established there (6). Another writer, Wilhelm Landig, in novel form, describes this and other secret post-war German bases in Antarctica, the Andes as well as a secret polar base near the North Pole (7). Mr. Landig recently died and it is now known that he was a Third Reich insider and knew of which he wrote. As mentioned earlier, it is now known that Landig was a member of the Waffen SS and at one time was responsible for security for

the development of German saucers (8). He knew that of which he spoke. His books each bore the sub-title "Ein Roman voller Wirklichkeiten" or "a novel filled with realities" as this novel treatment was an easy avenue in avoiding post-war legal entanglements.

Through the descriptions of the writers mentioned and other records it is possible to pinpoint the location of these secret German bases in Antarctica as well as a large Andean base in Chile. Bill Lyne as well as Mr. Robert Lesniakiewicz and Dr. Milos Jesensky state that a mysterious polar base existed in Greenland (9) (10). The latter writers cite the coast of eastern Greenland and cite a code-name which translates into "Beaver Dam", complete with underwater U-boat entrances.

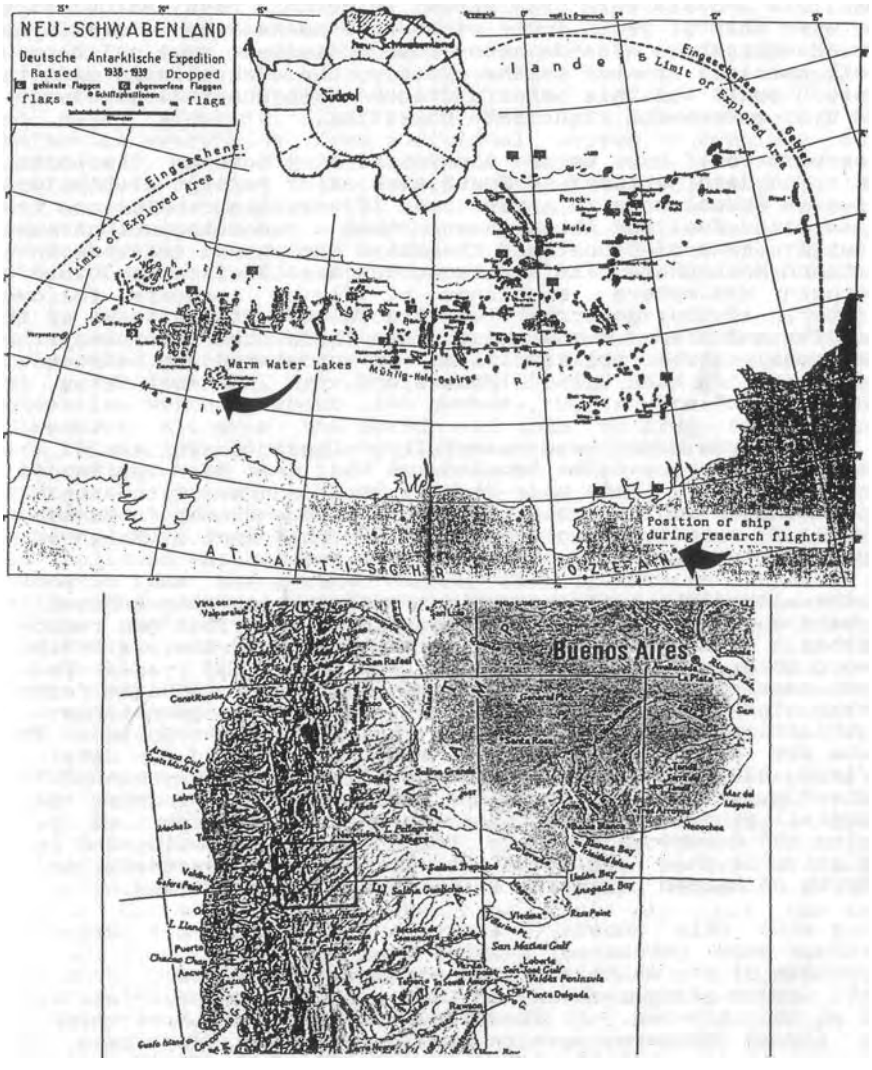
The Antarctic base was first attacked by forces of many nations, led by the United States, in a 1946 military action code-named "Operation High Jump". This operation involved a fleet of ships, including an aircraft carrier, submarines and support craft. It also involved aircraft and four thousand armed troops under the command of Admiral Richard Byrd. Immediately four aircraft were mysteriously lost and the whole operation, scheduled for six months duration, was canceled after less than six weeks (11) (12).

The Antarctic base, Landig's Point 211 (13), was in operation until the late 1950s when it became the subject of an American nuclear "test". In this test three bombs were detonated under cover of the International Geophysical Year 1957-58 (14). Landig claims the type of rockets used in the "test" to attack Point 211 were prototypes of the American Polaris missile, a solid-fuel rocket which was used later operationally, the final design being fired from submarines underwater (15). Detonation of these atomic weapons over the base generated electromagnetic shock waves which, it was hoped, would destroy apparatus in the base used for defensive purposes (16). Landig claims this tactic failed. The electromagnetic pulse attack was insufficient to destroy the improved apparatus (17). Both "High Jump" and this 1957-58 attack turned out not only to be a fiasco, but to be superfluous. The greater part of the German forces had already abandon the Antarctic base in favor of a base in the South American Andes.

Landig claims that the reason for its abandonment was the purity of the atmosphere in the Antarctic which is almost germ-free (18). It seems that the human immune system needs constant challenge to remain healthy even if this challenge does not always result in illness. Without a constant influx of visitors supplying this challenge, the staff on-hand lost almost all immunity to infection after a few years. The common cold became a serious matter.

As mentioned earlier, writers Dr. Milos Jesensky and Robert Lesniakiewicz see the origin of flying saucers over the USA

during the late 1950s as coming from a forgotten German facility called "Beaver Dam" in Eastern Greenland. According to these writers, this base did not surrender with the fall of Germany but continued to function. It was from this base that flying saucers were directed to the USA on spy missions, especially toward our nuclear facilities in New Mexico. Additionally, one wonders if this base was the real origin of the ghost rockets seen moving south from Northwestern Europe immediately after the war. The status of this base today is unknown.



There is no doubt that the Germans had bases in the Arctic. German bases were located on Soviet soil, as well as the soil of Greenland which belonged to Denmark. Denmark had been overrun by the Germans early in the war. What is most surprising is that Landig's claim that the Germans maintained a base in the high Canadian arctic right under the noses of Canada and the USA (19).

Is this all fantasy? Is there any hard evidence for secret post-war German bases? Has a post-war German base ever been discovered? Yes, one has. New evidence for this exodus theory comes to us from the discovery of a German U-boat way-station in the Atlantic which had a hand in moving this clandestine cargo from Europe to the austral world well after the war, right into the 1950s. This information is revealed in an article in the July, 1984 issue of Nugget magazine titled "Der U-Boot Bunker von Fuerteventura" (20). Fuerteventura is the eastern most island of the Canary Island chain and lies just out of sight off the west coast of North Africa.

Geologically, the base was formed by an huge, ancient volcanic bubble around which the molten rock solidified in the center of the island. According to the article, the Germans brought in excavation equipment and bored out three tunnels for underwater access by U-boats. On top of the island, directly over the bubble and the military facility rested a villa with a stairway leading down to the base from the cellar. The villa was owed by a respectable German family, named Winter. This base functioned during the war as a secret U-boat base for the Germans. It continued this function after the war as a way-station for transport U-boats.

In our modern world of science and academic history this claim of lost islands and hidden bases sounds like something out of a Jules Verne fantasy. If such a base really existed, would we all not be aware of its existence above and beyond an obscure reference in a publication which mainly deals with treasure hunting?

Actually, most readers are already quite familiar with this particular base. This base was the truth behind the visual images of the German U-boat base situated in the volcanic island off the coast of Africa in the movie "Raiders of the Lost Ark". In fact, this aspect of the story was the only part of the movie which was factual.

Top: Neuschwabenland (Antarctica). Bottom: "Colonia Dignedad" in Argentina near Chilean border comprising 25,000 quadratkilometers (over half as large as Switzerland)

The subterranean island base was actually visited by two eyewitnesses, according to the Nugget report. There, two derelict U-boats were discovered which had remained undetected for over thirty years. One of these U-boats was entered by the two adventurers. Inside they found detailed nautical maps of South America. To add to the mystery, the assertion is made that these U-boats and this base functioned with the full knowledge of the U.S. government right into the 1950s.

This base would have formed a physical link between the ports of Spain and destinations in South America. Perhaps even bridging bases in Greenland with Antarctica, if certain reports are true. It is also fuel for the argument that a technological transfer actually took place between the Third Reich and entities in the Southern Hemisphere. As surely as die-hard Nazis spread into the Southern Hemisphere sightings of flying saucers followed. Further, if the government of the United States knew of this transfer and these U-boat bases then there then there may have been some actual political link or understanding between the government of the United States and the post-war Nazis, the "Third Power".

If his words are read carefully, Landig's Point 211, the Antarctic base, can be located on the maps he supplies (21). Until, however, this base is visited and excavated and the evidence made public, this base along with the ones in Canada and Greenland constitute more speculation than fact. This is not true, however, in the South American situation.

In the immediate post-war world South America was a haven for Germans who could not stomach Occupied Germany for one reason or another. The political climate in these countries was favorable toward these refugees. Nazi gold and money was transferred to South America, particularly Argentina. Hunted Nazis found a market for their services in a variety of occupations. SS organizations set up shop as they had in Franco's Spain. These facts are hardly in dispute. They are covered in detail by Infield (22) as well as by Farago (23) a whole genre of "Nazi Hunter" writers. What is less often mentioned is that German technical people infused these countries with expertise gained during the Second World War. For instance, Argentina and Brazil had state-of-the- art jet fighters in the 1950s thanks to the efforts of German immigrant scientists and technicians.

Along with this monetary and technical transfer, large land holdings were purchased, secured and set aside with the full knowledge of the South American governments in power. From these vast secure areas members of these German organizations simply did as they pleased. It is not out of the question to think that the flying saucers seen in the late 1940s and 1950, both conventional and field propulsion, were built and flown from these bases. One of these Andean bases, referred to as "Colonia Dignidad" consisted a land area half the size of Switzerland (24). This is certainly more than enough room to develop hide

anything.

The South American industrial base during these times was more than adequate to make these saucers. But even if this were not true, this is no argument against construction of flying saucers in South America. Parts could have been ordered from suppliers in other countries as are done by major aircraft firms today. Each major aircraft firm has a host of sub-contractors who manufacture everything from individual screws to complete sub-assemblies. Many if not most of these sub-contractors are accustomed to filling these orders without ever knowing what the final assembled product will be. This is part of the security system and unquestioned. Germans working in South America would have no trouble using this system. They could have even ordered parts and sub-assemblies from companies in Europe and the USA.

This is exactly what Dr. Gerald Bull did in Iraq when he built the largest of his high-pressure cannons for that country. This nearly mile long fixed gun was built resting on the slope of a hill pointed at Tel Aviv. It would have been able to shoot projectiles weighing about 1800 pounds. Parts were built by sub-contractors all over the world and sent to Iraq for assembly where it was nearly completed. The sub-contractors were lied to or otherwise kept in the dark as to the purpose of their components. It was only by chance that word of this project reached the hands of opposing intelligence services. The result was near panic in the intelligence services of these countries. What followed was the assassination of Dr. Gerald Bull and a diplomatic ruse which bated Saddam Hussein into an invasion of Kuwait. This invasion facilitated the entry of the Americans into the conflict. The high pressure cannon was destroyed immediately, even though it was pointed in the opposite direction from Kuwait. If this risky, bulky weapon's system could be almost completed using a system of unwitting sub-contractors world-wide, imagine how easily a one-off flying vehicle could be built using the same system.

Richard Ross, a UFO researcher based in Austin, Texas, reports to me that even today vast tracts of land in South America are avoided by airline pilots there because of UFO activity in these areas. He obtained this information by interviewing the South American airline pilots themselves. He goes on to make the point that Latin America is a hotbed of UFO activity. Reports of this activity for some reason never find their way into the main stream American news media.

There still remains one possible hiding place on European soil. There remains the possibility that German flying discs were flown to Switzerland during the last moments of the 3rd Reich and hidden there in the vast system of caves built there for defensive purposes by the Swiss. This would imply a limited partnership with the Swiss concerning a technology that neither country wanted to loose. In modern times we have witnessed something similar when Iraq flew its jet aircraft to Iran for

safe keeping during the Gulf War. Iraq and Iran had been bitter enemies only a few years before but put these differences aside in order to save technology. If they could do it certainly the Germans and Swiss could do it also. One eye witness claims that he saw an experimental aircraft crossing the German border into Switzerland on the morning of May 9, 1945, the day after the surrender of the 3rd Reich (25). This same procedure could have taken place with even more exotic flying craft.

One of our most trusted sources, Renato Vesco believes that Canada was strongly involved in further developing captured German saucer technology. Vesco's belief seems to be that the British kept this information to themselves. That is, they did not share it with the United States. They did this in response to the latter's refusal to share atomic secrets with Great Britain. The British hid this research in the Canadian forests where they spent time and money developing it into the flying saucers of the 1950s. Somewhat related to this idea, the German researcher Klaus-Peter Rothkugel also believes post-war saucer research was the product of a massive and still-secret Anglo-American effort. Jim Wilson adds fuel to this fire in that there was apparently joint British-American-Australian involvement in the Lenticular Reentry Vehicle project (26).

Bill Lyne has another opinion. He believes all German saucer data was transferred to the government of the United States in a deal done with Admiral Karl Doenitz who was acting head of Germany for the week or so between the time Hitler shot himself in the bunker and Germany surrendered. Recently, Mark Kneipp has found some very interesting evidence which seems to support Mr. Lyne's sequence of events in this deal with Admiral Doenitz. This is one surprise I do not want to spoil so it will be left to Mr. Kneipp to reveal his research.

One real mystery remains absolutely untouched. This concerns the man who did know everything about Germany's saucer development and all its V-weaponry and other high technology for that matter. This was SS General and Doctor of Engineering Hans Kammler. Kammler first came to prominence because of his expertise in building extensive underground installations. Soon his high intelligence and "can do" attitude were recognized, resulting in a meteoric rise in rank and influence within the Third Reich. Kammler assembled the best of the best as far as weaponry was concerned and kept it close to him in the form of the Kammler Group, based at the Skoda industrial complexes near Prag. By war's end he was among the top five most powerful people in Germany. He had the entire SS technical organization to do his bidding. He was in charge of Peenemuende, "Der Riese" in modern Poland, Kordhausen, Kahla, the many facilities at the Jonas Valley in Thuringia, as well as the huge underground facility he built for himself in Austria. The Kammler Group was everywhere on the cutting edge of the cutting edge of applied technology. For instance it was the Kammler Group which was in the process of applying nuclear energy toward missile and aircraft propulsion

(27).

What happened to Kammler? This was the most knowledgeable of all the German technical people. Even Albert Speer, German Minister of Munitions, admitted under Allied interrogation, that Kammler was the expert in the area of V-weapons development. This was no small admission for Speer. With the cessation of hostilities in Europe, Kammler simply waltzed off the pages of history, never to be seen or heard from again. Why, then, was there no post-war manhunt for Kammler? What are we missing here?

Tom Agoston recounts the stories of Kammler's death (28). There are five in all. They all read like pulp fiction. None are even remotely believable. As proof of this, no serious investigation was ever done into any of these stories by any of the Allied Powers. But equally shocking is the fact that Kammler was ignored by the "Nazi Hunter" aficionados. A quick call to the Simon Wiesenthal Center in Los Angeles revealed that they were not looking for Kammler and have never looked for Kammler even though they fully agreed that the stories of his death stretched credulity. This, in spite of the fact that it was Kammler who was responsible for the many slave-labor camps, including Dora and S-3, where many inmates died working for the SS.

There is a sixth possible story for Kammler's demise. Could not the answer to this enigma be found in a practice commonly given to criminals in the USA, that of the "witness protection program"? Was Kammler given a new identity in exchange for his knowledge and knowledge of where the treasure-trove of SS technical information was stored? Actually, any country in the world at the time would have made Kammler this deal in a second. He was simply too technologically valuable to loose or to involve in a showcase criminal trial. A new identity was the best way out of his problems.

One thing is striking concerning the technological history of the Twentieth Century. The preponderance of that century's technology has its roots in the 1940s. The technology we use and take for granted today was invented or developed to the utilitarian degree during this time frame. These technological roots sink most deeply into Nazi Germany. In support of this argument, there is a laundry list too long to fully recount. It ranges from synthetic materials such as plastics and artificial rubber to metallurgy. It included the host of technologies which gave us the jet engine, rockets and so access to space travel. It includes atomic power. It also includes early semi-conductor research upon which our modern computer-based research, economy and communications are built. Technically speaking, we are still living off the Caracas of the Third Reich. Yet, still, to this day, much of that German technology remains veiled. Counted among this still-veiled technology are the German flying discs.

TOP SECRET / MAJIC

EYES ONLY

* TOP SECRET *

EYES ONLY

COPY ONE OF ONE.

SUBJECT: OPERATION MAJESTIC-12 PRELIMINARY BRIEFING FOR PRESIDENT-ELECT EISENHOWER.

DOCUMENT PREPARED 18 NOVEMBER, 1952.

BRIEFING OFFICER: ADM. ROSCOE H. HILLENKOETTER (MJ-1)

NOTE: This document has been prepared as a preliminary briefing only. It should be regarded as introductory to a full operations briefing intended to follow.

* * * * * *

OPERATION MAJESTIC-12 is a TOP SECRET Research and Development/ Intelligence operation responsible directly and only to the President of the United States. Operations of the project are carried out under control of the Majestic-12 (Majic-12) Group which was established by special classified executive order of President Truman on 24 September, 1947, upon recommendation by Dr. Vannevar Bush and Secretary James Forrestal. (See Attachment "A".) Members of the Majestic-12 Group were designated as follows:

Adm. Roscoe H. Hillenkoetter
Dr. Vannevar Bush
Secy. James V. Forrestal
Gen. Nathan F. Twining
Gen. Hoyt S. Vandenberg
Dr. Detlev Bronk
Dr. Jerome Hunsaker
Mr. Sidney W. Souers
Mr. Gordon Gray
Dr. Donald Menzel
Gen. Robert M. Montague
Dr. Lloyd V. Berkner

The death of Secretary Forrestal on 22 May, 1949, created a vacancy which remained unfilled until 01 August, 1950, upon which date Gen. Walter B. Smith was designated as permanent replacement.

On 24 June, 1947, a civilian pilot flying over the Cascade Mountains in the State of Washington observed nine flying disc-shaped aircraft traveling in formation at a high rate of speed. Although this was not the first known sighting of such objects, it was the first to gain widespread attention in the public media. Hundreds of reports of sightings of similar objects followed. Many of these came from highly credible military and civilian sources. These reports resulted in independent efforts by several different elements of the military to ascertain the nature and purpose of these objects in the interests of national defense. A number of witnesses were interviewed and there were several unsuccessful attempts to utilize aircraft in efforts to pursue reported discs in flight. Public reaction bordered on near hysteria at times.

In spite of these efforts, little of substance was learned about the objects until a local rancher reported that one had crashed in a remote region of New Mexico located approximately seventy-five miles northwest of Roswell Army Air Base (now Walker Field).

On 07 July, 1947, a secret operation was begun to assure recovery of the wreckage of this object for scientific study. During the course of this operation, aerial reconnaissance discovered that four small human-like beings had apparently ejected from the craft at some point before it exploded. These had fallen to earth about two miles east of the wreckage site. All four were dead and badly decomposed due to action by predators and exposure to the elements during the approximately one week time period which had elapsed before their discovery. A special scientific team took charge of removing these bodies for study. (See Attachment "C".) The wreckage of the craft was also removed to several different locations. (See Attachment "B".) Civilian and military witnesses in the area were debriefed, and news reporters were given the effective cover story that the object had been a misguided weather research balloon.

* TOP SECRET *

c. There is a possibility that some of the incidents may be caused by natural phenomena, such as meteors.

d. The reported operating characteristics such as extreme rates of climb, maneuverability (particularly in roll), and action which must be considered evasive when sighted or contacted by friendly aircraft and radar, lend belief to the possibility that some of the objects are controlled either manually, automatically or remotely.

e. The apparent common description of the objects is as follows:-

(1) Metallic or light reflecting surface.

Basic Ltr fr CG, AMC, WF to CG, AAF, Wash. D. C. subj "AMC Opinion Concerning "Flying Discs".

(2) Absence of trail, except in a few instances when the object apparently was operating under high performance conditions.

(3) Circular or elliptical in shape, flat on bottom and domed on top.

(4) Several reports of well kept formation flights varying from three to nine objects.

(5) Normally no associated sound, except in three instances a substantial rumbling roar was noted.

(6) Level flight speeds normally above 300 knots are estimated.

f. It is possible within the present U. S. knowledge — provided extensive detailed development is undertaken — to construct a piloted aircraft which has the general description of the object in subparagraph (e) above which would be capable of an approximate range of 7000 miles at subsonic speeds.

g. Any developments in this country along the lines indicated would be extremely expensive, time consuming and at the considerable expense of current projects and therefore, if directed, should be set up independently of existing projects.

h. Due consideration must be given the following:-

(1) The possibility that these objects are of domestic origin - the product of some high security project not known to AC/AS-2 or this Command.

(2) The lack of physical evidence in the shape of crash recovered exhibits which would undeniably prove the existence of these objects.

(3) The possibility that some foreign nation has a form of propulsion possibly nuclear, which is outside of our domestic knowledge.

3. It is recommended that:

a. Headquarters, Army Air Forces issue a directive assigning a priority, security classification and Code Name for a detailed study of this matter to include the preparation of complete sets of all available and pertinent data which will then be made available to the Army, Navy, Atomic Energy Commission, JRDB, the Air Force Scientific Advisory Group, NACA, and the RAND and NEPA projects for comments and recommendations, with a preliminary report to be forwarded within 15 days of receipt of the data and a detailed report thereafter every 30 days as the investi-

Basic Ltr fr CG, AMC, WF to CG, AAF, Wash. D.C. subj "AMC Opinion Concerning "Flying Discs"

gation develops. A complete interchange of data should be effected.

4. Awaiting a specific directive AMC will continue the investigation within its current resources in order to more closely define the nature of the phenomenon. Detailed Essential Elements of Information will be formulated immediately for transmittal thru channels.

APolish-language map of Nazi enclaves in South America, particularly Argentina. It is thought that some of the UFO activity in South America came from German saucers relocated to remote parts of that continent.

CHAPTER EIGHT:

CONCLUDING THOUGHTS

CHAPTER EIGHT

Concluding Thoughts

What can be concluded from this glimpse into the world of German flying discs? Certainly, it can be said that some of these projects were realized. This being true, it can be said that these were the first "flying saucers". It is also certainly true that German flying discs were re-created and perhaps further developed by countries comprising the former Allied Powers. It can be said that in all probability, Germans immigrated to places outside Europe after the war and also built these flying craft. It is also a certainty that the exact nature and real history of these flying devices has remained a closely guarded secret in all these countries. Not only has a secret been kept but an active effort, a conspiracy, has been made to keep it that way. This means that their exists an effort to keep the exact knowledge of these devices from the general populace for the foreseeable future. This effort extends back into time, into the origins of these projects in Germany and extends into the present. The victors wrote history. The victors omitted German flying discs and the victors are keeping quite now.

The exact methods of propulsion of the exotic versions of these discs still remains a mystery. Jet and rocket engines were used but there is still debate as to which models used which engine at what time. There is no doubt in my mind that field propulsion techniques were at least experimented upon during the 3rd Reich. This is established in my mind, if for no other reason, by the series of F.B.I. reports dealing with the witness who saw such a device while a prisoner of war near Gut Alte Gossen. The F.B.I. took these reports seriously enough to take them and save them all these years. Maybe we should also.

One overriding question concerning UFOs is why are they so, so secret? Dr. Milos Jesensky and engineer Robert Lesmakiewicz propose an atomic saucer in their book "Wunderland" Mimozemske Technoloaie Treti Rise. This conclusion is seconded by Klaus-Peter Rothkugel and Jim Wilson. This assertion should be taken very seriously.

The UFO-atomic connection fits the historical facts concerning both atomic energy and UFOs. UFOs have always been and are today

associated with atomic energy facilities. Los Alamos, Hanford and Area 51 are examples of nuclear facilities at which or very near to which UFOs are or were regularly seen. If we suppose atomic energy as a power source it might explain this association. But that can not be all there is to this matter. Methods of propulsion involving atomic energy seem to be known to us. Indeed, some were reviewed in this book. Why the extreme secrecy then? Might it be that there is some other arrangement involving nuclear energy of which we know nothing? Might the Germans have stumbled on to something really exciting during those war years, perhaps coupling field propulsion with atomic energy ? If this is so then not only would the association of UFO activity over and near nuclear facilities be explained but some of the extreme secrecy and conspiracy to cover-up the matter might also be explained.

At this point the reader may smiling and shaking his or her head in disbelief, perhaps even making comments involving the words "fantasy" or "science fiction". The German watch-word of those times was "nothing is impossible" and it is clear that within the Reich scientists took this saying to heart. Those scientists were not surprised by breakthroughs, they expected them. Please let me remind the reader that the alternative explanation is the real science fiction or fantasy. In this origin of UFOs a multitude of alien beings seemingly travel to earth from intergalactic space not to exchange ideas, exploit earth's resources or conquer the planet, but to abduct and inseminate our females. And above all, if we buy into this reasoning, these aliens seem particularly attracted to American women.

The story goes on from here to describe genetic experiments, mixing the DNA of humans and aliens to produce a hybrid human-alien. Anybody who entertains such nonsense has absolutely no understanding of the species concept in biology. Unfortunately, many individuals subscribing to the alien hypothesis fall into this category, even some with advanced degrees. Only one of two possibilities are within reason. The first is that these hominids are manifiested in the minds of the witnesses as the result of some black mind control project sponsored by the government. The second possibility is that they are the result of experimentation by the government involving human, hominoid or hominid genes. Either option is possible but both options are beyond the scope of this book. Both discussions are superfluous, however, since the topic of this book is UFOs, not aliens. "Aliens" have been used by the media and the government long enough to misdirect the inquiry into UFOs. Aliens are the ultimate "red herring".

In trying to crystallize these thoughts on the origin of UFOs, we are presented with two mutually exclusive hypotheses for the origin of flying saucers. The first is that they are a man-made technology. The second is that they are a non-man-made technology. In view of the fact that we now know the first senecio is true, why are we even considering holding on to the

second hypothesis? There is no reason for a duplicity of theory. If a failure to explain the facts is ever encountered in the "UFOs are man-made theory", then and only then are we justified in moving to another hypothesis.

Before signing off it is felt that an obligation exists to discuss another reason for the suppression of the German connection in the history of UFOs. English speakers sometimes recognize this as an unuttered truth once it is out in the open but many German speakers and others are usually well ahead of the curve on this one. Unfortunately, this is not going to be pleasant.

In some circles, the flying discs built by the Germans during the war are called "Nazi UFOs". Some may do this as a way to quickly name a concept but some others do this for an entirely different reason. The point that is being made is that technology usually does not adopt a political name. The atomic bomb dropped on the Japanese by the Americans was not called the "Democrat Bomb", for example, even though a Democrat was in power in the United States at the time. The Nazis are a special case, however, and this is a central problem and roadblock we encounter in researching their innovations.

The Nazis were defeated militarily by the Allies. Yet some in the media elite continue to fight this war. Of course, the Allies always win but that is not the purpose of their fight. The purpose is the nature of the Nazis themselves. The Nazis were not just a military machine. Hitler and his supporters brought other ideas with them into power. These ideas were historical, social, artistic, economic and scientific. In other words, the Nazis brought a completely new culture into prominence almost overnight and with at least the passive acceptance of most of the general populace.

It is sometimes said by these media people in question that America defines itself as what the Nazis were not. The fascination that the mass media, especially in Hollywood, has for the Nazis is evidenced in their ongoing campaign to insure that these cultural ideas are as thoroughly defeated as the Nazi military. In defeating the Nazis militarily on the silver screen they believe they also defeat the cultural ideas associated with the Nazis. They take every opportunity to do this. The media fight this propaganda war over and over again, as if the war was still going on, while attempting to link the military defeat of the Nazis with the cultural defeat of their ideas.

For a moment I want to digress in order to illustrate an example of exactly what I am talking about. This example is both germane to our discussion of UFOs as well as cutting to the very heart of this cultural conflict. It has to do with Hitler's myrmidons, the SS.

Historians tell us that the abbreviation "SS" stands for

"Schutzstaffel". "Schutzstaffel" could be thought of as "bodyguard" and in the early days of the Nazi movement members of this order dressed in black and were Hitler's personal bodyguard. As it developed, this order changed into many things.

Portrayal of the SS in the media has degenerated simply into a negative caricature to which we are all supposed to respond immediately with a politically correct, knee-jerk type of condemnation formula. As far as the media is concerned, this is all the SS was. Their point is that we now know enough about the SS and are supposed to drop further inquiry. This first unwritten law has already been violated in this book. In this discussion we have focussed on the SS as the organizational and in some cases the research and development framework behind German super-weapon's technology. But the SS was more than this. To insiders, initiates within the 3rd Reich, the abbreviation "SS" did not stand for "Schutzstaffel" at all but for the words "Schwarze Sonne".

"Schwarze Sonne" means "Black Sun" in English. The Black Sun to these initiated individuals was a physical body like our visible sun except that the Black Sun was not visible to the naked eye. This Black Sun radiated light which was invisible to the human eye. The concept of the Black Sun seems to have bordered upon the religious. It was said to be located at the center of our galaxy. The earth along with every other cellestial body in the gallaxy rotate around this Black Sun.

The Black Sun is sometimes represented symbolically as a black sphere out of which eight arms extend. Such is its most famous rendition on the mosaic floor at Wewelsburg Castle which served as the spiritual home of the SS. The number of arms are unimportant. There could be eight or six or only four. The more astute reader will recognize at this point that the swastika, the very icon of the Nazi Party, was itself is a Black Sun symbol.

The point is that concept of the Black Sun is not just Nazi mumbo-jumbo. The Black Sun is in reality a cold, collapsing implosive vortex as described by Viktor Schauberger or Karl Schappeller. It gathers and densities yet is as cold as interstellar space. It does generate unseen radiation in the form of cosmic, gamma and x-ray radiation. This is possible because in spite of what was said about those crazy "Nazi madmen", the Black Sun is very real. In fact, the Black Sun is the most powerful force yet observed in our universe.

Forty or so years after the demise of the SS, scientists, in this case astronomers, have located the Black Sun at the very center of our galaxy. In fact, we are all familiar with it by another name. Today, we call it a "black hole". It is the center of a great spiral vortex of stars which draws in matter and energy and generates the aforementioned radiations near it periphery. The Black Sun is, in reality, a huge system or perhaps it could even be called a huge machine. We and our entire galaxy are all part

of this machine whirling through space. All the matter it contains, the stars, planets, asteroids, comets, meteors and so forth, are all bound in a context of energy. Our galaxy, with the Black Sun as its heart, operates as a vast machine using all the matter and energy contained therein and using every law of physics at once in its operation. Its counterpart, the centrifugal vortex which remains unseen, may even be a doorway into another dimension into which this matter and energy from our dimension spew forth like a fountain. It is the same kind of implosive vortex from which the Germans were about to build a "new science" based upon creative, living energy as we have discussed. It may have been the same force which was to propel their flying discs.

Yet who in the media would dare give credit to those associated with the 3rd Reich for making these connections so long ago? In fact, who in the media would even point out this connection today? None. As far as they are concerned, one is politically incorrect to ever say or imply that the Nazis thought of or developed anything of value. To do so would be to commit professional suicide. To do so would mean the end of one's carrier whether in the business or the academic world. Even if one wanted to make this connection in print or film form, no politically correct publisher or producer would touch it, at least in English.

Not only does the media fail to give credit where credit is due, or to even mention or explain this concept, but anyone seeking to look into such concepts runs the real risk of being branded a neo-Nazi. This threat clearly extends into the UFO world. As a result, this threat has had a chilling effect on real UFO inquiry for over fifty years.

How should the media be treated in this case? How are we going to handle institutions within our culture which actively seek to stymie knowledge? Regardless of one's personal opinion of the Nazis, should we and are we going to allow these " open-minded champions of truth" the right to omit the history of UFOs, let alone the new science of this force of nature, simply because "they" find its origin politically offensive?

Returning from this example to our broader discussion of the media, in American culture it is sometimes said that the media's power rivals or exceeds that of the three branches of American government. With power such as this, the media believes itself up to any propaganda challenge. They are correct in this belief. As any thoughtful person realizes, the mass media's power has been used frequently in the last forty years to radically alter the course of those three branches of government.

In addition to the above referenced dilemma regarding media bias, we face a second obstacle in any effort to arrive at the truth. It is a culture of secrecy within the government itself. Vesco recognized this immediately. According to this "Vesco Doctrine"

no German secret was acknowledged publicly unless that secret fell into the hands of more than one of the four occupying powers, (USA, Soviet Union, Great Britain, France). He says:

> "In fact, of the numerous revolutionary "new weapons" that the Germans developed in that period, we know only those- fortunately, they comprise the majority-that fell into the hands of all, or at least more than one, of the four occupying powers"(1).

These governments seem to keep secrets for the sake of keeping secrets. In any event, they operate on a "need to know" basis in dispensing these secrets. We simply have no need to know in their eyes.

The differences between the media and the government itself are becoming more and more blurred. Politicians rely of instant polls, conducted the night before by the media, to plot today's public policy. The results of these polls are whatever the media says they are. In the meantime, the media itself is doing everything it can through "news", through entertainment and through movies to influence the results of those polls. The media and the government are so closely intertwined that for all practical purposes they can be considered as one. The C.I.A. spends a large portion of its budget in an effort to frame public discussion on issues it deems sensitive. The point here is that "truth" is not the goal of the government and in accomplishing their ends they use the methods of the mass media if they are not in partnership with the mass media itself.

For almost sixty years this government/media has been telling us through their propaganda machine, "Hollywood", that all the ideas of the Nazis were meritless, if not dangerous. "The Nazis never had a good idea" seems to be their simplistic mantra. Of course government, at some level, know what you now know about the origins of UFOs. In fact, they know that there is much more to this still-secret high technology than just UFOs. In the past, they have no trouble using captured German scientists when it is in their interest to do so, but they hate to admit it. The problem they face is that they have boxed themselves in a corner. They can not admit the origins of UFO technology without a re-appraisal of other ideas which they have succeeded in putting to bed. If they were to admit one good "Nazi" idea, the question might arise as to if there is another good idea. The elite media has already preempted this question rhetorically, calling any re-appraisal of the Second World War "Revisionism". They use this word disparagingly. Using a sort of "new-speak" they have kept the genie bottled up for almost sixty years.

What does this all mean to the researcher or truth seeker? With enough evidence could this information ever be acknowledged officially? With what level of proof could this elite media/government power axis acknowledge the fact that Germans working for Hitler built experimental flying craft that we could

not even touch? The simple answer is that they can not do so, period. Not with "all the proof in the world". Why should they? What is the upside for them? There are no good Nazi ideas. There is no need to know. There is perhaps a technological breakthrough behind the mystery. This is a loose-loose-loose situation for them by any reckoning.

Perhaps we can crystalize this nightmare for the power elite in an image. Suppose that tomorrow a highly technically advanced flying saucer landed on the White House steps in front of full, live, media coverage. Their nightmare would not be a little grey alien emerging from the saucer saying: "Take me to your leader". Their nightmare would be a former SS scientist emerging from the flying saucer saying: "I have an appointment".

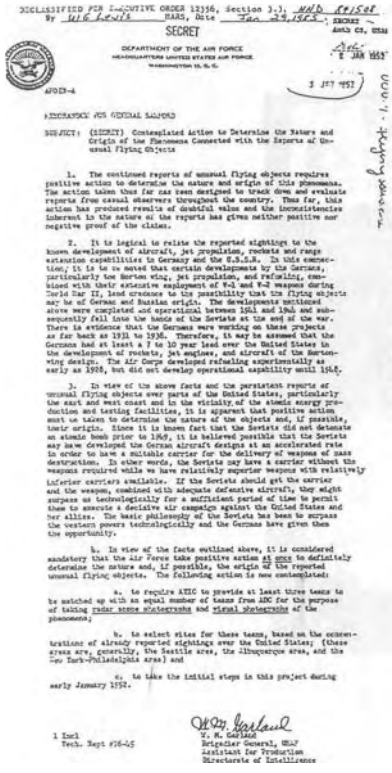
The implications are obvious. For over forty years the UFO community has been saying that we are on the verge of full government UFO disclosure. For the reasons outlined above, we are not now nor will we ever be on the verge of full UFO disclosure by the government.

This means that it is up to us to do the "disclosure". Anyone interested in doing research along these lines will be encouraged to know that there is plenty of room in this field. It is not necessary to be a scientist. It is not necessary to live in Europe. It is not necessary to read German. The most important ingredient in this research is interest. If you are interested, there are mountains of government files which remain unexplored. The censors did not edit-out everything. They made mistakes which can be caught and pieced together. If each researcher could contribute just one fact to this growing body of knowledge, our trouble would be over quickly. In short, "Disclosure" isn't going to happen unless we make it happen.

These scientists and technicians who built these early flying sauces may have been the very best and brightest of their time but they got up each rooming and put their pants on just like the rest of us. In fact, they are us. Now that we know that we earthlings are capable of manufacturing objects we call UFOs, should we not use these facts we possess in explaining this phenomena rather than ignoring this information altogether? Should we not cease creating a new and superfluous mythology, if not an outright religion, to explain this phenomena which is completely devoid of a factual basis? Real truth is usually quite simple. In this case the real truth is that the origin of UFOs and many more technological secrets are resting in the grave of Nazi Germany, simply awaiting our re-discovery.

This has not been "The Complete Book of UFOs" or even "The Complete Book of German Flying Discs". Within each topic touched upon in this book lie worlds within worlds of details and

additional information. It is for the reader to use the references cited as a starting point to root out what is of interest. This book was designed to get you started. It was only a guide.



Concluding Thoughts-References

Vesco, Renato, 1976, Intercept UFO, page 96, Pinnacle Books, New York, NY.

THANKS

Most everyone who has ever looked in to the matter of German flying discs has come to the conclusion that there is at least some truth to it. Still, opinions and interpretations within this group differ with the individual doing the research. Nobody can know or find everything. This certainly is true of the study of German flying discs. Many researchers in this field have set up a circle of correspondence or exchange with others interested in this topic. Even the brightest, most hard working individuals have benefitted from an exchange of information.

I have written up this book by doing some research and receiving a great deal of help, input and information sent to me by my friends. My deepest thanks and appreciation" go out to those individuals who have shared their findings with me, explained their research to me and/or shared the counsel of their wisdom. This is true even in cases of disagreement or in cases of differing interpretations. In all cases, they have gone much beyond their published material. These include: Michael Blaeser, Rainer Daehnhardt, the late Joseph Andreas Epp, Dr. Gordon Freeman, Heiner Gehring, Friedrich Georg, Dr. Milos Jesensky, Kadmon, Mark Kneipp, Robert Lesniakiewicz, William Lyne, Thomas Mehner, Theo Paymans, Richard Ross, Klaus-Peter Rothkugel, Horst Schuppmann, Vladimir Terziski, Milos Vnenk and Michael Watson. I would also like to thank my daughter, Lisa Stevens, for her work in proof reading and editing this text.

AFOIN-4

AIRMAIL/SPECIAL DELIVERY

SUBJECT: (SECRET) Contemplated Action to Determine the Nature and Origin of the Phenomena Connected with the Reports of Unusual Flying Objects

1. The continued reports of unusual flying objects requires positive action to determine the nature and origin of this phenomena. The action taken thus far has been designed to track down and evaluate reports from casual observers throughout the country. Thus far, this action has produced results of doubtful value and the inconsistencies inherent in the nature of the reports has given neither positive nor negative proof of the claims.

2. It is logical to relate the reported sightings to the known development of aircraft, jet propulsion, rockets and range extension capabilities in Germany and the U.S.S.R. In this connection, it is to be noted that certain developments by the Germans, particularly the Horton wing, jet propulsion, and refueling, combined with their extensive employment of V-1 and V-2 weapons during World War II, lend credence to the possibility that the flying objects may be of German and Russian origin. The developments mentioned above were completed and operational between 1941 and 1944 and subsequently fell into the hands of the Soviets at the end of the war. There is evidence that the Germans were working on these projects as far back as 1931 to 1938. Therefore, it may be assumed that the Germans had at least a 7 to 10 year lead over the United States in the development of rockets, jet engines, and aircraft of the Horton-wing design. The Air Corps developed refueling experimentally as early as 1928, but did not develop operational capability until 1948.

3. In view of the above facts and the persistent reports of unusual flying objects over parts of the United States, particularly the east and west coast and in the vicinity of the atomic energy production and testing facilities, it is apparent that positive action must be taken to determine the nature of the objects and, if possible, their origin. Since it is known fact that the Soviets did not detonate an atomic bomb prior to 1949, it is believed possible that the Soviets may have developed the German aircraft designs at an accelerated rate in order to have a suitable carrier for the delivery of weapons of mass destruction. In other words, the Soviets may have a carrier without the weapons required while we have relatively superior weapons with relatively inferior carriers available. If the Soviets should get the carrier and the weapon, combined with adequate defensive aircraft, they might surpass us technologically for a sufficient period of time to permit them to execute a decisive air campaign against the United States and her allies. The basic philosophy of the Soviets has been to surpass the western powers technologically and the Germans have given them the opportunity.

4. In view of the facts outlined above, it is considered mandatory that the Air Force take positive action at once to definitely determine the nature and, if possible, the origin of the reported unusual flying objects. The following action is now contemplated:

a. to require ATIC to provide at least three teams to be matched up with an equal number of teams from ADC for the purpose of taking radar scope photographs and visual photographs of the phenomena;

b. to select sites for these teams, based on the concentrations of already reported sightings over the United States; (these areas are, generally, the Seattle area, the Albuquerque area, and the New York-Philadelphia area) and

c. to take the initial steps in this project during early January 1952.

DEDICATION

This book is dedicated by the authors, their collaborators and the publishers to the unsung and often-maligned heroes of the Second World War.

ZÜNDEL

Every effort has been made by the authors to give credit to the originators of material whether it be written or pictorial. However, the search for such originators sometimes proved fruitless. Should anyone not be included, it is solely due to the confusing maze of claims and counterclaims to copyrights.

CONTENTS

FORWORD
THE MIND AND PERSONALITY OF ADOLF HITLER
ATOMIC BOMB
TRUTH STRANGER THAN FICTION?
WHY THE BIG UFO COVER-UP?

FORWORD

Ever since the fall of Berlin and the unconditional surrender of the German armed forces in 1945 one continually reads of Adolf Hitler's possible or definite escape from Berlin and Germany. Hitler has been reported to be living in several inaccessible spots in South America, in some well-guarded Shang-ri-la surrounded by S.S. Guards armed to the teeth. He is supposed to have spent some time in a monastery in Spain and other reports have him as a "prisoner" in Russia, itself.

Millions of words have been written and spoken to this effect. Over 100,000 books have been written about Hitler and W.W. II in most major languages of the world. Most of them were more or less fictional accounts and re-hashes of the official propaganda lines and clichés of the military victors of W.W. II. None of these studies were deep or exhaustive enough to be considered conclusive. Many very important facets were not covered at all or were only touched upon the fringes.

The book that is before you, is to the knowledge of the authors, their collaborators and to the publishers as well, the first attempt to cover some of these fringe issues in more depth. Consequently, they have drawn some very different conclusions to those already written on this vast and complex topic.

In order to start on a sound footing, and ultimately to do it justice, Hitler, the man is examined. Hitler, the thinker, the statesman, the politician and above all, Hitler the founder of the National Socialist Ideology (Weltanschauung) is examined in greater detail and in a more dispassionate manner. To only write about the technical aspects and ratifications of the UFO mystery, of the UFO's purely military potential, would, of necessity, lead to incorrect conclusions

To separate the totality of Hitler's control and influence over the production and eventual use of the UFO's and over every other secret development of the II Reich would be stupid. Without Hitler's backing or his knowledge of their potential uses, no weapons, not even the UFO's would have been developed; they would have been condemned to the "planners' morgue" or the junk piles.

Hitler knew about the research work being done on UFO's by his scientists, just as he knew about the other incredible secret weapons they were feverishly working upon in their bomb-proof laboratories. Many of these highly sophisticated weapon systems represented scientific breakthroughs of great importance. Many of these devices fell into Allied hands and they are pictured here for the first time and to the best of our knowledge. Others are re-created from engineering drawings or from testimony given to the Allied interrogators.

There is a whole array of jet and rocket-powered aircraft, both fighters and bombers. There are T.V. guided missiles and torpedos. There are plane and submarine-based rockets. Also there are wind cannons and many other devices.

In order to understand all aspects of this vexing problem we have to examine the governmental set-up of National Socialist Germany, especially war-time Germany. Unlike any other state in recorded history, Hitler's Germany was literally run by one man, much in the shape of a pyramid, with the chain of command moving down and out. In Hitler's hands ended all the strands; from his pinnacle of absolute power emanated all orders. From Hitler came the final orders of the scrapping or the production of any kind of weaponry. He alone was capable of making available the vast amounts of money for the research and production of what was needed to win the war. He alone could delegate the sweeping powers and set the orders of priority of one weapon system over any other.

All attempts to clarify this or that aspect of the German war effort, of diplomatic or military moves, which do not take fully into account this pyramidical structure of the decision-making process in Nazi Germany, are doomed to dismal failure. This structure of National Socialism is the very foundation of the movement, it is the "Führerprinzip" — leadership principle — in action. It is the failure or deliberate unwillingness to understand this basic principle, that has been the undoing of 95% of the writers, historians and media people of the world. By ignoring this simple principle in action and its effect on all things the origins of the UFO's (Krautmeteors), their current whereabouts and status, as well as Hitler's fate, have been shrouded in mystery and often contradictions.

The author of this book and his friends started to delve into the UFO mystery. They circulated their findings over the years to an ever-increasing number of friends and contacts around the world, but only as a basis for discussion and further study. Whenever more reports of UFO crews speaking German (Kearny Report) and behaving like German soldiers (electricity blackout Eastern States), or of sightings and documentation (French T.V. showed a UFO landing gear imprint in a clear swastika shape), reached the authors, they took a closer look. There now appeared a distinguishable pattern, in proper time and date sequence, that hinted at a possible connection between the appearance of UFO's in large numbers and Hitler's possible survival and escape from Berlin.

A book was born. Many publishers were contacted, all thought the material had merit, but none dared to publish it in its entirety. Many wanted to publish only the UFO developments. All would have loved to reproduce the hither-to unpublished engineering drawings and illustrations of prototypes of the German UFO's and the many other secret weapons but the authors insisted it was to be all or nothing.

So the manuscript made the rounds for years and years. Eventually it lay buried. Then one day, excerpts fell into the hands of a group of individuals who decided to collect money amongst themselves and publish the manuscript. With the help and active participation of the authors and their collaborators the book is now before you.

Against threats and persecution this courageous group of individuals composed of diverse ethnic backgrounds, has stood firm. We ask of the reader only to reserve judgement until he has thoroughly read through the book to the very last page. This book is not an easy book to read. One could almost call it an unnerving study of a very unusual and extraordinary man, his ideas his actions, his motivations and his ultimate goals. It also gives one a glimpse of German inventiveness and their capacity to suffer punishment and to be able to rise Phoenix-like from the ashes of "total defeat". This book also shows

Hitler's opponents in a new light; in the light of truth and not propaganda. The book can further serve the unprejudiced individual as a catalyst to study and re-examine many events from a new perspective. Now that many Allied documents are being de-classified, a new search will produce new and startling insights and conclusions.

We believe that the open-minded reader after studying this book and after delving into the many reference and source materials listed, will never again look at the world with the same eyes.

The publishers

P.S. Those of you fortunate enough to be able to speak and to read German will find a considerable difference between the English and German editions. The reasons are simply:

1. Difficulty in finding translators for such a deeply philosophical work.

2. The English-speaking readership is used to material in this lighter vein.

For the above reasons, this is not a true translation of the German version but rather a book about another book.

Hitler planning

THE MIND AND PERSONALITY OF ADOLF HITLER

The non-German world has a rather sketchy and fragmentary picture of the mind of Adolf Hitler; how he thought, felt and what motivated him. Lacking accurate knowledge, no one can possibly claim to understand the personality of this extraordinary man. Consequently, we will try to condense into a few paragraphs, what has taken historians volumes and volumes of books to describe.

Adolf Hitler was above all else, an intuitive, artistic human being, capable of accurately sensing situations and of grasping them with the clarity of an extremely orderly mind. He believed in the absolute supremacy of the spirit over the material, and this was borne out by his now-famous statement that for him, and for a National Socialist, two words did not exist in the dictionary — **impossible** (unmoglich) and **never** (niemals).

Let us look at his own life as a case in point. An early orphan, poor, with incomplete education, a stateless citizen in Germany with a sickly physical constitution, and, after the First World War, penniless and without a job or trade. He was just one of the many millions of Germans in similar desperate straits at that time in history. He had, one has to admit, not a chance to be anything other, even if lucky, than a manual labourer. Impossible, one would have to concede, that this man could ever become Mayor of Munich let alone the Chancellor of the largest, most populous, best-trained and educated country in the heart of Europe. Never — not in his circumstances!

Impossible? Never? Well, the entire world is witness to the fact that not only did the impossible become possible, it actually happened and in a very short period of time. The **never** and **impossible** were stricken from his and from history's dictionary.

Here enters the very first and most important component in understanding Adolf Hitler, and through it, the partial solution to the U.F.O. riddle.

Nothing in National Socialism was ever allowed to seem an impossible task or an unattainable goal. With Adolf Hitler it was always mind over matter. The belief then held by aircraft designers that the human body could not survive space flight and faster-than-sound speeds was scornfully put on one side by Hitler and it was his challenging of this belief that brought forth the U.F.O.'s.

Let us now return to the other facets of Hitler's mind in order to get an even clearer picture.

Hitler felt, based on his studies and an enormous amount of reading, that there existed a very definite plan by a small, but immensely powerful group of Jewish bankers, financiers, industrialists and others, to take control of the entire world. It is important to remember that he lived in Vienna during a time when a very noisy battle was raging between Zionist Jews, (who wanted to be a separate race,

religion, nation and culture with their own state, Israel), and the assimilated elements amongst the Jews, (who wanted to be part of the cosmopolitan establishment of the Austrian Empire), with all the privileges and power their immense wealth bestowed on them. Hitler's appraisal of the Jews can best be summed up as contained in "The Protocols of the Learned Elders of Zion". This is a very important aspect of the whole U.F.O. story, because in it, we find the seeds for many far-reaching decisions made 30 years later. Hitler saw in this actual or imagined Jewish drive for world domination, a very definite danger to his own work and plan.

From now on we must look at every problem from this vantage point. Hitler would undoubtedly double-check each major question by this criterion: "How would I act in this case if I were a Jew bent on world conquest?" Now we have the two most important keys to understanding the functioning of his mind.

There is, however, another very important fact, and this is motivation. What motivated this man? Why should this penniless and jobless vagrant, (often disparagingly called a paperhanger) act the way he did? Millions of words have been devoted to this question. All, or most of them, completely misrepresented him, and this is especially true in the non-German world where he is portrayed as some power-mad maniac, seeking power solely for destructive reasons. This kind of thinking might have been justifiable as propaganda during war time, but the truth requires a long over-due reevaluation, and the truth is simple.

The artistic, sensitive soul in this man rebelled at what he saw taking place around him. Since no single person, no group, no party and no ideology at that time expressed his feelings, he started expressing his own frustrations and ideas at the meetings of others. To his complete amazement he found that others listened and they listened in ever-increasing numbers. Thus, Hitler the agitator, the motivator, was born. There is no motivator without motivation and it was the concept of National Socialism that was his motivation.

It is neither the intent nor the desire of the authors to rewrite "Mein Kampf" and we shall restrict ourselves to the very barest of outlines to clarify his motivations. This is necessary to solve the U.F.O. riddle and can best be summed up in the 24 points of the N.S.D.A.P. Party Programme and also are reflected in a study Hitler made of the political situation for the army in Munich, where he was "Political Information Officer".

THE PROGRAMME OF THE PARTY

THE Programme of the German Workers' Party is limited as to period. The leaders have no intention, once the aims announced in it have been achieved, of setting up fresh ones, in order to ensure the continued existence of the Party by the artificially increased discontent of the masses.

1. We demand the union of all Germans, on the basis of the right of the self-determination of peoples, to form a Great Germany.

2. We demand equality of rights for the German People in its dealings with other nations, and abolition of the Peace Treaties of Versailles and St. Germain.

3. We demand land and territory (colonies) for the nourishment of our people and for settling our surplus population.

4. None but members of the nation may be citizens of the State. None but those of German blood, whatever their creed, may be members of the nation. No Jew, therefore, may be a member of the nation.

5. Anyone who is not a citizen of the State may live in Germany only as a guest and must be regarded as being subject to the Alien laws.

6. The right of voting on the leadership and legislation is to be enjoyed by the citizens of the State alone. We demand, therefore, that all official appointments, of whatever kind, whether in the Reich, the provinces, or the small communities, shall be granted to citizens of the State alone.

We oppose the corrupt Parliamentary custom of the State of filling posts merely with a view to Party considerations, and without reference to character or capacity.

7. We demand that the State shall make it its first duty to promote the industry and livelihood of the citizens of the State. If it is not possible to nourish the entire population of the State, foreign nationals (non-citizens of the State) must be excluded from the Reich.

8. All further non-German immigration must be prevented. We demand that all non-Germans who entered Germany subsequently to August 2, 1914, shall be required forthwith to depart from the Reich.

9. All citizens of the State shall possess equal rights and duties.

10. It must be the first duty of every citizen of the State to perform mental or physical work. The activities of the individual must not clash with the interests of the whole, but must proceed within the framework of the community and must be for the general good.

We demand therefore:

11. Abolition of incomes unearned by work. Abolition of the thraldom of interest.

12. In view of the enormous sacrifice of life and property demanded of a nation by every war, personal enrichment through war must be regarded as a crime against the nation. We demand therefore the ruthless confiscation of all war profits.

13. We demand the nationalization of all businesses which have (hitherto) been amalgamated (into Trusts).

14. We demand that there shall be profit-sharing in the great industries.

15. We demand a generous development of provision for old age.

16. We demand the creation and maintenance of a healthy middle class, immediate communalization of wholesale warehouses, and their lease at a low rate to small traders, and that the most careful consideration shall

be shown to all small purveyors to the State, the provinces, or smaller communities.

17. We demand a land-reform suitable to our national requirements, the passing of a law for the confiscation without compensation of land for communal purposes, the abolition of interest on mortgages, and prohibition of all speculation in land.

On 13 April 1928, Adolf Hitler made the following declaration:

"It is necessary to reply to the false interpretation on the part of our opponents of Point 17 of the Programme of the NSDAP.

"Since the NSDAP admits the principle of private property, it is obvious that the expression 'confiscation without compensation' refers merely to the creation of possible legal means of confiscating, when necessary, land illegally acquired, or not administered in accordance with the national welfare. It is therefore directed in the first instance against the Jewish companies which speculate in land."

"(Signed) ADOLF HITLER."

"Munich, April 13, 1928."

18. We demand ruthless war upon all those whose activities are injurious to the common interest. Common criminals against the nation, usurers, profiteers, &c., must be punished with death, whatever their creed or race.

19. We demand that the Roman Law, which serves the materialistic world order, shall be replaced by a German common law.

20. With the aim of opening to every capable and industrious German the possibility of higher education and consequent advancement to leading positions the State must consider a thorough reconstruction of our national system of education. The curriculum of all educational establishments must be brought into line with the requirements of practical life. Directly the mind begins to develop the schools must aim at teaching the pupil to understand the idea of the State (State sociology). We demand the education of specially gifted children of poor parents, whatever their class or occupation, at the expense of the State.

21. The State must apply itself to raising the standard of health in the nation by protecting mothers and infants, prohibiting child labour, and increasing bodily efficiency by legally obligatory gymnastics and sports, and by extensive support of clubs engaged in the physical training of the young.

22. We demand the abolition of mercenary troops and the formation of a national army.

23. We demand legal warfare against conscious political lies and their dissemination in the Press. In order to facilitate the creation of a German national Press we demand:

(a) that all editors and contributors to newspapers employing the German language must be members of the nation;

(b) That special permission from the State shall be necessary before non-German newspapers may appear. These need not necessarily be printed in the German language;

(c) That non-Germans shall be prohibited by law from participating financially in or influencing German newspapers, and that the penalty for contravention of the law shall be suppression of any such newspaper, and immediate deportation of the non-German involved.

It must be forbidden to publish newspapers which do not conduce to the national welfare. We demand the legal prosecution of all tendencies in art and literature of a kind likely to disintegrate our life as a nation, and the suppression of institutions which militate against the above-mentioned requirements.

24. We demand liberty for all religious denominations in the State, so far as they are not a danger to it and do not militate against the morality and moral sense of the German race.

The Party, as such, stands for positive Christianity, but does not bind itself in the matter of creed to any particular confession. It combats the Jewish-materialist spirit *within* and *without* us, and is convinced that our nation can achieve permanent health from within only on the principle: the common interest before self-interest.

25. That all the foregoing requirements may be realized we demand the creation of a strong central power of the Reich. Unconditional authority of the politically central Parliament over the entire Reich and its organization in general.

The formation of Diets and vocational Chambers for the purpose of executing the general laws promulgated by the Reich in the various States of the Confederation.

The leaders of the Party swear to proceed regardless of consequences—if necessary at the sacrifice of their lives—towards the fulfilment of the foregoing Points.[1]

MUNICH, February 24, 1920.

In a meeting held in the Circus Krone on 18 September 1922 Hitler formulated "*some fundamental demands of the Party":*

"1. We must call to account the November criminals of 1918. It cannot be that two million Germans should have fallen in vain and that afterwards one should sit down as friends at the same table with traitors. No, we do not pardon, we demand—Vengeance!"

"2. The dishonouring of the nation must cease. For betrayers of their Fatherland and informers the gallows is the proper place. Our streets and squares shall once more bear the names of our heroes; they shall not be named after Jews. In the Question of Guilt we must proclaim the truth".

"3. The administration of the State must be cleared of the rabble which is fattened at the stall of the parties".

"4. The present laxity in the fight against usury must be abandoned. Here the fitting punishment is the same as that for the betrayers of their Fatherland".

"5. We must demand a great enlightenment on the subject of the Peace Treaty. With thoughts of love? No! but in holy hatred against those who have ruined us".

"6. The lies which would veil from us our misfortunes must cease. The fraud of the present money-madness must be shown up. That will stiffen the necks of us all".

"7. As foundation for a new currency the property of those who are not of our blood must do service. If families who have lived in Germany for a thousand years are now expropriated, we must do the same to the Jewish usurers".

"8. We demand immediate expulsion of all Jews who have entered Germany since 1914, and of all those, too, who through trickery on the Stock Exchange or through other shady transactions have gained their wealth".

"9. The housing scarcity must be relieved through energetic action; houses must be granted to those who deserve them. Eisner said in 1918 that we had no right to demand the return of our prisoners—he was only saying openly what all Jews were thinking. People who so think must feel how life tastes in a concentration camp!"

"Extremes must be fought by extremes. Against the infection of materialism, against the Jewish pestilence we must hold aloft a flaming ideal. And if others speak of the World and Humanity we say The Fatherland—and only the Fatherland!"[1]

Hitler's "Study of the Jews" — for the army

In so far as the danger with which Jewry threatens our people today finds its expression in an undeniable aversion experienced by the majority of our people, the cause of that aversion is not generally to be found in a clear awareness of the Jews' systematically destructive effect, whether conscious or unconscious, on our nation as a whole, but arises mainly from personal intercourse and the impression made by the Jew as an individual... . Thus antisemitism all too easily takes on the character of a mere manifestation of emotion. And that is wrong. As a political movement antisemitism cannot and must not be determined by emotional motives but by a recognition of the facts...: To begin with, Jewry is incontestably a race and not a religious community. And the Jew himself never describes himself as a Jewish German, Jewish Pole or, say, a Jewish American, but always as a German, Polish or American Jew. In no case has the Jew ever . . . assimilated very much more from other nations than their language. . . . Even the Mosaic faith . . . is not the final word on the question of Jew or non-Jew. . . . By a thousand years of inbreeding, often occurring within a very small circle, the Jew has generally kept his race and type more sharply defined than the peoples among whom he lives. The result of this is that we have in our midst a non-German, foreign race neither willing nor able to sacrifice its racial characteristics or to renounce its own way of feeling, thinking and striving and which nevertheless has just the same political rights as us. If the Jew's very feelings are concerned with the purely material, how much more so his thinking and striving. The dance round the Golden Calf becomes a merciless struggle for all those possessions which to our way of feeling ought not to be the only and ultimate things worth striving for. The value of an individual is no longer determined by his character, by the importance of his achievements to the whole, but exclusively by the size of his fortune.... A nation's stature is no longer to be reckoned

> by the sum of its moral and spiritual forces but only by the profusion of its worldly goods. From this feeling there arises that thinking, that striving after money and after the power to protect it, which leads the Jew to be unscrupulous in his choice of methods, and pitiless in applying them.... In an autocratically governed State he whines to gain the 'majesty's', the prince's, favour which he abuses [by battening] on his subjects like a leach. In a democracy he goes whoring after the favour of the masses, crawls before the 'majesty of the people' and knows only the majesty of money. He destroys the prince's character by Byzantine flattery, and national pride – the strength of a people – by mockery and the shameless promotion of vice. His weapon is public opinion . . . which he guides and distorts by means of the Press. His power is the power of money which in his hands proliferates unceasingly and effortlessly in the form of interest.. .. Everything that induces men to aspire to higher things, be it religion, socialism, or democracy, is to him only a means to an end – that of satisfying his lust for money and domination. He acts on the peoples like racial tuberculosis. And as a consequence antisemitism arising out of purely emotional reasons will find its ultimate expression in the form of progroms [*sic*]. Antisemitism based on reason, however, must lead to a systematic and legal campaign to deprive the Jew of the privileges which he alone of all the foreigners in our midst enjoys (Aliens Legislation). But its final goal must always remain the removal of the Jews as a whole.

It could be said that we are a little far off the U.F.O. problem but without this groundwork it is not possible to unravel this very complex story. We now have a clear picture of the basic working of Hitler's brain. We know how he felt about "his enemies", real or imagined, and we also know what motivated him in his political moves and decisions.

To sum up:—

1. Hitler never thought anything impossible; he never accepted defeat. Hitler did not believe that even death was the end and thought of death only as a transition, after which the struggle continued only on a different plane. This can be clearly seen in his words "Und Ihr habt doch gesiegt" — "And you were victorious in spite of death" — often repeated during memorial speeches while honouring those of his supporters who fell during the march on the Feldherrnhalle on November 23rd, 1923 in Munich. This same thinking permeates his last two public speeches broadcast January 10th, 1945 and February 25th, 1945 in which he re-affirmed that Germany would still win the war — " . . . and the Last Battalion will be ours".

2. Hitler saw a world-wide conspiracy of Jews and their Allies, (democrats, liberals, social democrats and marxists) in a concerted, well-planned drive for Jewish world domination. He argued vehemently and convincingly to untold millions of Europeans that there was a struggle taking place for a Jewish world in which all non-Jews were to be mere work slaves, with Jewish rulers, similar to those forming the Communist government in the Soviet Union, e.g., Trotsky (Bronstein), Litvinoff (Finkelstein), Kanganovich (Cohen), Ehrenburg and Berija, or for an Aryan world where the white man played a forceful dynamic role in global affairs, based on self-determination but within strict limits of a larger white world or what the Germans call "Abendland".

3. Hitler's motivating force was an unusual synthesis, (never before or since attempted), of the best features of **Socialism** and of **Free Enterprise** as opposed to multi-national corporations, (then called monopoly or state capitalism) on the one side, and Nationalism (based on ethnic origin and adherence) versus universalism or internationalism on the other. Hitler's synthesis worked and it was eminently successful all over Europe, providing full employment, financial stability (zero inflation) and introducing the greatest worker-benefit programmes of any modern, industrial state. It was never defeated as an idea but only destroyed (by military power), as a system.

An idea can only be superseded or defeated by another, better idea. Germany was only defeated militarily in 1945 but the idea of National Socialism is still as strong as ever and is flourishing around the world, but by necessity, underground.

The above three factors must constantly be kept in mind as we move from chapter to chapter and from event to event in the following pages.

SCIENTIFIC RESEARCH ESPECIALLY IN THE AIRCRAFT FIELD IN N.S. Germany

When Germany sent unmanned guided missiles, in the form of the V.1 and later the V.2 (the V standing for Vergeltungswaffen or Revenge Weapon), crashing into England as payment for England's, treason against Europe, a weapon was thus introduced to the astonished world that up to that time had only been written about in Science Fiction magazines. Again, the "impossible" had been realised. There was no defence in England against the V.2 and there would have been no defence against the A.9 and A.10 (America Rockets) which were destined to rain on New York and Washington in the Fall of 1945. These rockets were intended as revenge for the aimless and merciless killing of German civilians by the saturation fire-bombing of German cities by the U.S. Air Terrorists.

The breakthrough in the rocket weapon field by Germany so astonished the Allied leadership that Winston Churchill, fearing panic would break out in England,, contemplated germ warfare against Germany. It was only a lack of germs that prevented such action. However, the rocket breakthrough came too late to turn the tide for Germany. Conventional mass-bombing and mass-killing by the Allies took such a heavy toll that the war ended before all the new technology developed by German genius could be brought into the war. It was the knowledge that it was quantity winning over quality that had driven the hopelessly outnumbered German soldiers to despair, and the new technology gave them a feeling of relief plus the knowledge that only for a space of time had mass overwhelmed spirit.

Secret Weapons

General Eisenhower wrote in his book "Crusade in Europe": "It seems likely that if the Germans had succeeded in perfecting and using these new weapons six months earlier than they did, our invasion of Europe would have proved exceedingly difficult, perhaps impossible. I feel sure that had they succeeded in using these weapons over a six month period, particularly if he (Hitler) had made the Portsmouth-Southampton (landing) area one of his principle targets, Overlord (the invasion) might have been written off". Those were the "conventional" V. I and V. II rockets mentioned by Eisenhower with such awe.

Winston Churchill spoke of the “miracle weapons” that Goebbels had promised the Germans, and that if they had come half a year earlier Hitler would have driven the allies out of Europe!

It is interesting to speculate about what weapons these two allied war leaders were referring to. Some were undoubtedly the remote controlled missiles, V.I and V.ll already mentioned. But there were others. There were ground-to-air missiles, some radio-controlled, some heat-seeking, some radar-guided and others even more sophisticated.

Long Range Rockets (ICBM) The “Amerika Rocket” at extreme left was to be operational by Fall-Winter 1945. (Note size of man in relation to size of rockets). Some of the German jet planes on the drawing boards and in the test stage. The experienced observer can trace most “modern developments” to these ancestors. Germany was at least a generation ahead of the rest of the world in “conventional” aircraft design

Flying bombs — remote controlled. See fore-runner of famous U.2 spy plane at top right. All were operational

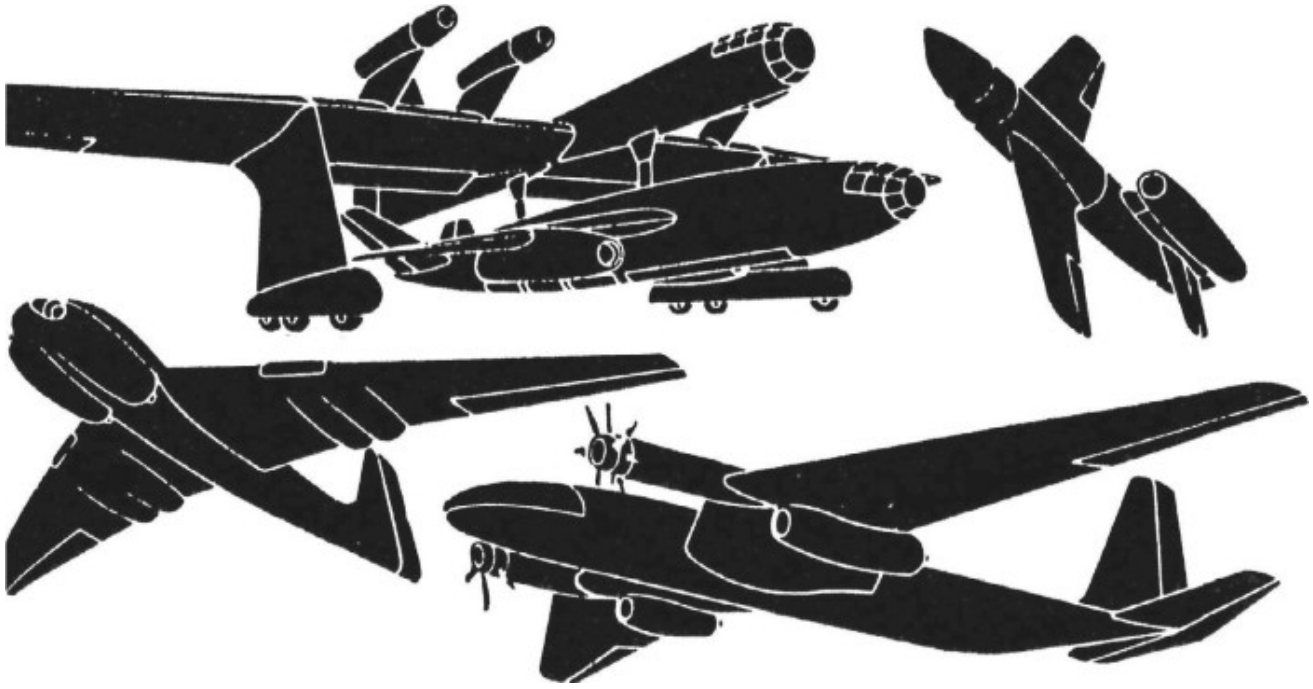
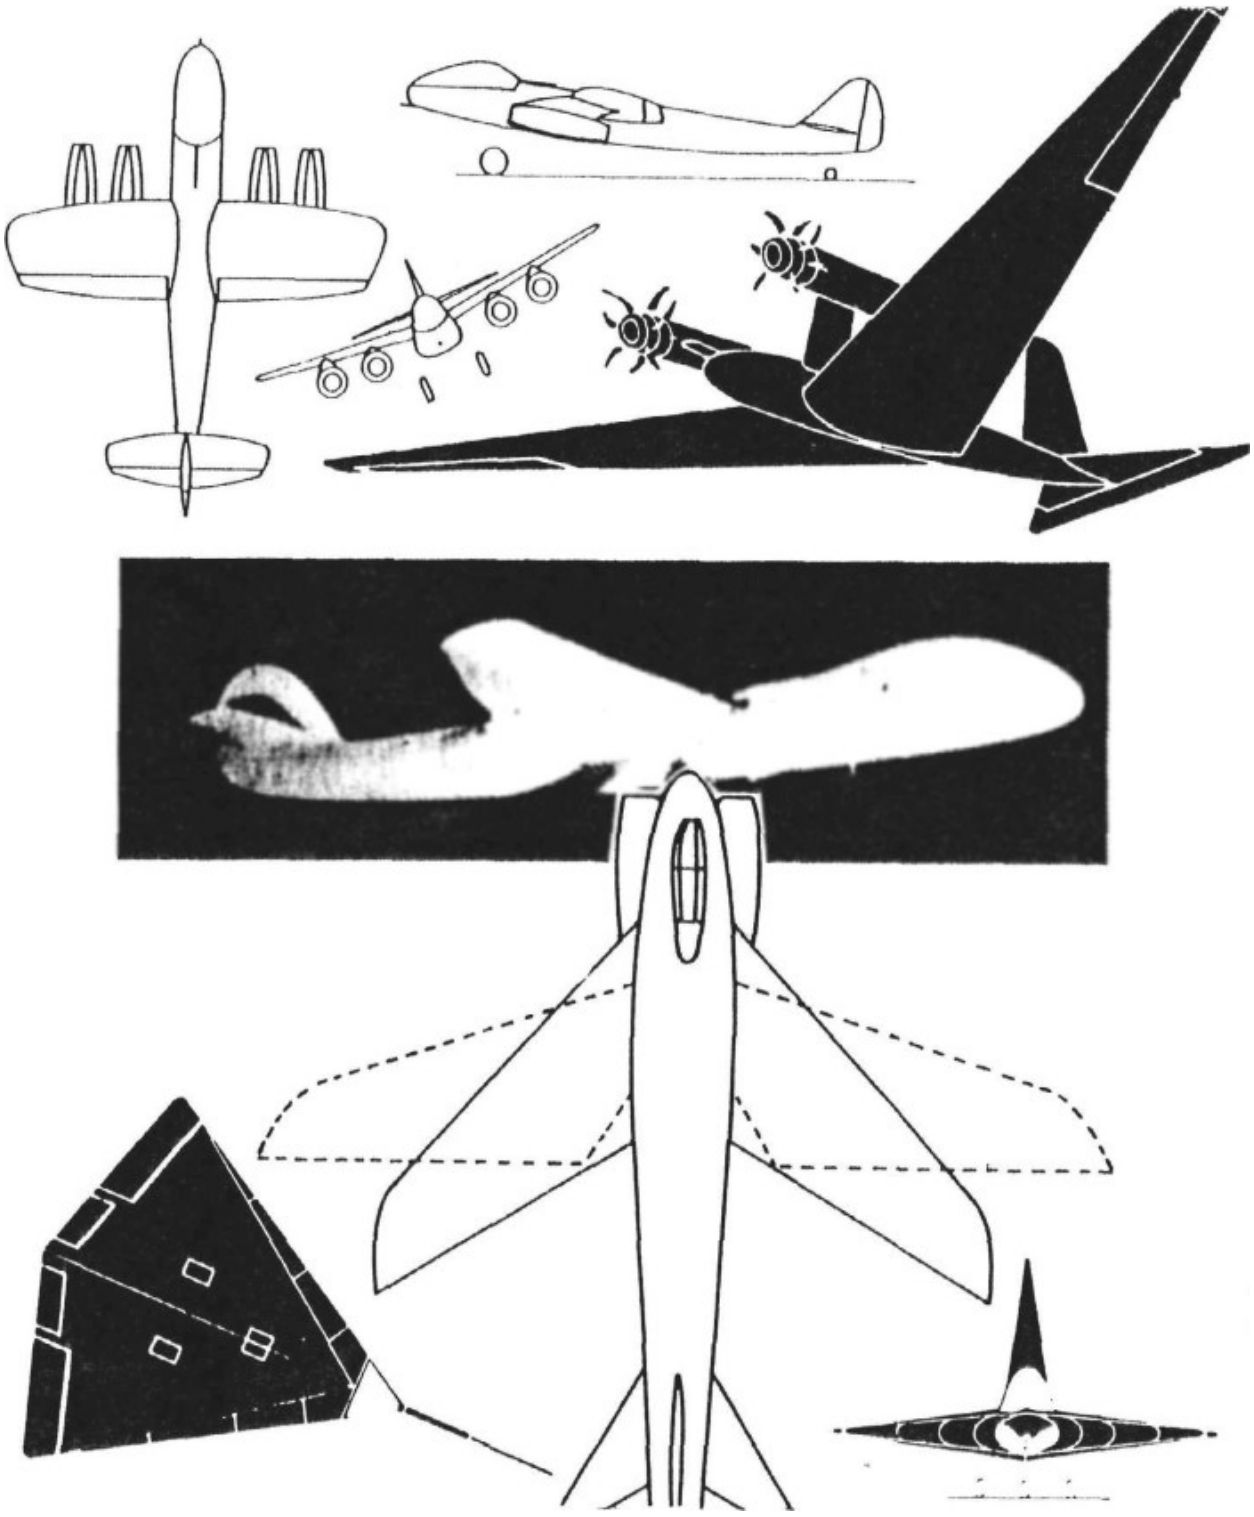
In April 1945, Germany had, in fact, over 130 different types of missiles and rockets. We reproduce here a' cross-section of the most important types. Please note their size relative to the size of a man. All the ones pictured were operational types. Many others were just days or weeks away from combat use. Amongst them were the devastatingly successful R.4-M, air-to-air missiles which were mounted under the wings of an aircraft. A ME-110 could carry 48 R.4M's and Germany's new jets carried 24 of these murderously effective weapons.

Luftwaffe Lieutenant Werner Schneider, a German Wing-Commander, flying a F.W.190, attacked on allied bomber formation near the town of Schweinfurth in April 1945 and reported after his landing, "We were about a mile away when we received our directions from the control centre. 'You are close enough' a missile expert told us. 'Hold that range. Just point your noses forward towards them and pull the switches.' With a hissing sound the missiles blasted away. The result was beyond our wildest expectations. The missiles equipped with proximity fuses, some also with acoustical detonators, sent forty bombers to the ground within minutes."

Before the war ended, Germany had produced over 20,000 of these missiles of the R4M type in underground factories in the Sudetenland. Allied sources have put bomber losses at the hands of the R4M to over 500 in a few weeks. However, since aircraft were in short supply at that time, greater emphasis was placed on ground to air missiles. To mention but a few, there are the Enzian (Gentian), Hecht (Pike), Feuerlilie (Firelily), Schmetterling (Butterfly), Rheintochter (Rhine maiden), Wasserfall (Waterfall) and the Taifun (Typhoon). The last one had an acceleration of an incredible 45 G's.



Wasserfall could reach 50,000 feet and was later improved upon. It was equipped with an infrared guidance system which sent it in a beeline for any Allied bomber — and was 100% accurate. The Butterfly was another step in the V (Vengeance) weapon programme. In April 1945, 3,000 were produced; in June it was to be 10,000 missiles of this type alone.



When V.E. day came around, on May 8th, 1945, many expert analysts amongst the victors expressed the opinion that not a single allied plane would have been able to penetrate the borders of the German Reich after May, 1945. Germany's defence curtain of anti-aircraft missiles would have been 100% fool proof. Not even the atomic bomb would have been able to be "delivered", not to mention the

fact that London and Washington were by that time within range of existing Germany long-range rockets and jet bombers. But there are other weapons to be mentioned here.

There was the “Lafferenz Projects” which was just completed at the time it permitted the firing of missiles from submerged U-Boats. Attacks were planned on cities such as New York, Boston, Philadelphia, Washington and even far-off Detroit.

Tests had been completed using small-scale subs and rockets (Lake Topliz, Austria) and large V.ll’s towed behind a submarine off Cuxhaven on the North Sea. Then there were flying bombs with built-in computer-controlled T.V. cameras, controlled by pilots who could be hundreds of miles away. There were long-range jet bombers, with 12,000 mile range, jet aircraft — aircraft carriers, transport planes that carried other smaller planes (12 of them) piggyback to their target area and then let loose their cargo of death and destruction. There were ram jets, jet fighters, bombers, transports and there was even an SST transport capable of flying four times the speed of sound.

T.F.X. Jets and S.S.T. airliners; their origins can clearly be traced to Germany's Research labs.

Also there were passenger jets, a few of which are reproduced here. These plans had already progressed to the stage where models were being tested in the wind tunnels. It is interesting to see that the Americans adopted the German engine mountings on their later aircraft, but most startling of all is the Jumbo jet shown in these pages. Many of the Allied postwar developments originated right here

in Germany's laboratories, as is evidenced by the following excerpts photographically reproduced from "America's Aircraft Year Book," an official publication. It speaks for itself.

> As part of its comprehensive research program to exploit former enemy aeronautical developments, the Air Materiel Command's Technical Intelligence agency was using the services of some 86 top-flight German aviation scientists of World War II. Working side by side with American military and civilian aeronautical engineers in the laboratories of Wright Field, these German experts were being used, as were tons of captured enemy materiel, documents, blueprints and microfilm, to save American engineers the time they would devote to problems already investigated by the Germans. Their knowledge also helped the Americans to catch up and improve upon Germany's wartime advancement in such phases of aeronautical developments as rocket and jet power. Similar groups of former enemy technicians were employed in other parts of the country by various branches of the armed forces. At Fort Bliss, Texas, one group was working in connection with research on German V-2 rockets and other guided missiles. Others were working with the Army ordnance and engineer experts, and still others were working for the Navy in several fields of applied war research and development.
>
> Among those in the German group at Wright Field were Rudolph Hermann, Alexander Lippisch, Heinz Schmitt, Helmut Heinrich, and Fritz Doblhoff and Ernst Kugel. Hermann was attached to the Peenemunde Research Station for Aerodynamics, where Germany's V-2 rockets were hatched and launched against England. A specialist in supersonics, he was in charge of the supersonic wind tunnel at Kochel in the Bavarian Alps. He also was a member of the group entrusted with Hitler's futuristic plans to establish a space-station rocket-refueling base revolving as a satellite about the earth at a distance of 4,000 miles—a scheme which he and certain high-ranking AAF officers in 1947 still believed to be feasible.
>
> In order to break down the language difficulties in deciphering captured German documents, prominent educators were working with the AAF in compiling a new 75,000-word German-English dictionary intended to clarify German aeronautical terms and phrases. Supervising the project was Dr. Kurt I.. Leidecker, on leave from the Behr-Manning Corporation and Rensselaer Polytechnic Institute, where he was assistant professor of modern languages and instructor of scientific German. Nearly half the contents of the new dictionary were to be new words. The Germans had nazified aeronautical terms formerly having classic roots, and had coined many new terms not found in any existing dictionary. Material for the dictionary was being extracted from broken enemy codes and from 250 tons of captured German air documents. Considerable value was attached to the widely heralded German ZWB (Central Organization for Scientific Reports) Index which contained important scientific documents. Included were many of the newer aeronautical terms and some applications of older words, which served as an aid to the project translators. Also helpful were German translations of American and British aeronautical terms found in captured documents, and the arbitrary words and phrases applied to German prototypes and equivalents of Allied equipment and accessories.
>
> The German scientists worked voluntarily at Wright Field under special contracts as alien civilian employees of the War Department. Their salaries ranged from $2.20 to $11 a day, and were paid to their banks or families in Germany.

There are other developments never mentioned in any official book, namely the UFO and other even more devastating weapons. Why is no mention made of them officially? Is it because they were not found? Or that they were destroyed?

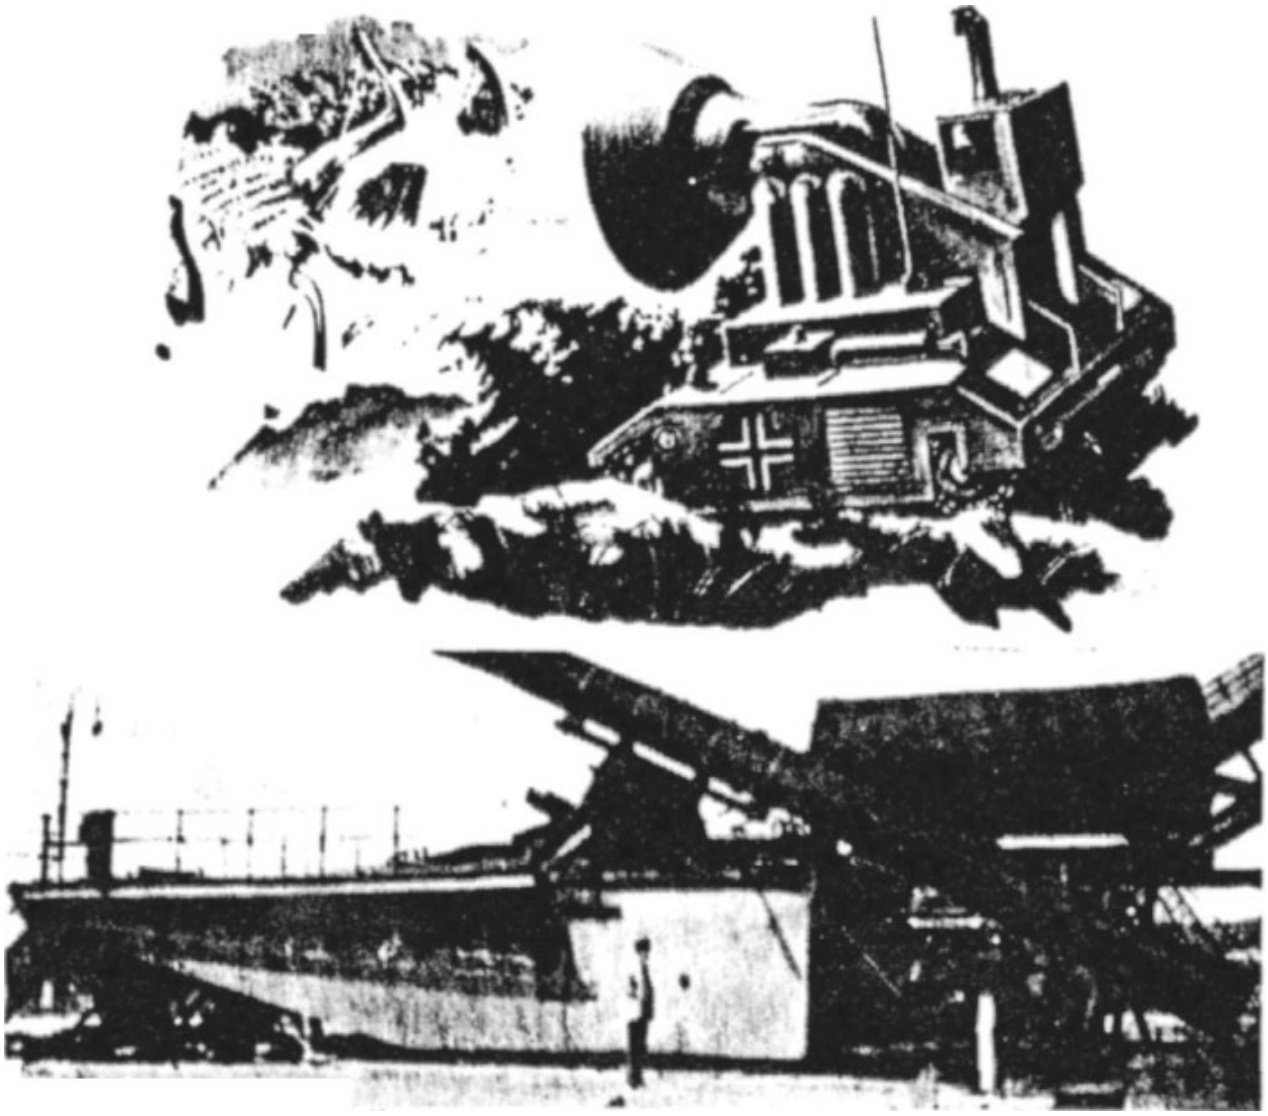
However, before proceeding with the UFO's there are a few more secret developments which must be covered and which, perhaps, you have never heard of before, — the death rays, the sun cannon, Pandora's Box and the Aeolus Bag.

ART BY FRANK BOLLE

The Sound Cannon

Once again, we find Hitler steering his scientists towards using nature, not opposing it. He had them harness two important elements, namely the power of the air and the power of the sun.

The first experiments started as early as 1943, on a lonely, rarely-visited mountain plateau in Tyrol. For a number of weeks scientists and specialists from the Reichsluftfahrtamt in Berlin (Office of Aeronautics) — of which Major Lusar, who reported about the German UFO programme, was also a member, had been busy setting up a camp, or more appropriately, a base. They were busy unpacking and assembling some odd-looking pieces of equipment. Huge crates arrived by truck from various parts of the Fatherland. Significantly again, many factories which were involved in this project were located underground in what is now Czechoslovakia. When all was assembled, there stood on that lonely, bleak plateau, high in the mist-shrouded mountains of Austria, a most fearsome weapon — the Sound Cannon. (see photograph reproduced here). It looks like a weird longish platform with an angular smoke stack that can be turned into horizontal positions and a fire place or boiler seems to be at the base of it. In actual fact it is a rigid steel combustion chamber in which methane and oxygen can be ignited under high pressure, with the ultimate aim of creating a series of powerful explosions at rapid intervals. The shock waves created by these explosions were to be directed, via the conical smoke stack against any aggressor, with a devastating force. The whole infernal principle was based on the knowledge that the shock waves



of sound, generate a certain pressure upon objects which may be in their path. Thunderclaps with their earth-shaking after effects served as the father of thought, in this particular case.

Sonic booms as created by fast and high-flying jet aircraft can, in effect, damage buildings and burst ear drums. Sound, therefore, if strong enough, can kill. And so the reasoning went behind these tests. Why were they testing this device way up in the Alps? To the peasants below and around, it sounded like a thunderstorm and so created little suspicion.

The scientists had had hundreds of dogs and pigs trained to take the place of attacking Russian infantry. The animals were trained, Pavlovian style to run in a certain direction for their daily fodder, about 400 yards away. The day the experiment was started, they were once again headed for their troughs. The Sound Cannon had been erected behind some bushes. First came the dogs, then the pigs. There were no eaters at troughs that day; not one animal survived that 400 yard dash.

The dogs came first; at 150 yards distance the first salvo was fired, there was a terrific bang and then followed the shock waves. The dogs stood as if frozen to the ground. Suddenly they let loose a heart-rending howl and raced towards the troughs only to be hit by another round. The dogs had come within 50 feet of the sound cannon and not one of them survived that second shot. The pigs, still 100 yards away were paralyzed for hours. All suffered from disorientation effects, causing them to run helter skelter in each and every direction. None of them made it to the feeding troughs.

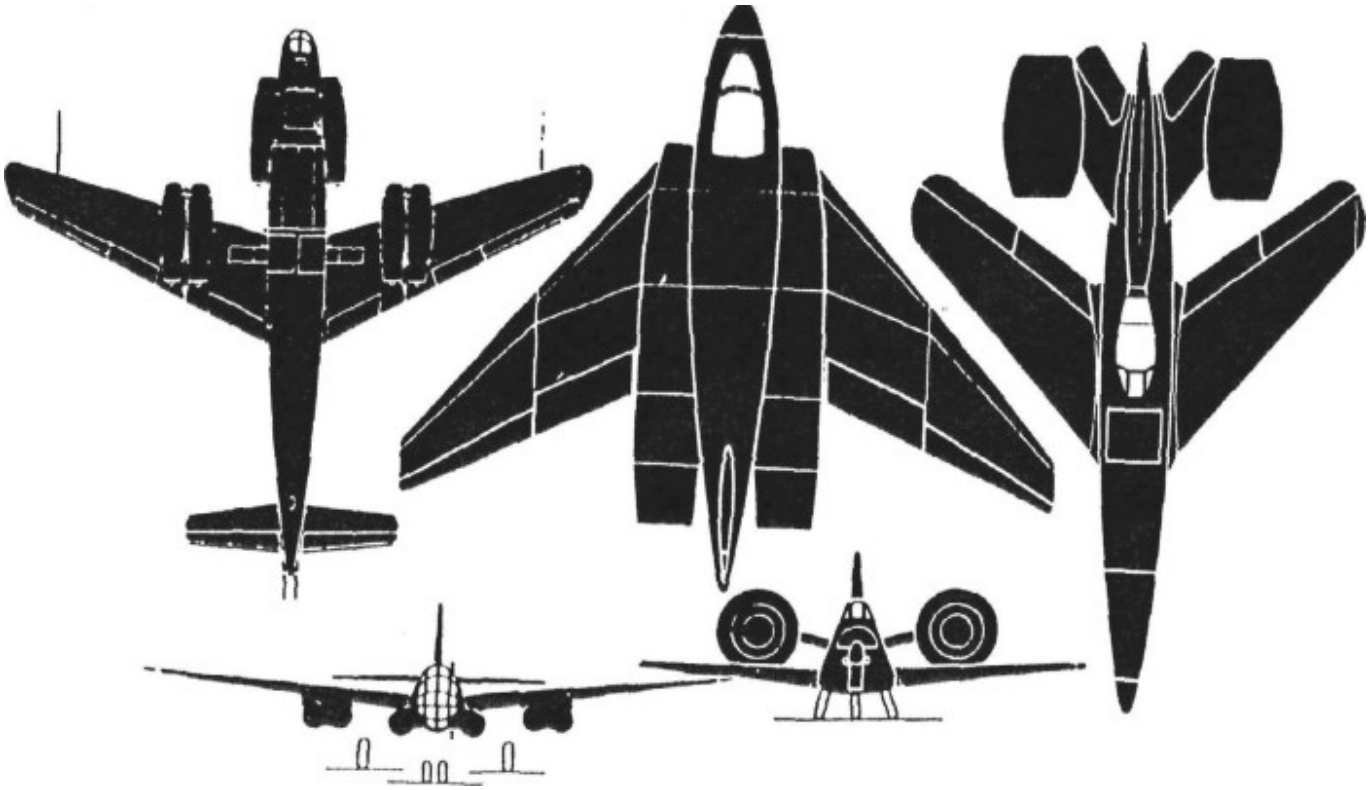
The sound cannon was used operationally against the Russians on the approaches to the Elbe River and against American aircraft close to Passau on the Danube — with the same results. (One wonders did Admiral Byrd suffer the same fate as the pigs when he gave orders to abort that Antarctic overflight after all his orientation instruments went haywire in 1947?). Illustration shows artist’s conception of the Sound Cannon.

The Aeolus Bag

This New-Age weapon was used to fight off the seemingly endless hordes of Mongolians that were spewed forth from Asia's vast steppes. It used oxygen and hydrogen for combustion. The weapon's function was similar to an air compressor, commonly found on construction sites. If you have ever witnessed the concentrated power of pressurized air from a pneumatic tool or drill you will be able to appreciate the potential impact of the Aeolus Bag. It could stop a truck or a plane dead in its track before disintegrating it.

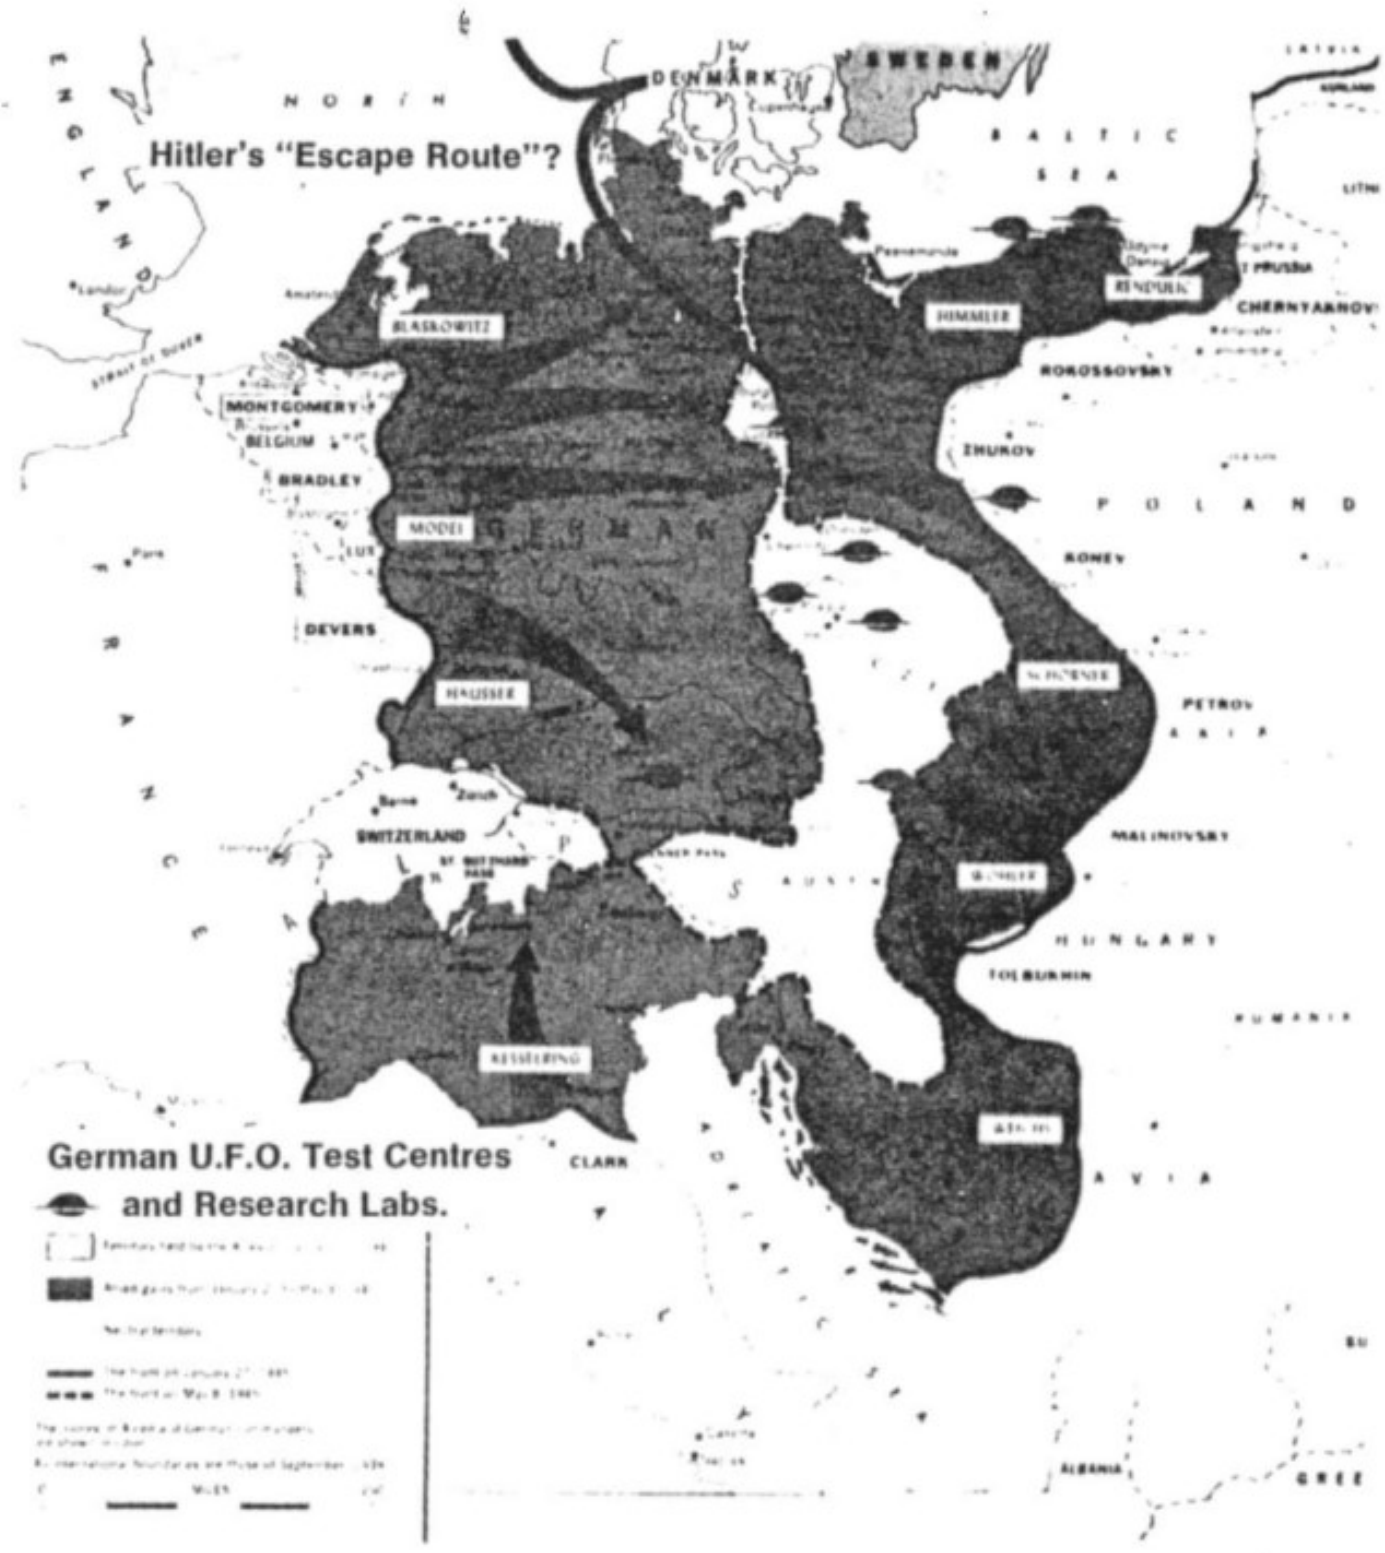
The Sun Cannon

Very early in the war, the Germans, well-versed in Greek mythology, built another contraption of note. This silent weapon consisted of a huge truck-mounted mirror able to be rotated at will. The sun's rays were to be collected, concentrated and sent back towards the sky, blinding enemy pilots and gunners, and so giving to the German fighters very easy pickings. Due to weather conditions over northern Europe, the weapon was seldom used "at home". However, a member of the Africa Corps reported it used on the ground on some occasions and with excellent results.



Pandora's Box

When first conceived Pandora's Box was thought of as an anti-aircraft weapon, but it proved to be most devastating on the ground. The SS used it against the Jewish, uprising in the Ghetto of Warsaw.



The inventor was, in civilian occupation, a mining engineer. He simply re-created the dread of all coal miners — an underground coal dust explosion. The explosion literally razed any building from its foundations. (See illustration). None of these weapons were ever used by the allies in any of the 50 wars since the end of W.W. II. One could safely assume therefore that these weapons did not fall into allied hands, since every other German invention has been reproduced; from missiles to space flight and satellites, and each has been always loudly heralded as some scientific breakthrough by either Russia or Uncle Sam.

This brings to mind a glaring example of the “Brain Drain”. Recently it was announced with great fanfare that a U.S. paint company had perfected a superb camouflage paint capable of absorbing radar waves or make them unintelligible. They must have either “re-invented” a German invention which had been long in U.S. hands, and probably at great expense to the U.S. taxpayer, or else they just pocketed the money for going through Hitler’s files, for it was nothing more than the paint used on German planes at the end of the war.

There were also other fantastic developments in the purely conventional aircraft design. Reproduced here are a few of the planes on the drawing boards when Germany surrendered. The famous B.M.W. plant in Munich produced for Hitler the world’s first supersonic jet bomber only 12 months after Hitler had requested it. It’s range was to be 10,000 miles. Six jet engines were to give it the speed of sound at an altitude of over 50,000 feet. The plane’s code name, the Horten XVIII, would have been rolling off the assembly lines in the summer of 1945. It was to have carried 8,000 pounds of explosives to America and Russia and was designed to give the native population of these continents a taste of what it felt like to be at the receiving end of the “Liberators”.

Hitler was an ardent believer in the teaching of Clausewitz and despite having under his control all of the above advanced technology and the atom bomb, he realised the necessity of having a certain amount of physical force to be able to occupy and control any given land-populated area. This Hitler lacked in April 1945 and hence his strategic withdrawal from Berlin.

Positions in February, May 8th, 1945

With the advancing allied armies came teams of scientifically trained specialists, whose sole jobs were to hunt for German scientists and to ensure that their installations, laboratories and factories were not destroyed. The Americans were the cleverest and best organized in this field, capturing many "prize catches", and this, much to the chagrin and often anger, of the British, the French and especially the Russians. This great American "brain robbery" of the defeated enemy was so mind-boggling that a special dictionary for technical jargon of the aircraft industry alone had to be created by the captured Germans. It was comprised of over 75,000 separate terms and it made possible the exploitation of the stolen German patents. Wind tunnels, whole factories, all machines, every nut and bolt, including models, drawings and prototypes were shipped to America and to a lesser degree to the other allies. Top flight scientists were "invited" to work in the U.S. for $2.20 a day while being kept prisoners. In order to get cooperation, their starvation diets were kept "supplemented". Some were even offered citizenship as an inducement, or "war crimes" trials if they didn't produce. They included "Wernher von Braun"!

The Russians used methods only slightly different to those used by the Americans. On one particular occasion in an extremely well-coordinated plan conducted all over Soviet-occupied Germany, 275,000 specialists with their wives and children were hauled out of their beds in the early hours of the morning.

KIDNAPPING OF GERMAN SPECIALISTS

The raid was conducted in the Soviet Zone, 21st and 22nd October, 1946, all over central Germany by heavily armed troops, working to a minutely detailed plan. The specialists were forced to sign work agreements of five-year duration. Those who refused were taken in spite of their refusal. Women, children and even babies were taken. Protests were ignored or beaten down.

With few personal belongings, they were all shipped off to Russia. German factories were awaiting them, already dismantled and crated. There these specialists worked around the clock for three bowls of borscht soup and a slice of dark bread daily. In this way they were forced to help in bringing the Soviets, first, up-to-date and into the 20th Century, and then into the space age. With the further aid of U.S. Communist spies, Rosenberg, Greenglass et al the Russians were able to produce the first atom bomb. German science allowed them to produce Mig fighter-planes which were used to kill many Americans in Korea and later, in Vietnam.

The German scientists worked in about 40 different locations all over Russia:

40% in Kujbyschew — aircraft and jet engineer works
31% in Podberesje — aircraft design
6.5% in Moscow — radio, telephone technicians
4.5% in Tuschinow — pipelines
3% in Ostasckleow —
2% in Suchumi — Atomic research
1.5% in Leningrad — T.V. technicians

When the Germans protested as a group, they were shown documents, in English, signed by President Roosevelt of the United States, and by Winston Churchill, granting the Russians the express right to utilize any German person as they saw fit. Apparently these democratic leaders had no regard for human rights or liberties. These were the same men, who had wailed at Nuremberg, about the Germans utilizing forced labour in concentration camps. What hypocrites.

After their five year terms had been served, during which many had died and many were condemned to slave labour camps for life — camps such as "Workuta", the scientists were kept for another 2-3 years in quarantine, so that they would forget the projects they had worked on, no pencils, no paper was allowed them. What devils in human form. Sanctioned by the leaders of England and the U.S.A.

All submarine construction, torpedo development, tank-building and, of course, military rocket construction was performed by the forced, slave labour of the German top brains and thus was fulfilled the agreement made by the Allies, and in particular by the Americans, at conferences held in Potsdam and Yalta.

The Allies committed the greatest highjacking crime in all recorded history when they stole thirty railroad cars full of German patents. Stolen is the only word that fits this crime, for not a cent was ever paid to Germany in royalties or property rights. However, the true motives of both the East and West were soon revealed to the entire world. It was not humanitarian ideals that led to the "get Germany" war in 1939 but obviously it was outright theft and industrial-economic considerations. As soon as the Allies had in their hands the German specialists and had bombed their troublesome competitor (German industry) out of the world market place, (not a savoury method but an extremely effective one), (see photo copy of U.S. Steel Speech), they couldn't have cared less about freedom. There was no freedom of the press, freedom of speech or of opinion in Allied-occupied Europe and even today, thirty years later, there is still none.

U. S. Steel President Here, Predicts Big Market In Europe For Postwar Rehabilitation

BY LARRY GLENN

Europe will look to the United States for steel for rehabilitation for several years after the war because its own steel industries have been crippled by aerial warfare, Benjamin F. Fairless, Pittsburgh, president of the U. S. Steel Corporation, said in New Orleans today.

"Bombings have taken a heavy toll in Europe," he said. "If reports reaching us are accurate, then we are led to believe that the steel industry, if not destroyed, is seriously crippled. European countries will need steel for rebuilding. It is only logical to suspect that we will be called upon to produce steel for her needs.

"European requirements, together with substantially more business with South America than ever before, will keep the steel industry in this country humming for some time to come.

"The industry in this country is today producing all the steel it can possibly turn out. There is a need for even more but we do not have the man power or the facilities with which to produce it.

"U. S. Steel Corporation shipped 21,000,000 tons last year. This was a third of the nation's total output. The steel industry as a whole produced last year between 20,000,000 and 30,000,000 tons more ingots than it did during pre-war years.

"I don't like wars. But as a result of the present war, the steel industry has shown tremendous advancements in the development of new products and new techniques. The ultimate development of these new ideas will take place after the war.

PLANTS FOR SOUTH

"I am enthusiastic about the future of the South, and I look for the establishment of new plants using fabricated steel for their products."

Mr. Fairless has been in the steel business for 32 years, and has been president of U. S. Steel since 1938. He is 55, and is here on an inspection tour of his firm's subsidiaries. The corporation's plant in New Orleans is the Bennett Manufacturing Co., on the Jefferson Highway near Cam Plouche.

He is accompanied by Mrs. Fairless, George Wolfe, president of the U. S. Steel Export Co.; Robert Gregg, president of the Tennessee Coal, Iron and Railroad Co.; M. H. Geisking, vice-president of the same company, and E. D. LeMay, public relations director of the U. S. Steel subsidiaries in the southeast division.

Mr. Fairless was slated to inspect harbor facilities here today, and will leave tomorrow for Texas.

War and its aftermath always mean big profits for big business

It was also the victors who introduced at Nuremberg the “democratic” order that “Might was Right” and so hanged Europe’s elite for alleged crimes, which similar crimes the victors were still committing daily, such as employing slave labour (P.O.W.’s), establishing and running concentration camps, (Dachau, Buchenwald, Auschwitz etc., but now with Allied guards), and expelling millions from their ancestral home lands, to name a few.

However, despite all the stealing, one prize catch eluded both the east and west. Germany’s U.F.O. research scientists could not be found. At first, drunk with victory, this important factor was overlooked but as the hangover from booty hunting, rape and conquest came to an end, it was too late. That some key scientists were obviously missing became clear, and although some plants and their installations were located, the staff with their machinery and prototypes had disappeared. Even the test pilots had vanished.

The Allied Intelligence networks again became active, but now the singleness of purpose — to kill the Krauts — was missing. The Allies began to suspect and accuse each other of having captured the “last secret”. They had agreed to divide the loot “honestly”. Each Ally was to receive microfilm copies of each and every German patent and secret document, regardless of whom had captured them, and since each stated they had kept their side of the bargain, a deadlock was reached. This controversy, which took place in the utmost secrecy and on the highest level, suddenly took a new and alarming twist.

From Northern Europe, and especially from neutral Sweden, came reports of Flying Saucers, called by the Swedish Press, “German Secret Weapons”. This caused a sensation not only in Europe but in the entire world.

Stories abounded about overflights by these strange objects at speeds and in formations which the Swedes had only seen during the latter days of the war. During intense German secret weapon development, many of these weapons were being tested in the then still safe Baltic area. This U.F.O. activity (as it soon became called), occurred at just about the same time as serious European, and especially North and South American newspapers and radio networks, were carrying sensational reports about Hitler.

It was being claimed that Adolf Hitler had never committed suicide but had escaped from the Bunker in Berlin via a “hospital tank”, had been taken to Tempelhof airfield and there, with his wife, Eva Braun-Hitler, had transferred to one of Germany’s fast jets and flown first to Denmark and then on to Norway. Both Denmark and Norway were still firmly in German hands. From Norway, Hitler and a mysterious group of people, making up an entire convoy, were claimed to have left for an unknown destination. Let us now investigate!

Whilst the last paragraph reads like a story out of a sensational publication, (the type usually dealing with crime and sex), nevertheless Time magazine issue of May 7th, 1945, (one day before the war was officially ended), gave space for the following article, and this seven days after Hitler’s supposed suicide. Add to this the fact that the Press service from which this report emanated and was distributed, seems to be the same one or at least connected with, the Press service for which a certain Willy Frahm (now known as the retired Chancellor of West Germany, Willy Brandt) quite freely filed stories whilst in exile. Should this be the case then the report must be given added credence, for another of these exiles using this service was Herbert Wehner, today a top West German politician. At this time he was known as one of Stalin’s most active operators in the European underground and under constanct surveillance by the Swedish Police as a “Soviet Agent”.

Hitler Story

Along with the authentic news from the perishing Third Reich came a rash of rumors and "reports." The dizziest to reach print was whelped by the unreliable "Free German Press Service," operated in Stockholm by Germans who call themselves "*émigrés*." F.G.P.S.'s latest gasp:

The "Hitler" who was in Berlin was not Hitler at all. It was a Plauen grocer named August Wilhelm Bartholdy, whose face was his misfortune: he looked like the Führer. Grocer Bartholdy, said F.G.P.S., had been carefully coached and combed, then sent to Berlin "to die on the barricades. . . . He will act as Hitler's trump card, creating a hero legend around the Führer's death, while Hitler himself goes underground." To fasten the hoax on posterity, *Reichsbildberichterstatter* (Photographic Reporter for the Reich) Heinrich Hoffmann would "be on hand to film Hitler's last moment on the battlefield."†

† When Hoffmann was taking the real Hitler's picture in front of the Eiffel Tower in 1940, the Führer reportedly cracked: "Take this one, Hoffmann; then the next one in Buckingham Palace and the next in front of the skyscrapers."

These types of Press services were usually the mouthpieces of communist spy rings inside German-controlled Europe. They were organized and financed by the Soviet Komintern or K.G.B. Their sources of information were from secret communist cells operating vast guerilla and spy networks which the Russians had set up even before W.W. II. Usually their information was first hand.

The Reds were waiting for the day of Germany's defeat when they could then get away with "murder" by killing all anti-Communists and conveniently calling them Nazi-collaborators.

Local Man Sends Truman $5000 To Start a Capture-Hitler Fund

In the belief that Adolf Hitler is still alive and is being protected by his followers, Attorney William J. Brock today sent a certified check for $5000 to President Truman with the request it be used as the nucleus of a $500,000 fund for the capture of the former fuehrer. The attorney said the award would be made entirely at the President's discretion.

In his letter, Mr. Brock said:

"Newspaper comments from time to time seem to indicate the possibility that Adolf Hitler is still alive. His name is historically synonomous with evil. Hitlerism has soiled the pages of history, causing the death of millions of innocent persons, the destruction of property, and what is even worse, has caused a perversion of the sous of millions more. It would be tragic if the trail of blood, oppression and foulness that he has left could again be followed by activation and further growth of Hitlerism upon his return from hiding.

"Since Hitler and his followers had been proven devoid of ideals and were, and still are, motivated by selfishness, greed and avarice, I feel his own followers would be tempted to turn Hitler over to the Allied authorities provided the price is sufficiently large.

"I hereby tender the enclosed check for $5000 which I hope will form a nucleus for further sums to be contributed by public-spirited Americans for a fund to be offered as a reward to the person or persons causing the capture, apprehension and trial by the Allied Commission of Adolf Hitler. It would seem the sum of $500,000 would be a sufficient attraction for the most ardent adherent of Fuehrer Hitler."

Another very interesting article was one which appeared in many U.S. newspapers announcing the formation of a "Capture Hitler Fund"! This is only second to an incredible book written by one of America's senior diplomats, former Secretary of State Jimmy Byrnes, in which he reveals a lengthy conversation he had with Stalin about the touchy subject of Hitler's disappearance from the world scene, and confirms Stalin's belief that Adolf Hitler had not died in the Bunker in Berlin.

Reproduced here is a condensed version of an article which appeared in an American religious publication entitled "The Cross and The Flag" of date April 1948, and gives Stalin's response to a direct question from Mr. Byrnes about Hitler's whereabouts. It seems that even the highest echelons of the Allied governments were not convinced of Hitler's death, for any reports of Hitler having been seen were always thoroughly checked out.

Is Hitler Still Alive?

Former Secretary of State Jimmy Byrnes reveals in his new book entitled "Frankly Speaking" that it is the opinion of Joe Stalin that **Hitler is still alive.** The statement of Byrnes sounds more like a belated confession than an historical account. Says Byrnes in effect: "While in Potsdam at the Conference of the Big Four, Stalin left his chair, came *over and clinked his liquor glass with mine in a* very friendly manner. I said to him; **'Marshal Stalin, what is your theory about the death of Hitler?' Stalin replied: 'He is not dead. He escaped either to Spain or Argentina.'"**

If anyone knows where Hitler is, outside of his intimate friends, it is Josef Stalin. It will be remembered that the American troops were ready to invade Berlin first, but at the order of Franklin D. Roosevelt, acting through Ike Eisenhower, the American troops were held back in order that Stalin might have the honor of capturing Berlin. What a deal! What a betrayal of the pride and dignity of the United States Army, and what an insult to the British Army which was also ready to move in with our troops.

There are numerous theories concerning what happened to Hitler. I list them below:

1. The publicized theory is that he was burned up during the bombing of Berlin.
2. He was captured by the Russians and is now a prisoner in Moscow.
3. *He was captured by the Russians, tortured* and then killed.
4. He was spirited away by certain Jewish extremists who desired to slaughter him as an act of revenge.
5. He was assassinated by one of his own aides who had accepted a large sum from Hitler's enemies and promised safety.
6. He committed suicide.
7. He commandeered a military plane and escaped with a staff of trusted compatriots.

Evidently Joe Stalin believes that the seventh theory is correct. I agree with Stalin in this theory. The most sensational neglect of a news story is in the fact that when Stalin told this to Byrnes it was not flashed across the world and given sensational display in the headlines of every daily newspaper on earth. It is still one of the most sensational pieces of news to come out. I will give you my reasons for believing that the first six theores are not well founded.

1. Just prior to the capture of Berlin, Hitler was in complete command of all military forces. Why did a man as brilliant and powerful as he was crawl down into a shelter and submit himself to cremation. This is illogical and unreasonable in the light of all that is known about Hitler.
2. Hitler was hated by the Russians more than any enemy that the Soviet had. He never would have submitted to being captured by them alive, and there was no reason why he should have been captured. Escape was really easy as far as he was concerned.
3. The argument which eliminates the second theory eliminates this one.
4. There were practically no Jews in Berlin when it was captured or prior to its capture. This theory seems far-fetched.
5. This theory might stand up were it not for the fact that only a few months prior to his disappearance certain corrupted friends had planted a bomb under his chair and somehow it did not go off at the proper moment, but *went off after* he left his chair, injuring him but not killing him. This made him very cautious and it is reasonable to believe that he was very alert at the time of his disappearence to betrayal within his own camp.
6. This theory is exploded by the fact that Hitler was a very courageous man. He never did anything to indicate physical or moral cowardice. It will be recalled that newsreels showed him walking freely and mixing freely with the crowds. A courageous man, whether he is wrong or right, whether he is a statesman or criminal, never commits suicide.
7. This theory stands up and there is any one of five or six places where he might be today. They include (a) *Argentina;* (b) *Spain;* (c) *Ireland;* (d) *Sweden;* (e) *Africa;* (f) *Portugal;* (g) *Switzerland.*

Hitler was known to have many, many followers in all of these countries. It will be remembered when Stalin was about to overrun and undermine Spain, and his followers were burning the churches, that Hitler sent an abundance of help to Franco, and Franco evidently felt under lasting obligation to Hitler.

Whatever the truth may be concerning this matter, it is not to be overlooked that Hitler, Mussolini and Roosevelt left the stage of action within a few weeks of each other. Mystery still surrounds the passing of Roosevelt. Thus, these 'three rulers,' who were perhaps three of the most powerful men that ever lived, disappeared from public life shrouded with mystery. It is now a matter of common knowledge that Mussolini was hanged by a Communist mob. The same people who hung Mussolini and spat upon him and rolled his body in the

gutter in such a barbaric manner that the church authorities protested — it is now a matter of common knowledge that the same people and leaders who lynched Mussolini without a trial are now the leaders of the movement to make Italy Communist and turn it over to Tito and Stalin.

To those who believe that Hitler is dead I submit the following questions:

1. Who saw him die?
2. Why hasn't someone been able to produce a piece of metal or a bone or a tooth filling that remained after his alleged cremation?
3. Why did he voluntarily wait to be consumed when he had so many opportunities for escape?
4. Why does his personal aviator admit that he flew him out of Germany and turned him over to another plane?
5. Of course, the $54 question is: Why did Stalin tell Mr. Byrnes that he was convinced that Hitler was still alive? Although Stalin is perhaps the world's biggest liar, there would be no object in his not telling the truth concerning this matter. Stalin guessed Spain or Argentina. My guess is Argentina. The Argentine people were very friendly to Germany. The Argentine has a large German population, many of whom were pro-Hitler. Peron has made it safe for Mussolini's son and now his family.

THE SATIRE OF FATE

The satire of the passing of time in the hands of fate lies in the fact that we are now in Hitler's boots in one respect. We are trying to figure out how to push back Stalin.

When the Jew lynch mob which runs the Nuremberg Court caused the top generals of Germany to be virtually lynched without an appeal to a higher court and in violation to America's sense of justice, one of the generals said, as he was about to be hanged *"Some day Stalin will do this to you."*

It is interesting to note that the presiding judge at Nuremberg, a high class Supreme Court Justice from Iowa, recently announced that if he had known the facts he never would have gone to Germany. He criticized and virtually condemned the whole set-up. (See editorial elsewhere in this magazine entitled "Judge Gets a Stomachful".)

We may need a knowledge of Hitler's experience some day if we are to prevent Russia from overrunning the world. We need to know why Hitler failed to stop Stalin in order that we may profit by his mistakes.

As the truth comes out we begin to discover reports being made by the most conservative journalists that the war could have been avoided and that by a statesmanlike manipulation Hitler and Stalin could have weakened themselves on each other without destroying all of Europe and without involving us in a debt which now threatens inflation and depression. Strange enough, England and France, our two chief allies, are suffering almost as much as Germany, although they were, along with us, alleged victors.

If Hitler is still alive I hope it will some day be discovered and he will be permitted to tell his experience. Some experience! It could be that both Franco and Peron are profiting by his mistakes. They have established governments strong enough to eliminate Communism, free enough to give opportunity to the people, and sincere enough to protect the churches. Let us hope and pray that a strong central government will never be necessary in the U.S.A., but if we have to choose, may it be God's last will that as between a strength dedicated to Stalin and a strength dedicated to Jesus Christ, it may be the latter.

Oberst Skorzeny was a famous German Commando leader and a personal friend of Hitler. Hitler entrusted him with many daring missions, such as the rescuing of Mussolini from his mountain-top prison, and the arresting of Vice-Regent Horthy of Hungary from the Castle in Budapest, at a time when the Castle was surrounded by thousands of Hungarian elite troops. Skorzeny was repeatedly interrogated by the American C.I.C. and even as late as 1947-48, about his alleged role in the escape of Hitler!

Did Hitler and some of his closest men indeed survive the Third Reich? This question is of world significance, and it is with this in mind that the following articles are quoted, and some are reproduced in photo copy form for those readers who are multilingual.

Of all the articles and the versions of Hitler's escape from his embattled bunker in Berlin, the following seems the most plausible: In the German-language book "Das Ende des Hitler Mythos", page 339, reference is made to a series of events which completely negate the claims of the suicides of Hitler and Eva Braun. These suicides are usually stated to have happened at the Fuhrer Bunker, Berlin, April 30th, 1945, 3.30 p.m. In the above book it is claimed that Hitler was seen at 4.15 p.m. on that same day. Eyewitnesses gave their accounts under oath. Hitler either made a Christ-like resurrection, three quarters of an hour after his "death" or he had left the Bunker alive and with a plan.

LA SUPUESTA FUGA DE HITLER

VARSOVIA, — (A. P.) — [illegible] periódico "Wieczor" [illegible] afirmado hoy que el ex [illegible] de las SS, capitán Peter Baumgart, como lo [illegible] de Hitler y Eva Braun [illegible] a Finlandia [illegible] a bordo de un submarino, dos días [illegible] de la caída de Berlín, en [illegible].

Baumgart fué citado en forma similar por el mismo diario, en octubre del año pasado, diciendo [illegible] pero, en esa opor-

Tanquista alemán dice haber visto escapar a Hitler

MUNICH, 17 (UP). — Un tanquista alemán de 24 años de edad, que no quiso revelar su nombre por temor a represalias nazis, declaró bajo juramento que vió a Hitler escapar de la Cancillería en un tanque ambulancia el 29 de Abril de 1945, es decir, el día que el Fuehrer se suicidó.

Esta historia ha provocado poco interés oficial.

PRETENDE HABER VISTO A HITLER QUE HUIA

NUREMBERG, Alemania, [illegible] (AP).— Funcionarios del Servicio de Inteligencia del Ejército de Estados Unidos encontraron a otro alemán que pretende haber visto a Hitler y Eva Braun escapar de Alemania. Artinio Frederick Angelotte Mackensen, ex piloto de la fuerza aérea alemana, afirmó a los oficiales que él vió a Hitler y a Eva escapar por avión de Berlín hacia Dinamarca, a fines de abril de 1945.

Mackensen fué arrestado en Molfratshausen, cerca de Munich, por una información proporcionada por una muchacha alemana.

Los oficiales dijeron que relatos similares les han sido hechos en el pasado, pero nunca

S. —iniciales con que se designaba a la "Schutz-Staffel", la [illegible] organizada y [illegible] Heinrich [illegible]

Spanish newspaper reports about Hitler's escape

According to further evidence contained in press reports emanating from Munich and appearing in the pages of "Diario llustrado" of Santiago, Chile issue of 18th January, 1948, "on 30th of April, 1945, Berlin was in dissolution but little of that dissolution was evident at Tempelhof airfield. Ground support organizations, such as radio, radar as well as harbour and riverboat direction were functioning at peak efficiency. Takeoffs and landings were handled smoothly. The airspace was crowded. Every six minutes a plane landed and ten planes took off every hour, and all of this with a city under siege. Highspeed German fighters and jets could be seen circling about to secure airspace and consequently Tempelhof runways had received only minor damage. The sound of machine-gun fire could be heard in the distance. Radio operators had received reports that the Russians had advanced to the Koch and Oranian Strasse. Contact to the city's centre had been interrupted. Two alternatives remained, escape by air from Tempelhof or capture by the advancing Soviet troops".

"At 4.15 p.m. a JU52 landed, and S.S. troops directly from Rechlin for the defence of Berlin disembarked, all of them young, not older than 18 years. The gunner in the particular plane was an engineer by the name of B..... whom I had known for a number of years and for whom I had endeavoured to get exemption from military service. He sought to tank up and leave Berlin as quickly as possible. During this re-fuelling interval Mr. B..... was suddenly elbowed in the ribs by his radio operator with a nod to look in a certain direction. At about 100-120 metres he saw a sleek Messerschmitt Jet Model 332. (The reporters must have made a mistake here, it could only have been an ARADO 234 — a mistake not difficult to understand since secrecy was the hallmark of the Nazi Regime. This Turbojet had a range of 4,000 km.) Mr. B..... and the radio operator saw and without any doubt whatsoever, standing in front of the jet, their Commander in Chief, Adolf Hitler, dressed in field-grey uniform and gesticulating animatedly with some Partyfunctionaries, who were obviously seeing him off. For about ten minutes whilst their plane was being refuelled the two men observed this scene and around 4.30 p.m. they took to the air again. They were extremely astonished to hear during the midnight military news bulletin, some seven and a half hours later that Hitler had committed suicide".

It was during this military news broadcast that Admiral Donitz announced that he was taking over as the new Commander-in-Chief. This same bulletin was broadcast over the German civilian radio network and Dr. Goebbels reported that the Fuhrer had entered Valhalla, (that mystical place in ancient Nordic sagas where heroes dwell after death).

Upon questioning, the engineer Mr. B..... denied the possibility of error on his part and reiterated that on April 30th, 1945 at 4.15 p.m., whilst refuelling his plane at Tempelhof airport, and in the bright light of the setting sun he saw Adolf Hitler, and at a time when it was no longer possible to reach the Reichskanzlei (Hitler's Bunker). When Mr. B..... first heard the news reports he concluded that Hitler had died in an airplane crash." This particular report by Mr. B..... with all the sensational content, was never published in the English-speaking press.

The Soviet Information Office reported on May 3rd, 1945, that Hitler's servant, Fritsche had been captured and interrogated by the Soviets and had stated that Hitler, Goebbels and the new Chief of the General Staff, General of the Infantry, Krebs, had committed suicide. Lt. Heimlich of the American C.I.C., whose responsibility it was to check all rumours and reports, all sightings and evidence regarding the whereabouts or the death of Hitler, reached the conclusion that Hitler, Eva Braun and Martin Bormann were still alive and that there existed not one iota of proof that Hitler had actually died.

The report (INS) further stated that according to investigations by the American authorities it would have been relatively simple to escape from Berlin, whilst experts pointed to the almost impossible task of burning a corpse in the open air by just dousing it with a can of gasoline and not leave behind some recognisable evidence.

It is a fact that a working party made up of American, British, French and Russian soldiers did find a ditch which produced two hats, supposedly belonging to Hitler, and also a pair of panties bearing Eva Braun's initials, but no corpses or parts of corpses.

This is where Hitler's hats and Eva Braun's panties were found. (Allied investigators)

Much has been written regarding identification through medical and dental records and Hitler has been much in the news in this respect. A recent report by the Canadian Broadcasting Corporation makes interesting reading. On the programme "As it Happens" on September 17th, 1974 at 7:15 p.m., a Prof. Dr. Ryder Saguenay, oral surgeon from the Dental Faculty of the University of California at Los Angeles revealed the facts that Hitler had ordered a special plane to leave from Berlin with all medical and dental records, and especially X-rays, of the top Nazis and for an unknown destination, and that any drawings, charts and other evidence which have been presented, regarding Hitler's dental status; have been drawn from MEMORY by the dental assistant to Hitler's dentist, the latter who was himself never found.

To fully appreciate the importance of the above evidence, the situation of Germany at the end of the war must be taken into account. Planes were scarce, but apparently not too scarce for Hitler to decide

it was of great importance to use one to fly medical and dental records to some unknown place. If Hitler had been contemplating suicide why would he have bothered to remove such vital evidence? To where were they flown and why did he feel it was necessary to remove all traces of such identifying material? Unless the "suicide" was a well-thought out ruse to confuse the Allies whilst Hitler was escaping.

There are a few other reports from the Spanish-speaking press which deserve mention and reproduced here is one as it appeared in Editorial "Zip Zag". Santiago, Chile, on 16th January, 1948. It seems that on April 30th, 1945, a Peter Baumgart (FlugKapitan — Flight Captain), took Adolf Hitler, his wife Eva Braun, as well as a few loyal friends by plane from Tempelhof airport to Tondern in Denmark (still firmly in German hands). From Tondern, where Baumgart landed, the Fuhrer's party continued in a new plane with another crew, to Kristiansund in Norway, also still in German hands. There a German submarine convoy was waiting to receive its unusual "cargo". In the meantime the Junkers which had brought the Fuhrer returned to Tondern, circled the airfield and dropped a mes-, sage to the effect that the Fuhrer had reached his destination safely. This unusual method of communicating was chosen, so as to keep radio silence and not attract undue notice. (From Mattern, U.F.O. Letzte Geheimwaffe des III Reiches page 50-51).

Another dimension is added to this story when comparing some of the statements made by Erich Kempka who had been in Hitler's employ, as chief of his carpool since 1932. In his book "Ich habe Adolf Hitler verbrannt" — "I burnt Hitler", page 109, he recounts that after some confused telephoned conversations with Gunsche (Hitler's personal adjutant), Gunsche shouted at him, wide-eyed and rather theatrically — "The Chief is dead". Kempka stated how shocked he felt and then how he asked Gunsche how could it have happened since he had spoken to Hitler just the day before when he, Hitler, was completely well and completely controlled. In the same book on page 139 there is further information which all points to a well-conceived plan. A German submarine commander had stated under interrogation by the American C.I.C. that he was under orders since 25th April, 1945, to be at constant readiness, "Besonderen Verfugung", under immediate control of the Fuhrer. At Bremen this submarine commander declared that at least 10 other submarine commanders had received the same order! .

Further, the C.I.C. found that twelve Flight Captains had been issued a valid secret order from the Fuhrerhauptquartier (Hitler's H-Q.) to be in a constant state of readiness for Hitler's departure.

Gross Admiral Donitz has always figured in developments surrounding Hitler's whereabouts, and Donitz was Hitler's successor. The American writer, Malcolm X refers to him in his book "We Want You? Is Hitler Alive?", page 10, and claims that Donitz knew about Hitler's plans and was instrumental in his escape to an oasis in South America.

Mattern, in his German version of the U.F.O. Story, repeatedly quotes Donitz as playing a key role in the Fuhrer's plans. On page 15 he reports excerpts from one of Donitz's speeches at a graduation

ceremony to naval cadets in Kiel, in 1944: “The German navy has still a great role to play in the future. The German navy knows all hiding places for the navy to take the Fuhrer to, should the need arise. There he can prepare his last measures in (“aller Ruhe”) complete quiet”.

Michael Bar-Zohar speaks of the role of Donitz — “The Avengers” page 99. Essentially, Bar-Zohar corroborates Michael X and Mattern. Excerpts below.

Michael Bar-Zohar speaks of the role of Donitz

> In 1943 Admiral Doenitz had declared: “The German U-boat fleet is proud to have made an earthly paradise, an inpregnable fortress for the Fuehrer, somewhere in the world.”
>
> He did not say in what part of the world it existed, but fairly obviously it was in South America.
>
> As far back as 1933, when the Nazi Party had come to power, the new masters of the Reich had made a special effort to spread their doctrine in South American countries. For several reasons, these countries presented a fertile field. There were large German colonies strongly established in many parts of Latin America. Several hundred thousand Germans or people of German stock were settled in Brazil, At Blumenau and Florianópolis, in the federal state of Santa Catarina, everything was, and still is, reminiscent of Germany—the countryside, the style of the houses, the appearance of the people, their speech. It was the same in several regions of Argentina. In the capital, Buenos Aires, in Tucumán, Formosa, Córdoba, and Cordier, in the Gran Chaco and the vastness of the *Paraná Misiones*, and at San Carles de Bariloche, a bit of Switzerland in the southern hemisphere, with its pine trees and snow-clad mountainside—at all these places German colonies had settled and expanded with amazing rapidity. In Paraguay, tens of thousands of German immigrants had cleared and cultivated virgin areas to the east of the Asnnción and had given their new towns names like Hohenau to remind them of their origins. Another wave of German immigrants had spread over the southern part of Chile, the region round the towns of Osorno and Valdivia, and the island of Chiloé, as well as settling in the capital. Santiago. Many more had gone to Peru, Uruguay, and other Latin American countries.

Having made an initial study of the mind of Hitler and having some understanding of his modus operandi we can now move into another area of this story. What are the other indications, which point to where, why, when and how? Let us examine some of the statements made during Hitler’s career.

Hitler never tied the success of his mission on the sole fate of Germany. He fully realised, and early in his career, that Germany proper could be over-run by his enemies. He said right at the beginning of the war and during the conquest of Poland, “And if our enemies should inundate (uberschwemmt) all of Germany, we shall then fight on from abroad, we will never capitulate.” And another statement from no less a book than “Mein Kampf”, German version, 1938, page 470: “The battle that rages today is for very high goals. A culture fights for its existence, that encompasses the heritage of ancient Greece and modern Germandom as well . . .”

Again, we see that Hitler saw the struggle as a global one even before the war. He had written Mein Kampf in 1923-24. On page 475, of the same volume he states further: “Certainly the world is approaching a great upheaval. It can only be around one single issue; will it be favourable to the Aryan people or will it benefit only the eternal Jew?”

In these sentences can be found a very clear indication that Hitler felt, as far back as 1923-24 that the struggle, his struggle, (which, incidentally, is the literal translation of the words "Mein Kampf") was not for Germany alone but for all Aryan man, or to put it in simple language, for the existence of the white man.

It is evident from Hitler's alliance with "yellow" Japan and his collaboration and active support with many non-white independence movements, such as the Arabs, the Caucassus tribes, the Cossacks and also India, that he was never the narrow-minded, racist bigot allied propagandists have tried to brain-wash the world into believing. The German general, Beck, once said about Hitler, "This man has no fatherland". It is important we approach this entire question with an absolutely open mind, for only then will we be able to unravel this Hitler-U.F.O. connection.

Had Hitler been a narrow-minded, nationalist politician, a mustachioed dictator who experienced his thrills by ranting and raving at large crowds of cowed followers driven to mass rallies at bayonet point, then his end would seem explainable. He was far more than that, namely a prophet, with global vision much in the cast of the prophets of old who have been recorded and revered in the old Testament by both Christians and Jews. He was born into German-speaking central Europe, that's all. An accident of fate. Undoubtedly, he would have preached the same eloquent sermon had he been born in France or England.

On July 20th, 1944 Skorzeny arrived at Hitler's Headquarters bringing with him the liberated Mussolini. This visit coincided with the one and only nearly-successful attempt on Hitler's life. Hitler made to Skorzeny a most significant statement. "I begin to doubt whether the German people are worthy of my ideals". This statement again reveals Hitler's detachment from Germany and points up the mentality of a universal-thinking individual. It must be granted, that indications are present that Hitler was ready to continue the struggle from outside Germany. But how, and with what methods and weapons? Before we continue we must take another look at the suicide plot.

1. The bodies of Hitler and Eva Braun were never produced.

2. The items introduced as "evidence" are only circumstantial; two of Hitler's hats, 1 pair of panties with the initials E. B. and a few bones. (There were millions of bones lying all over Germany as the result of the mass-killing by the Allied aerial bombing)

3. The bloodstains found on the furniture in Hitler's quarters in the Bunker were not of his blood type.

4. Hitler was not suicide prone. On the contrary, only a few days earlier after he had heard of the suicide of the Mayor of Leipzig and his family, he had condemned suicide as cowardly and unbecoming to a National Socialist.

5. The most important witnesses and the men closest to Hitler have never been found, e.g. Bormann, Stumpfegger, Gunsche et al.

6. Hitler, by his very nature, and his unfailing belief in his mission, (one of global and not national dimensions), would tend to continue the struggle from elsewhere.

7. There are too many reports and sightings, eye witness reports and even evidence that the suicide attempt was a brilliantly-successful, carefully-staged scenario. A typical Hitler production.

In view of the above summation, we can assume that there was indeed a contingency plan.

One of the iron-clad rules of wartime Nazi Germany was to never let anyone, however high their position or rank, know more about a plan or operation than was absolutely necessary to the execution of his or her particular contribution to the overall whole. This rule applied to all and even to men like Himmler who was Chief of the S.S. and who by the end of the war, commanded vast military forces on the eastern front. Himmler had known Hitler since his earliest days and even he could not comprehend the absolute calm and certainty of final victory that Hitler displayed in those terrible last days in the Bunker in Berlin. He saw, when he tabled his ever more devastating reports about lost ground, enemy advances, bombing damage etc. how Hitler would listen attentively and quietly. This led him to speculate aloud and come to the conclusion "The Fuhrer has some kind of a plan" — reported in Trevor Roper's book "Hitler's Letzte Tage" on page 101.

There are other indications that even very high level military types, such as General Keitel and Jodl were not privy to all secrets. An April 22nd, 1945, these two men received orders to leave for the Obersalzberg (Hitler's famous "Alpine Redoubt" about which we will speak later). Although loyal to the very end to their Commander-in-Chief, they did not want to die in the "Rat Trap" as they called the Bunker in Berlin. Consequently, they tried to persuade Hitler to leave with them. A heated debate ensued, according to the ever-present stenographer, Hergesell, and even a forceful abduction of Hitler to the Alpine fortress was considered by the two top generals. Finally Bormann, one of the few who apparently was in the know about the plan, persuaded them otherwise, and they left without Hitler.

Dr. Josef Goebbels, one of the most brilliant followers and exponents of Hitler, seems also to have been initiated to some degree, in the final phase. He had a three hour meeting with Hitler in those hectic last days and left the meeting calling out "Mein Fuhrer was sind Sie gross" — "My Fuhrer, what a great man you are". A few days later in a radio broadcast he made a number of interesting statements and one in particular which referred to new Secret Weapons, so fantastic "they made my heart beat more quickly when I saw them".

There are also some statements he made to his secretary on April 22nd, 1945, as reported in the book "Mit Goebbels bis zum Ende", Durer Verlag, Buenos Aires ". . . We want to see if under these circumstances the Americans will shoot us in the back". A few days later Goebbels gave a further highly-significant glimpse of what was planned when he said "May God protect our Fuhrer during the approaching danger" — reported also in the above-mentioned book. Was Goebbels referring to the underwater journey to the paradisical oasis in South America? How much clearer could we be told of what was afoot?

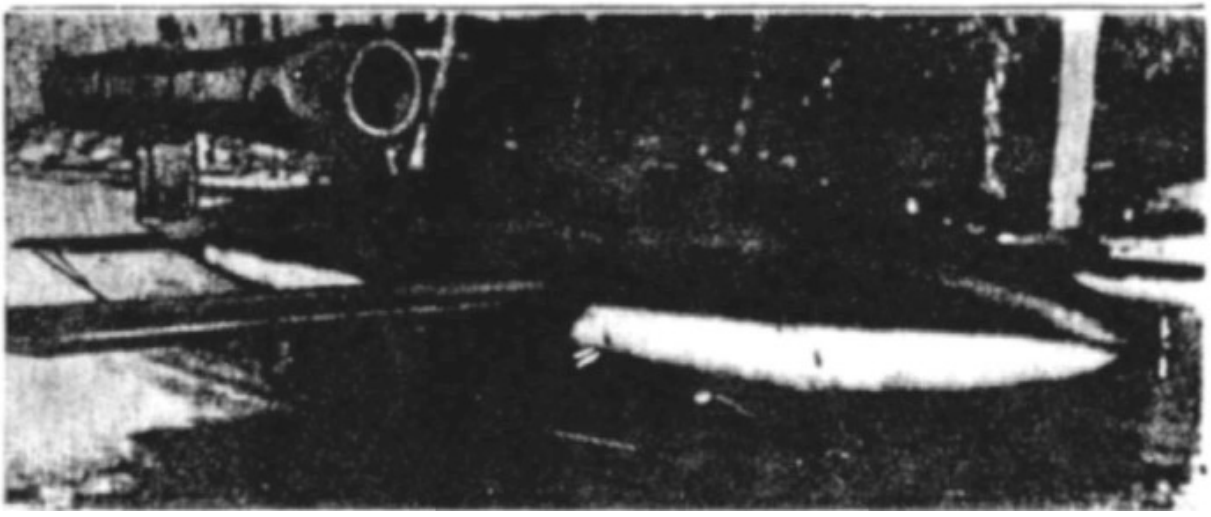
Maybe in Hitler's own words? On February 24th, 1945 Hitler made a prophetic speech at the end of which he said these words:— "In this war there will be no victors and no vanquished either, but only the dead and the survivors. The last battalion however, will be a German one". A further definition can be obtained by Hitler's remark, towards the end of the war, that ". . . the inevitable and automatic clash between east and west will come sooner or later and we (the Germans) will then be and act as the proverbial tip of the scale".

Should there still be some doubt in the reader's mind as to whether there was, in fact, "something cooking" in Adolf Hitler's fertile brain in those days when his world around him was going up in dust, flames and smoke, then read this. Germany's legendary female flyer, Hanna Reitsch, holder of many world records, first rocket plane jet pilot, daredevil of the air and one of the Fuhrer's favourite people, had voluntarily accompanied one of Germany's top men — Ritter von Greim, to embattled Berlin. They flew over the Soviet lines in order to get into the beleaguered capital and were hit by Russian antiaircraft fire. Ritter von Greim was hit by shrapnel and badly wounded. Hanna Reitsch managed to wrestle the controls of the floundering aircraft out of the hands of von Greim and landed the aircraft in Berlin's famous Unter den Linden Boulevard.

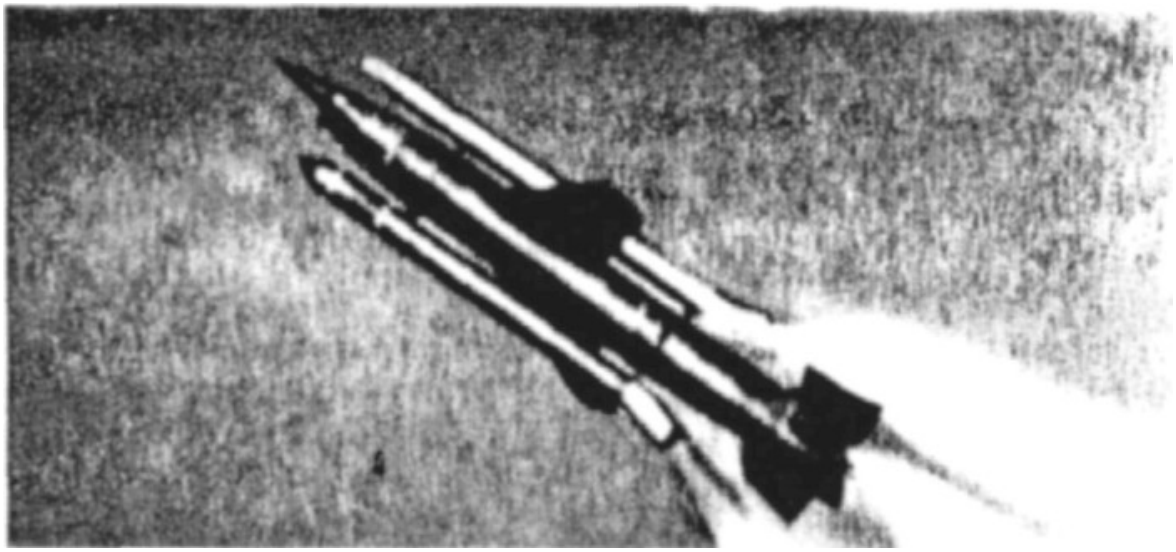
In the previously-quoted book of Trevor Roper, "Hitler's Letzte Tage", page 146, mention is made of a telephone conversation which took place on April 28th, 1945 at Hitler's headquarters, between Ritter von Greim and his subordinate, General Koller, who was in Furstenberg. "It goes something like this" said General Koller "He, (von Greim) would be lost. Gen-Koller offered his condolences about Greim's condition, his wounds, and his seemingly useless promotion to new Chief of the German Luftwaffe (after Goring's firing). He bemoaned the state of things generally and the future of Germany, in particular. He also reiterated his doubts about being able to do anything with the Luftwaffe. Then he paused. He expected a similarly gloomy echo from the Fieldmarshall on the other end of the line. But the world was still full of surprises for Gen. Koller. Life in the Bunker Headquarters seemed even more surreal than his experiences at Furstenberg. Koller was astounded when instead of lamentation of impending defeat, he heard an optimistic analysis of the future, and even promise of an inevitable German victory. "Just wait", said the new Chief of the hard-pressed Luftwaffe. "Don't despair. **All will be well!** The presence and

optimism of the Fuhrer have given me new hope. The Bunker affects me like a fountain of youth". Koller listened in disbelief and was incredulous. He just could not understand it at all.

So the optimism in Germany in these last days was spoken from the mouth of Goebbels, a brilliant doctor of jurisprudence, the Reichsminister and the hero of Berlin. The man who had wrestled the communist-controlled workers of Berlin out of the clutches of the false prophet's of Moscow and delivered them to the Fuhrer as a gift to Germany's inner healing. A level-head and a first-rate brain. Also from Heinrich Himmler, the cold realist, a top cop of Germany, holding the same position and wielding even greater power, than the late J. Edgar Hoover had held in the United States. And lastly, from Fieldmarshall Ritter von Greim's conversation with a General Staff Officer. All these men had had lifelong careers and training in the martial arts and were cool, non-emotional Prussians to the core. From the above, there can be only one conclusion and that is that Hitler did not commit suicide. Hitler did not die.

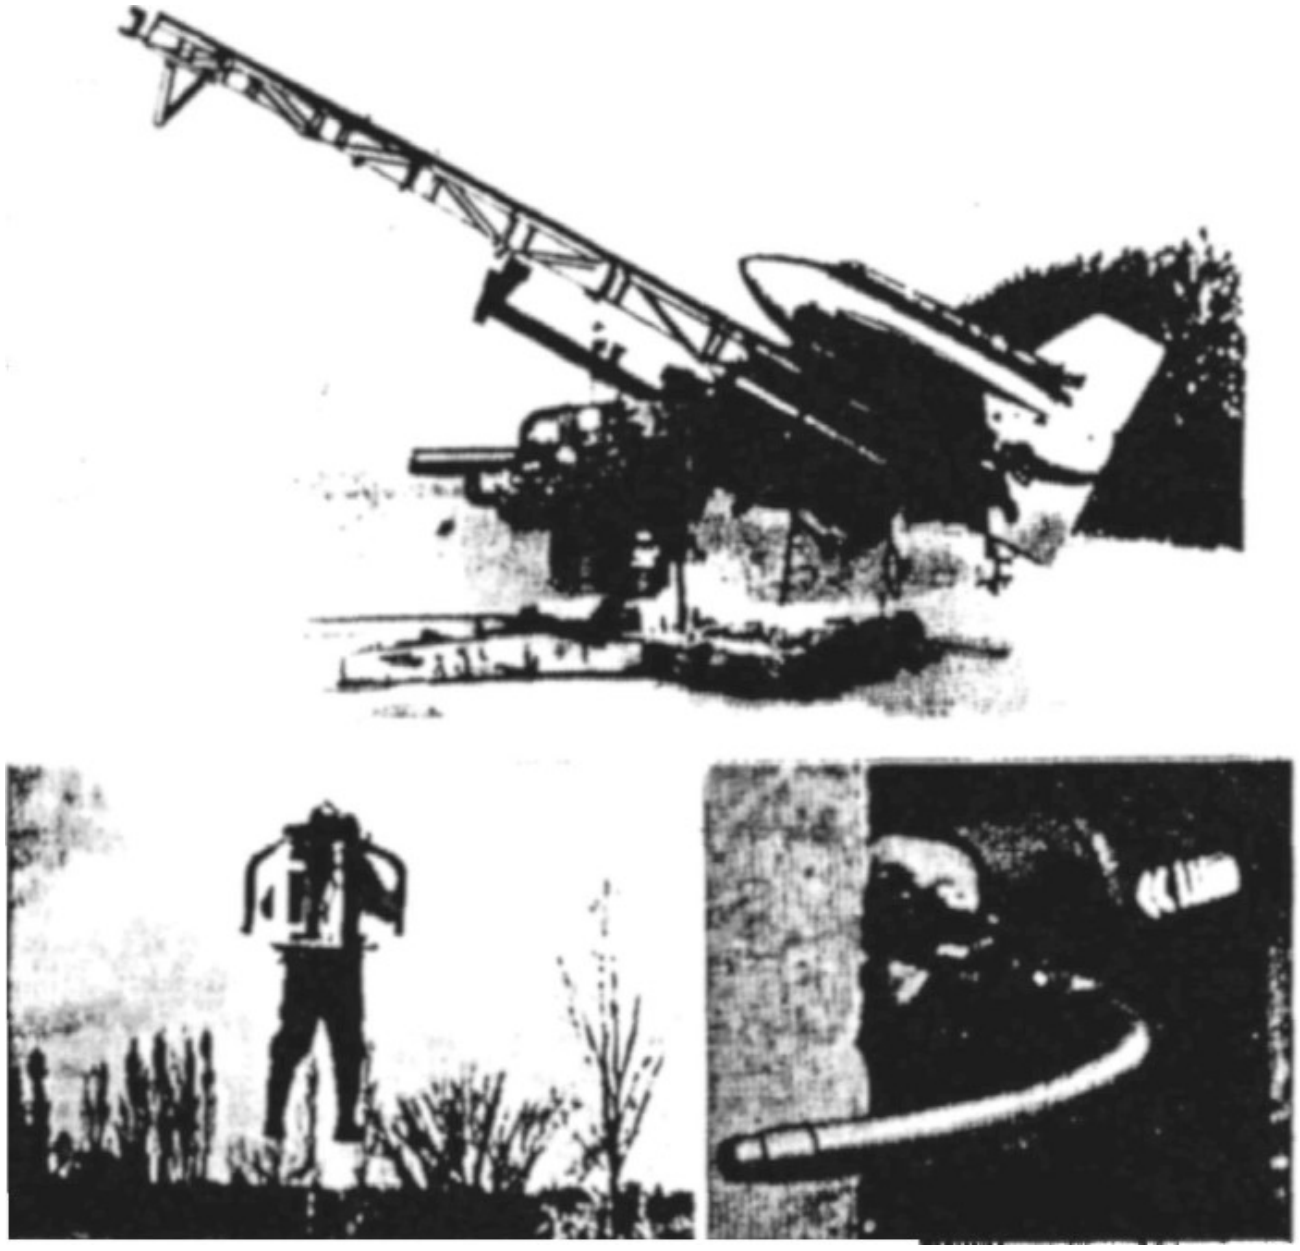


That there was a drama could hardly be denied, as evidenced by the article (reproduced earlier) from Time magazine, but weighing all the evidence, an escape from Berlin is certainly more likely than a suicide.



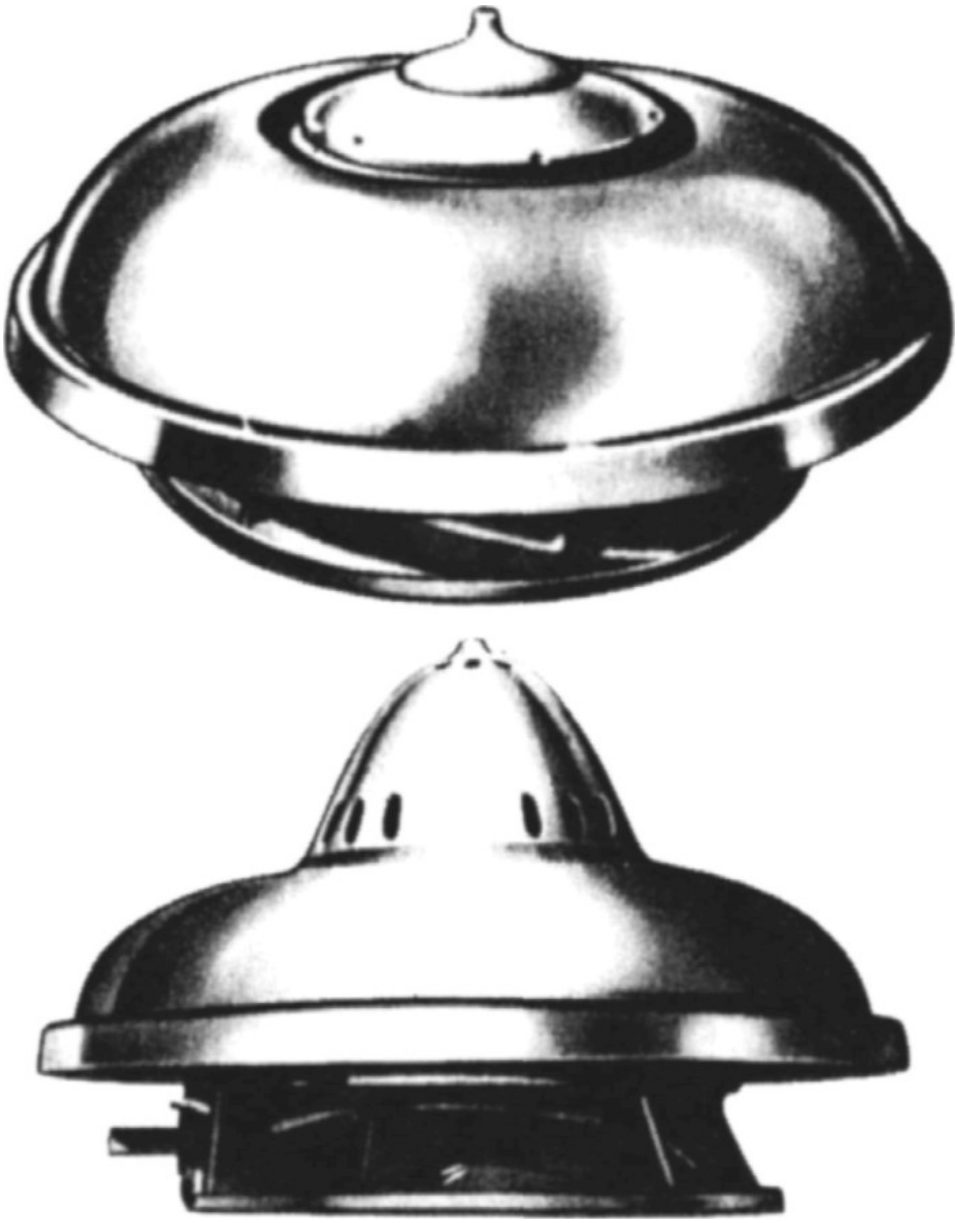
We have now covered almost every loose end and woven the loose strands into a more or less logical pattern. Now there remains only the how and where? Hitler escapes! Why?

Why were the secret weapons not used in the battle for Germany's survival? Many of them were, but there was a standard requirement in German military thinking that demanded that for every new weapon introduced, a defence had to be introduced with it. A sensible safety measure in case any weapon ever fell into enemy hands which could then quickly be copied and used against Germany. Thus, when radar was introduced, radar jamming devices were introduced at the same time. When fast jet planes were brought in, (200 kilometers faster than the fastest Allied planes in existence or in the planning stage), ground to air defence missiles were concurrently introduced.



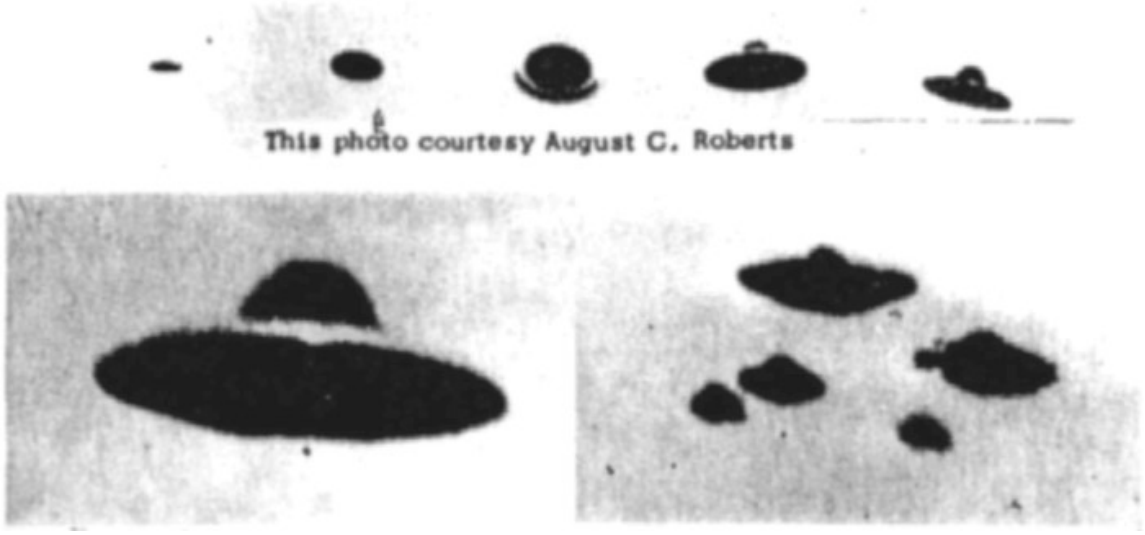
It might interest the reader to have a look at this array of advanced technology, unparalleled in variety and ingenuity even to this day. The photographs shown here are of operational types only. Some of the "planned" hardware is also shown in order to give the reader a quick look at how far ahead National Socialist Germany was in 1945 compared with the rest of the world.

German U.F.O. being serviced. Conventional propulsion system.



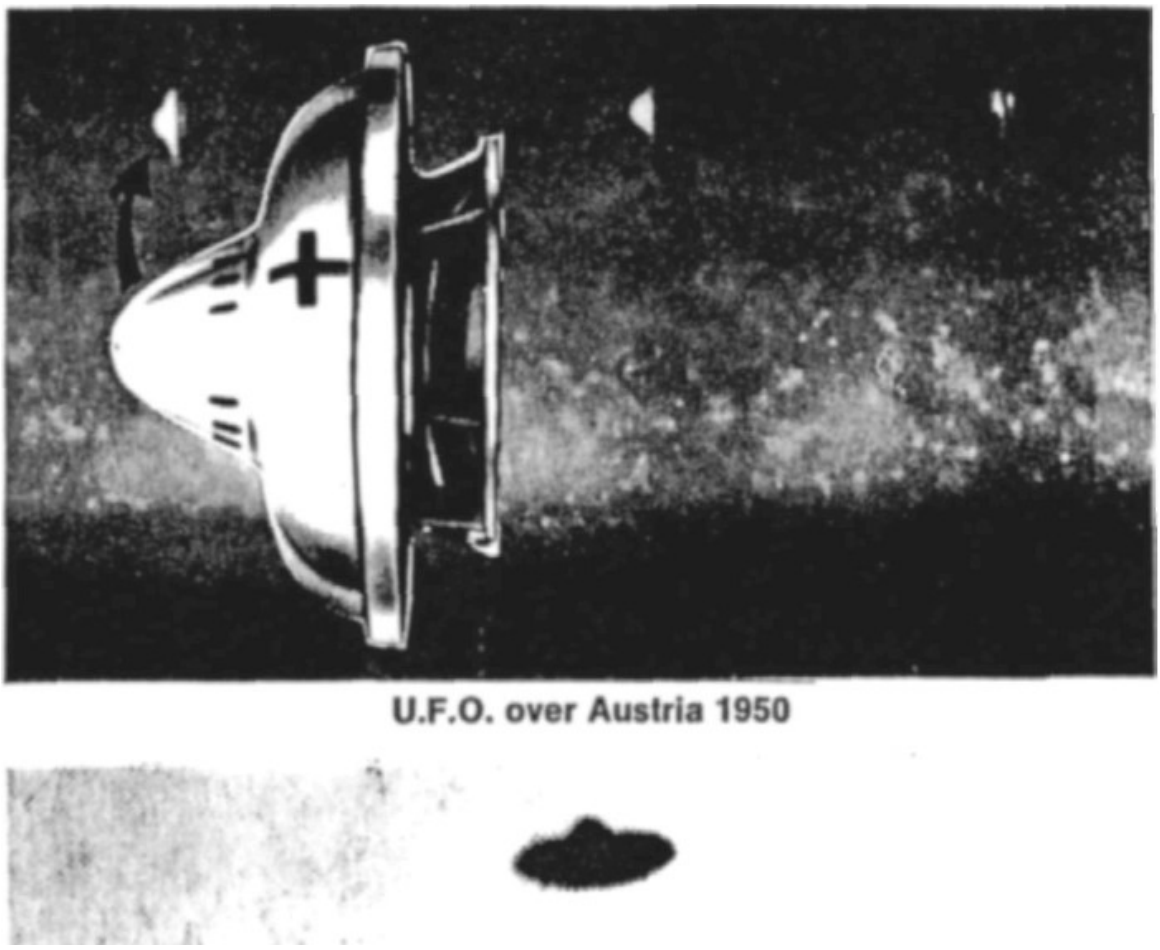
Anti-aircraft, ground to air rockets would have completely stopped Allied air activities over Germany after June, 1945

Flying People. Jet-powered back-packs — called "Himmelsturmer" — Sky stormer. Designed for mountain troops and for leaping across rivers



Intercontinental missiles were already a fact and although stolen by both the U.S. and Russia after the surrender in 1945 it took them another 15 years to come up to the German level, even though they were using many of the "captured" scientists. This brings us back to the actual story of the U.F.O. mystery.

Germany had U.F.O.'s as early as 1940. We find photographic proof of the existence of flying prototype models. Reproduced here are two photographs of two different U.F.O. designs, both operating on the electromagnetic propulsion method of Victor Schauberger, (also the inventor of the implosion motor), and produced by the Kertl firm of Vienna IV, which was then part of the greater German Reich.



These are the famous smokeless, soundless, Schauberger Models. Note similarity to real U.F.O. shown in A.C. Roberts Photo

Below are reproduced a series of actual photographs of a U.F.O. photographed in flight over New Jersey in 1958 by George J. Stock of Passiac, N.J., courtesy August C. Roberts Wayne, N.J. The similarity to one of the Schauberger models is self-evident and is conclusive enough proof to most people of the German origin of the U.F.O.'s. However there is more.

Photographed by A. Birch, February, 1964. Mosborough, England.

Photographed by Bruno Ghibandi, 27th April, 1961, Pescara, Italy.

U.F.O.'s were seen by American and German night fighters and bomber pilots *over* Germany in 1943-45. The Americans called them Kraut meteors and were scared of them. Even the top brass knew about their existence, as is indicated in the book entitled "Der Weltraum Ruckt Uns Naher", Blanvalet Verlag, by Major Keyhoe the famous U.F.O. investigator, Chapter III. Major Keyhoe says the U.S. infiltrated 600 scientists into Bohemia, in tank crew uniforms, in 1945, to check over some of the U.F.O. bases.

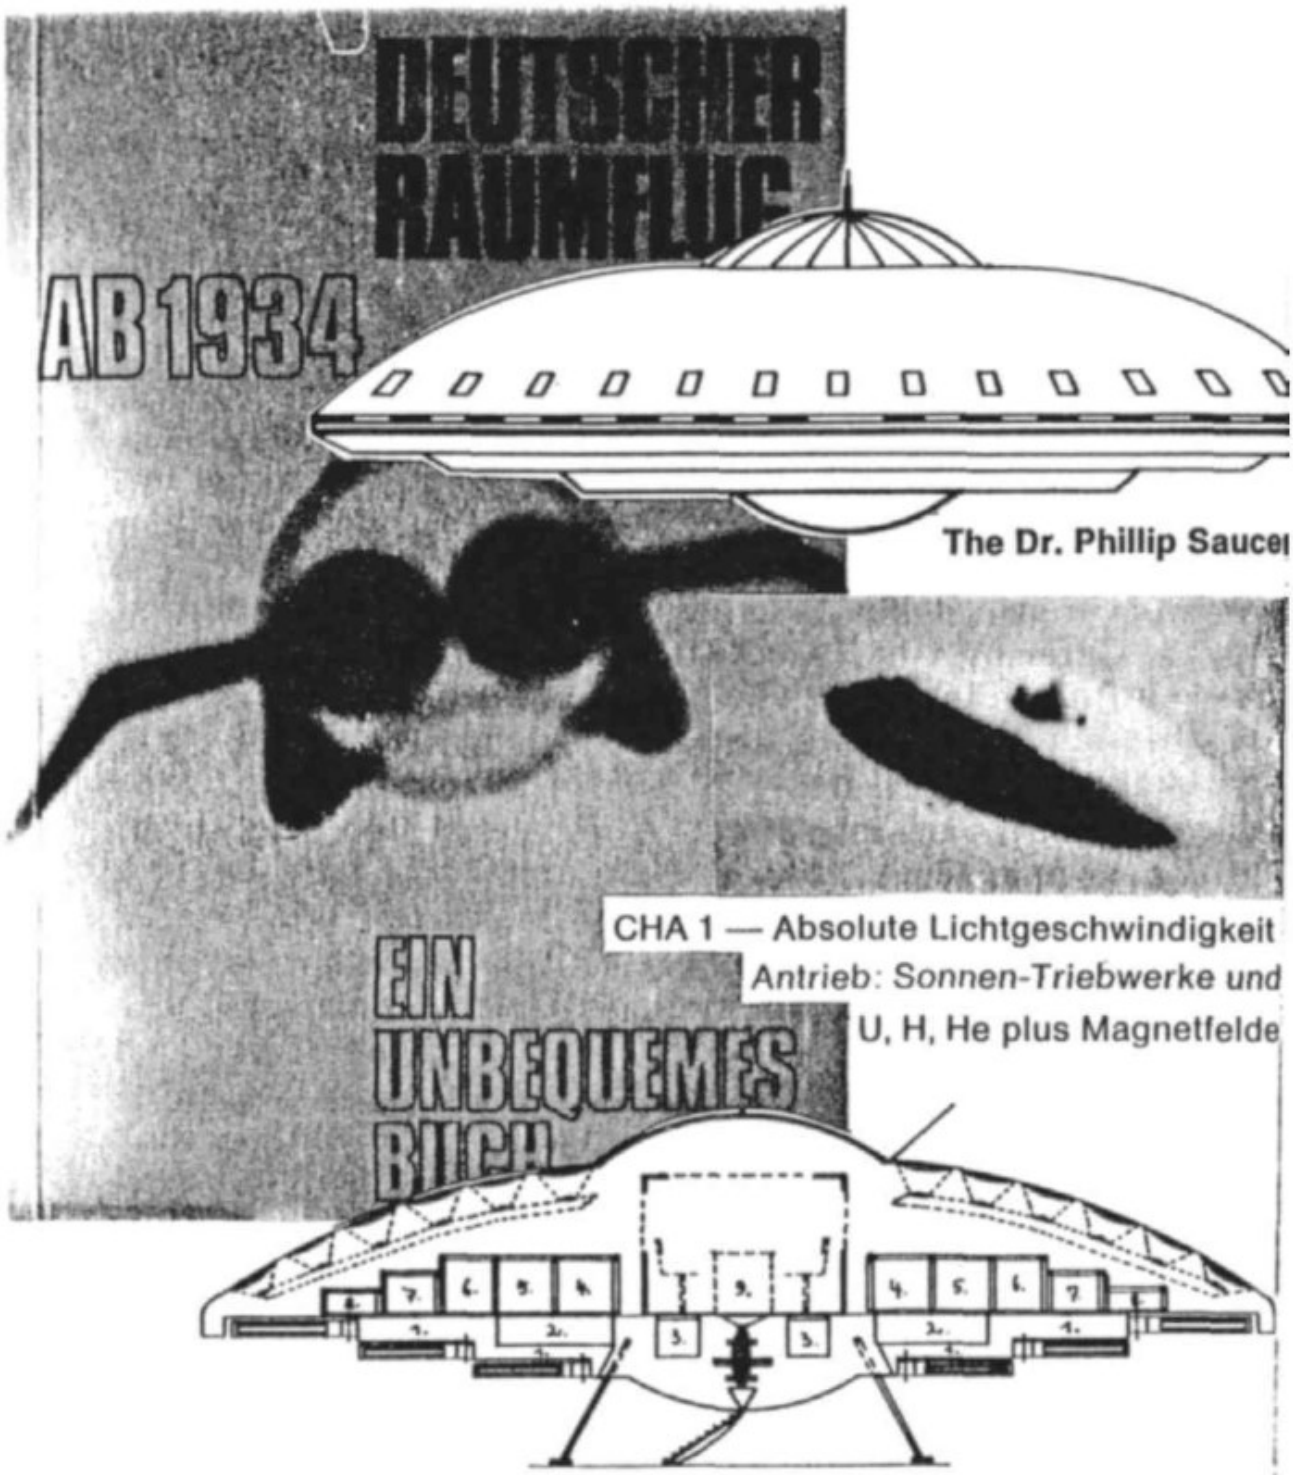
German Flying Saucer — called Kraut Meteor — during night flights in 1943-44.

Focke-Wulf 190 fighter plane in foreground. U.F.O. shooting straight upwards at tremendous speed. Over Austrian Alps 1944. Rare photograph.

Following is a letter from a lady, still alive and personally known to the authors which we have translated into free English. The lady attests to having been one of the first and top secretaries in the S.S. Reichssicherheitshauptamt working in the anteroom of one of the most powerful men in Nazi Germany — S.S. Amtschef III Ohlendorf (the subject of many books and articles since the end of the war). The lady letter writer states that one day in 1938 a young scientist came into her office clutching a document, neatly typed and comprised of about 60 pages. The young man said that the contents were a revolutionary new approach to the aircraft propulsion problem. He proceeded excitedly to explain to the young lady some of his ideas. He said he hoped for active help and protection from the S.D. (Security Service) in doing experimental work on his project, since both Himmler and Ohlendorf were absent from Berlin at the time, she took the document into safe keeping, storing it in her safe. This document was later handed to Himmler and Ohlendorf. After reading it they contacted aircraft and propulsion experts. A number of top secret conferences were called but with no positive results. The experts scoffed at the revolutionary proposals advanced by the young man, which amongst other things, contained such suggestions as the creation of a vacuum in front of the disc shaped aircraft into which the craft could then move, without effort, at incredible speeds. Also proposed was exploitation of the earth's natural magnetism along with a steering mechanism based on internal polarity shift.

mir sagte, hat er den Mr. X während seiner USA-Reise persönlich kennen gelernt und [redacted]. meint, daß X Holländer sei. Die darin aufgeführte Meinung, daß die UFO's auf das Schauberger'sche Prinzip zurückgehen, teile ich nicht, weil Herr Schauberger auf einer anderen Grundlage aufbaute und da auch nicht mitgenommen wurde. Die UFO's arbeiten auf elektromagnetischer Basis. Ab September 193[redacted] war ich im RSHA (damals noch SD-Hauptamt) in einer der ersten [redacted] tätig und habe das Vorzimmer des Amtschef III, Ohlendorf, betreut. 1939 so um die Zeit des Kriegsbeginns erschien eines Tages bei uns ein freundlicher etwa 30-jähriger junger Mann bei uns und gab eine etwa 50-60-seitige Niederschrift ab, daß ihn seitens des SD Unterstützung bei der Durchführung gegeben werde, die er aber nicht bekam, weil unsere "Akademiker" das nicht begriffen und als "verrückt" ablaten, worüber er damals empört war, obwohl ich es nicht verstanden habe. Neben dem Chef und seinem Vertreter habe auch ich die Niederschrift gelesen - mit atemloser Spannung. Darin war genau beschrieben, was man machen könnte, wenn "Luftelektrizität und Erdmagnetismus" in der beschriebenen Form verwendet würden. Begriffen hatte ich es damals nicht, aber der Inhalt blieb in meinem Gehirn wie ein Steckschuß sitzen. Diese Schrift lag einige Wochen bei mir im Panzerschrank, bis eines Tages der Herr freudestrahlend erschien und sagte"Frau [redacted].kann ich meine Nierderschrift wieder haben, ich habe jemand gefunden, der sich der Sache annehmen will."
Als 1954 im Blanvalet-Verlag das von Major Keyhoe auf Veranlassung des Pentagon geschriebene Buch unter dem Titel "Der Weltraum rückt uns näher" erschien konnte ich in Kapitel VIII lesen, daß der "kanadische Untertassenforscher Wilbert Smith festgestellt habe, daß diese Dinger auf magnetischer Basis arbeiten würden, mußte ich sofort wieder an diese Niederschrift von 1939 denken. In Kapitel III schreibt Keyhoe, daß "diese Dinger 1944 der Schrecken der amerikanischen Nachtjäger gewesen seien und von diesen Sauerkraut-Meteore genannt wurden. 1945 wurden 600 amerikanischen Wissenschaftler in Panzeruniform gesteckt und nach Böhmen eingeschleust;"alle Welt wunderte sich damals, was die Amis in Böhmen zu suchen gehabt hätten, wenn sie sich sowieso gleich wieder zurückzogen.
Im Juli 1954 fuhr ich erst nach Wien und dann nach Klagenfurt in Urlaub, wo ich frühere Kameraden aus dem FlüHi besuchte. Als ich in Wien einem KrimKom. die große Neuigkeit erzählen wollte, winkte der ab und sagte:"Ach das haben wir schon 1943/44 gehabt. Wir bekamen damals eine GKdS in der stand, das und das wird sich in der Luft zeigen, bitte beobachten,Eindrükke hierher mitteilen und zu niemandem sprechen". An einem schönen Juli-Abend hatte ich dann in Klagenfurt meine schönste Sichtung: eine Lichtscheibe größer als der Mond zog mit Schweif von Südwest nach Nordost, am nächsten Tag waren die Zeitungen voll. Da sich zur damaligen Zeit über Österreich diese Dinger massenhaft zeigten, veranstaltete eine Zeitung eine Rundfrage und erhielt u.a. einen Leerbrief von einem Dipl.-Ing. aus Baden b/Wien, in dem es hieß:".. jawohl, diese Dinger wurden bei uns im böhmisch-mährischen Raum erzeugt. 1943 wurden die Anlagen auf Befehl des Führers abgebaut und abtransportier und seither fehlt von meinem Freund, der da Einflieger war, jede Spur !!"

To the young secretary all this seemed very difficult to comprehend and only because it was so totally out of her usual line of work does she remember all of the above details. The closed minds of the consulted experts annoyed her, it was their arrogant **impossible** and **never** which stuck in her mind. Being a convinced National Socialist, she had known of the Fuhrer's abhorrence of the stuffy traditionalists and reactionaries with which Germany, especially, seems to be plaqued? The project was still being discussed when the young man re-appeared, and in a very happy frame of mind asked for the return of the documents. He told our correspondent that he had found someone else to support and finance his research and experiments, even with plant facilities to produce them.



Years later, after the war, when the U.F.O. sightings were the topic of the day, she mentioned the above to a friend, a man, who had been a Kriminal Kommisar (Criminal Commisar similar to the American G man of old) in Austria during the war (then a part of the greater German Reich). He was not at all surprised but on the contrary he remembered having received a top secret telex order, issued by Berlin Headquarters, requesting that the people's reactions to "strange flying objects" be monitored, and

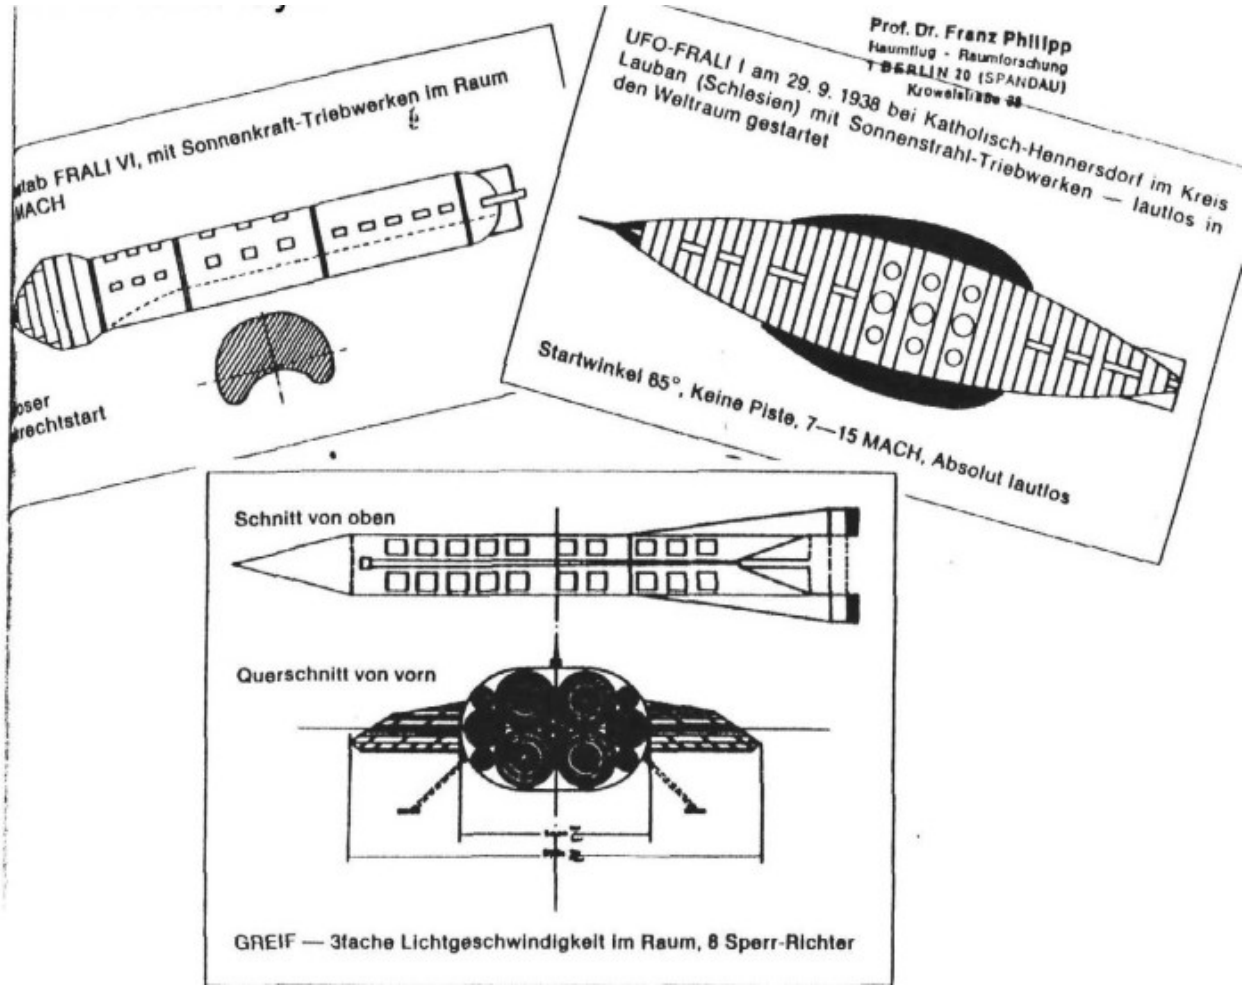
that these flying objects would be appearing in the skies over the entire Reich. There would be no need to sound the alarms for they belonged to Germany. The date? 1943-44. In due course, the flying objects appeared. The German fighters thought they were American, the Allies thought they were German secret weapons. The Americans nick-named them appropriately enough, "Kraut meteors". (Keyhoe) There is one final aspect of the lady's letter which seems particularly significant. While in Vienna she saw a letter published in a large daily newspaper by a well-known Diplom Ingenieur from Vienna's fashionable suburb, Baden, and this letter stated:—"We built flying saucers in Bohemia and Sudetenland. My friend was one of the test pilots for these devices. One day in 1943 the entire plant was dismantled and shipped by freight train to destinations unknown. From that day to this, I have never heard from my friend, the test pilot. Incidentally, orders for this dismantling came directly from Adolf Hitler".

A most incredible development. Were the flying saucers not used in combat because the Germans had not come up with the required anti-weapon? Or were they, perhaps, not available because of the rare metal needed in large enough quantities to make the required impact? Or were they used and so devastatingly that no survivors were around to tell the story? Once again, a letter and some suppressed books written by a German engineer, can help us fill the gap. We reproduce excerpts from a letter received by the authors from divided Berlin, Germany. The letterhead of the correspondent states he is a Diplom Ingeneur who seems to head a private spaceflight research organisation in Germany and Switzerland. He is the author of several books about spaceflight and we reproduce the cover of one. The title translated into English is: "German Spaceflight Since 1934", with a sub-title of "A Troublesome Book". In it are many engineer's drawings of weird and strange-looking craft the like of which we have never seen anywhere before. Strange names are given to these contraptions. One model especially merits to be reproduced here for your evaluation. The claim is made that the author launched a rocket to the moon in the early thirties, propelled by a light conversion power plant. In other words, the rocket was propelled by sunlight transformed into energy. Certainly, a revolutionary concept.

In a series of letters we have received, Prof. Dr. Phillips, claims to have been a wartime comrade (W.W.1) of Adolf Hitler, and that they kept in close touch and that Hitler was kept fully informed about all the research and that he, Hitler himself, entrusted Phillips with critical missions, in rare cases. He further states that to this day he has in a bank safety depository a special pass of the Fuhrer giving him sweeping authority. See photocopy of excerpt of letter.

Two other points mentioned in different letters are relevant to our story. Dr. Phillips who speaks several languages, and amongst them Russian, claims to have been employed by the Russians in the very "collecting camps" the Soviets had set up for screening German scientists for use in their own weapons development. His linguistic abilities made him "Chief Screener". If all this is true, then one can safely assume that Hitler's friend would find ways and means to ensure that top grade scientists did not fall into the hands of the Soviets at least in this instance. Prof. Dr. Phillips claims he knows exactly who went where and many other details. Dr. Phillips also men-lions his experimental work during the war with the practical use of death rays.

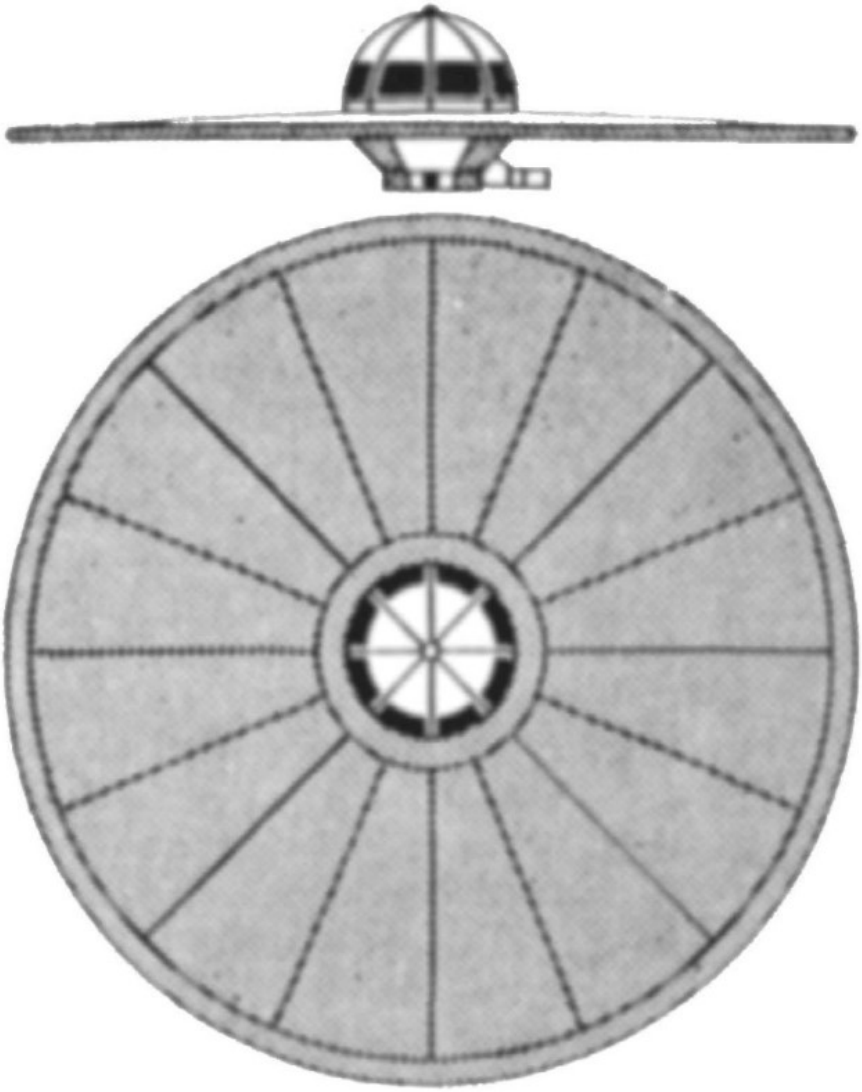
Noch etwas : Ich besitze (auch heute noch im Banksafe liegend)
d e n Sonderausweis des Führers über "plein pouvoir" .-



ami-Flieger gültig, die im Rundfunk vorerst bekanntgaben : die Bewohner von Bremen werden ausradiert. Militär war sowieso keines dort !
Nun ruht der Pulk geschlossen in der Nordsee !

Frdl. Grüße

Jhr



(pp. Philipp)

Excerpts of letters

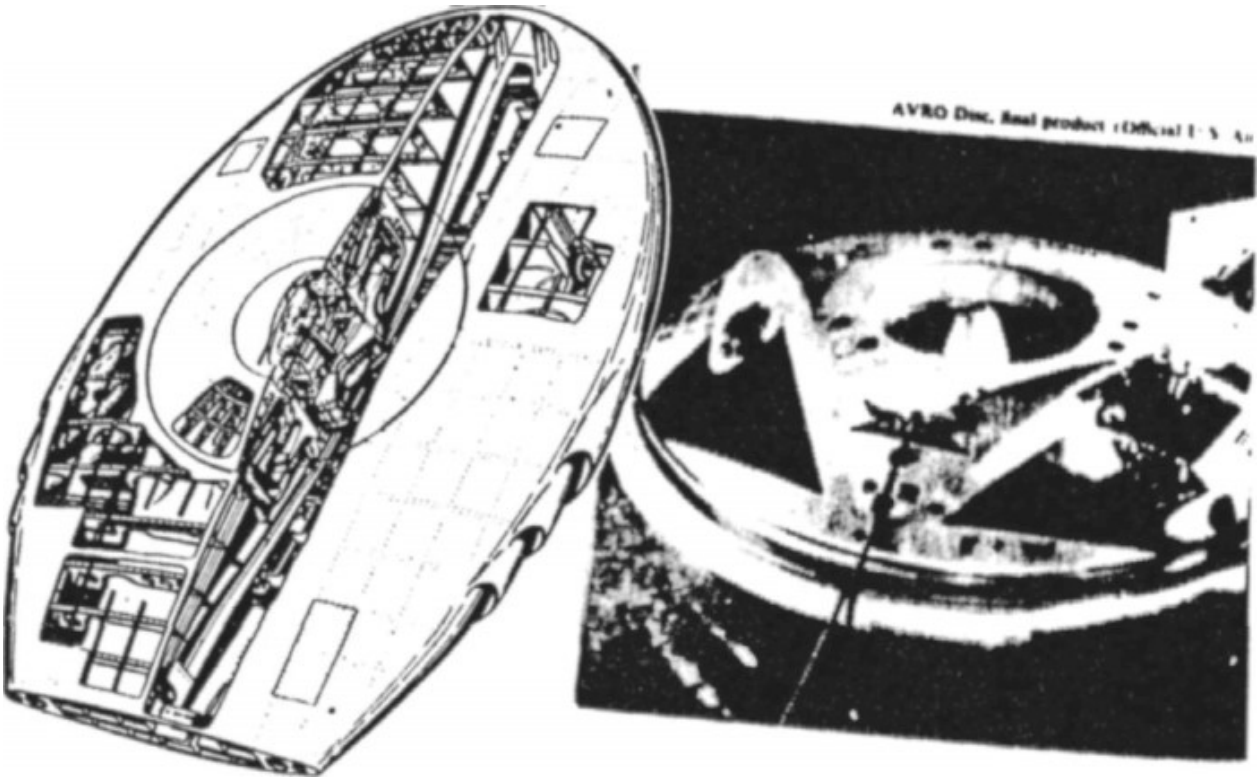
The solar-energy-powered space vehicles

However, there are also other sources available for the U.F.O. verification. There is the best-selling book already in its 5th Edition called “Die Deutschen Geheimwaffen des Zweiten Weltkrieges und ihre Weiterentwicklung” by Rudolf Lusar, published by Lehmann Verlag of Munich, West Germany. A small English edition exists but seemingly is suppressed. One of the authors of this book obtained just one copy from the author himself. The late Rudolf Lusar had been a Luftwaffe Major, an inventor and engineer, he had been employed during W.W. II in the patent and experimental section of the Reichsluftwaffen Ministerium in Berlin. In this book Lusar describes some pretty far-out, highly-advanced technology on rocket torpedoes, submarine fired ballistic missiles, Flying People (see photo) and very detailed information on the flyinq saucer programme. Shown here are photographs of engineering drawings, top and front view, along with excerpts of his descriptions.

Flying Disc

Flying Saucers

Flying saucers have been whirling round the world since 1947. suddenly turning up here and there, soaring in and darting off again at unprecedented speed with flames encircling the rim of the saucer's disc. They have been located by radar, pursued by lighters and yet nobody has so far succeeded in establishing the existence of such a "flying saucer" or managed to ram or shoot one down. The public, even the experts, are perplexed by an ostensible mystery or a technical miracle. But slowly the truth is coming out that even during the war German research workers and scientists made the first moves in the direction of these "flying saucers". They built and tested such near-miraculous contraptions. Experts and collaborators in this work confirm that the first projects, called "flying discs", were undertaken in 1941. The designs for these "Hying discs" were drawn up by the German experts Schriever, Habermohl and Miethe, and the Italian Bellonzo. Habermohl and Schriever chose a wide-surface ring which rotated round a fixed, cupola-shaped cockpit. The ring consisted of adjustable wing-discs which could be brought into appropriate position for the take-off or horizontal flight, respectively. Miethe developed a discus-shaped plate of a diameter of 42 m. in



which adjustable jets were inserted. Schriever and Habermohl, who worked in Prague, took off with the first "flying disc" on February 14, 1945. Within three minutes they climbed to an altitude of 12,400 m. and reached a speed of 2,000 km./h. in horizontal flight (!). It was intended ultimately to achieve speeds of 4,000 km./h.

Extensive preliminary tests and research were necessary before construction could be started. Because of the great speed and the extraordinary heat stress, special heat-resisting materials had to be found. The development, which cost millions, was almost completed at the end of the war. The then existing models were destroyed but the plant in Breslau where Miethe worked fell into the hands of the Russians who took all the material and the experts to Siberia, where work on these "flying saucers" is being successfuly continued.

Schriever escaped from Prague in time; Habermohl, however, is probably in the Soviet Union, as nothing is known of his fate. The former designer Miethe is in the United States and, as far as is known, is building "flying saucers" for the United States and Canada at the A. V. Roe works. Years ago, the U.S. Air Force received orders not to fire at "flying saucers". This is an indication of the existence of American "flying saucers" which must not be endangered. The flying shapes so far observed are stated to have diameters of 16, 42, 45 and 75 m. respectively and to reach speeds of up to 7,000 km./h. (?). In 1952 "flying saucers" were definitely established over Korea and Press reports said they were seen also during the NATO manoeuvres in Alsace in the autumn of 1954. It can no longer be disputed that "flying saucers" exist. But the fact that their existence is still being denied, particularly in America, because United States developments have not progressed far enough to match the Soviet Union's, gives food for thought. There also seems some hesitation to recognise that these novel "flying saucers" are far superior to conventional aircraft—including modern turbo-jet machines—that they surpass their flying performance, load capacity and manoeuvrability and thereby make them obsolete.*

According to Lusar, of the many scientists who worked on U.F.O. projects only one of these was found, a man named Miethe, and he was from the team who worked outside Prague. His whereabouts and movements are known. He worked in the early fifties for the A. V. Roe Company in Malton, Ontario, a suburb of Toronto, Canada. This man Miethe is the originator of a genuine flying saucer, which was produced by Avro on contract to the U.S. Air Force.

See photograph below — compare similar shape and concept with Lusar's drawings. Of particular interest is the propeller fan blade arrangement. The craft pictured above was shown to the press on the ground only, not in flight. However, we reprint a photograph or what is purported to be a photograph which originated with the Royal Canadian Airforce in Ottawa, Negative File No. T.P. 1256C, unit 2 Rd. The craft looks similar to the Miethe-designed Avro saucer, that has never been seen air borne by anyone. This was reprinted by the now defunct Toronto Telegram, once the second largest daily newspaper in Toronto.

The much-maligned Avro Disc, built with the collaboration of the German scientist, Miethe. Because it has never been seen "flying" does not mean it has not "flown" when the press were not around. Design clearly employs the "Vertikalzugschraube" experimented with by Miethe and his colleagues in Germany, or at least elements of the idea.

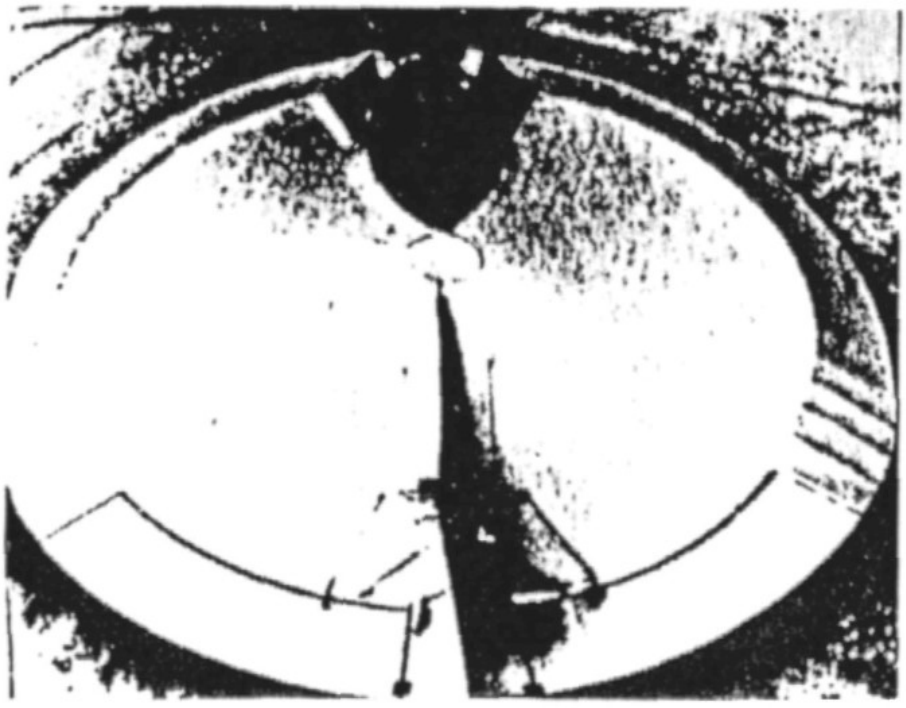
The Truly Great Books
107 King St E
Toronto 110, Ontario

Dear Sir:

This is to thank you for your letter dated 12 June, 1974.

Our research department has checked our files and made inquiries at various other photo departments in the Ottawa area, but unfortunately they have been unable to locate the negative that you asked about.

We regret we are unable to assist you with your request, but if we may be of any assistance to you in any future quest, please do not hesitate to write us.



Yours truly,

J.A. Young
Lieutenant Commander
Commanding Officer
Canadian Forces Photographic Unit

The authors contacted the defence department in Ottawa for permission to re-print the photograph. The file was missing and it was reported that no trace could be found of anything, negatives or prints. So that leaves the big question — why didn't Miethe's saucer fly? Or did it fly and we were not told the truth? Or, was Miethe a victim of the previously described German policy of only letting an individual know as much as he needed to know, to fulfill his task? No more and no less! Did he purposely sabotage the American Flying Saucer? Of greater importance, where is Miethe today? I doubt that we will ever know.

The A.V. Roe aircraft company was driven into bankruptcy in 1958-59 by the then Prime Minister of Canada — John Diefenbaker. Thousands of top flight scientists were overnight out of work and the cream of them were quickly hired by Boeing, General Dynamics and others. Miethe and the flying saucer he helped to build have vanished without a trace!

The Soviets too got into the act during the height of the UFO craze in the late 50's and early 60's. Since the Communists have ruled Russia, they have invented everything or reinvented everything, from gunpowder to spaceflight! To assure that credit goes where it is due, reproduced here is the Soviet flying saucer. A poor photograph of a canvas-covered circular-shaped wingless aircraft, the type the Germans experimented with around 1935 and in concept similar to the United States all-wing bomber. Surely, if the Soviet's had captured, as had been feared for some time, the German UFO teams and their factories, they could have come up with something a little better! And so again, we must conclude there is a missing link.

Where are the flying saucer teams now? Or better still, to where did they go after they left Germany? It is almost a certainty that they did leave Germany. There are a number of possibilities, but all point in the general direction of the Southern Hemisphere.

Essentially, Bar-Zohar corroborates Michael X and Mattern.
"The Avengers" page 110 111 Excerpts below.

> When the fighting ended in Berlin, some men of the Russian Fifth Army came across a burned-out tank at Spandau, and lying near it was the body of a man wearing a long leather jacket In one of the jacket pockets they found a small book which turned out to be the diary of Martin Bormann, the Fuehrer's deputy and one of the most astute of the Nazi Party leaders.
>
> The dead man was not Bormann—this was very soon verified—but an entry in the diary, in Bormann's handwriting, said "May 1, attempt to break out."
>
> A telegram that the Reichsleiter had neglected to destroy was found in his office: "April 22, 1945. Agree with proposal of dispersal in southern zone beyond the ocean. Signed, Bormann."
>
> These two sentences clearly conveyed Bormann's intentions to flee to South America and showed that he had begun to put his plans into effect on May 1.

There was Peron, Hitler's admirer, in power in Argentina. It is a well known fact that huge tracts of land had been bought up by Nazi money and interests. An interesting aside is that Germany's top fighter-bomber pilot Hitler's favourite, (Stuka divebomber ace with over 2,500 sorties and over 500 tanks and 140 planes to his credit), Hans Ulrich Rudel, worked on secret aircraft development schemes for Juan Peron after the war. He met Peron personally on several occasions and the team around Rudel, Tank and Horten did produce a very fast jet fighter plane for Argentina. See photographs. From this fact it is possible to deduct that both the facilities as well as the talent were available and did not lay idle. Rudel by the way has made over 75 trips to South America since then!!! What for?

German scientists produced this jet for Peron.

Peron and the German experts

So we have seen Berlin fall. We have looked into the suicide drama, we have seen Hitler leave Berlin for Denmark and Norway. We have double-checked every angle, even Hitler's mind and motivation. We have traced his thinking back to as early as 1920 right up to 1945 and gleaned from his own book "Mein Kampf" and from his various speeches right up to the last days in Berlin and all are valuable insights, having a direct bearing on the solution to the UFO mystery.

Now we must follow the U-Boat convoy that allegedly has Hitler and Eva Braun aboard on its secret underwater journey — to where? Will it be possible to break out of the ring of steel and fire the seemingly all-conquering allies have thrown around the crumbling Third Reich? The first indications come from a captain of the British Navy. His cruiser was part of a large allied force which engaged the Fuhrer's convoy in a battle. The allies were obviously not aware of the significance of this particular convoy, but must logically have expected some isolated break out attempts by a select group of top political and military leaders from fast-sinking Germany. They had thrown up a virtual blockade around the entire North Sea, stretching from the polar region down to the Spanish coast.

The Fuhrer convoy was detected and promptly engaged by all available allied units in the general area, and with unexpected and devastating results. It would seem that the secret weapons, which Goebbels had spoken of in such glowing terms only a few days previous, were now put to use for the first time in an actual battle situation. The result, was one sole survivor from a British destroyer and it was from this, the captain, that the words were uttered: "May God help me, may I never again encounter such a force". The report of the captain's words was carried in El Mercurio, Santiago, Chile and in "Der Weg" a paper published by exiled Germans living in Buenos Aires, Argentina.

Michael X in "We Want you — Hitler is Alive" mentions that the great mediaeval seer and prophet, Nostradamus prophesied Hitler's escape from Germany, and in a submarine, and we quote him as follows:—

"The leader who shall lead an infinite number of people,
Far from their home land to one of strange manners and language,
Five thousand in Candia and Thessaly finished,

The **leader escaping, shall be safe in a barn on the sea"**.

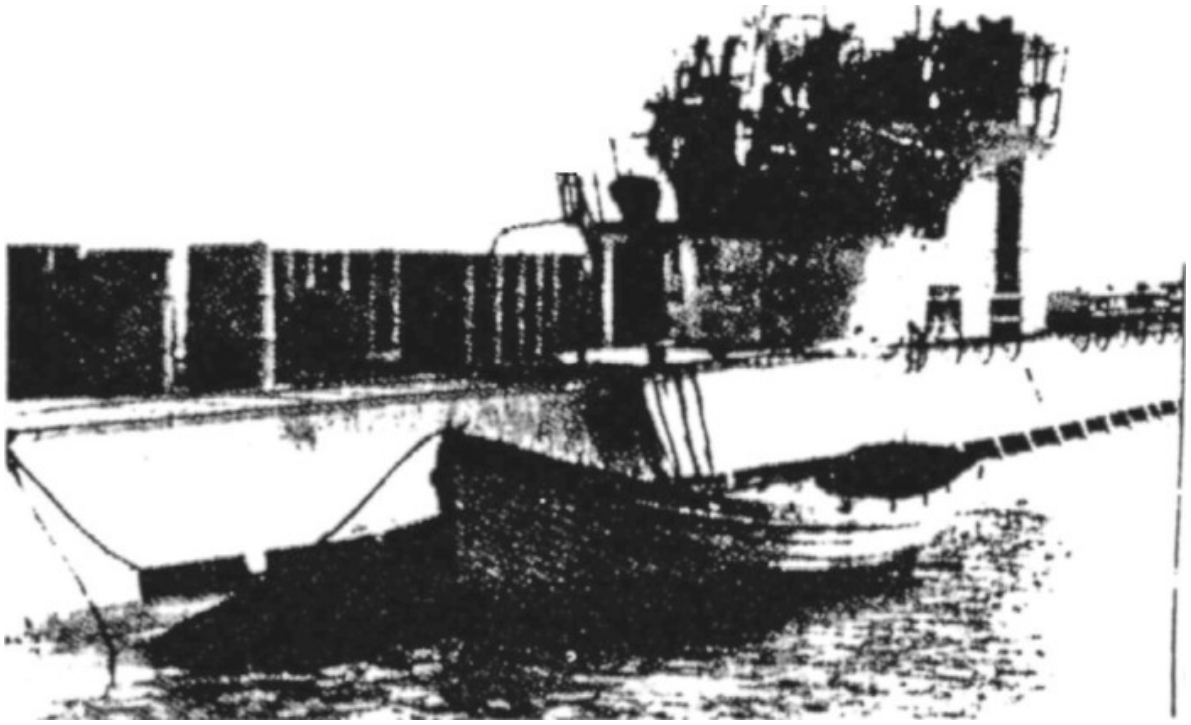
But there is another verse, even more explicit, mentioning an "iron cage" — a clear reference to a submarine.

Wild beasts for hunger shall swim over the rivers,
Most of the land affected shall be near the Danube
Into an iron cage he shall cause the great one to be drawn
When the child of Germany shall see nothing"

The wild beasts are obviously the raping, all-devouring Allies, fording the Neisse, Elbe, Rhine Moldau, **Danube**, that's where it all ended in April 1945. Or did it?

Michael X also involved Donitz and the German submarine fleet, and speaks of a paradisical oasis in Latin America. There is even more weightier evidence of the submarine escape of Hitler and Eva Braun. On July 10th, 1945 a sensational news report made headlines around the world. (A world that was busy getting ready for the sell-out conference of Potsdam where a final stamp of approval was given to the Bolshevik armies allowing them to rape, plunder and drive from their ancestral homes, millions of Germans beyond the Oder Neisse line, who were now defenceless since the German soldiers, beaten, disarmed and starving were performing unpaid slave labour in England, France and America. The Soviet methods were even more indescribable than those of the rest of the Allies.)

A German submarine, of the latest design, "U-530", had given itself up to the Argentine authorities, but not before all scientific instruments and weapons on board had been destroyed. The U-boat had calmly slipped into the harbour of Rio de la Plata. The Commander's name was Otto Wermoutt. The world was stunned and electrified! What was a German submarine doing all the way down there in South America more than two months after the war had officially ended? Why had they not surrendered earlier?



The U.S. government immediately demanded internment and extradition of the entire crew to the United States. As per usual in Yankee dealings with South America, the colonial master whistled and the Latin dog had to wag its tail. In order to save face the Argentinian authorities "studied" the request just long enough to question the officers and crew about the why and where of their surrender unusual. Since Washington became very insistent, the prisoners were turned over to the U.S. authorities. Special planes had been dispatched to Argentina and the men were shipped off to the United States for interrogations. An icy silence settled over results obtained and also about the whereabout of the crew. Rumours have it that the entire crew answered all questions put to them with similar answers so that the impression remained that they had been prepared for this eventuality.

Apparently little useful information was obtained from officers and crew about the intended purpose and final destination of their U-Boat. However, the Argentinian investigators did find that the U-530 was part of a larger submarine convoy which was travelling entirely underwater and under strict

orders to keep absolute radio silence, a measure usually employed only during extremely sensitive and highly-secret missions, for this type of movement risks the loss of cohesion of the convoy and therefore the possible loss of U-Boats and crews to the watchful enemy. Obviously, whoever had planned this mission was willing and capable of losing some boats. The precautions taken in order to safeguard the secret of the final destination are extraordinary.

It was later revealed in a news report that James Forrestal, then U.S. Secretary of the Navy, (who later supposedly jumped to his death from a 13th storey window while in the Walter Reed Army Hospital) had stated that the U-530 was chiefly a transport submarine and had only carried a few torpedoes. They were of a new type called “torpedoes-arana” or “spider torpedoes”. In effect, they were wire guided underwater missiles and remote controlled and they never missed their targets. Due to the devastating effectiveness of the secret weapons carried by the convoy, there apparently were few Attack U-boats in the convoy.

Two things, however, aroused the suspicions of the interrogators. The U-530 carried a crew of 54 men aboard. The usual German crew size was only 18 men. There were also unusually large food stocks on board. However, the real surprise was 540 large tin cans or barrels, all hermetically sealed and upon opening were found to contain nothing but cigarettes. This was especially unusual since all crew members turned out to be avowed non-smokers. Now what was a German U-boat of the very latest and very largest design doing, cruising around South American waters two months after the end of the war? And with a triple strength crew; carrying a cargo of nothing but cigarettes?

Photograph of U-530 after surrender In Argentina. Note “tin cans” on submarine — mentioned in text

The average age of those 54 men turned out to be less than 25 years, with the exception of the machinist who was 32 years old. The commander himself was only 25, and the second officer an incredibly 22 years young. (Photograph shows the extreme youth of the crew. Shown with them are the tin cans on the deck of the submarine.)

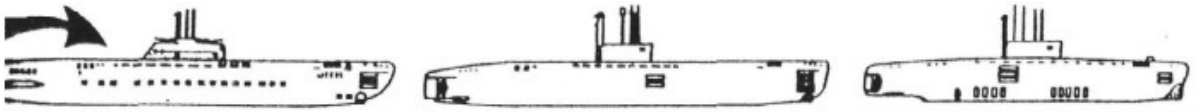
Faces of crew clearly reveal how young they are. Close up photos for more detail.

Age and name-list of crew of U-530

Officers: Captain Otto Wermoutt (25 Jahre), Karl Felix Schubert (22), Karl He
Lenz (22) Petri Leffler (22) Gregor Schluter (32).

Sub-officers: Jürgen Fischer (27), Hans Setli (26), Johannes Wilkens (3
Paul Hahn (45), Georg Rieder (27), Kurt Wirth (24), Heinz Rehm (24), Rud
Schlicht (26), Rolf Petrasch (26), Ernst Zickler (24), Georg Mittelstaedt (2
Robert Gerlinger (24), Viktor Wojsick (27), Günter Doll (21), Rudolf Bock (2
Werner Ronenhagen (24), Arny Krause (25), Karl Kroupa (25).

Crew members: Herbert Patsnick (22), Sigismund Kolacinsky (22), Friedrich Mü
dick (23), Arthur Jordan (21), Eduard Kaulbach (23), Rudolf Mühlbau (2
Franz Hutter (22), Harry Kolakowsky (21), Franz Rohlenbücher (22), Johan
Oelschlager (20), Willy Schmitz (21), Heins Hoffman (20), Heins Paetzold (2
Gerhard Nellen (20), Ernst Liewald (21), Reinhard Karsten (22), Hans Wolfg
Hoffmann (22), Arthur Engelken (22), Hans Sartel (21), Erhardt Piesnack (
Joachim Kratzig (20), Erhardt Muth (25), Friedrich Ourez (21), Werner Ze
(20), Erhardt Schwan (20), Hugo Traut (20), Engelberg Rogg (20), Franz Je
retzki (23), Georg Wiedemann (21), Günther Fischer (29), Georg Goebl (24



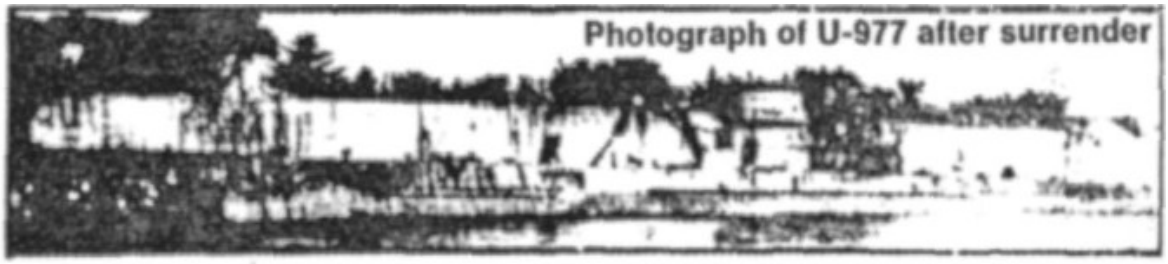
Extensive checks and cross checks were conducted by the American and the Argentinian authorities with the files at the German Naval Headquarters in Kiel, and another mystery was brought to light — there was no record of a Captain by the name of Otto Wermoutt as commander of U-Boat 530; he

along with several others of the U-530 had similar mysteries surrounding them. Interrogation by the allies brought forth from Otto Wermoutt and his crewmembers the same response — "We are alone. We have no living family relations". Apparently, their wives, parents, brothers, sisters and sweethearts had died in air raids or had been killed in some way or another during the war.

Soon the world forgot about U-530 and its fate and was busy listening to radio reports of the sudden arrest of Rear Admiral Karl Donitz, whom Hitler had designated as his successor as military leader of Germany — significantly enough not as the new Fuhrer but as military leader of Germany. Donitz was arrested and with his entire cabinet was shipped off to Nuremberg for war crimes trials. Germany thus became a country with its entire government behind bars.

Donitz after his "arrest"

In the meantime, Allied Naval Intelligence Units were engaged in endeavouring to locate Hitler's monster submarines which had been built on the insistence of Hitler and whose success once led him to remark "I am of good mind to scrap all surface vessels — the future belongs to the submarine". Not one single operational submarine was found. It was not until the surrender of Japan that a number were turned over to the Americans. Occasionally, stories were heard of mysterious submarines appearing and disappearing, mostly alleged to be of Soviet origin, or more often, of unknown identity.



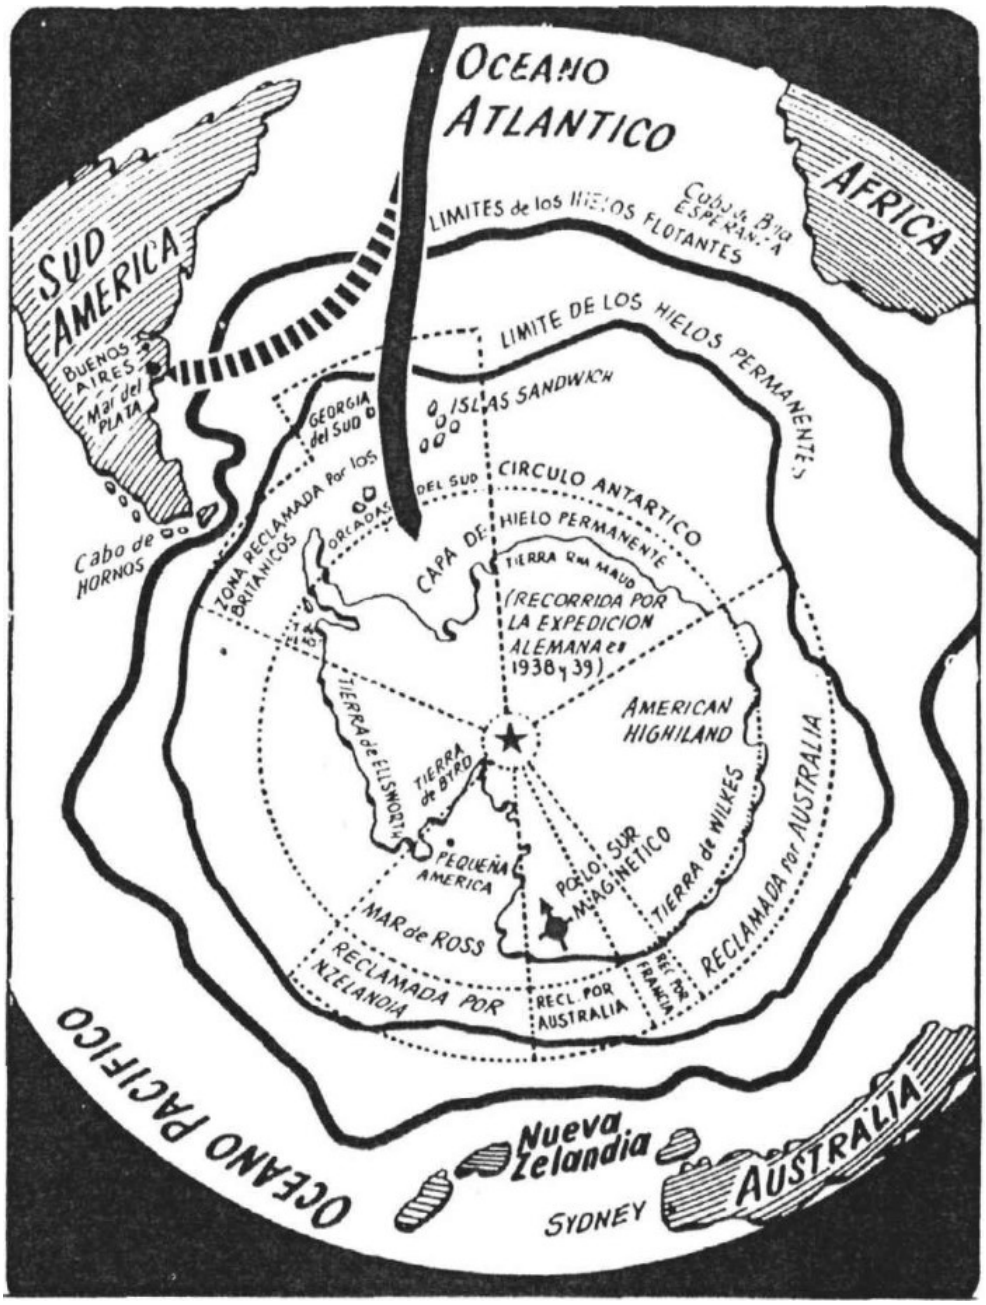
XXI (1944)

Typ XXX (Entwurf 1944)

Typ XXVI (Entwurf 1944)

On August 17th, 1945, five weeks later, another sensational submarine surrender took place and again at Rio de la Plata. A German U-boat, U-977 under Commander H. Schaffer gave itself up to the Argentinian authorities, and this, three months after the end of the war in Germany. This time the crew consisted of only 32 men, but this was still fourteen above the average crew number. It was soon learned that another 16 men, all of them married and with families in Germany, had been dropped off "on orders", on the Norwegian coast. It would certainly seem that whoever was in charge of this operation was completely in control and knew the smallest detail right down to an individual crew member's family and marital status. From the logs of both submarines, the U-530 and the U-977, it was found that they had

left Kristiansund, Norway, on May 2nd, 1945; none other than the exact same spot where earlier reports stated the Fuhrer had been taken after his departure from Berlin.



Age and name-list of crew of U-977

Officers: Captain Heinz Schäffer (24), Karl Reiser (22), Albert Kahn (23) ingenier Dietrich Wiese (30).

Sub-officers: Hans Krebs (26), Leo Klinger (28), Erich Dudek (23),

Crew members: Gerhard Meyer (23), Karl Kullack (21), Wilfried Husemann (20) Heinrich Lehmann (21), Rudolf Schöneich (21), Walter Maier (19), Rudolf Ne mirther (20), Hans Baumel (21), Hermann Heinz Haupt (21), Hermann Rie (21), Johannes Plontasch (20), Heinz Blasius (21), Alois Kraus (20), Ku Nittner (21), Heiz Rottger (20), Heldfried Wurker (19), Heinz Waschek (20) Kurt Naschan (20), Gerhard Eofler (19), Harry Hentschel (19), Helmuth Mar (20), Alois Knobloch (19), Karl Homorek (19), Heinz Franke (21), Adwi Baier (19).

The fact that Captain Schaffer had waited another five weeks before giving himself up in the same manner and in exactly the same spot as the U-530 can only mean that he had waited, in the hope that he was to be picked up by a search party. He must have known of the fate of the U-530 since radio reports were regularly monitored. Captain Schaffer wrote a book about his experiences called “U-977” in which he supplies these details. “We were whisked out of Argentina with great haste. However, not before every square inch of the U-Boat, even floor boards, walls and corners had been painstakingly examined and probed for a trace of the Fuhrer — **In the clear knowledge that the Fuhrer was still alive”**.

Map taken from the Spanish book "Hitler esta vivo?" — "Is Hitler Alive?", showing the Fuhrer convoy route and the deviation of U-530 and U-977 (broken line)

Less well known, but equally significant, is the report supposedly originating with the British Admiralty. On June 5th, 1945, five weeks before the surrender of the U-530, the 47 crew members of a German submarine had surrendered to the Portuguese authorities, opposite Leixoes, after they had scuttled their heavily damaged submarine. One can certainly assume that this submarine also belonged to the Fuhrer convoy. Time and direction certainly seem to coincide. Perhaps the submarine which had been abandoned had been damaged during the allied blockade force attack?

THE STORY OF U-859

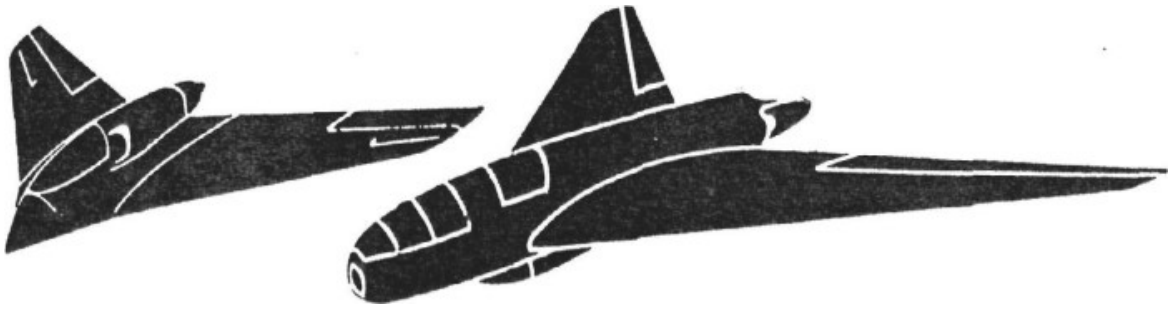
On April 4, 1944 at 4:40 a.m., the German submarine U-859 under Kapitanleutnant Jan Jepsen left Germany for a mysterious mission which was to come to an abrupt end several months later, at a place half way around the world. The unusually large crew of 67 men had not the faintest idea where they were heading. For several months they cruised around Africa then Arabia and India and finally they ended up in the area of Sumatra, Indonesia. During this time they sank some freighters and an Allied troop transport.

Just outside Penang in the Straits of Malakka, fate caught up with U-859. The U-boat was sunk by a British submarine and most of the crew lost their lives. Not in itself an unusual event in wartime, and therefore soon forgotten by the world. Almost forgotten that is. One of the survivor's mentioned on his deathbed, almost 30 years later that U-859 had taken a treasure to its watery bed. He insisted that welded into the bow and holds of U-859 were 33 tons of mercury, all in glass bottles and sealed again in watertight tin crates.

Since mercury is a very expensive item, even today, an expedition was organized to investigate the rumour. After months of effort U-859 was indeed located, and just where the dying sailor had indicated his comrades' large steel coffin would be found. Divers went down into the shark-infested waters and started to cut open the hull with the latest of underwater blow torches. After several months of very difficult work the divers found large black tin crates which were hauled to the surface and opened with blowtorches. The dying man's story was found to be true in every detail. Packed in neat rows, none the worse for their 30 years at bottom of the ocean was 33 tons of mercury.

Again the question must be asked, what was a German U-boat doing with an incredibly large crew of 67 men, carrying a secret cargo of war-vital mercury half way around the world? To where was the U-boat heading? For whom was the cargo intended? And for what use was the mercury to be put to? Obviously the British did not know the real mission of U-859.

The Mercury Treasure of U-859 after it was salvaged



Here again, was that remarkable loyalty and discipline of the German displayed — this secret had been kept for 30 years, almost unto death. It is interesting to speculate how many more submarines, similar to U-859, were on mysterious missions and to ponder as to where they now may be.

Still more reports of mysterious German U-Boats arriving in South America can be found in "The Avengers", page 105, written by Michael Bar-Zohar, published by Hawthorne Press. Excerpts reproduced here.

> Two more U-boats, according to reliable sources, appeared off an uninhabited stretch of the coast of Patagonia between July 23 and 29, 1945. Two sailors from the *Admiral Graf Spee*, Dettelman and Schulz, who were sent to Patagonia by Captain Kay with several of their shipmates, later described their "mission." They were lodged at an *estancia* belonging to a German-owned firm, Lahusen. From there they were taken to a deserted part of the coast and saw two U-boats surface. The *Graf Spee* men went aboard the U-boats and collected some heavy crates which they ferried ashore in rubber dinghies. Then the crates were quickly loaded on eight trucks and taken to the *estancia*, but very soon afterwards the trucks set off again with their load, heading inland. The rubber dinghies also served to bring about eighty people ashore, a number of whom were in civilian clothes. Judging by their manner of giving orders, they were obviously important people. They got quickly into cars waiting for them with engines running, and were driven off.

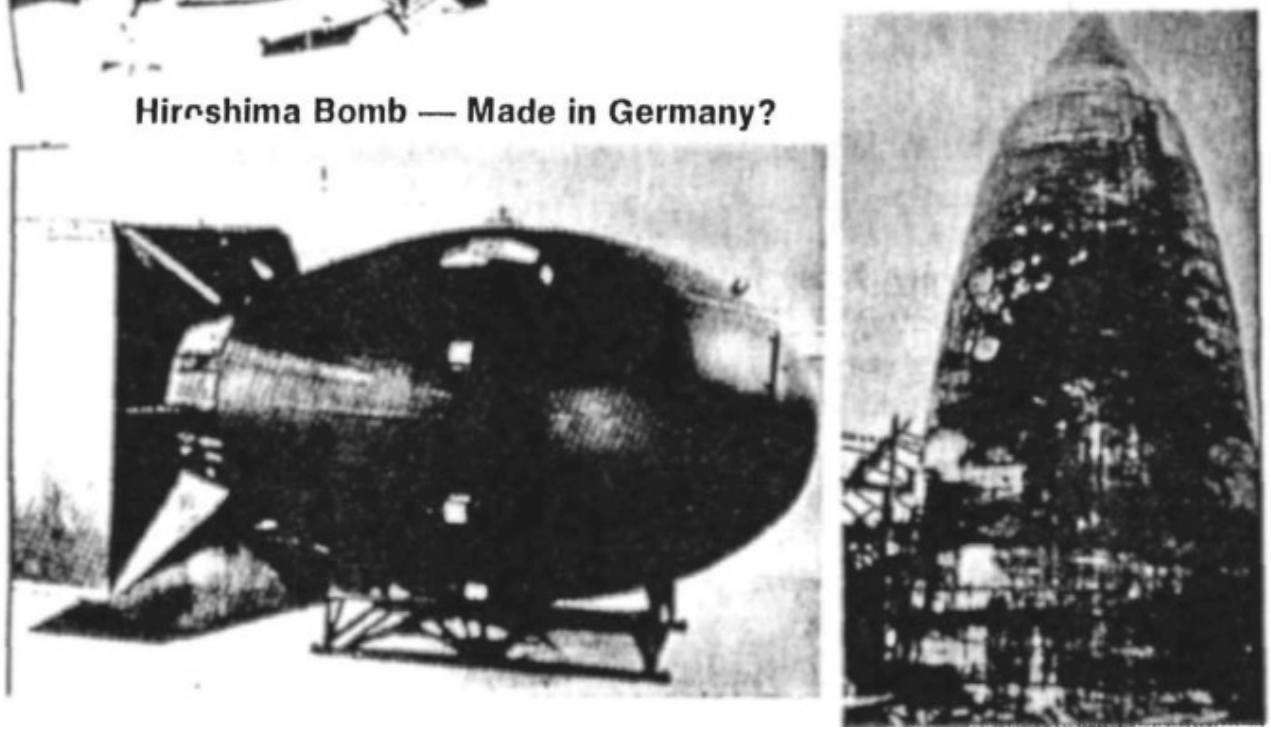
There has been a great deal of speculation about the size of the Fuhrer convoy. An assumption can be made that it must have been considerable, for otherwise the loss of three boats, with large crews, would have prompted "rescue attempts", an easy enough task in the quiet waters off the South American coasts during that summer season. If Hitler had indeed set up some refuge in South America, we might ask ourselves with how many people. No definite answer can be supplied but again, by deduction, we can arrive at an approximate number.

Perhaps unknown to many north American readers, is the fact that in Europe, there exists a registration obligation for each member of a community. Precise and detailed records are kept of where a person lives, number of children, sex, age etc. and also place of work. Also noted, are details of closest relatives. In Europe, therefore, it is relatively easy to trace and locate anyone and at short notice. True, there was a temporary breakdown in the last few months of the war due to heavy bomb damage and the refugee problem, but conditions soon returned to the usual bureaucratic precision. The Allies found these exact records to be extremely useful in the job of ferreting out “Nazi war criminals”. They soon discovered that 250,000 persons had disappeared. Taking into account, casualties and deaths from all causes, this number of 250,000 has remained relatively constant and has been a continual source of speculation. To where could so many people disappear in densely populated Germany? Could the answer be found in a new “Third Reich” located in some far away place? Were select individuals withdrawn, over a long period of time, and re-located somewhere? Were they the “last battalion” to which Adolf Hitler referred several times In his prophetic speeches towards the closing days of the war? Are they the cream of the crop — saved for the day — that inevitable day when east and west shall meet in mortal combat and WE, as Hitler put it in several speeches, “will be the tip of the scale”? Will they hold the balance of power? How? With what? Will their Secret Weapons be the disappeared “Kraut meteors” the “Fliegenden Scheiben” or the flying discs? With what will they be armed? The death rays spoken of by Prof. Dr. Phillips?

* According to a Washington report at the end of 1955, the United States Air Force was then shortly going to test aircraft models whose appearance would fully correspond to the conception of the “flying saucer”. Secretary of the Air Force Donald Quarles has stated that these models are disc-shaped and able to take off vertically. They will do without expensive runways (see “German flying discs”).

ATOMIC BOMB

The great guessing game as to whether Hitler had or did not have the atomic bomb can be answered rather conclusively. The German scientists whom the western Allies scrounged together after V.E. day who were working on the atomic bomb revealed they had reached a critical point in their research. They were part of the teams who had done research work near Berlin and at the Max Plank Institute. Later on they worked at Haigerloch, a little Swabian town in the south of Germany.



The scientists were imprisoned after the war in Farm Hall, an English maximum security prison. Their rooms and cells were bugged with microphones. During the night of Aug. 6th, 1945, when the American A-Bomb was dropped on Hiroshima, the British "listeners" found out how far Hitler's atom bomb had progressed. Apparently it was ready. Prof. Oppenheimer is reported to have said that the bomb dropped on Hiroshima was made in Germany.

Germany first started atomic research when Hitler was sent a letter by Prof. Dr. Harteck. Hitler's order was signed Sept. 26th, 1939. Dr. Esau was put in overall charge. With the capture of Norway there was available to Germany a source of heavy water which had previously been lacking. Production was ordered to be increased by 5,000% at the heavy water plant at Vermork. This plant was the repeated target of frantic Allied bombing raids and a favourite source for "commando raids". Some were very damaging and did hamper Germany's efforts. Apparently one tanker full of heavy water had not been accounted for to this day. It was presumed lost or sunk by a mine. An interesting question would be — "Did it get sent to some place else for later use?"

It is interesting to note that Hitler sent Field Marshall Erhard Milch to the Gottow laboratories near Berlin, where atomic research was also being carried out in 1945, to do an inspection. He also was given wide powers to supply the scientists with anything they might need. During the inspection Milch asked Dr. Werner Heisenberg: "How big would a bomb have to be in order to destroy New York or London?" Heisenberg told the Fuhrer's envoy: "About as big as a pineapple, and we will have a basketful for the Fuhrer by Christmas . . .!" Heisenberg was later tried and the above statements were introduced by the allied prosecutors as evidence!

Two of Hitler's A-Bomb experts. Dr. Wirtz. Dr. Mentzel

Hiroshima Bomb — Made in Germany?

Haigerloch Atomic Research Lab

As a passing note, it may be of interest to the reader to know that America's atom bomb effort took 125,000 workers and cost well over two billion dollars. It was later betrayed to the Russians by communist spies, Ethel and Julius Rosenberg, Nobel, David Greenglass, Fuchs and other Jews.

Was Wernher von Braun and his staff of conventional rocket experts deliberately sacrificed to put America on the obsolete track of wasteful fire-cracker rocketry while the Nazis perfected the superior U.F.O.'s somewhere in South America?

TRUTH STRANGER THAN FICTION?

The following story was made available to the authors by a British businessman who has requested to remain anonymous. The identity of the nurse and hospital are known to him. We include it without commentary.

Letter is unedited. Punctuation and spelling as in original

I have been a night nurse in charge of a terminal geriatric ward for many years and as you can guess have seen some pretty horrible sights, but still met some interesting people, the one who was really fascinating was this German chap I mentioned to you some time ago, the poor chap was a terminal case, a terrible carcinoma of the stomach, he was in a side ward by himself as he rarely got more than a couple of hours sleep a night even with the huge injections of heroin we gave him, but he never complained and was always ready to have a chat, and many a night when it was quiet I would take him in a cup of coffee and sit with him and chat for an hour or so. He spoke English well, with a marvellous German, American accent which he had picked up in America, he had been with us over a year, when one night I was sitting talking about my service in the navy and the conversation got on the Flying Saucers . . . he then went very quiet and gave me an odd look, I laughed and said:

"Do I sound mad talking about Flying Saucers?"

He said no, and then said, I might think he was mad as he had flown in one, anyway I had to leave then but the next night we continued the conversation, for the first time he told me he had been in the Luftwaffe, a security officer, attached to somewhere called Rechlin, where they were experimenting with all manner of almost science Fiction type weapons, he mentioned a wind gun, rockets and laughed and said Germany had all these long before the rest of the world had even thought of them and that given another year or so, the war would have had a completely different ending, and that even now things could still happen engineered by the Reich that could alter the world's future.

I laughed, and he continued, on and on about the progress that had been made during the war years, a lot of things I had heard about but some that seemed way out of this world . . . heat rays, queer new explosives and new type flying vehicles, then he went on about the saucers, how they began with quite small open ones with one man cockpits then on to bigger and bigger ones.

Later they moved to another base, and here for the first time he heard about the so-called "Neuer Deutschland" in the Antarctic, pre-war there had been rumours but never many details, there were many scientists at the new base and flying took place only by night as allied planes were continually flying over, and there were continual attacks, as time went by and the outcome of the war became more apparent the work was speeded up more and more and late in 1943, the first of the big saucers was flying and then came the news that certain specialists were being chosen to go on a special trip to a secret base where the war was to be continued from, he flew in planes on several occasions to bases in the North of Norway, escorting men and women scientists equipment, files, specialised machinery and weapons, all of this was

taken direct to long range U-Boats and put straight on board, the weapons were all very modern and he described them as brand new automatic rifles that later were known as MP 44s, there was also a large amount of explosive.

The saucers flew continually and as soon as a new one was built and tested it was loaded with equipment and crewed and when night fell they took off and did not return, as time went by stories of the U-Boats coming and going taking out masses of supplies and people, not just scientific personnel but also administration and military, security, cooks, and amongst them a fair contingent of women.

As the end of the war came near organisation began to break down and supplies ran short they were being bombed and strafed daily by Allied fighter bombers, when the last saucer left, the base was abandoned, he flew on in one of the last planes to leave the base a Heinkel III, they were attacked by a Russian fighter and damaged and landed eventually just outside Oslo. Norway was in chaos at this time but he got a lift in a car with an SS officer, he explained he was heading for a U-Boat base and a possible way out, the SS man had no better ideas and they went North, they reached the base two days later and found two U-Boats refuelling and restocking for their final trips, there were not as many people wishing to use the vessels as most wanted to go home after the war, in fact the cargo carrying boats were even short of crews, they were full of supplies of all sorts, the day after they arrived there was a raid by American bombers a lot of buildings were damaged but the boats were not. . . they sailed that night.

They reached the Antarctic base after a long trip, by sea and across the ice cap, but after a couple of weeks he went back to the coast to carry on his security work with some last minute arrivals on a U-Boat, he then left with instructions to meet another boat in the Atlantic, things however went wrong and his vessel was damaged and sunk by a patrol boat, he was rescued and was made a P.O.W., his captors did not realise who he was as he had got rid of his papers and was wearing naval cold weather gear.

He was held as a P.O.W. in America, and after his release was repatriated to Germany, when he saw the way things were going there under the occupation he got himself some new papers, Polish and managed to get to Britain as a refugee, he settled down, married, his wife died in the late 1950's, and he was having treatment for cancer, radium treatment was tried but slowly things got worse and he was eventually admitted to hospital where he died.

End of letter

Whatever the merits of this dying man's story are, one thing we can be very certain and that is of one terrible weapon at the Fuhrer's command and of which Hitler spoke towards the end of the war when he clearly made reference to the atom bomb — "May the heavens forgive me, if I should reach for that final terrible weapon still at my disposal! We are today already able to blow up half the planet".

Another startling fact proving quite definitely that W.W. II did not end on 8th May, 1945 is the following account in "France Soir", a serious paper (not a scandal sheet):— "Almost 1½ years after

cessation of hostilities in Europe, the Islandic Whaler, "Juliana" was stopped by a large German U-boat. The Juliana was in the Antarctic region around Malvinas Islands when a German submarine surfaced and raised the German official naval Flag of Mourning — red with a black edge.

The submarine commander sent out a boarding party, which approached the Juliana in a rubber dinghy, and having boarded the whaler demanded of Capt. Hekla part of his fresh food stocks. The request was made in the definite tone of an order to which resistance would have been unwise. The German officer spoke a correct English and paid for his provisions in U.S. dollars, giving the Captain a bonus of $10 for each member of the Juliana crew. Whilst the food stuffs were being transferred to the submarine, the submarine commander informed Capt. Hekla of the exact location of a large school of whales. Later the Juliana found the school of whales where designated. This is the direct quote from "France Soir". Added to this must be a wire service bulletin releasd by France's own Agence France Press on the 25th Sept. 1946, which further clarifys the above: "The continuous rumours about German U-boat activity in the region of Tierra del Fuego (Feuerland, in German), between the southernmost tip of Latin America and the continent of Antarctica are based on true happenings".

Putting all these details into proper sequence and perspective a clear picture emerges. Selected segments of the Third Reich survived the collapse of Germany proper and obviously did not surrender to the allies as they were supposed to have done under the "Unconditional Surrender" signed by Donitz on behalf of the German people.

There must be rather large secret Nazi bases where work continues on the UFO's and other secret weapons. Investigation shows that huge amounts of money were clandestinely invested by Nazi Front men all over the world, but especially in South America. An incomplete, but nevertheless surprising statistical compilation of these funds appeared in the newspaper "Zig-Zag" in Santiago, Chile, on 19th June, 1947. According to this compilation, Spain received 300 million dollars, Sweden 250 million, Switzerland 100 million and Portugal 50 million and this represents only about 25% of such investments.

This amounts to nearly 3 billion dollars invested in large tracts of remote jungle and pampas real estate, factories, transportation, airlines, shipping(!!!) companies,, food processing and agriculture. **In the shockinly candid book entitled "The Avengers" written by Michael Bar-Zohar dealing with Jewish war and post war tactics against the Germans, we find a lot of detailed information about the transfer of German money to foreign lands. Some excerpts are reproduced here.**

> A most unusual conference of German officials and industrialists was held at the Maison Rouge Hotel in Strasbourg on August 10, 1944. The proceedings of this "Red House" conference are known from the shorthand report, which fell into the hands of the American OSS at the end of the war. A Lieutenant Revesz showed it to Simon Wisenthal, who took a photostat and published it some years later.
>
> Among those present at this conference were representatives of the Ministry of Munitions and the Foreign Office, delegates from the big industrial combines—Krupps, Messerschmitt, Rochling, Goering Werke, Hermannsdorfwerke—and several senior civil servants. The object of the meeting was to decide upon measures for safeguarding the treasury of the Third Reich. They reached two

main decisions—some of the riches would be hidden away in the territory of the Reich; and German capital would be sent abroad.

The conference urged that the Nazi Party should go underground in the event of defeat, and should prepare for a return to power with the help of the treasures safely hidden away.

These decisions began to be put into effect in the following months. An "experimental station" was set up near Lake Toplitz and a number of containers packed chiefly with forged pound notes and documents were submerged in the lake, and some other containers were hidden away in old mines in the hills. Most of them were removed again when Allied forces were approaching the region. Although the Allies did not have full knowledge of these hiding places until the report of the "Red House" conference fell into their hands, some information on the Nazis' postwar plans had reached the Allied secret services early in 1945. In March of that year a detailed report on the subject was submitted to the State Department in Washington:

"The Nazi regime has made very precise plans for the perpetuation of its doctrine and domination after the war. Some of these plans are already being put into effect.

"Members of the Nazi Party, German industrialists and Army leaders, realizing that there is no hope of victory, are presently preparing commercial plans for the postwar period, endeavoring to renew connections with industrial circles abroad in the hope of reestablishing prewar cartels. After the war, the intention is for 'front men' to appeal to the courts of various countries against the 'illegal' seizure of German industrial concerns and other German property by the Allies at the outbreak of the war. In the event this method does not succeed, the recovery of the German property would be made through figureheads possessing the requisite citizenship. German attempts to continue to have a share in the control and development of technological progress during the immediate postwar period are reflected in the phenomenal increase in German patents registered in certain foreign countries during the past two years. These registrations reached their peak in 1944....

"German capital and plans for the building of ultramodern technical schools and research laboratories are being offered on very advantageous terms, in view of the fact that the Germans will thereby be able to make and perfect new weapons.

"The German propaganda program is an integral part of this general planning for the postwar period. The immediate aim of this propaganda program will be to bring about a relaxation of Allied controls on the pretext that the Germans should be treated 'honestly.' Later, this program will be extended and intensified with a view to reviving Nazi doctrine and pursuing German ambitions of world domination. Unless these plans are counteracted, they constitute a constant threat to the peace and security of the postwar world."

The American specialists had greatly extended their knowledge of this subject by the end of the war. They soon had a list of 750 firms with head offices in neutral countries, founded or bought with German capital. Switzerland headed the list with 274 firms; then came Portugal with 258, Spain with 112, Argentina with 98, and Turkey with 35. A number of firms had also been acquired in South American countries other than Argentina.

Special accounts in Swiss and Liechtenstein banks were placed at the disposal of the Argentine Government, officially to help their industrial development. Some of the accounts were made personally available to Argentine leaders.

As military defeat and final castastrophe had become more certain, the Nazi chiefs stepped up their preparations for the future—a future in which they meant to have a stake. They had deposited large sums with banks in neutral countries and salted away just as much in the portfolios of apparently respectable persons in Liechtenstein, Portugal, and Patagenia, and had hidden much wealth in the depths of old salt mines in Austria and below the dark water of the Alpine lakes. All of this hidden treasure might indeed permit a revival of Nazism one day—so long as there were still Nazis around able to draw upon it.

Added to this must be the fact that the high priority tasks of the newly elected National Socialist government in 1933, was the securing of adequate food supply for the entire population. Extensive research was immediately launched into areas of artificial food cultivation, in huge greenhouses, with everything grown only on "chemical soil" and under artificial light. Butter was apparently produced from coal and dry milk was another German invention. A method was also discovered to indefinitely preserve wheat flour. Great strides were also made in Freeze Drying all types of food and this was carried out particularly in experimental plants located in the area of Helmstedt. Hitler was keenly interested in these projects visiting them frequently. In a very short time, Germany was more or less self-sufficient and for the first time in centuries. No German ever experienced want and hunger again until the Allies burnt or robbed all the huge warehouses of their contents in 1945 and after.

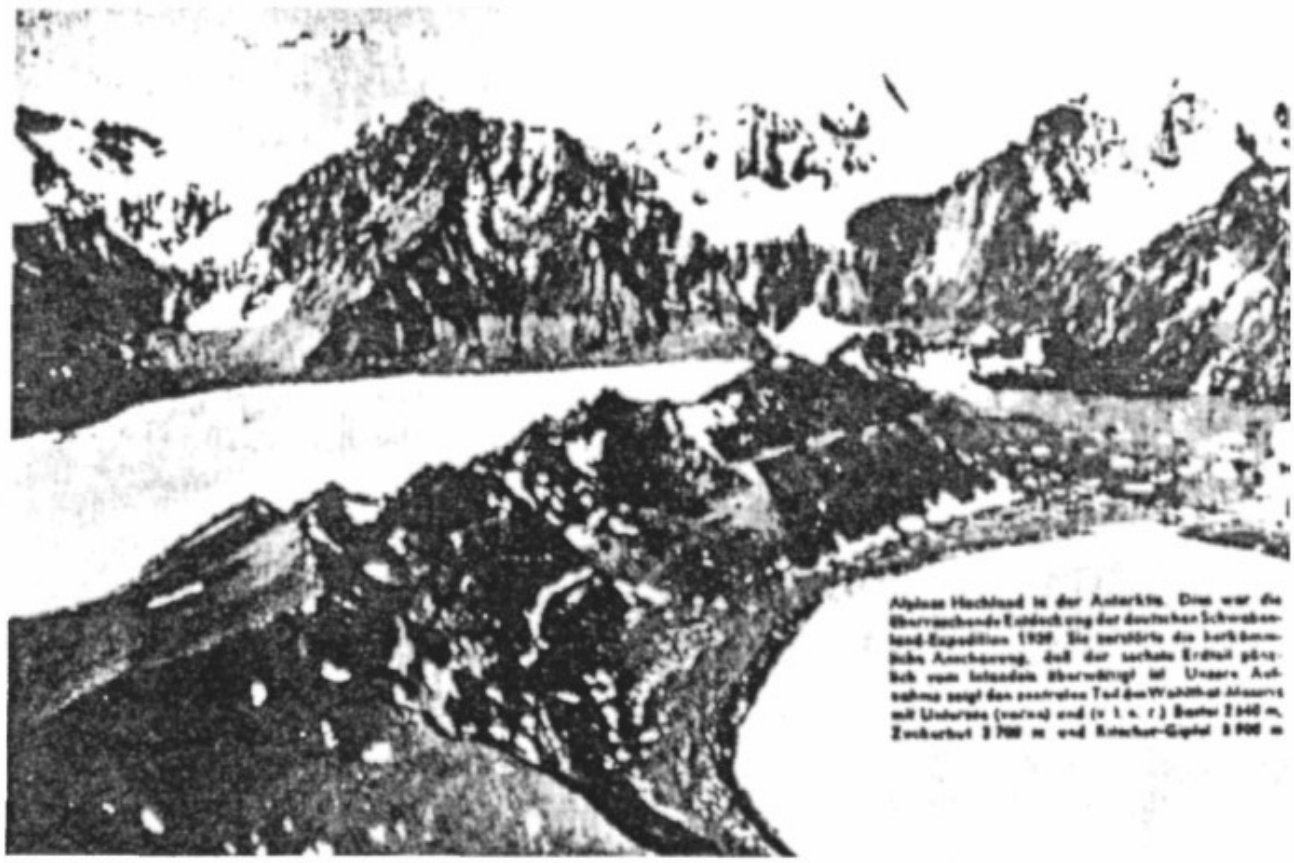
Any German who lived through that dreadful time will tell you what the humanitarian liberators of Germany doled out as food rations after their victory. In the French zone of occupation it was officially 850 calories a day, in the American zone a little more, whilst the inmates of Hitler's concentration camps, (whose bony corpses you are still seeing daily on T.V. and in the newspapers), received more than double that amount of calories daily. The resultant famine and death from starvation, particularly among the elderly and infants is well remembered by the German population. They call it a "peace crime". The food supply for any secret UFO force, (which we shall call by the name Hitler himself had given it) — The Last Battalion, had already been solved. But how about necessary monies to keep such an enterprise running? Hitler had again already planned, with great foresight for this inevitability. In captivity in concentration camps such as Dachau, Buchenwald and Auschwitz, were Europe's best-known and most skilled forgers, — many of them Jews. They were geniuses at their particular craft.

The victims of the "Liberators".

One day, a secret order arrived from Berlin code-named “Operation Bernhard”. All the forgery experts were collected and were offered life and freedom if they cooperated in producing for Hitler, perfect forgeries of some of the allied currencies, but in particular, forgeries of the British pound and the American dollar. At first they refused, but one by one they cooperated and in an astonishingly short space of time, they produced what seemed to be perfect forgeries. The German government supplied from its own papermills what is usually the stumbling block to perfect counterfeiting — high quality paper. The plates and paper were perfect, but not satisfied with their own judgement, a secret agent was sent to neutral Switzerland with a suitcase full of “German-made” pounds and dollars as well as other currencies in all denominations. This agent went to one of Switzerland’s largest banks and requested to see the manager and stated: “I am negotiating a business deal with a man I suspect of being a Nazi agent, and he intends to pay me in this currency with these bills. Please test them and see if they are genuine”. The bank manager explained he could not do this right away since it was in foreign currency, so the Nazi agent left the bills with the bank manager arranging to return within a few days. Upon his return, he was told that the money was genuine, and that the bank would be pleased to accept it for exchange. The agent returned to Germany and the printing presses started rolling in Auschwitz and Buchenwald. Untold millions were printed, so much so that Britain after the war, withdrew from circulation its five pound note — a first in British history.

There is an interesting sequal to this story. Rumours persisted about operation Bernhard long after the end of the war and one such rumour was checked out. For weeks a group of Austrian government frogmen searched Lake Toplitz in Austria. Eventually they found the wreckage of a German plane, the skeleton of the dead pilot still strapped to his seat. In the hold were large metal trunks which, when pried open, revealed over 300,000 British five-pound notes, in neat bundles, perfectly unspoiled and with them, some of the printing plates. The money was confiscated by the Austrian authorities, although it was at that time useless the five pound note having been withdrawn from circulation by the British after the war.

Now remember the U-Boat captain had paid for his food in U.S. dollars and obviously had no shortage of money since each crew member of the whaler had been given a $10 bonus.



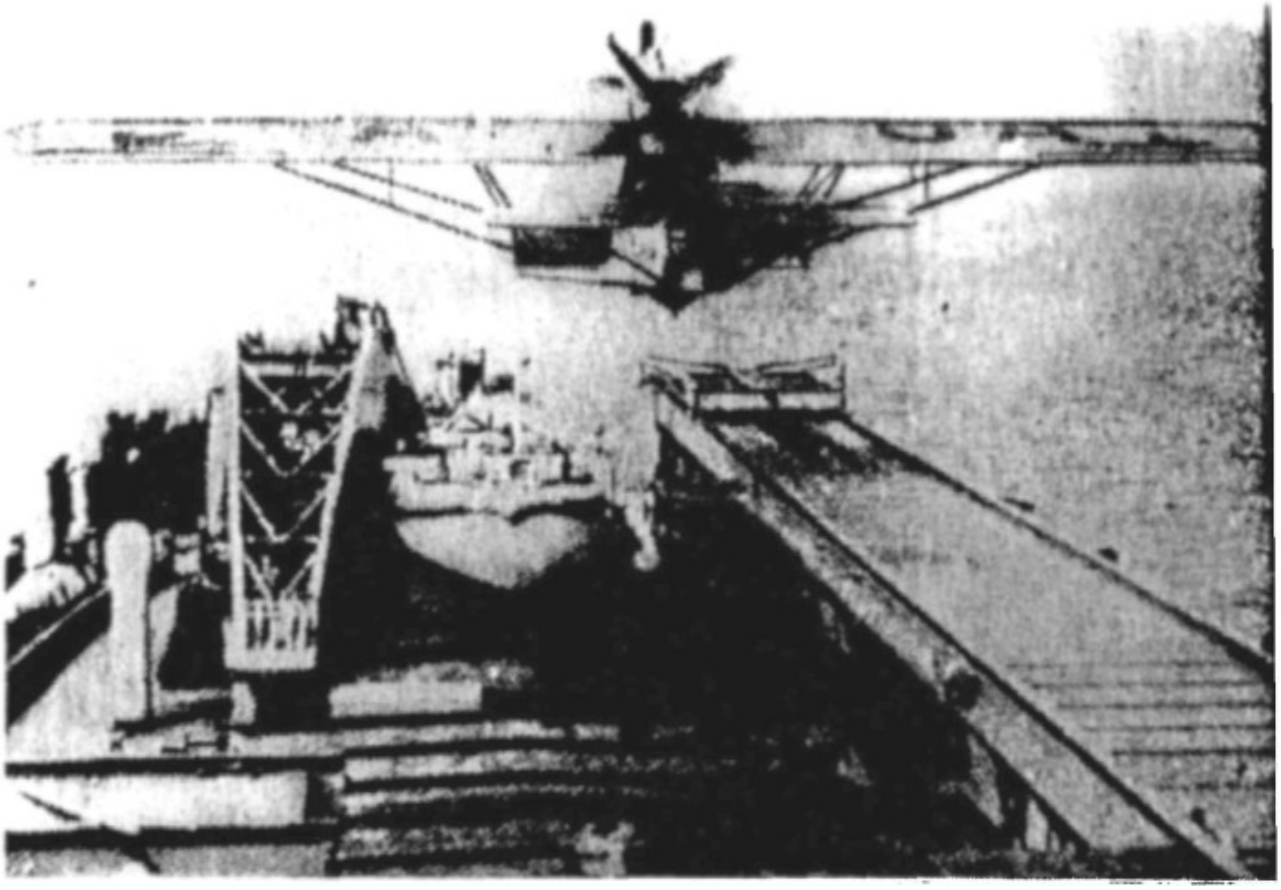
It is not generally known that the entire Reichsbank Treasure, (All of Germany’s reserves) disappeared from the bank vaults in Berlin, before the end of the war. Guinness “World Records” book lists this story under **“The greatest unsolved robbery!”**

During the U.S. balance of payments crisis, Time magazine carried an article about discussions taking place at the Headquarters of the World Monetary Fund in Basle, Switzerland. They found that 15 Billion Dollars were in circulation, which should not really exist. One wonders where that amount of money came from?

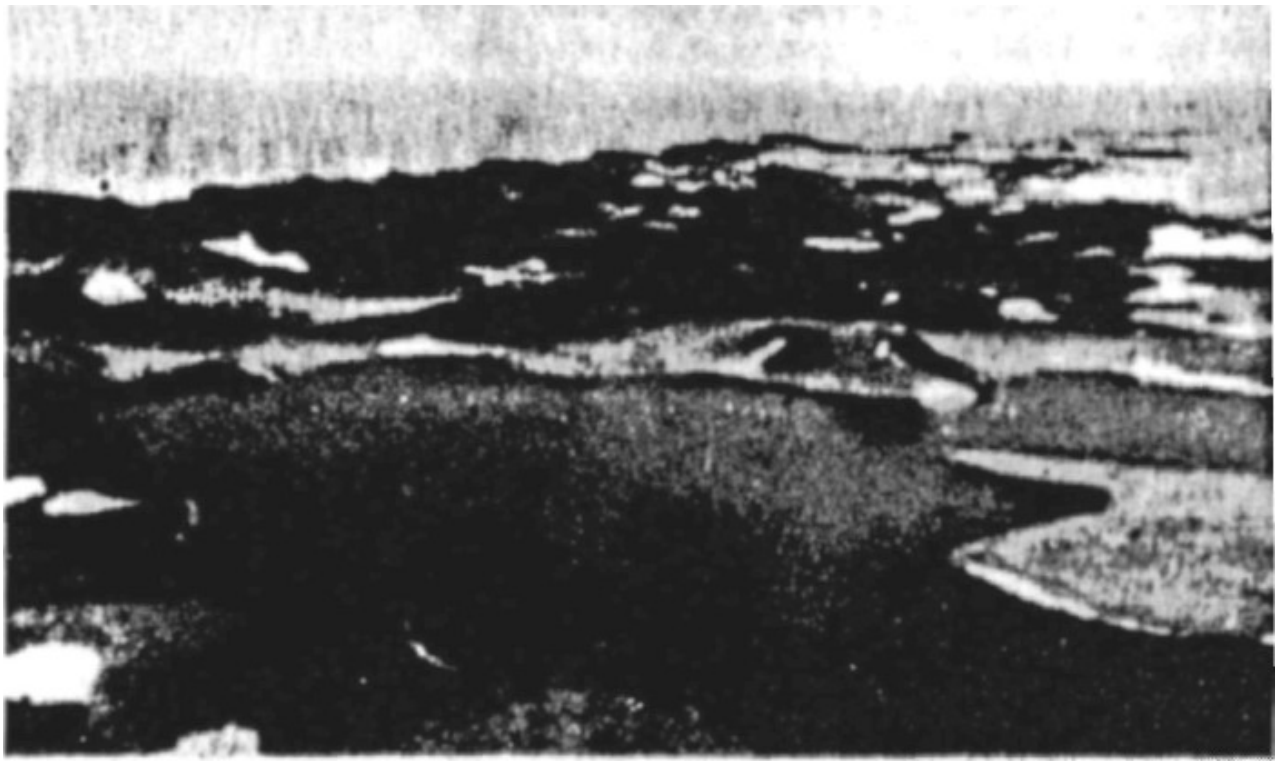
TOP-SECRET NAZI EXPEDITION

Let us now turn our attention to the location of the bases. Again, even in this area Hitler had planned far ahead and at long range. Obviously guided by the possible occupation and subsequent loss of Germany itself, he had cast around for land still available for colonization and found that Antarctica was, at that time, the only continent still unclaimed. With his usual dispatch, a polar expedition was organized,

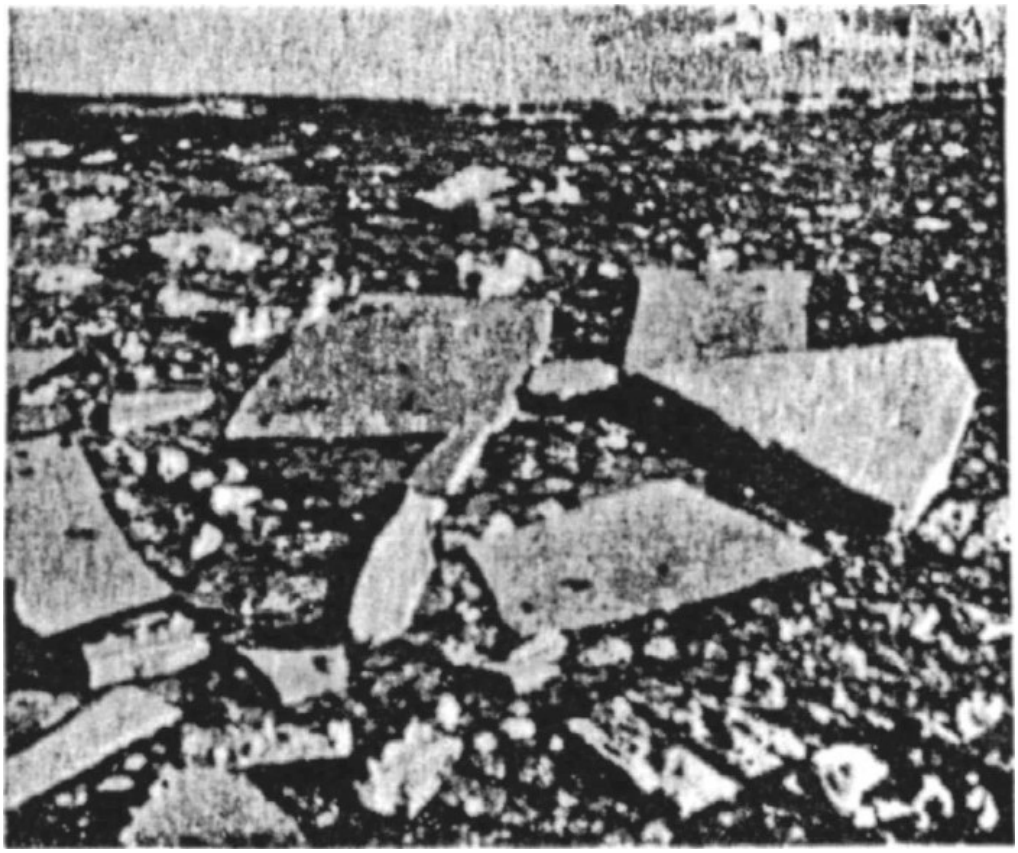
the preparation of which was kept secret. The force consisted of several large vessels, at least two of which were aircraft carriers, not the present-day type but rather large ships with float-equipped airplanes on board. The planes were rocket-catapulted off special ramps at the end of the ships and retrieved out of the water via a crane. This secret Nazi Expeditionary Force was headed by Kapitan Ritscher and took place in 1937-38. The force landed in the area of Queen Maud Land and established bases there. Large float planes of the Dornier-Wal type, with their unusual pusher-puller propellers were used to explore a huge area of Antarctic terrain. Over 11,000 photographs were taken for mapping purposes. Significantly, a Swastika flag was dropped *every* 20 kilometres to substantiate the German claim to that land, comprising over 600,000 square kilometres in all. In this way, not only was a terrain claimed by Germany, larger than Germany itself, but more significantly, for the first time, ice-free oasis (warm lakes) were found by this secret Nazi expedition. They were photographed along with Alp-like mountain ranges of over 4,000 metres in height. Naturally, the explored areas were given German names and so we have today places like “Ritscher Gipfel” — “Ritscher Peak”, named after the leader of the expedition. The hot oasis amongst the eternal ice was called “Schirmacher Seen Platte” — “Schirmacher Lake Group”. The different coloured appearances of these inland lakes were caused by alga found floating in the sweet water. The waters are warm enough to allow swimming and bathing with just bathing suits and swim trunks.



The Alp-like mountain range discovered by Germans; the highest peak over 4,000 metres was christened “Ritscher Peak” after the leader of the expedition.

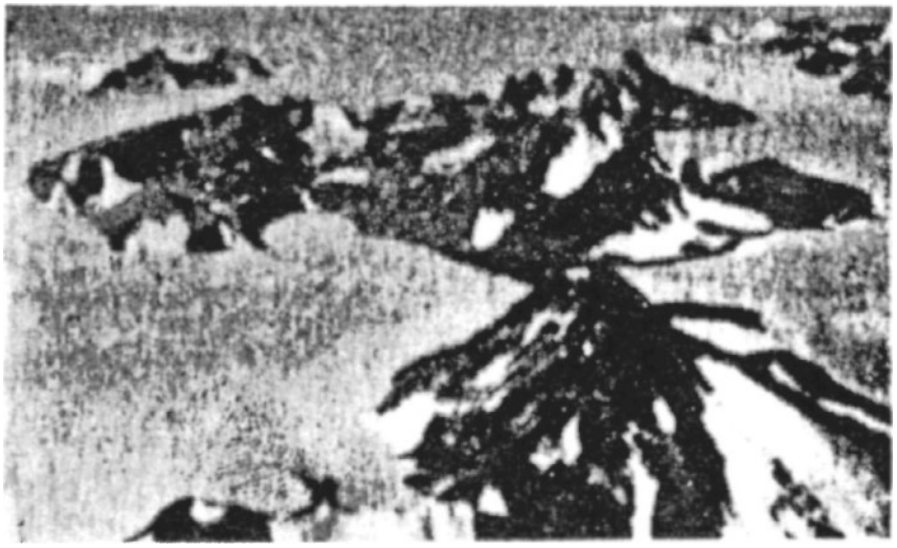


German landing party in rubber dinghy. In background the aircraft carrying ship "Schwabenland"



Centre: Expedition members showing one of the Swastika flags, dropped by the mapping planes every few miles to underline Germany's claims.
Bottom: German flying boat on the ice-free oasis, warm water lakes, discovered by the expedition. Note pusher-puller propeller arrangement

The German catapultship One of the large Dornier-Wal flyingboats is just taking off. (Note large motor vessel in drydock area)

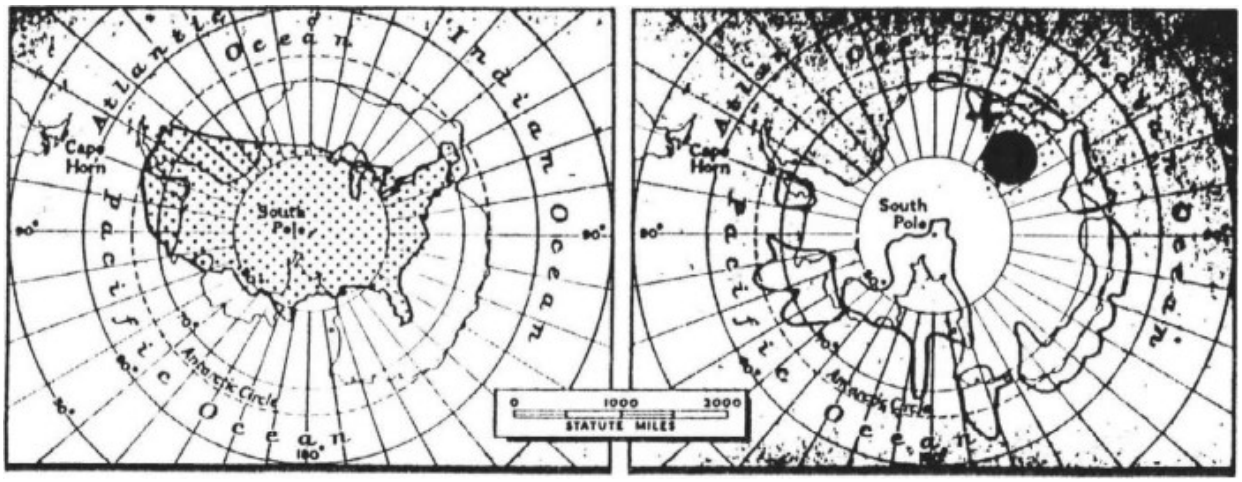


The Expedition took over 11,000 photographs, mapping approx. 600,000 square kilometres. Here is a photo of the "Schirmacher Seenplatte" — the ice-free islands, "Re-discovered" by Admiral Byrd ten years later.

The little specks on the ice are seals and sea lions weighing up to 2,000 pounds and "not too bad to eat" and very plentiful.

THE MOUNTAIN RANGES DISCOVERED

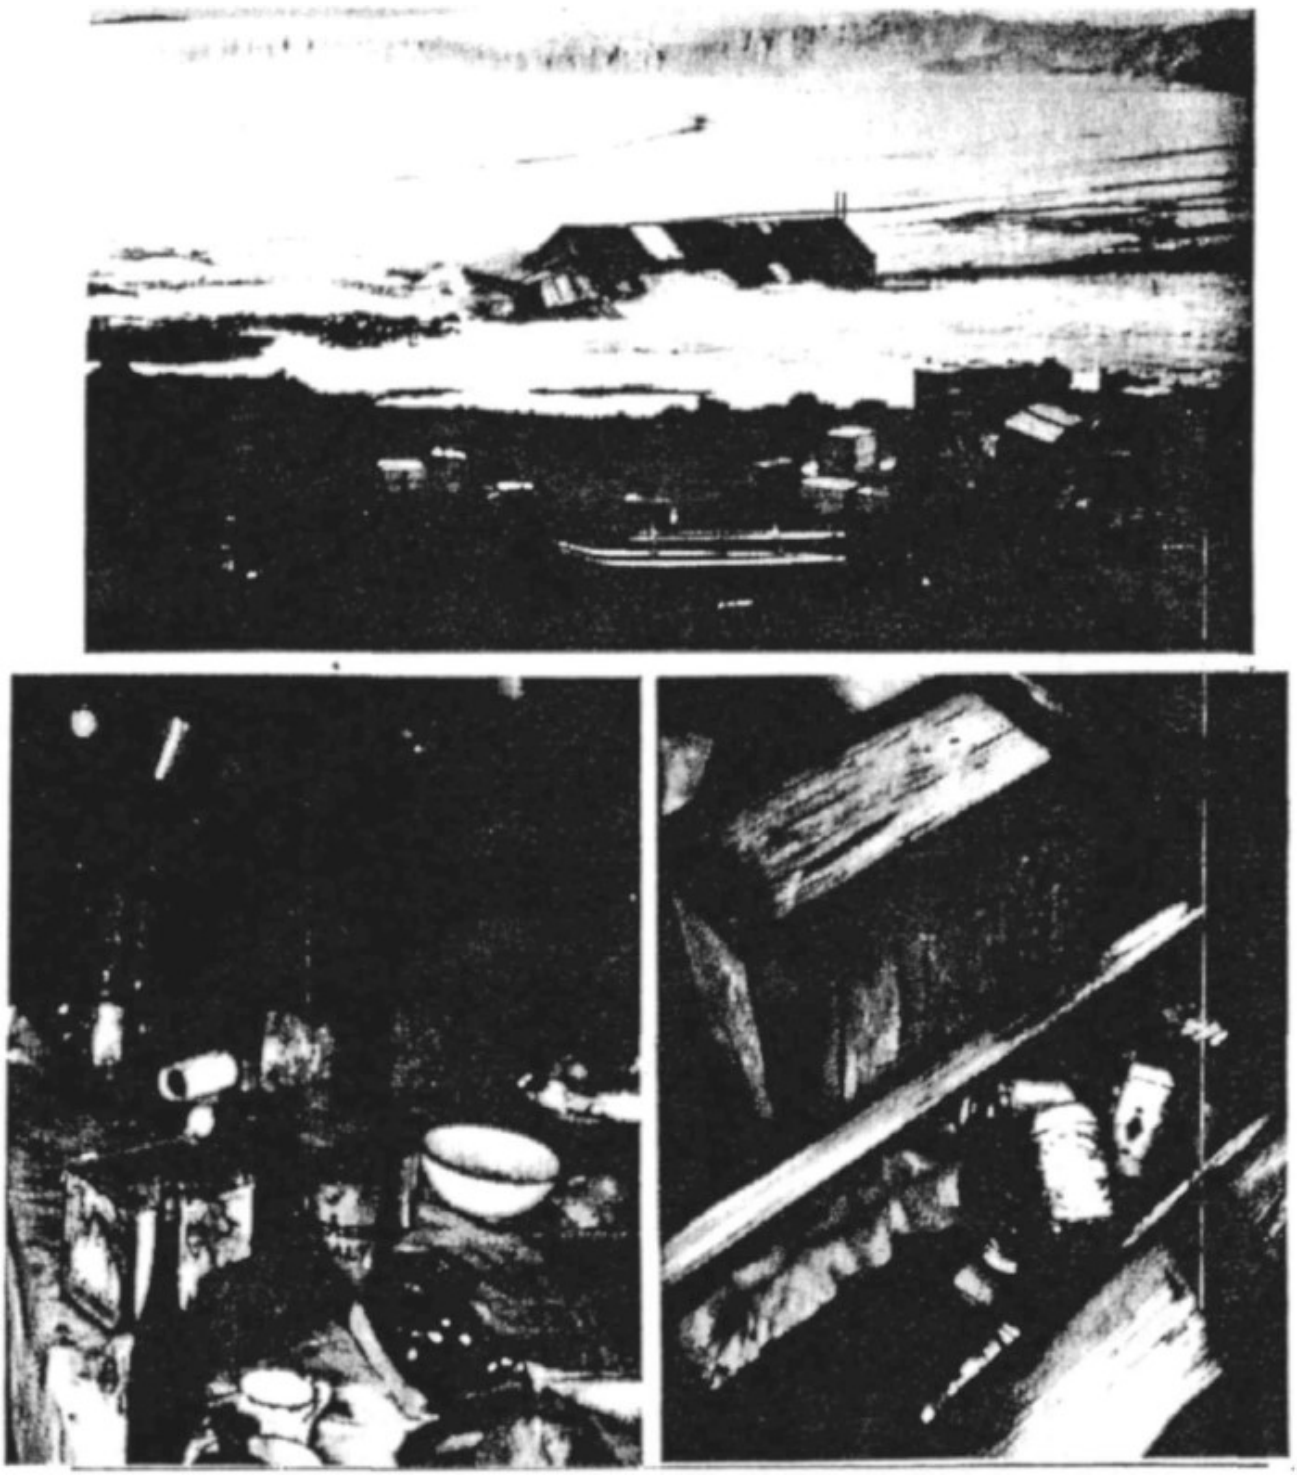
Heretofore never published in the English-speaking world, are actual photographs of this Nazi expedition and some of the startling discoveries.



**The Alp-like mountain range discovered by Germans;
Taken from the air**.

Added credence to the secret bases thesis can be found in remarks attributed to Joachin von Ribbentrop at the outbreak of the war. "In accordance with Germany's long-range political strategy, we have taken into firm possession the Antarctic area, called New Swabia (New Schwabenland) to ensure a safe retreat in case of necessity." (Taken from Mattern's previously quoted German edition of this book).

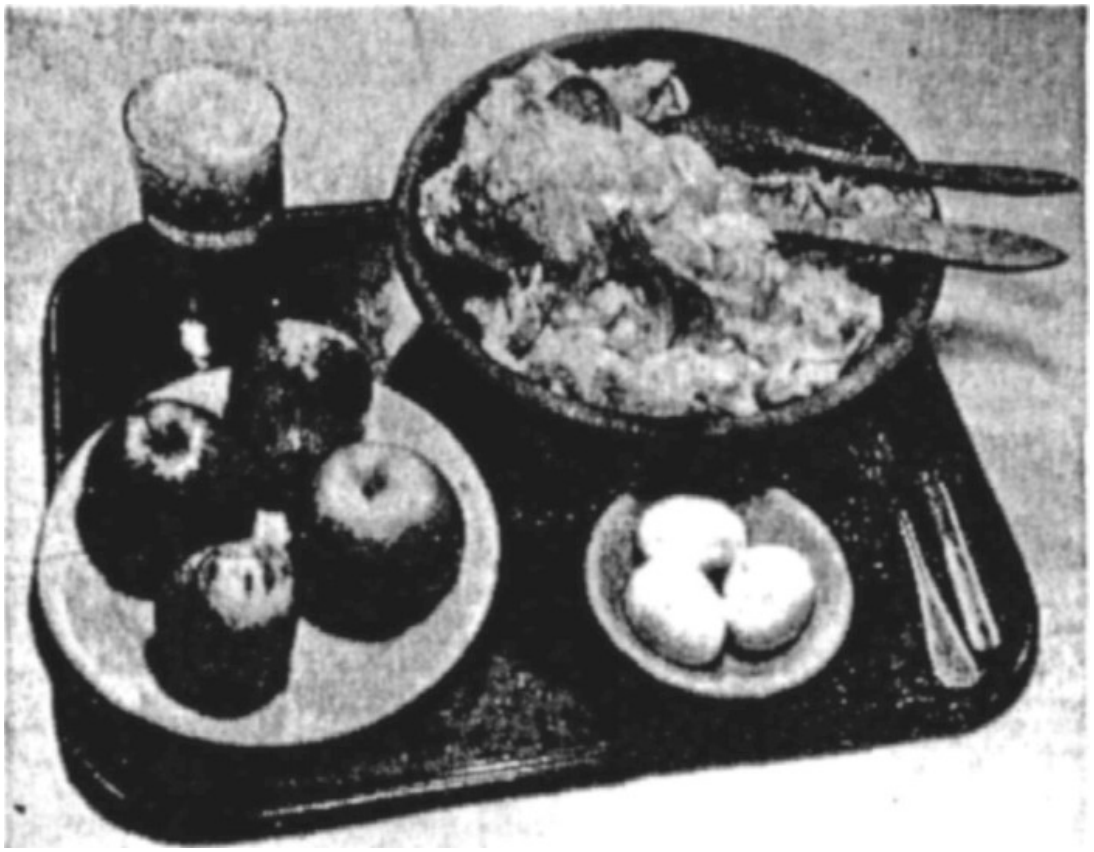
For an exact location of the German area of Antarctica, please look at the map reproduced here, and compare the relative size of the United States with Antarctica. A huge area, indeed.



Continental United States in comparison with Antarctica

The Byrd expedition and its mapping mission indicated by wavy lines. Black circles indicates German territory. Byrd's intercepted flight marked X

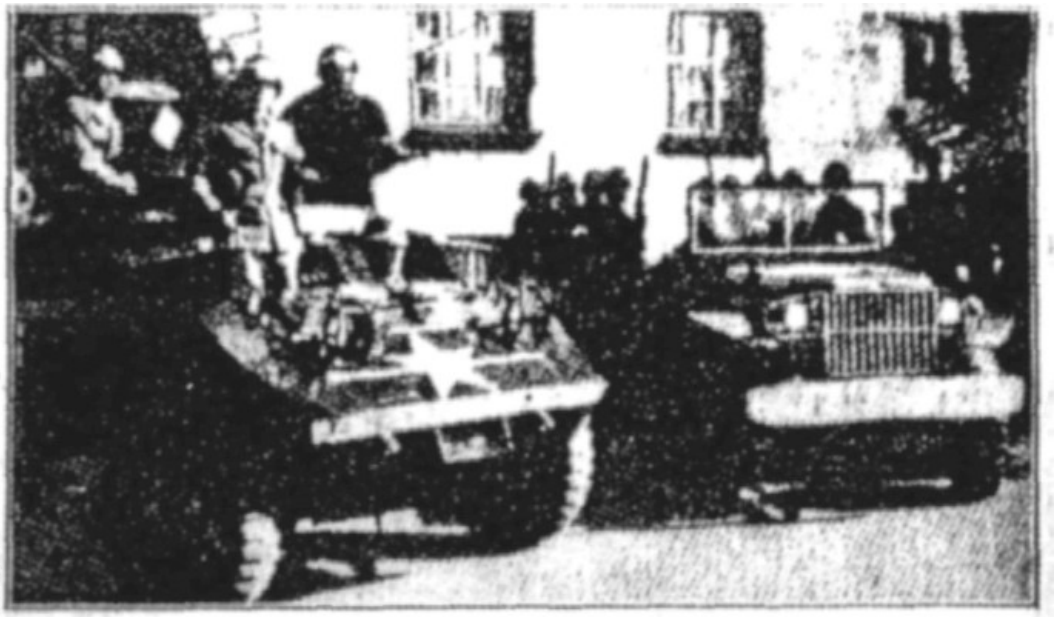
Other factors make Antarctica an ideal place for these bases. There is no rust, no germs, and consequently very little illness or decomposition. Food remains edible forever it seems, since the whole region acts rather like a giant freezer. For instance, the shed where Scott spent some months pre-W.W. I, before he launched his ill-fated antarctic expedition, was recently discovered. The food which remained in the shed, from almost 70 years ago was still as fresh and edible as on the day it arrived in antarctica, and wooden boxes, tin cans, cups, candle and paper (in fact everything), are as well preserved as if by inanimate suspension. Antarctica has no flies, no bugs, — no bacillus can survive the cold temperatures — not even the common cold can survive.



See photographs of Scott's camp.

The camp of Polar-explorer Scott, re-discovered after 60 years. Food supplies which were left were still edible. The table setting was as if just left. No deterioration.

These same non-deteriorating conditions where found in Jan. of 1947 by Admiral Byrd at the headquarters in Antarctica which he had established and lived in for months in the early 30's. From this it would seem safe to assume that human beings too would be subject to the same natural laws and therefore



age much less quickly. The significance of all these factors would not have been lost to **a** very health conscious, vegetarian Adolf Hitler.

Health-conscious Hitler was a vegetarian. Here is a typical meal. No alcohol. No nicotine.

Now could all of this have taken place in the 20th century without detection? Hardly! What steps were taken to discover the truth? What has been done about the secret bases now that their existence has been established and established beyond **a** doubt? Why did the world not hear about these incredible events?

Obviously, Hitler's escape was soon discovered, otherwise the statements of Stalin and of Eisenhower and all other quoted sources would be an exercise in insanity. It has been speculated that the Nuremberg War Crimes Trials were staged, to a great extent, in the hope that the "Last Battalion" could be drawn from their impregnable, inaccessible hideouts, and thus force the Fuhrer's hand. A large armed force of elite troops surrounded the whole of the Nuremberg area during the long agonizing months of the typically-Bolshevik show trials. Perhaps there are readers who will be able to recall from newspaper pictures or newsreels the "tight security" that existed in the whole of Germany during these trials. Some S.S. men were actually caught, tried and convicted for attempting to free their leaders, but when the orgy of strangulations and torture was over, the Fuhrer was still nowhere to be found. Some UFO overflights and activities were reported but no actual armed clashes or incidents took place.

(Associated Press Radiofoto)
Manned by U. S. troops, an armored truck and a weapons carrier stand guard outside Nurnberg courthouse while verdict is being read.

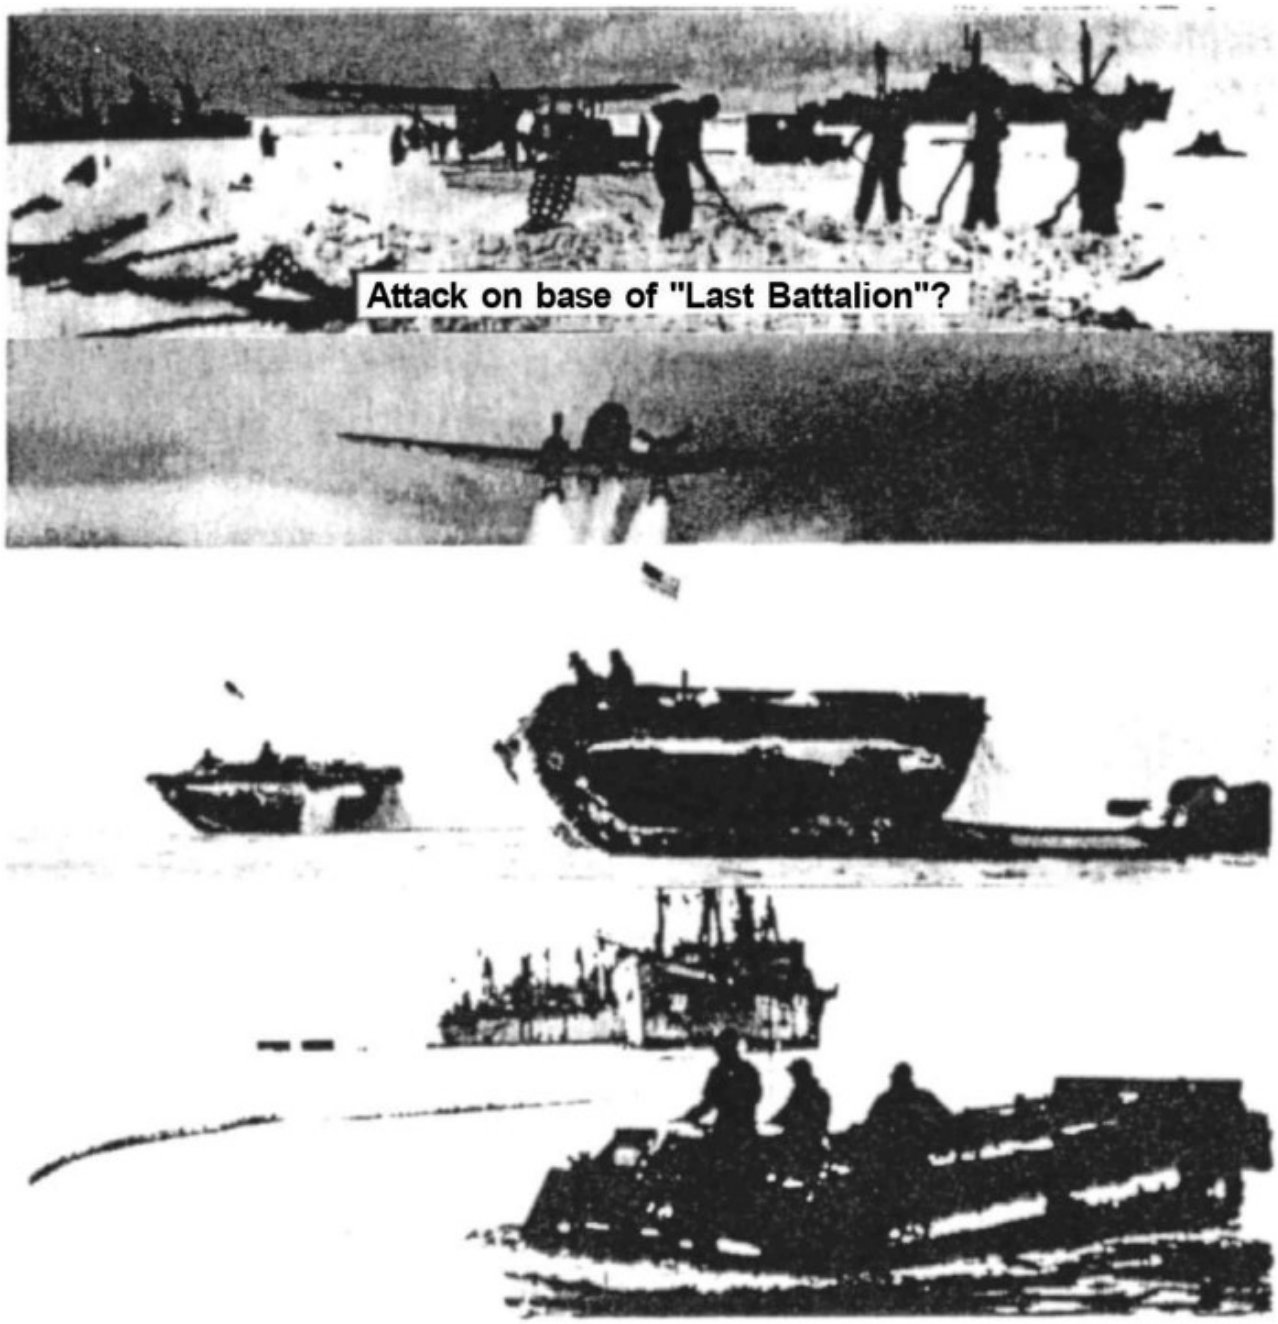
Washington, Moscow and London then decided to really "get into the act"; in fact, eight countries in total decided to do some "scientific" work and in Antarctica, of all places!! A large expedition, lavishly financed was quickly put together. It consisted of over 4,000 specially selected elite U.S. navy troops along with an eight month food supply. Thirteen ships under the overall command of Admiral Byrd made up this purely "scientific" expedition, composed mostly of military-types and very few scientists.

The U.S. Antarctic battle fleet left Norfolk, Va. on Dec. 2, 1946 — three distinct battle groups, comprised of the Mount Olympus, Admiral Byrd's command ship, the ice-breaker, "Northwind", the catapult ship "Pine Island", the destroyer "Brownsen", the aircraft-carrier "Philippines Sea", the U.S. submarine "Sennet" and the two support vessels, "Yankee" and "Merrick", as well as the two tankers "Canisted" and "Capacan", an additional floatplane carrying ship, "Currituck" and the destroyer "Henderson".

At the same time it was announced officially that a similar English-Norwegian force was operating in a support capacity in Antarctic waters around Bahia Marguerite. A Soviet contingent was also reported to be participating in the "research".

U.S. Convoy in Antarctica

The Soviet participation is an interesting one, since Winston Churchill had already spoken of an "Iron Curtain" and felt that "they" — the crusaders to Europe had "killed the wrong pig". Obviously Churchill now realised that they should have destroyed Bolshevik Russia not Germany.



The general public was told that the "RESEARCH" mission was interested in locating uranium and studying the weather. Admiral Byrd, who had already undertaken a similar, though much smaller and speedier, investigation of the north pole was asked why he had recommended the establishment of armed observation camps. His reply, "Because the pole lies between us and our enemies" — El Mercurio, Santiago, Chile, July 7th, 1947. Further questioning as to which enemy he meant, since the Axis powers had just been defeated and had "unconditionally surrendered," brought no response.

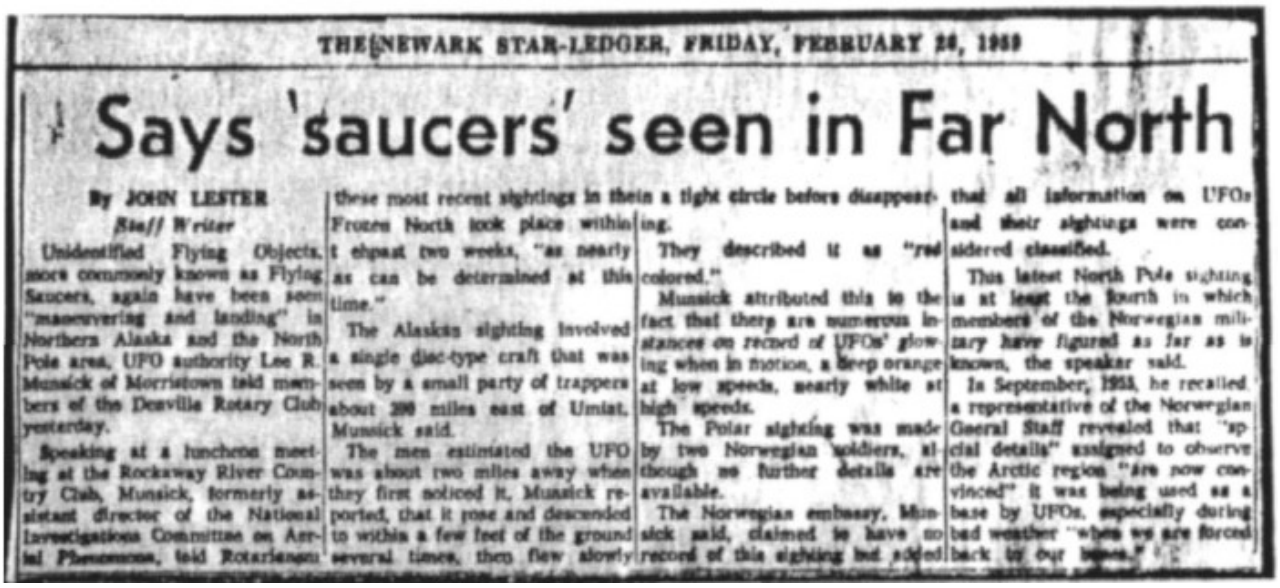
However, it was soon learned that as well as the scientific jobs, the mission had the task of "observing the activities of a foreign power in the South Pole Region". Questioned further on this part of the expedition's activities, Adm. Byrd reportedly replied "To break the last desperate resistance of Adolf Hitler, in case we find him in his Neuberchtesgaden inside "New Schwabenland" in the Queen Maud Land region, or to destroy him".

The Spanish book "Hitler esta vivo" page 161, reports that Byrd's expedition was equipped with the very latest devices, amongst them "detectores termo magnetico" — as stated by Ladislao Szabo.

The U.S. expedition duly arrived and landed in Antarctica. With them the very latest in military gear and gadgets, from amphibian tanks to troop carriers, helicopters, floatplanes and every other conceivable military apparatus. Bases were established and quickly expanded. Observation planes were sent out all over the region. Reproduced here is a map giving a flight pattern of all the flights undertaken. Many thousands of photographs were taken and mapping missions flown. One particular flight stands out amongst all those reported and one in which Adm. Byrd, himself, was aboard. The instruments went totally haywire and the performance gauges and altimeters behaved in a most erratic manner, causing

Adm. Byrd to abort the flight and return to base on “visual” control. All instruments returned to normal as soon as open terrain had been reached.

U.S. Amphibian landing



It has been reported by papers and sources previously mentioned here, that Admiral Byrd had located the Secret Nazi Base and was approaching it when the above incident took place causing abandonment of the flight, but not before he is reported to have dropped an American flag (some reports mention **a** bomb) on the approximate spot of the base. Undoubtedly this was done to warn Hitler he was not entirely safe even in his “New Berchtesgaden” or, as one writer calls it, Hitler’s Shang-ri-la.

Vengeance was apparently swift and it seems the Fuhrer was not to be humoured. Within 48 hours, four of Byrd's planes had been lost, some without a trace and others without any survivors. (See crash sites marked on map). Adm. Byrd hastily abandoned all his efforts and disembarked, with all his force, for home.

German Base? German defenders? Red Alert!

On board his flagship "Olympus" he gave the following startling interview, translated from the Spanish as it was reported in the paper El Mercurio, Santiago, Chile on March 5, 1947. It appeared on the front page under the headline "On Board the Mount Olympus on the High Seas". Apparently Adm. Byrd granted an interview to Lee van Atta. "Adm. Byrd declared today that it was imperative for the United States to initiate immediate defence measures against hostile regions. The Admiral further stated that he didn't want to frighten anyone unduly but that it was a bitter reality that in case of a new war the continental United States would be attacked by flying objects which could fly from pole to pole at incredible speeds. (Earlier he had recommended defence bases at the North Pole). Admiral Byrd repeated the above points of view, resulting from his personal knowledge gathered both at the north and south poles, before a news conference held for International News Service".

THE NEWARK STAR-LEDGER, FRIDAY, FEBRUARY 20, 1959

Says 'saucers' seen in Far North

By JOHN LESTER
Staff Writer

Unidentified Flying Objects, more commonly known as Flying Saucers, again have been seen "maneuvering and landing" in Northern Alaska and the North Pole area, UFO authority Lee R. Munsick of Morristown told members of the Denville Rotary Club yesterday.

Speaking at a luncheon meeting at the Rockaway River Country Club, Munsick, formerly assistant director of the National Investigations Committee on Aerial Phenomena, told Rotarians these most recent sightings in the Frozen North took place within the past two weeks, "as nearly as can be determined at this time."

The Alaskan sighting involved a single disc-type craft that was seen by a small party of trappers about 200 miles east of Umiat, Munsick said.

The men estimated the UFO was about two miles away when they first noticed it, Munsick reported, that it rose and descended to within a few feet of the ground several times, then flew slowly in a tight circle before disappearing.

They described it as "red colored."

Munsick attributed this to the fact that there are numerous instances on record of UFOs glowing when in motion, a deep orange at low speeds, nearly white at high speeds.

The Polar sighting was made by two Norwegian soldiers, although no further details are available.

The Norwegian embassy, Munsick said, claimed to have no record of this sighting but added that all information on UFOs and their sightings were considered classified.

This latest North Pole sighting is at least the fourth in which members of the Norwegian military have figured as far as is known, the speaker said.

In September, 1953, he recalled a representative of the Norwegian General Staff revealed that "special details" assigned to observe the Arctic region "are now convinced" it was being used as a base by UFOs, especially during bad weather "when we are forced back by our bases."

During this press conference the Admiral also stated that in a quickly shrinking world the United States could no longer derive any sense of security from its isolation or on the geographic distance of the poles or oceans. The Admiral affirmed once again his belief that the entire Antarctic continent should be closely watched and surrounded by a "wall of defence installations, since it represented the last line of defence for AMERICA". (These defence measures have since been taken). Admiral Byrd further stated that no one could give a more accurate accounting of the true significance of the situation than he could, since he had had occasion to employ the latest scientific developments and from what he had learned he could make comparisons. (Meaning he had encountered the effect of the secret weapons?)

When Admiral Byrd had arrived in the United States and the significance of his findings had found their way into the press, he was hospitalized. No hard information was ever unearthed but it seems his frank statements to the press in South America and on board the Olympus were not appreciated by the powers that be in Washington. Was he thus the first victim of a long string of prominent people "removed from circulation" for their honest belief in Unidentified Flying Objects, flying at incredible speeds from pole to pole?

Many definite and also very important conclusions can be drawn from the previous reporting:

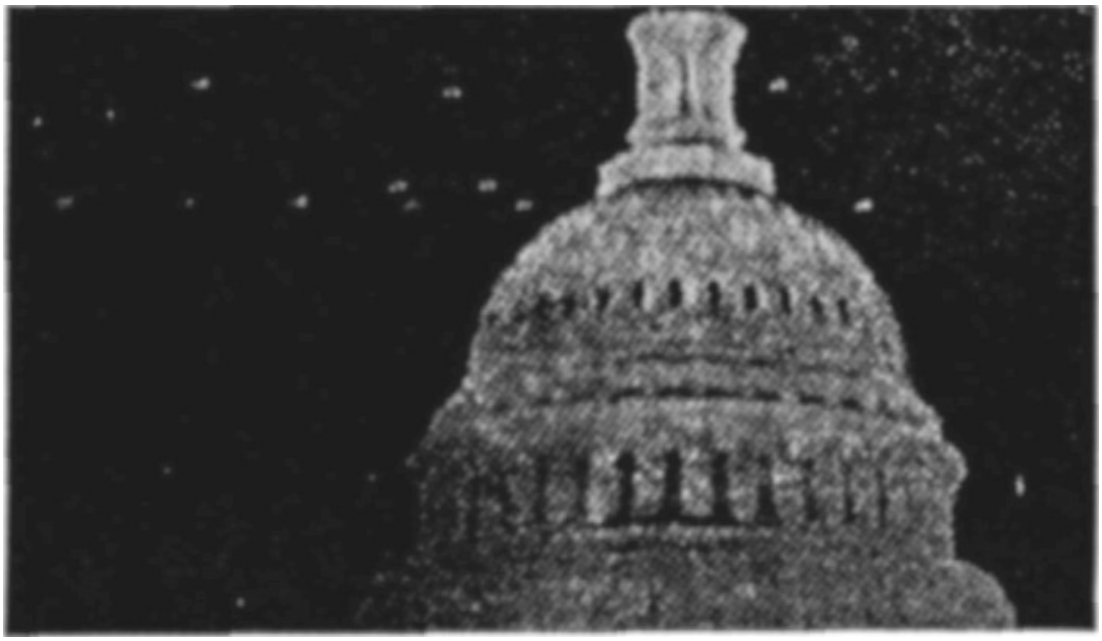
1. The final outcome of W.W. II is yet to be decided. This is borne out by the late General and former President Eisenhower's statement—"The second world war has not yet ended" and corroborated by Admiral Byrd's alarming phrase "in the case of a new war". Hitler's Last Battalion is waiting for its golden opportunity to be "the tip of the scale" in any conflagration yet to come.

2. The over forty-four small wars since 1945 including Korea and Vietnam, were supposed to provoke a premature "showing of hands" by the Last Battalion.

3. Hitler has defended his secret lair as successfully against Byrd as he had his numerous headquarters in Europe, during the war against the Allies. Byrd was forced to retreat and to acknowledge the superiority of the UFO's, and their secret weapons.

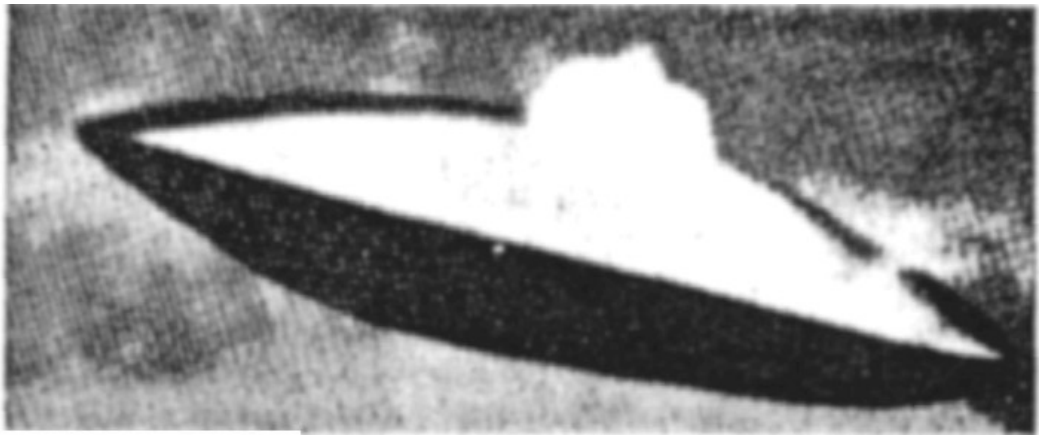
4. The "New Third Reich" has maintained its crucial time — technology advantage over its W.W. II adversaries — possibly even increased it.

5. Idealism (spirit) has triumphed already over Materialism (money), since only the German state was destroyed but not the ideology of National Socialism.



6. There has been a 30-year cover up by brain and more often by brawn, about the true identity of the UFO's or at least many of them. Their origins have been known, but deliberately suppressed by the rulers of the Unholy Alliance of 1939-45.

7. The real and only reason for the insane UFO cover up, now falling apart, is to be found in most UFO's German origin. The Allies in East and West have told so many lies about the barbaric, sadistic behaviour of the Nazis, that they now fear wide-spread panic amongst their populations, should the truth become known. After all, if the Nazis are still around, would it not be logical and natural for them to take revenge one day? With U.F.O. power!



WHY THE BIG UFO COVER-UP?

For 30 years some of the world's most imaginative people have wondered about the "strange" behaviour of their governments when it came to the questions of the UFO's. If the UFO's are extra terrestrial and the humans on this planet have no "defence" against them, then why annoy these beings by orders to "shoot to kill?" It is interesting that once again we see perfect harmony of approach between the U.S. and the Soviets. Recently there was a very detailed report about the Soviet Air Forces having stumbled upon some secret UFO bases in far off Mongolia. Apparently the Soviets went in in their usual barbaric style, bombed and burned everything to the ground, as reported by Dipl. Ing. A. Schneider in the Viennese newspaper, K. Die aktuelle Serie, P.a. Sat. Sept. 14,1974. ". . . the following remarkable report reached us today from the Soviet Union: April 24, 1970 was a day that all hell broke loose. A supersonic Soviet jetbomber in a secret mission from Moscow to Vladivostok was lost without a trace over Siberia. The pilot was in voice contact with ground control stations when suddenly the transmission was interrupted. An intensive search by nearly two hundred planes was quickly organized over the area where the pilot was last heard from. Almost simultaneously a number of pilots reported to ground control "we are not alone up here, above us are flying objects, may be 25 or even more. They are huge, they are so high we cannot get near them". That same afternoon in Krasnojarsk, red alert was sounded and troops were deployed around the city because an entire formation of these silvery, silent visitors circled over the scared town. Apparently, entire salvoes of ground to air missiles were fired at hundreds of flying discs which crowded the airspace of the Sino-Soviet-Mongolian frontier area. There was a concerted action by the strange intruders against the town of Ulan Bator, where all flights seemed to emanate from and end. A spokesman for a group of touring German students said after returning from Mongolia, where they had been at the time of the "UFO invasion", that the Soviet Union had destroyed a secret UFO base of immense proportions consisting of many miles of subterranean tunnels, and dozens of pyramid like structures in the northern area of Mongolia." However no photographic proof or documentary evidence exists. The Soviets are always very secretive.

After Admiral Byrd's hasty retreat from Antarctica he not only suggested bases around both poles and a ring of armed camps, but offered this plan: Turn Antarctica into atomic test ranges where atom and hydrogen bombs could be dropped to be "tested". No sooner had the idea been advanced and announced in the press than a strange thing happened. Capitol Hill in Washington, D.C. received an official visit. There is not a UFO fan who has not seen this historic photograph of an entire "swarm" of U.F.O.'s flying over the nearby Congressional Buildings and the White House in perfect, "typically-German" formation. Many UFO researchers have been puzzled about that particular flight. Was it a demonstration of strength? Strength calculated to show that open cities such as Washington or New York, with the many skyscrapers, were far more vulnerable to havoc than the continent of Antarctica with its three to four mile thick ice cap. Interesting too, that the Antarctic test site idea was never again seriously considered. Perhaps we should score another victory of the Fuhrer's "Last Battalion"?

Many sightings took place around the world from Japan to Korea, where we have a particularly good example of a UFO de-materialising in front of the cameras. (See photo.) One must ask "Why do these UFO's always show themselves, but why do they not land"? If one accepts the normal theory that they are extra terrestrial then the behaviour is certainly strange. Did the crews of these UFO's travel for so many millions and millions of miles and now not be able to make up their minds to land or not to land? Hardly sensible. Surely it makes more sense to assume they are from this earth, consequently they don't have to land since they know what earth is all about, and that they are, in fact, reconnaissance aircraft of some earthly power and have no need or desire to communicate. After all, they can tune in and monitor all radio, T.V. and telephone conversations without too much effort, and this would be "old hat" to people who have lived with this, our own technology, all their lives.

A book which makes very interesting reading is "Incident At Kearney" written by a German American who claims, and claims most convincingly, that he was taken up in a UFO on several occasions. He writes that the entire crew spoke German and behaved like German soldiers. He was taken on a flight to the pole. (Why to the Pole and not to the jungles of Africa or Brazil???) They were friendly and correct to him. No sooner had this author, Reinhold Schmidt, landed in his native America than he was

put through a regular hell on earth. Soviet methods were used to persuade him to "shut up" including the K.G.B. tactic of "insane asylum" treatment as reported by Solzhenitsyn and others. One further note of interest is that Schmidt was taken up in a UFO which matches exactly the shape and design of at least two German design UFO's. Just coincidence? I am inclined to think not.

The UFO cover up is similar in action to those other unholy alliances such as the mass murders of Operation Keelhaul, at Katyn, Dresden and Hiroshima. Let anyone dare to "not conform" with "the establishment's" version of things and we see people being hounded, defamed and persecuted.

The same pattern that applied in politics globally, when the non-conformist Hitler threatened to upset the international applecart, is still being applied' to the UFO cover up and has been applied for the last 30 years. Why?

Finally even N.A.S.A. seems to have caught on that rocketry is a rather old fashioned method of spaceflight and according to "Das Neue Zeitalter", of 5th August, 1967, is now ready to "drop rocketry in favour of flying saucers for flights beyond the Sun and Jupiter". However, not too much has materialized in that direction to this date.

It is here that another question must be asked. At the speed of our own space vehicles, the nearest "base" for visitors would be 170,000 years away. Well, that's quite a distance. Even granting a superior technology which could increase speed ten-fold, it would mean that the saucer crews would have to have taken off 17,000 years ago, when we barely had hairy Neanderthal "ancestors" grunting their way through caves along the "corocodile" invested Rhine. At that time, we had not even invented the wheel, hardly fire, never mind rockets. The only aircraft around at that time on this planet were, at best, birds and may be a few fire-flies. The space people could hardly have been worrying about us and our atomic experimenting — not when they left their bases, so perhaps we should stop making ourselves the laughing stock of the universe. Undoubtedly there is life out there in space amongst all those lovely stars in the sky. Not to believe this would be the height of ignorance and arrogance. Most of the UFO's we are hearing about on this planet are **earthlings!**

In 1959, in three separate large circulation newspapers in Santiago, Chile, it was reported on the front pages that UFO's had been seen, had landed, and that the crew members behaved and talked like "soldados alemanos". When the big UFO flap was on in the Catskills and in New York and in New Jersey in the early sixties, farmers repeatedly spoke of the crew members as addressing them in German or in English with a German accent. The power of the UFO's was pretty well demonstrated beyond the shadow of a doubt by the great "black out". Many people still insist the black out was the work of UFO's. There certainly was a rash of sightings at the time over and along hydro lines and power stations.

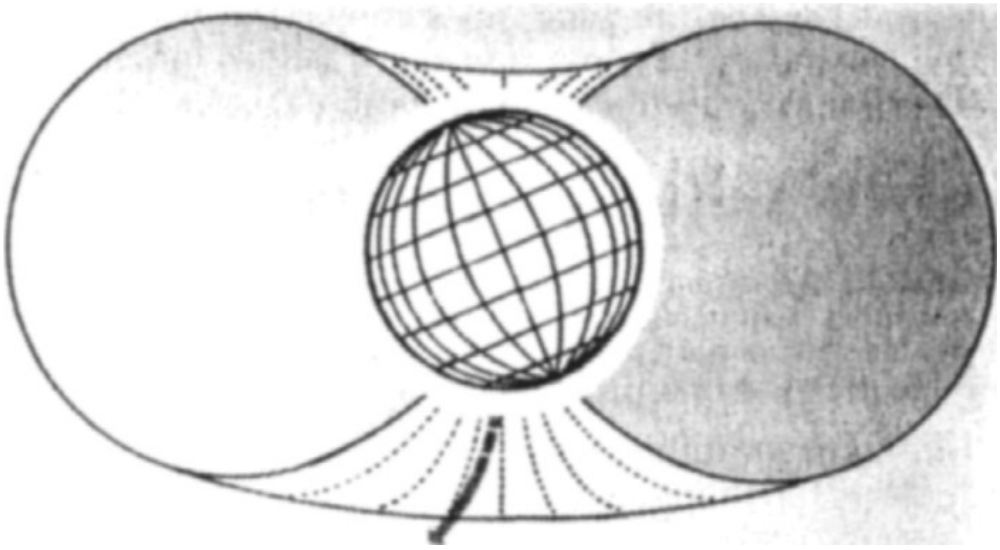
Often, UFO fans advanced the theory that the strange flying objects come from distant planets and galaxies to check on our "atomic experimenting", and some people state "contactees" have been told that the UFO's would prevent an atomic war on the planet earth. Why should they? Why should they care? They certainly do not demonstrate any great desire to colonize the earth — at least not in any great numbers. However if they are from earth, this attitude makes sense.

Unknown Object Sighted in Argentina

11/14/64

BUENOS AIRES, Argentina — (Reuters) — Argentine astronomers Sunday were puzzled over a red, unidentified flying object which sped across flattened, and red crossed the observatory's telescope range in four minutes, whereas normal artificial satellites take roughly 18 minutes.

But there are other reasons why the UFO's will not allow atomic devastation to wreck this planet:—



a) The UFO's are, by this time, driven by electro magnetism, consequently all secrets surrounding electric power have been discovered. Since all modern communications and guidance systems are based on electronics, it is an easy task to "listen in", decode and prevent the start or to re-direct whilst in flight, any vehicle or space craft, now in use by the "allies".

b) The destructive power of atomic weapons is therefore much more of a threat to the powers who possess them and have them stored in silos, in subs, in planes or on their own soil than to those countries who do not have these weapons at all, since they could quite easily be set off by remote control from the UFO's, before they were even launched.

c) The UFO's will undoubtedly prevent atomic war to prevent the extinction of the White Race. At the moment the white people are outnumbered ten to one on the planet and should there be an atomic exchange the ratio would be a hundred to one in our dis-favour.

No man of the calibre of Adolf Hitler, deeply committed to the survival and resurgence of Western Culture, would ever allow this tragedy to happen to the White race.

There is an interesting aside to this UFO Antarctic business and spaceflight. Perhaps a few of our readers know that in the region of the South Pole (Antarctica), and to a lesser extent the North Pole, it is possible to escape from the earth's magnetic pull and death through radiation because the Van Allen Belts open up, funnel-like, at both of these extremities. It is possible to launch a spacecraft, with very little radiation protection from this area avoiding enormous weight, a crew needs no radiation-protection gear.

The Van Allen Belts; radio active death belts surrounding the planet earth. They are open funnel-like at the north and south poles, permitting flight into space without heavy lead shields and protective suits.

We must also remember Hitler's feasibility studies of space stations, based on Prof. Dr. Oberth's ideal, 2-hour trajectory. An artificial satellite was to be rocketed into space in 1947 with the A9-A10 rocket, in a steep angle away from the axis of the earth, and counter to the earth's rotation. From this point it would have been possible to:

1) Observe any spot on earth within any given two hour time period.

2) Hit any spot on earth with accurate missiles, bombs, radar-guided or other gadgets such as "mirror beams" or "death rays".

Julius and Ethel Rosenberg mentioned these platforms in their testimony during their espionage trials. They called them "Warships of space". Where did they get this information about these top secret plans, not realised by the Allies until 25 years later? From the same documents that gave them the atomic bomb? But all of this is an indication that spaceflight was already known to a mysterious group of beings.

The American astronomer, Prof. Dr. James Greenacre and four of his colleagues made an astounding observation from Flagstaff, Ariz. Observatory and reported it to a Conference on "Moon Problems" in New York City in May of 1964. Because of the UFO cover-up policy still in force by the U.S. government, Prof. Dr. Greenacre was only able to give his report verbally to colleagues who were present at the Conference. Here is roughly what he said "On 29th Oct. 1963 we observed several colourful spots on the Moon, the spots moved in formation across the motionless face of the moon. One month later Prof. Dr. Greenacre observed the same phenomena. The May 1966 issue of "UFO Nachrichten" Vol. 117 reproduced what Dr. Greenacre had stated he had observed . . . "Prof. Dr. Greenacre saw on or close to the moon at least 31 space craft of gigantic size. Some were from 300 metre to 4.8 kilometres long. They were in motion while being observed through the telescopes. Also, clearly discernible were numerous

smaller craft approximately 150 metres in diameter, which moved past or alongside the huge craft, the "mother craft" occasionally changing colour, as in the often-reported, pulsating style." (The distance from the earth to the moon is 384,000 kilometres). End of report.

The American Professor thought at first the Russians might have beaten the Americans to the punch but as it turns out, the workers' paradise has not managed to land even a man on the moon — last report was that they were seen improving the brand barbed wire used in their more than 1,000 slave labour and death camps on earth, not on the moon. So, who is out there in the wild blue yonder? Prof. Dr. Phillips of Berlin, Hitler's wartime comrade claims he knows! He even sent the author of this book some charts and times tables of his flights. They match!!

Before we leave this area of investigation, we have to look into the repeatedly reported "glowing" or "pulsating" lights emanating from U.F.O.'s. We find an interesting reference to this phenomena in the previously-mentioned book "We want You" — "Is Hitler Alive?". On page 17 the author reports about a brilliant German metallurgist who had created "a metal harder than diamonds" called appropriately enough "Impervium". This metal glows alternately in the colours of the rainbow when heated to a high degree. This seems to tie up another loose end. Again the timing is interesting. The metal was used for the first time commercially in 1935-36. The laboratories were located not at Schramberg as Michael X reports, but at Starnberg and Starnberger See. However, this could be a simple spelling error by someone not too familiar with the German language.

Now it is time for us to get deeper into the state of actual German UFO research and development. Some is based on hard evidence, other areas have to be pieced together from bits and pieces.

German research and science were once the envy of the world. Every time Nobel prizes were awarded, one could find half a dozen Germans amongst those honoured. That was for achievement, real honest effort; recently, the only Germans so honoured were for betraying the interests of their country, usually to the Reds, in the east. When German scientists were given proper encouragement, sufficient funds and lofty goals their creative output was truly amazing. In the few short years from the time Hitler

achieved power, the Germans graduated from W.W.I-type airplanes to jets. The first all jet-powered plane was aloft in 1938 — a Heinkel. Since Germany was forbidden by the Treaty of Versailles to build large planes or military planes, research and development was taking place clandestinely in Russia for a time, but Russia being the type of country it was and still is, this work did not amount to very much.

In National Socialist Germany as soon as Hitler gave the directive, things got rolling. A tremendous amount of experimental work was carried out in several fields of development, namely:

a) conventional propeller-driven planes, usually all metal skin.
b) experimental, all-wooden, to scale delta wing airplanes, and all wing designs.
c) jet-powered planes and rockets, as well as turbo props.
d) the futuristic designs, such as flying disc and boomerang-type aircraft, powered various ways; flying platforms, people, tanks etc.
e) the helicopter, rotating wing, the gyrocopter designs as well as U-Boat pulled kites and gyroscopes etc.

During peace time all this work was carried out at regular aircraft plants near airports of major aircraft producing towns such as Munich, Augsburg, Stuttgart etc. These places were safe from aerial attack until America got involved in the war. Then the designs on the more futuristic designs were transferred to Silesia, East Prussia, the Sudetenland, Bohemia etc. The laboratories were usually underground in abandoned salt or coal mines, in some cases, however, entire mountains were honeycombed with a maze of tunnels, shafts, elevators and underground railroads. Smoketacks were camouflaged as medieval castle turrets. Entrances were so well camouflaged by entire forests that had been transplanted and in one such case it took playing youths six weeks after the war to stumble on a secret jetbomber factory the Americans had overlooked.

One case, known to the author's father, is the airfield in the Sudetenland, without any runway. The entire airfield, in effect, was built into a mountain. The planes touched down on what looked like the extension of a regular highway and were immediately gobbled up by a yawning crack in the side of the mountain. On the opposite side of the mountain, the jets would roar out at almost the speed of sound whenever they took off. Eventually, the Allies stationed 20 fighters on an around-the-clock basis always circling the "hole in the ground", hitting the elusive German fighters at that crucial time when forced to slow down to aim for the hole in the mountain. It is in bases like the above-mentioned, that some of the UFO experiments were conducted. All areas were guarded by electrified barbed wire, constant patrols and minefields. It was only possible to enter with special passes granted only by Himmler's Headquarters, all were consecutively numbered and had a picture of the bearer affixed. All security arrangements were in the hands of the S.S. Troops. Often when rumours got around to flying discs,

wings etc. amongst these S.S. Troops, they referred, in hushed tones to “Himmler’s baby”, leaning on a play in words, since Himmler in German means sky — “Himmelskind” or “child of the sky or heaven”. Why this strange nomenclature? Actually it is not so strange at all. The German “Landser”, the popular nickname for the German version of the G.I. had always developed short, but very fitting descriptive titles. For instance, when the Russians introduced their feared rocket batteries which sent a salvo of 12-16 projectiles screaming across to the German lines, it sounded like discordant organ music, therefore it was immediately nicknamed the “Stalin-organ”. So to the S.S. men the flying saucers became known as Himmler’s babies”, just as the Americans quickly called them “Krautmeteors”, appropriately enough, since they were fast as meteors and just as silent.

Let us visit one of the German saucer bases as described by the late Prof. Dr. Friedrich Kuhfuss, who died in Barcelona, Spain, in exile, having never been captured by the Allies. Prof. Kuhfuss had for years been involved in all manner of experimental flying activities. His family was wiped out by an American air raid and he vowed he would rather take his knowledge on flying saucers to his grave than to ever share them with “those barbarians from across the seas or those peachy complexioned hypocrites along the River Thames”. From Dr. Kuhfuss we at least know how one of these bases looked . . .

BASE X

Deep among the near-primeval, dark and foreboding forests, somewhere in one of the many hilly areas of Germany, there was a secret base simply called X. To the outside world it looked like an ancient hunting lodge, perched atop a small hill. Only two meandering winding roads led up to the “Jagdschloss” as German woodsmen and small farmers of the nearby village (about 8 km. distant) would simply call it. Apparently some gruesome murders had taken place in centuries past at the castle and local woodsmen insisted that on certain nights one could hear the frightful din and clash of arms and the shrieks and cries of the wounded and dying. Therefore the spot was treated with a peasant’s healthy respect, for stories of this type were never taken too lightly in Europe. However, someone in high places had apparently not heard of the ghosts and had decided that because of its strategic location at the end of the world, the Jagdschloss would be a good site for some far out experimentation and before the peasants and woodsmen knew what was happening, their forest area had been declared a restricted area. They were told that for the duration of the war the entire area was under the direct control of the S.S. All villagers were issued with special passes, with photographs; no outsiders were allowed to visit them and they were sworn to secrecy. War was war, and this was not the first time in their lives they had had to restrict their lives because of special circumstances and besides they found a ready market amongst the soldiers for some of the few things they had to offer for sale, such as eggs, the occasional chicken, goat, rabbit and perhaps even a pig. They observed, however, bus loads of people driving through their village usually sombre looking men, very few women, but many of them uniformed and an exceptional number of higher rank officers.

Since there was only one Inn in the village, The Gasthaus zum Goldenen Ochsen (The Golden Oxen) occasionally some of the heavy Mercedes and Opel automobiles would stop and their occupants lunch or partake of snacks. The men behaved in a most peculair manner. They all took their briefcases with them to lunch, many of these cases being of a size larger than the usual German briefcase. They were chained and locked to left wrists and time and time again the local peasantry stood open-mouthed with amazement as these people from “the outside world” descended upon their peaceful Inn, asking for dishes with which they were not familiar and asked for in German dialects which they could hardly understand.

However, the hand motions of the eaters, sometimes shooting into the air, or weaving back and forth, sometimes hovering and the occasional word fliegen (flying), schweben (float in air), aufsteigen (climb up) which they could understand, they began to realise that something to do with flying was being discussed and obviously in connection with the Jagdschloss.

One day, one visitor even asked the proprietor's daughter to fetch some old saucers from the kitchen with which a very serious group of men piled out into the courtyard and watched with much excited discussion and nodding, how saucer after saucer was hurled into the air like today's "Frisbees", to demonstrate to the assembled guests (obviously scientists) the flight peculiarities of Saucers, all of this much to the chagrin of the young woman, because dishes were a pretty precious commodity during war. However, the guests paid well for them, more than the "new" price and after the demonstration they roared out of town.

There was relative quiet for a number of weeks and then one day S.S. men asked the local burgermaster to call together the local inhabitants. An officer was introduced, he announced that close to the Jadgschloss an auxilliary to a concentration camp was to be set up and that the inmates were war plant workers engaged in extremely important work. Nobody was to fraternize with these people and all strangers or strange happenings were to be immediately reported to the S.S. Ortskommandatur. The inhabitants were thanked for the exemplary manner in which they had treated their "uninvited" guests and hoped for future good relations. He raised his arm, everybody said "Heil Hitler" and he walked out, leaving the townspeople talking excitedly amongst themselves. A few days later, truck after truck loaded with construction equipment of every conceivable description rolled through the village. Then followed wood lumber, many rolls of tarpaper and finally barbed wire. Later, followed a few buses, with windows painted over, followed by truckloads of steel-helmeted soldiers with carbines. Quiet settled again on the village. A few weeks later, where there had been meadows was now a hustling, bustling camp.

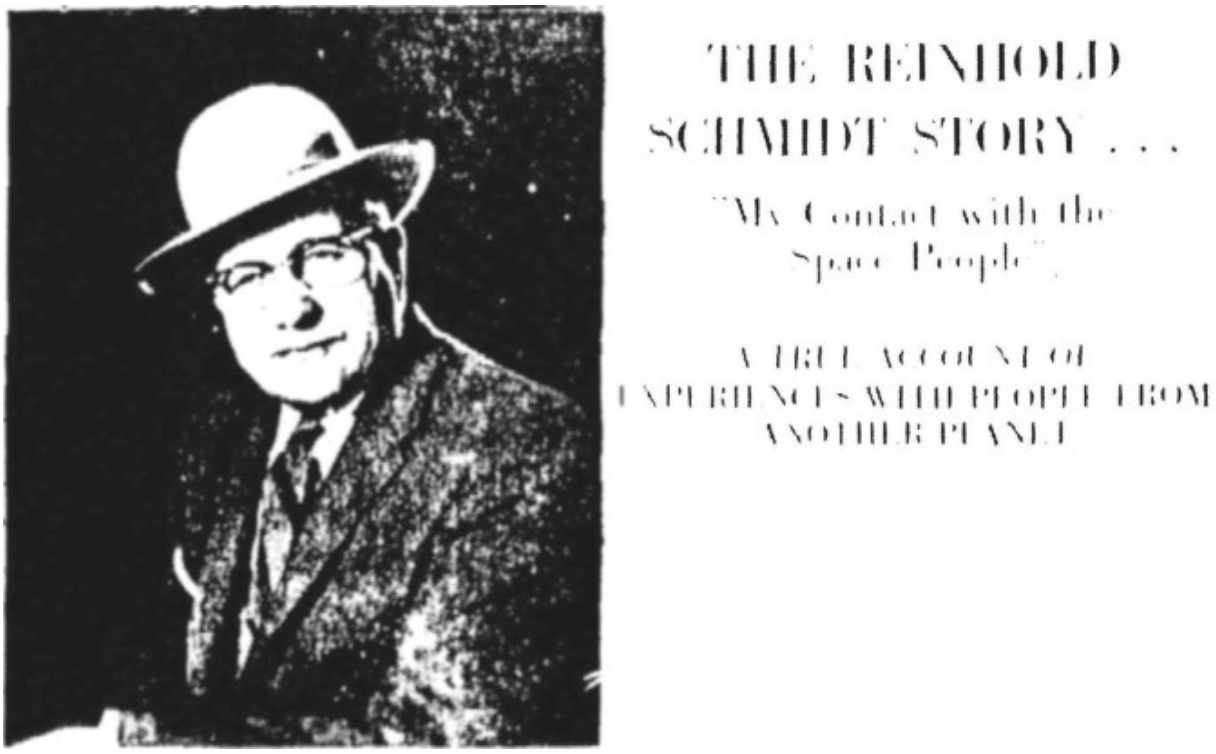
Soon loud and frightening blasts could be heard day in and day out, reverberating through the valleys. After a few months they ceased. Then huge, slow-moving, flatbed trucks began to arrive carrying loads, covered with tarpaulins all chained to the platforms and guarded by soldiers. This went on for many, many weeks. By now the whole village was rife with the most unbelievable rumours.

One night, the entire village was awakened and terribly frightened by sound of such high pitch and frequency that had commenced only as a hardly audible humming, that it was soon realised that something very unusual was happening. They rushed outside and to their utter amazement and bewilderment they saw a brilliantly illuminated "thing" hovering in the air in the general direction of the Jagdschloss. Then, just as violently as it had announced its arrival the sound died down, the light faded and the strange "thing" settled behind the treetops, out of sight of the relieved, yet still shaken local people. Eventually, this strange sound became familiar to them and only the children became excited about it everytime a "thing" started or landed. Soon, several of these strange vehicles, each a little different from the other, were flying about, at first slowly but later at such fantastic speeds that it was difficult to follow them with the naked eye. But now a new annoyance frightened the farmers. They had observed that their cows and dogs seemed to be affected by the high whine of the engines of these "things". Sometimes, when flying so fast, they made frightful noises, big bangs, that reverberated around the valleys rather like heavy thunderclaps. All in all they were beginning to be a little

“unheimlich” (scary) and there was talk of asking the mayor to protest again these shenannigans to the S.S.-Ortskommandantur.

In the meantime, two of the local boys who were in the Army, came home on leave. When they were told what was going on they mentioned to their folks the nicknames “Himmelskinder”, and how it was thought that they were the miracle weapons the Fuhrer had spoken of several times in the last few months. This consoled the local population for after all reports from the front were none too rosy and if their valley could help to turn the tide of events and be of aid to the Fuhrer then it was alright with them. So, the months became years, then one day long columns of trucks clogged the roads. Since there were two roads into and out of the Jagdschloss it was difficult to know what was transpiring, but soon they knew. Les and less flying “things” were seen and soon the camp was only a shadow of its former self. One day all work ceased, tremendous explosions ripped, once again, through the valley, smoke rose from the area of the Jogdschloss and a few weeks later the Russians rode into town, unopposed, raping and looting everything in sight. They found only ruins at the Jagdschloss. When they were told, during interrogation, what had been seen, they just stared over their vodka bottles disbelieving the Germankis. Little did they realise that in those caved-in caverns, with electrical cables and wires dangling from now damp ceilings, on the debris-littered floors, in seemingly endless halls, with strange burn marks on the concrete floors, walls and ceilings, had taken place one of the wonders of the world. Now all lay wrecked and mute, only worthless bits of pieces of metal, nuts, bolts, steel rods, rubber tires, some leather and some strange-looking and feeling “slacklike”, greyish substance was to be found amongst all the rubble. There was the usual amount of rusty and burnt bunk bends, with their half-rotten straw sacks, broken down tarpaper shacks, half burned, empty cans, containers, some empty munition boxes, guard huts and two or three abandoned, cannibalized trucks. And that was all. No records, no evidence, only destruction.

THE U.F.O. PUZZLE



Technical Details

One could safely state without fear of contradiction, that the UFO origins and their technical aspects, such as method of propulsion, guidance, metallurgical composition of the craft themselves, and the origins of the crews, human or non-human, have perplexed an entire generation of people.

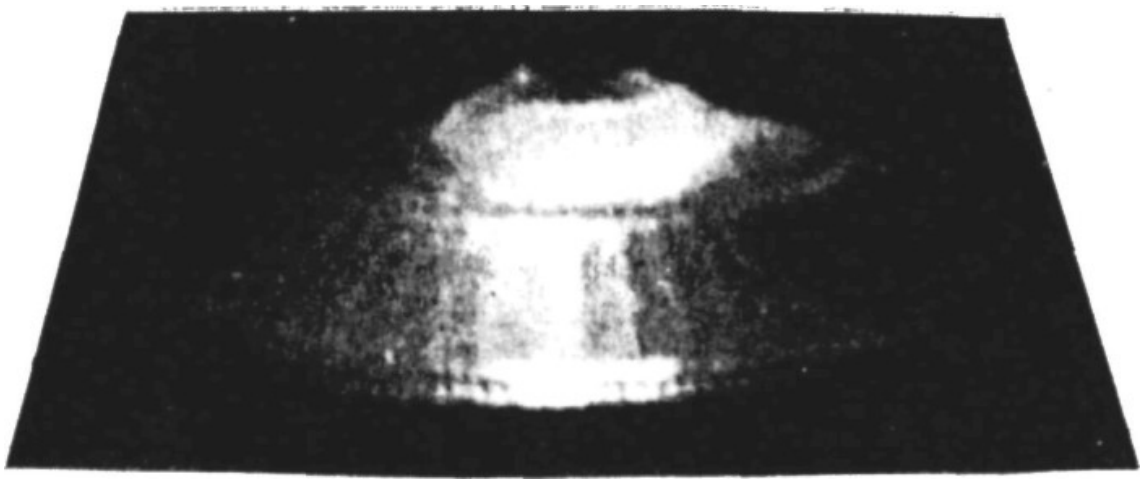
Much has been stated in this book that has never been looked at before in the light of German operated UFO’s. Now it is time to look at the available data, real hard facts.

Most people interested in the UFO phenomenon know the Reinhold Schmidt story, so we will only summarize here that he was an American, born in America, but who could still speak some German which his parents had taught him. He has stated that he was taken into a flying saucer on several occasions and actually taken for rides as far away as the poles. The crew spoke German and behaved like German soldiers. Certainly a remarkable story. The crew leader claimed he was from another planet, which could certainly be true, and it could mean that Germans have inhabited other planets. Then comes the obvious question — how did Germans get to other planets? Reinhold Schmidt forgot to ask. However, we do have a sketch of the flying saucer he was taken up in, and it certainly resembles the German UFO’s that follow,

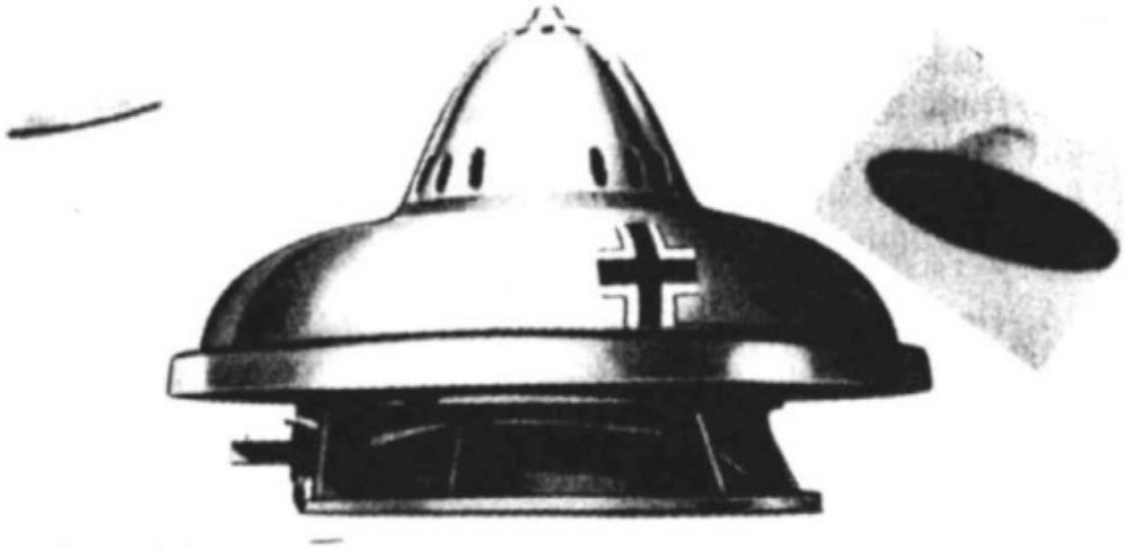
a photo of Schmidt's saucer and the Bellonzo-Schriever-MietheModel which actually flew. There are two authorities who can vouch for the actual flights and some of the details as to propulsion, size, speeds reached in actual flight etc. One is the late Major Rudolf Lusar, author, and an engineer by profession who worked for the German Air Force Ministry and in the patent and discovery evaluation section during the war. We reprint his account of the Flying Disc experiments from his definitive work on German Secret Weapons of W.W.II, pages 165 and 166 of the English edition, published by Neville Spearman, London, England.

Photograph of Reinhold Schmidt and front cover of his book

Mentioned in other pages of this book



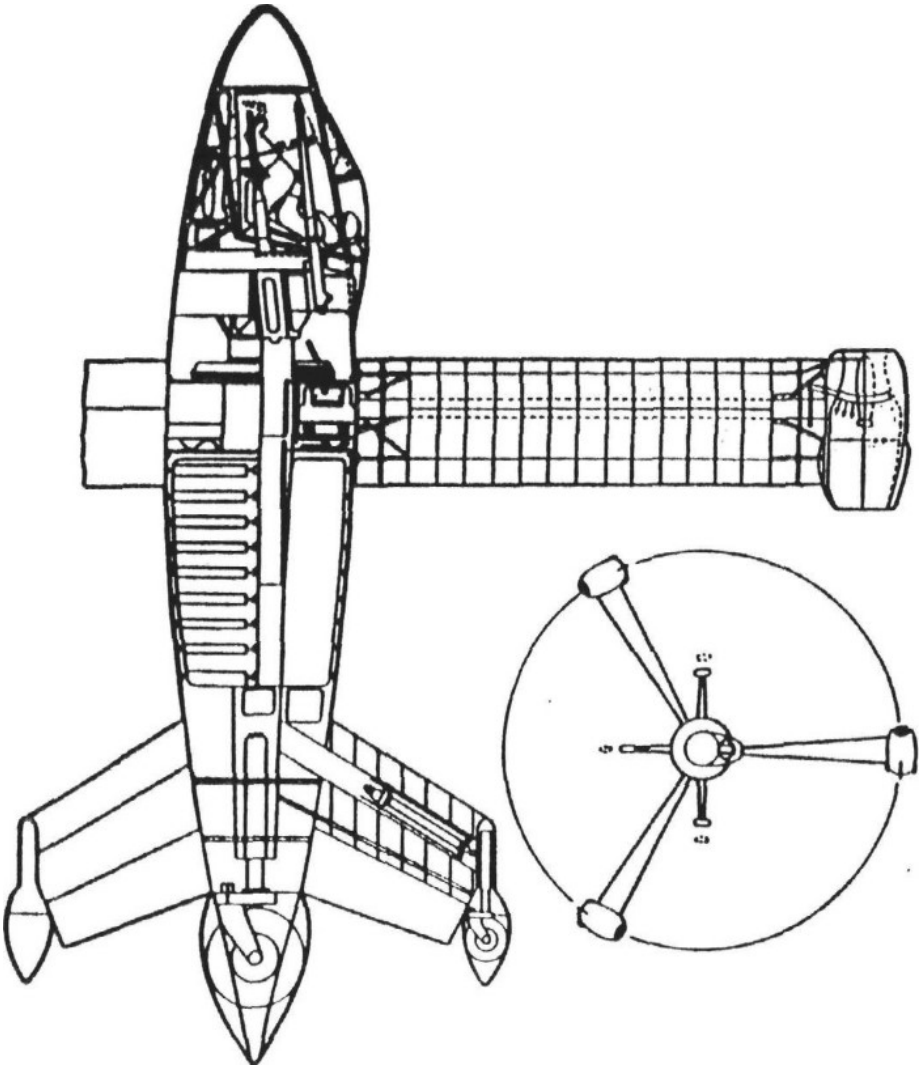
There are a number of speculations which Lusar makes as to the postwar whereabouts of some of the scientists and their plants, equipment etc. which have since been established to be erroneous. However, in 1953 when he wrote this book, that was all that was then known and all that could be surmissed. In conversations with the author just before his death, Lusar mentioned that he was going to update the 6th German Edition; his premature death prevented such updating.



Now we must turn our attention to another man who has been closely linked with the German UFO story — Victor Schauberger. Reproduced here are photos of two of his electro-magnetically powered "Flying Hats" and some photographs that show how strikingly similar they are to actual UFO's photographed flying over the United States. Victor Schauberger lived for some years in the United States after the war where he was reported to be working on UFO projects. Apparently he was well financed and supported by a group of mysterious, but obviously wealthy people. He received wide publicity in

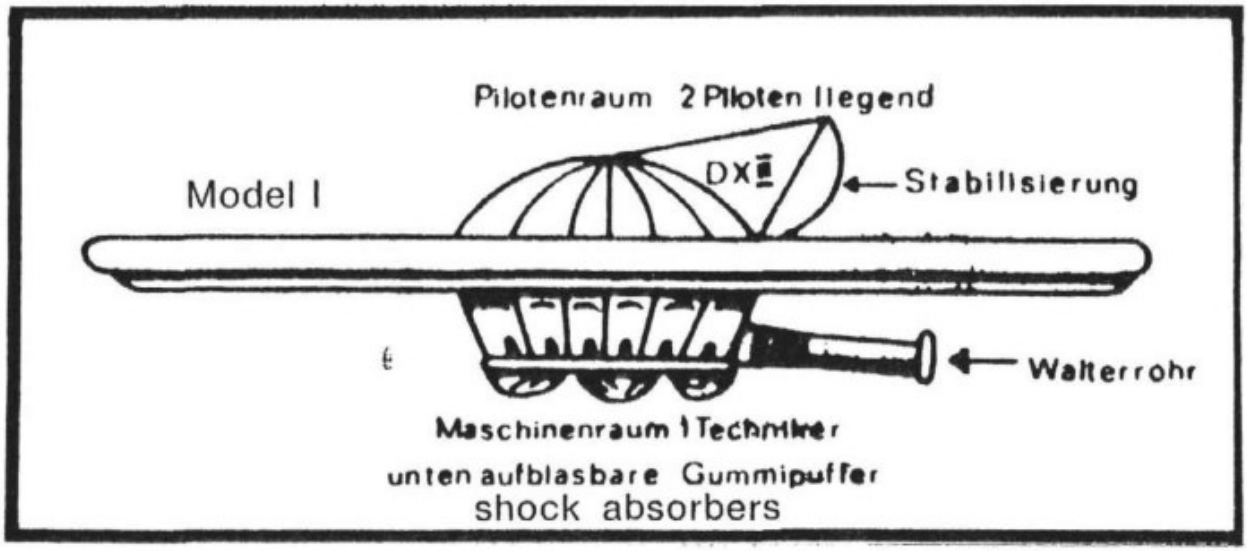
the middle 1950's when he first published his work on "implosion" instead of "explosion", which is a concept as revolutionary as saying "not nuclear fission but nuclear fusion" is the way of the future. His articles were greatly discussed and then one day in Chicago he just vanished. His battered body was found and as to who killed Schauberger or why has never been solved. One version has it that gangsters tried to beat his revolutionising secrets out of him and accidentally killed him. However, Schauberger did experiments early in 1940-41 in Vienna and his 10 foot diameter models were so successful that on the very first tests they took off vertically at such surpriing speeds that one model shot through the 24 foot high hangar ceiling, damaging not only the roof but also causing the first UFO casualty, namely itself, for it was blown to bits. After this "success" Schauberger's experiments received "Vordringlichkeitsstufe" — high priority and he was given adequate funds and facilities as well as help. His aides included Czechoslovakian engineers who worked at the concentration camp af Mauthausen on some parts of the Schauberger flyinq saucers. It is largely through these people that the story leaked out. There is a further witness to all this, he is a Diplom-Wirtschaftsfachmann (Economist) named Hermann Klass from Muhlheim a.d. Ruhr who wrote extensively about his wartime involvement in the UFO development in the "Bergische Wochenpost" a regional paper in his area. We reproduce here a few of his photo copies which date back as far as 1941.

These are the famous smokeless, soundless, Schauberger Models. Note similarity to real U.F.O. shown in Photos



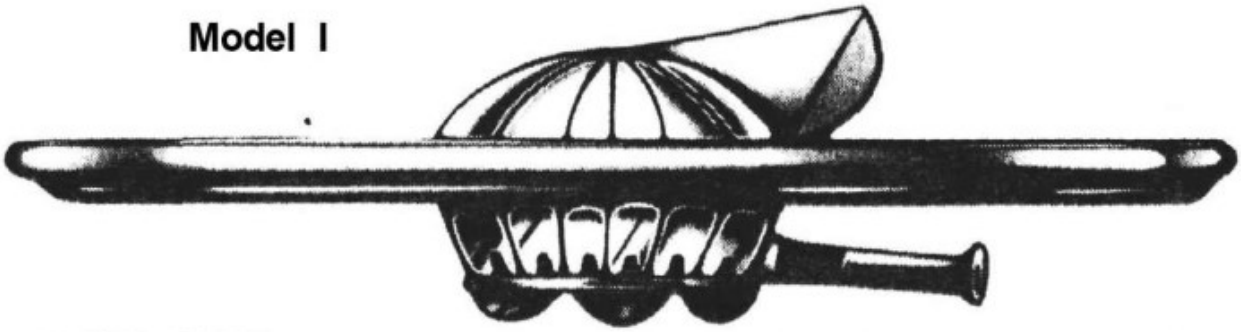
SPOT FLYING SAUCER—Above is an artist's conception of an unidentified flying object spotted low over the horizon near Chantry Island in Lake Huron Thursday night. David Powell of Paris, Ontario, an artist, along with his brother, Steve, 8, and two cousins, Carol Powell, 23, of Ingersoll and Terry Hook [illegible] from Southampton. They continued observations until it disappeared into the distance 45 minutes later. The object emmited a greenish glow "like a light bulb" said Mr. Powell. He estimated it to be about the size of two or three stars, moving in a northerly direction. (Sketch by David Powell)

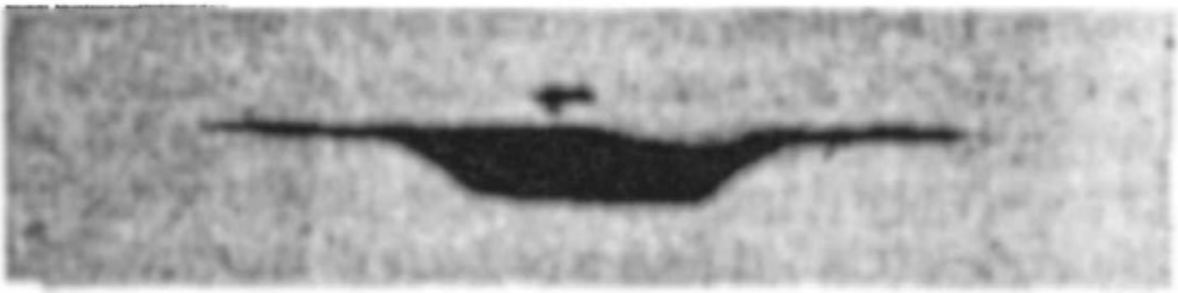
The Owen Sound Sun-Times



Photographed by Dean Margan Red Bud, III. 1950

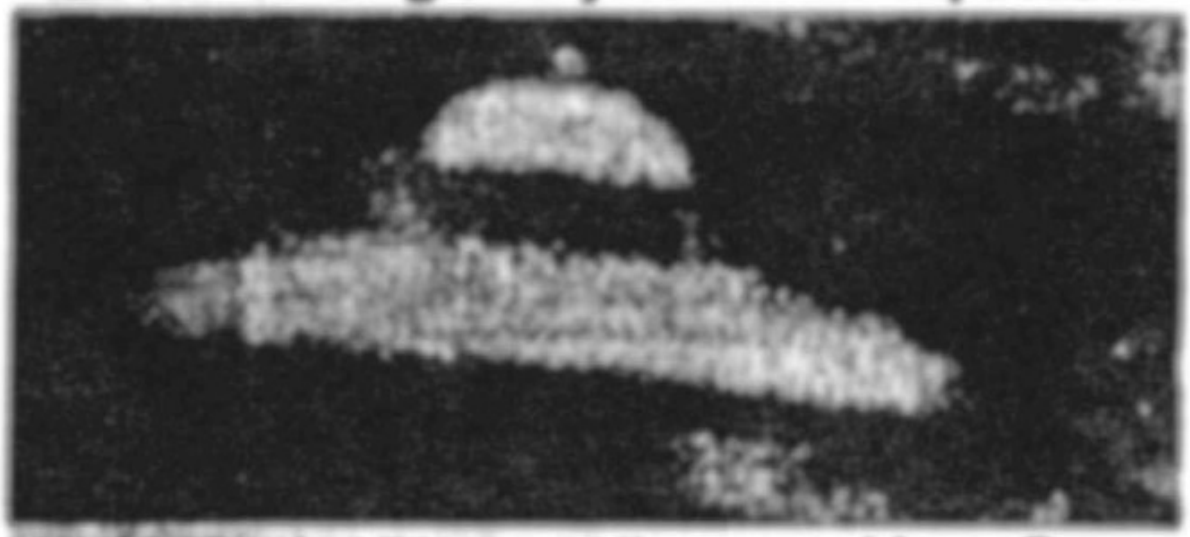
Hermann Klaas knew Victor Schauberger personally and transported U.F.O. parts from Mauthausen to Vienna and most likely to the factory named Kertl which is mentioned in the book "Flying Saucers over South Africa" written by Sievers. The director of this Viennese firm complained once to Klass about the fantastic speed and silent take-off of Schauberger's invention which had caused the hole in the roof — earlier reported.



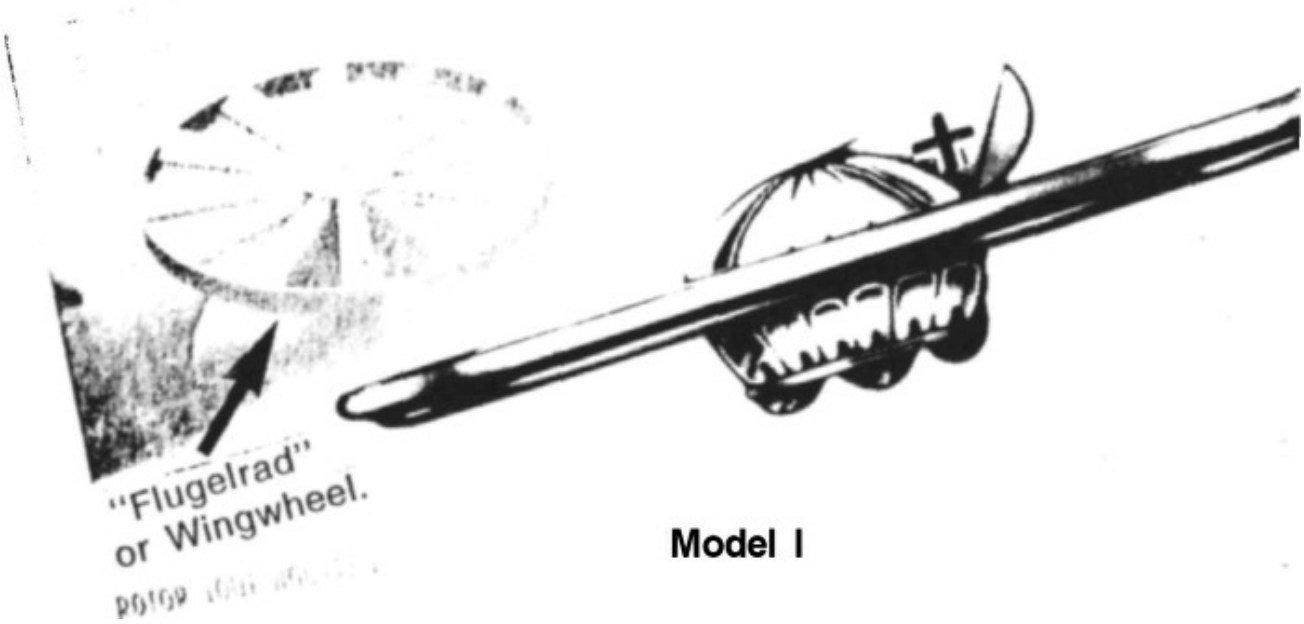


The "Verlikalzugschraube" principle as well as tillable rotating jets in wing tips incorporated in unusual "plan". Many elements were used in German Flying Saucers. Note: Pilot's seating arrangement.

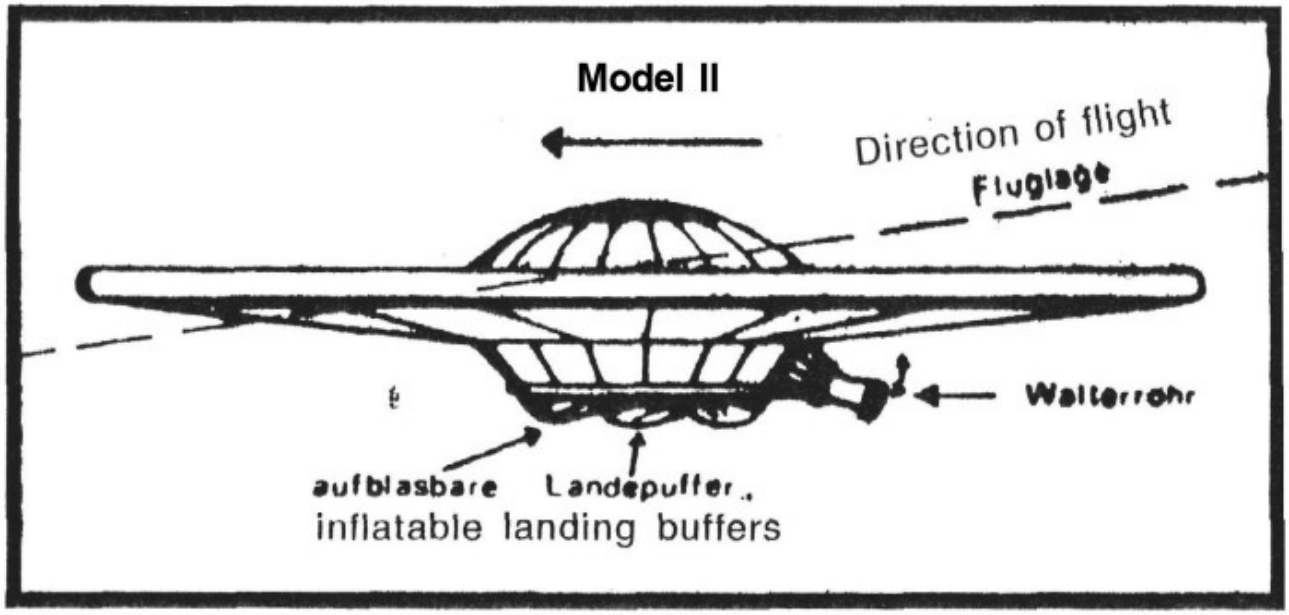
Let us now examine each saucer in detail. We leave the original German descriptions and add English translations on the engineering drawings.



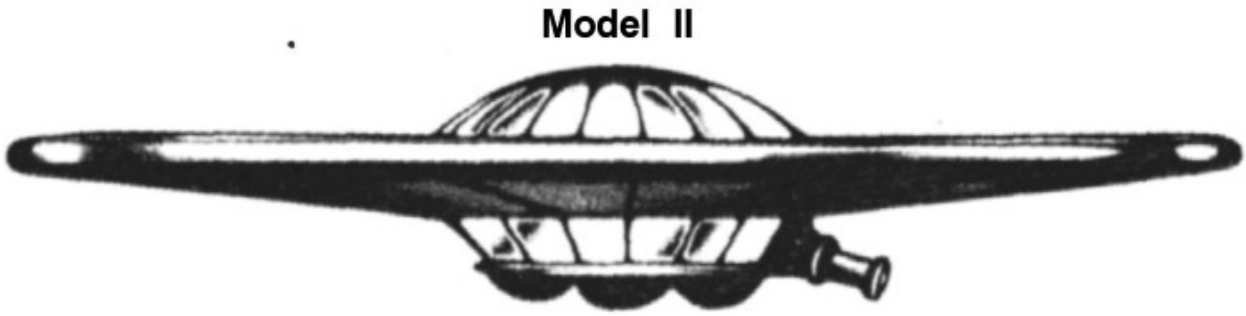
Model I



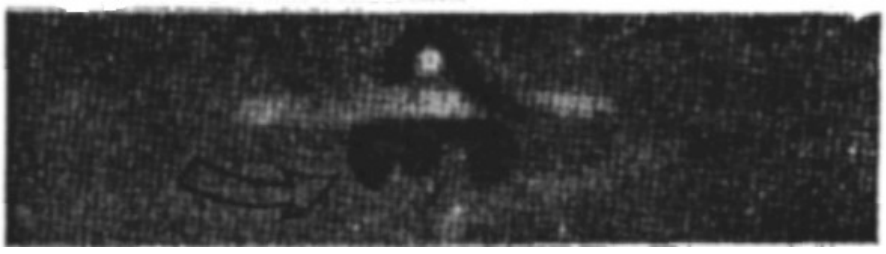
1969: A single object in Goias, Brazil.



1973: In the Rimac valley near Lima, Peru.

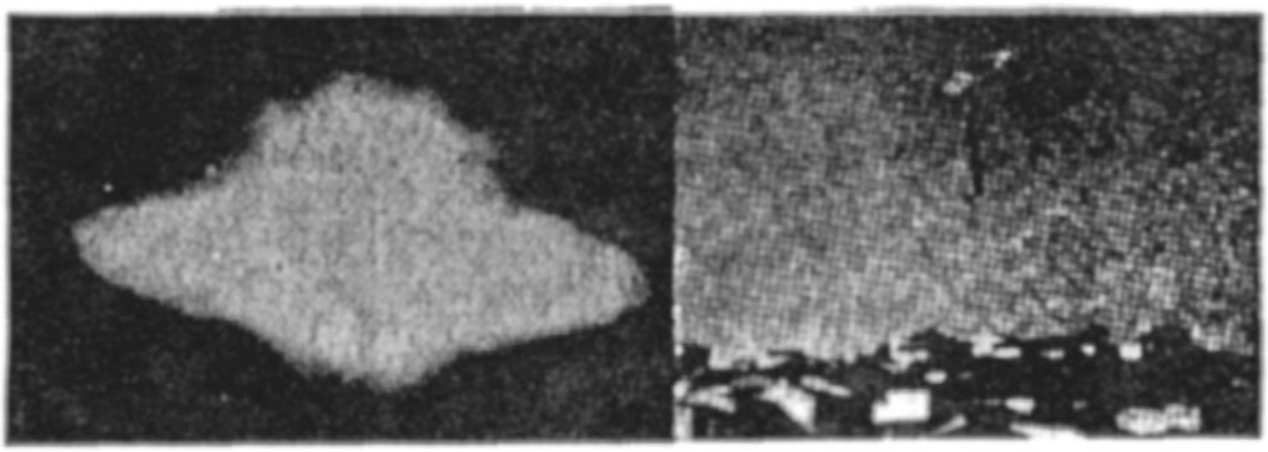


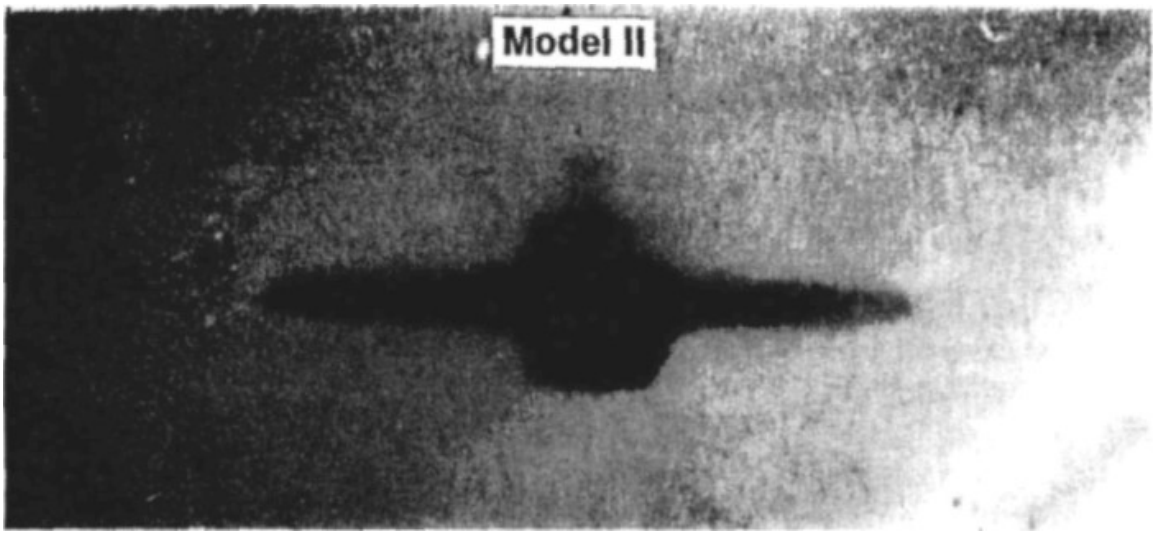
Model I



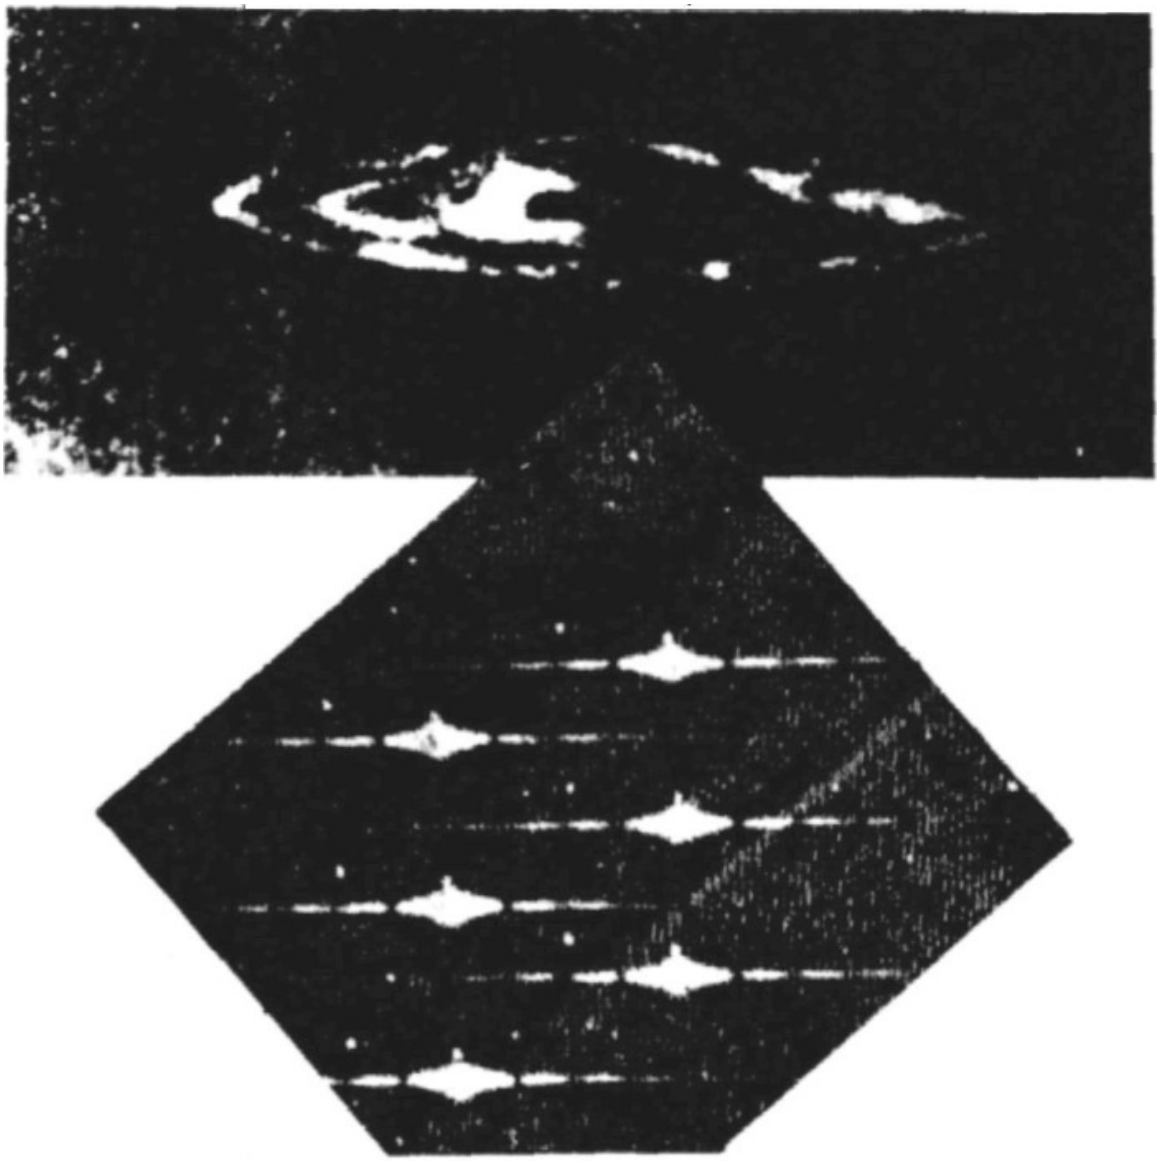
This prototype was first test-flown in 1941-42; it is also the world's first vertical takeoff flying vehicle. It has similar flight characteristics as the Schauberger models but it was less stable. The wings which issued from the centre of the craft like spokes towards the outer rim, were tillable. The Germans called that "Flugelrad" or Wingwheel. This caused the designers immense problems because the smallest imbalance caused the wingwheel to vibrate and this vibration increased at high speeds and was the cause on many occasions of wrecked machines. Perhaps the best comparison is to the tire of a car that is not properly balanced or is unevenly worn. Since the r.p.m.'s were so utterly fantastic, the problems faced by the designers can be easily appreciated even by the layman. Whilst car wheel balancing can be corrected by adding lead slugs to the rims of the wheels, German UFO scientists could employ no such crude remedy and so it was repeatedly "back to the drawing board" and it was absolute perfect workmanship which finally eradicated the problem. This model was test-flown with the standard German Rocketmotor then in use and called the Walterrohr. Because of its tremendous speeds, fuel consumption was very high and there was not sufficient tank space on board. At first, the pilot sat in a reclining contour seat as in an airplane. Later the position was changed to lying flat. Provision was made for one flight mechanic whose compartment can be seen below the "Flugelrad". The jet engines on all conventionally propelled flying saucers were manouverable or tillable in order to achieve what is called the "Coandaeffeckt" which results in the vertical take-off of the craft. Many improvements were naturally made in the course of the experiments and flight trials.

More German hardware





These photographs are identical to the German craft, even including the "inflatable" airbags or cushions that were lowered when coming in for a landing (photos from Australia)



Another U.F.O., closely resembling the German type.

German spacecraft?

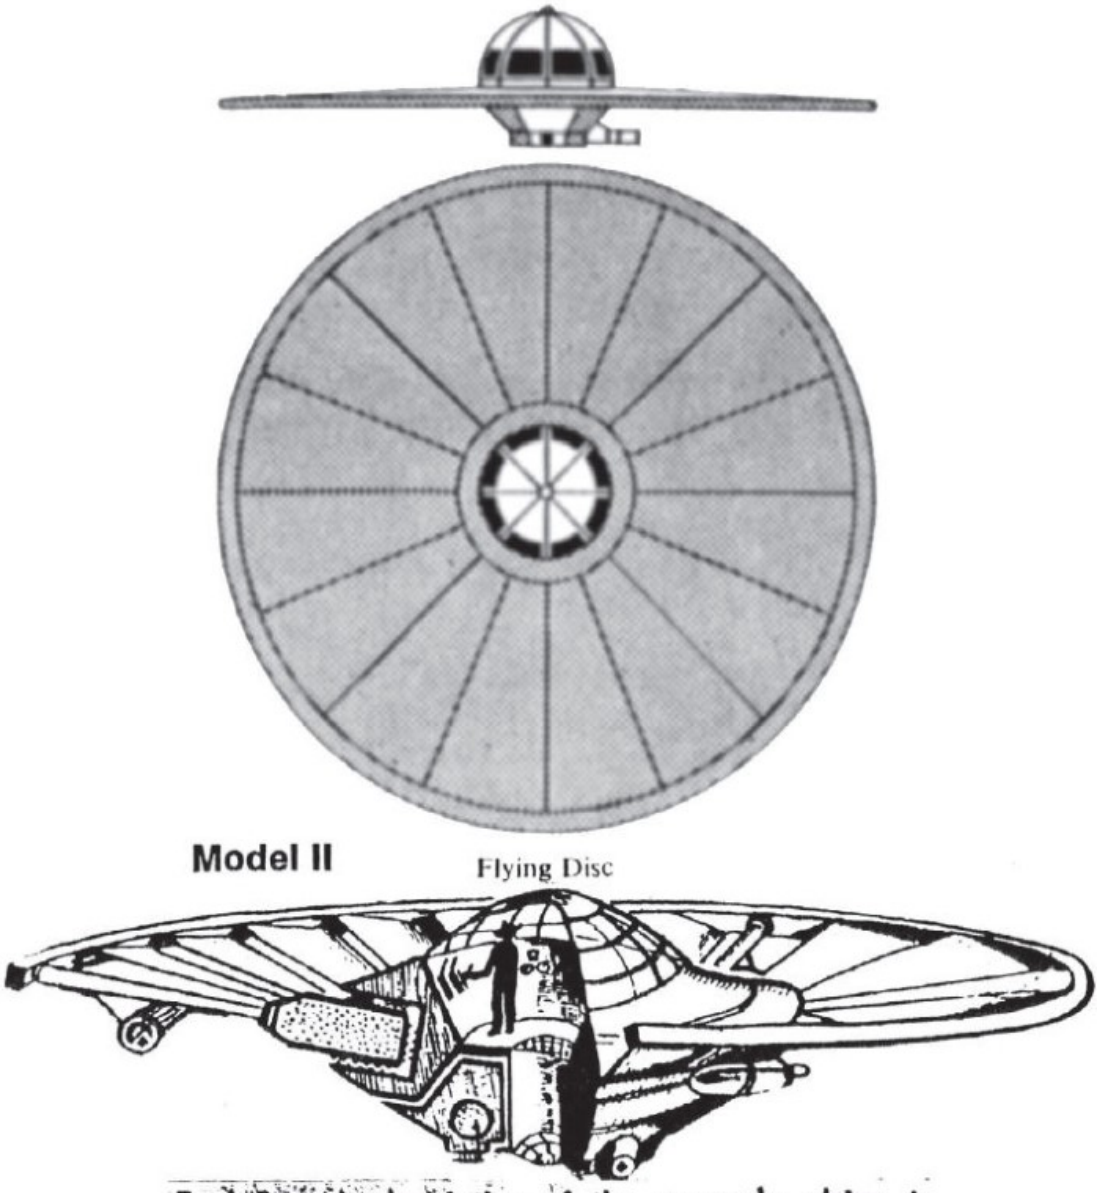
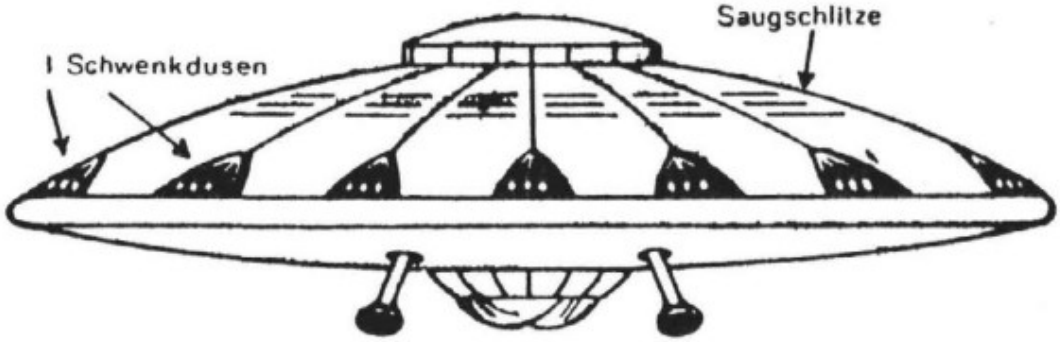
GIANT PRINTS PRESSED INTO EARTH AT SCENE WHERE BOY CLAIMS SAUCER LANDED



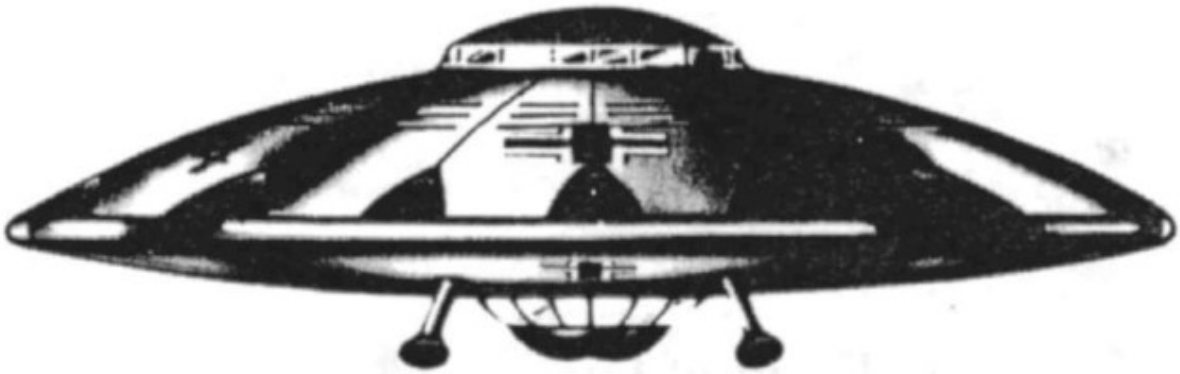
The Galt Saucer of July 30th, 1957

Jack Stephens (centre) who says he watched a round silver-covered object hover for 40 minutes before landing, shows a sketch of what he saw to chums Jerry Pawelko (left) and Danny Oliver. He said the saucer was about 35 feet in



Model II embodies some of these changes. The size has been increased to accomodate two pilots lying in a prone position and the engine compartment as well as fuel carrying capacity have been increased. This model also used an airplane-like rudder steering-assist mechanism for stabilization. Speeds of between 1000-2000 km/hour were reportedly achieved. The problem of wheel balancing had been solved and the wingscrew or wing propeller arrangement worked to satisfaction. The German terms coined at the time were "Vertikalzugschraube" or vertical pull propeller. As soon as the desired height was reached the propeller blades were adjusted to a very flat angle and now the pull up propeller became the "Tragschraube" or carrying propeller — very similar to the principle of the helicopter.

Mentioned in other pages of this book



Fred Regan's description of the saucer he claims to have been in is very similar to a design by Schriever.

TURNING OUT SKETCH OF A "SAUCER"

Model III

The previous few pages and some of the following ones show quite clearly the trend in U.F.O. development. Significantly some of the best photos, originated in South America and Europe. They span over 30 years.

This disc-like craft was photographed over Alberton, South Australia. Experts say it could not be an aircraft or a satelite.

"Sightings" Boom in Mexico

A REAL FLYING SAUCER, at least that's the claim, shows clearly in this photograph taken by a businessman during an otherwise routine trip in Northern Mexico. It was one of dozens of such sightings during a 2-month period.

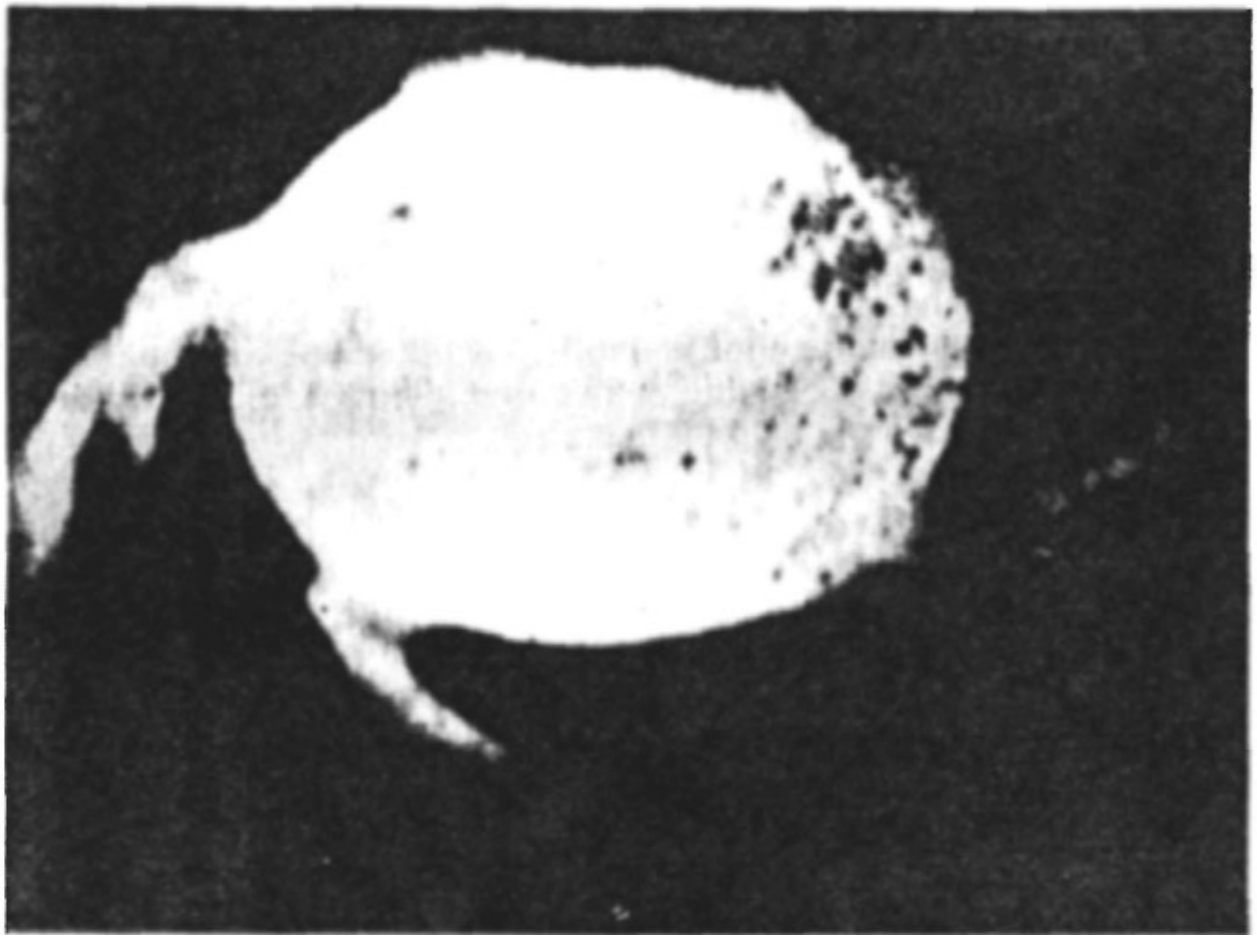
PICTURE OF A SAUCER: The top diagram, from a book published in 1953, shows a spacecraft that bears a close resemblance to the composite drawing (below) of an unidentified flying object which many people reported seeing last week in Michigan.

The early picture was supposedly produced by a creature from Venus who visited saucer buff George Adamski in California, took away Adamski's negative of his spacecraft, and returned with this substitute photo with an undecoded message.

Photographed by Henk Beverloo, 5th April, 1959. Rotterdam



Model III last known German prototype

Model III This is the final model; some experts refer to it as the Bellonzo-Schriever-Miethe Diskus. This version was produced in various sizes, some as large as 135 feet and even 225 feet in diameter. Actual speeds recorded were over 2000 km/hour. Conventional rocket motor speeds of up to 4000 km/hour were anticipated. As is clearly visible, this model already incorporated a very aerodynamic shape and for the first time also had retractable stilt-like shock absorbers. The craft is ringed by a sophisticated arrangement of tiltable directional jets which guaranteed not only a tremendously increased manoeuverability but also increased speed and better fuel utilization. The top of the craft was ringed by suction openings which had a dual purpose; a) to cool the engine and b) to create a near vacuum into which the craft could glide or ascend into with much less effort. The flight mechanic or flight technicians' compartment was retractable during high speed flying and was only lowered during slow flying or upon landing.

In this advanced, conventional, design can clearly be seen all the basic ingredients of just about every subsequent UFO type which has been sighted and photographed around the world. Undoubtedly, these models were also powered by Viktor Schauberger's flameless and smokeless implosion motors. However, to date, no German technicians who ever worked on these advanced machines have volunteered their knowledge.

We reproduce here many photographs and drawings of UFO vehicles which have been sighted and photographed and any interested UFO investogator can readily compare them with the Model III German flying saucer.

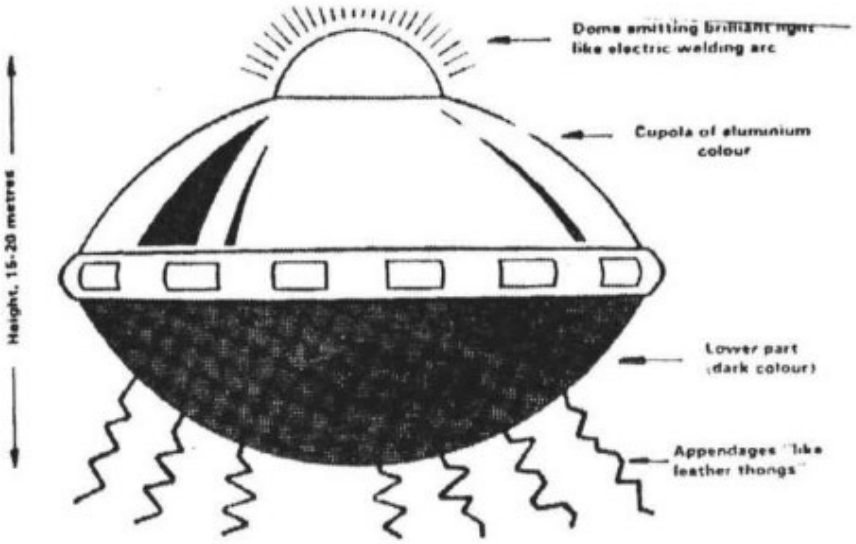
OPERATIONS & TRAINING

UFO'S SERIOUS BUSINESS

Unidentified flying objects - sometimes treated lightly by the press and referred to as "flying saucers" - must be rapidly and accurately identified as aerius USAF business in the ZI. As AFR 200-1 points out, the Air Force concern with these sightings is threefold: First of all, is the object a threat to the defense of the U. S.? Secondly, does it contribute to technical or scientific knowledge? And then there's the inherent USAF responsibility to explain to the American people through public-information media what is going on in their skies.

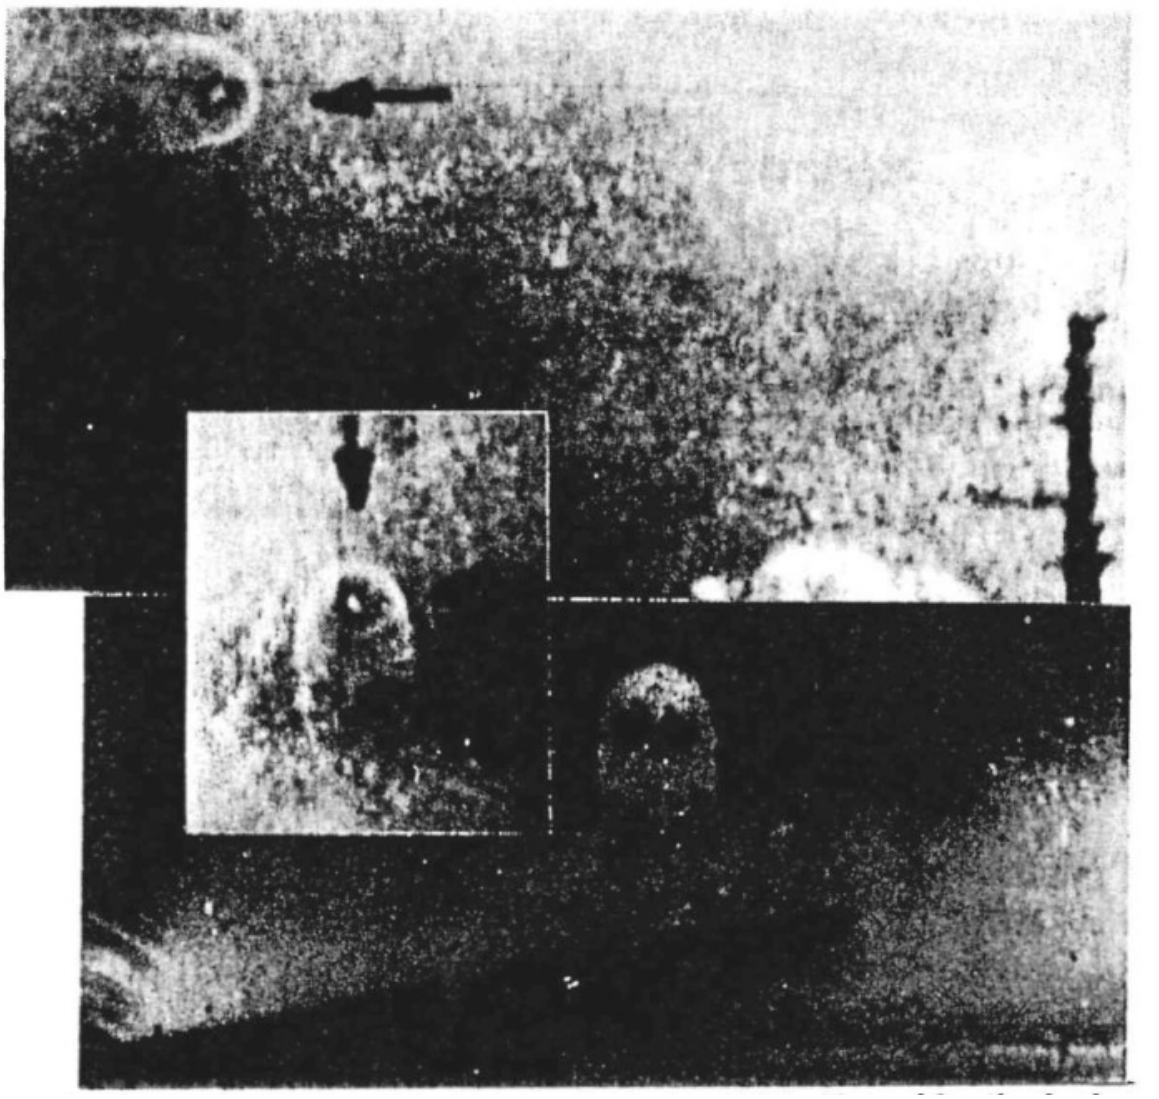


The phenomena or actual objects comprising UFO's will tend to increase, with the public more aware of goings on in space but still inclined to some apprehension. Technical and defense considerations will continue to exist in this era.

Published after three months study, AFR 200-2 outlines necessary orderly, qualified reporting as well as public-information procedures. This is where the base should stand today, with practices judged at least satisfactory by commander and inspector:

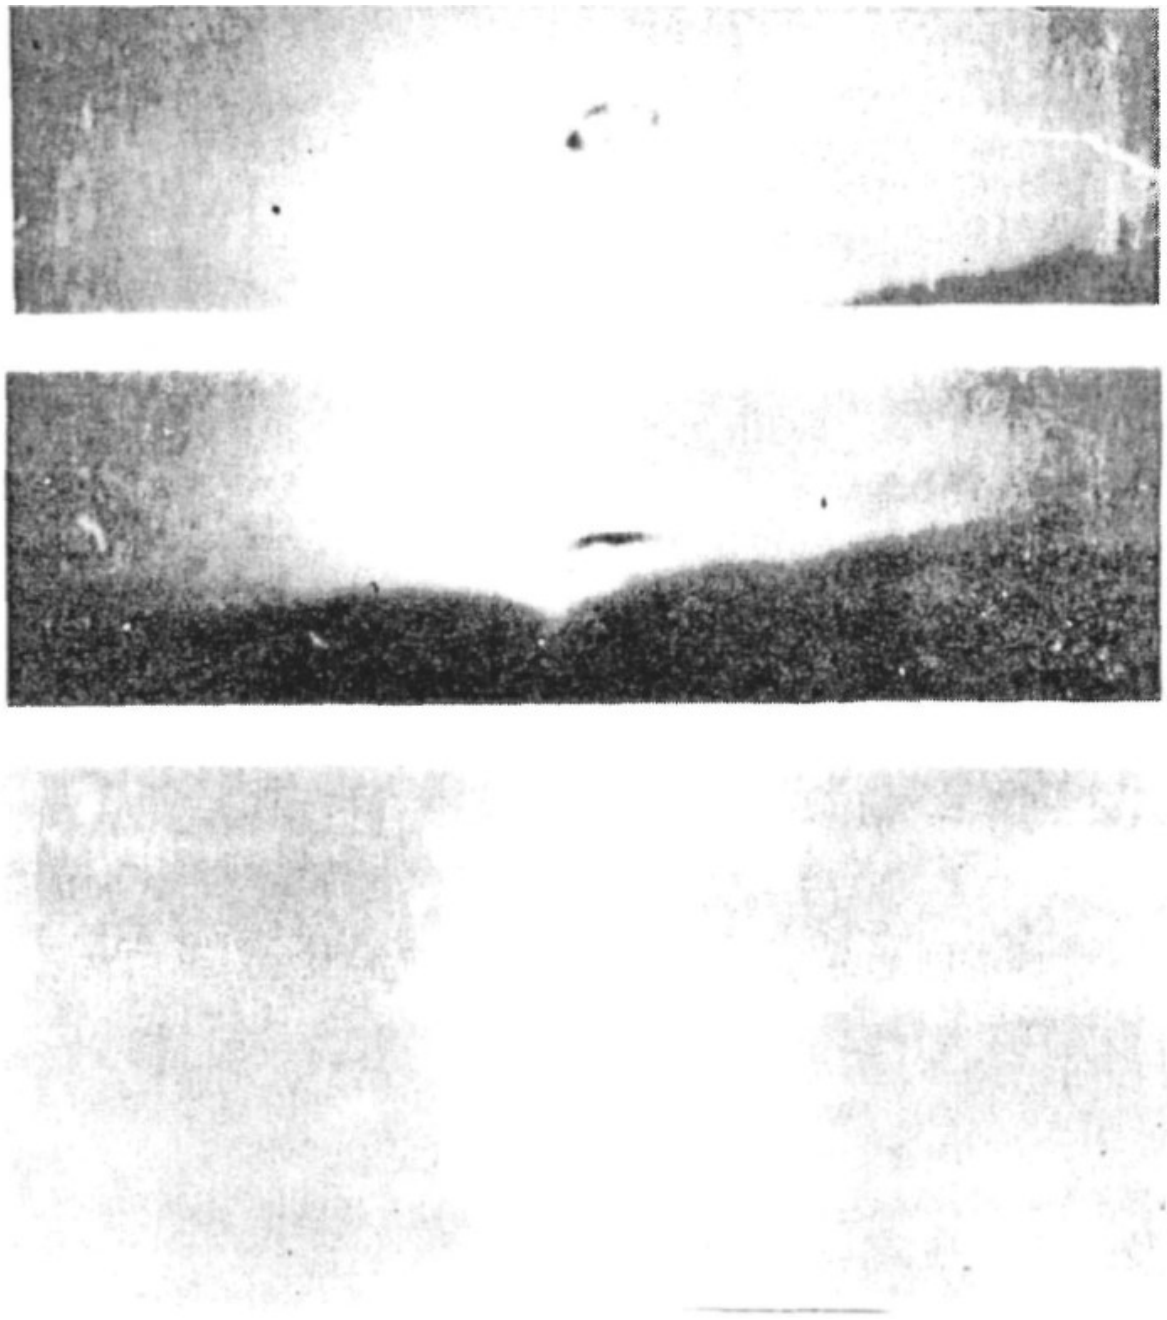
- Responsibility for handling UFO's should rest with either intelligence, operations, the Provost Marshal or the Information Officer - in that order of preference, dictated by limits of the base organization;
- A specific officer should be designated as responsible;
- He should have experience in investigative techniques and also, if possible, scientific or technical background;
- He should have authority to obtain the assistance of specialists on the base;
- He should be equipped with binoculars, camera, Geiger counter, magnifying glass and have a source for containers in which to store samples.

What is required is that every UFO sighting be investigated and reported to the Air Technical Intelligence Center at Wright-Patterson AFB and that explanation to the public be realistic and knowledgeable. Normally that explanation will be made only by the USAF Information Officer. It will help us to get all the facts of being experts in our own domain.



Official U.S. Government poster, recognizing existence of U.F.O.'s and detailed instructions of what to do in case of their appearance.

Frequently reported shapes of U.F.O.'s and how they function.



German U.F.O. Base? Flight Control Area?

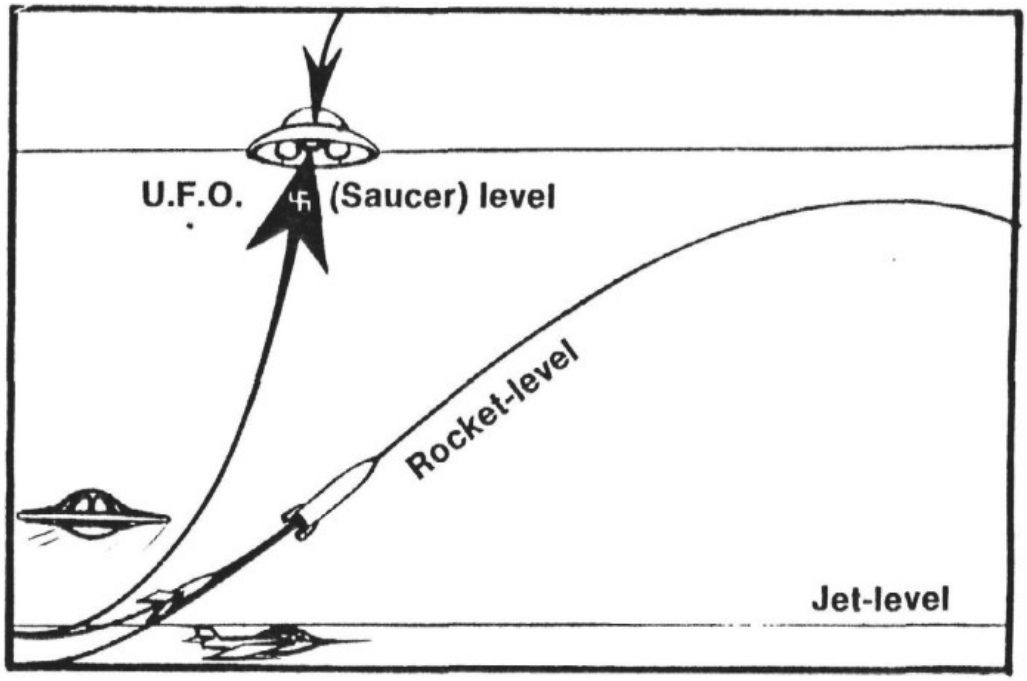
U.F.O. performing like the one at left.



U.F.O.'s appearing over the Japanese battle fronts after the war in Europe was over. Called Foo-fighters!

Undoubtedly, tremendous advances must have been made on these flying machines by those who knew the secret of flying saucers, and any unbiased reader must admit that the German Flying Saucer development ushered in a new age in travel. However, because of the new technology we have to ask ourselves some very searching questions.

Did the Germans have help from "real" U.F.O. people because their technology was the most advanced?

Did Hitler's scientists perform their "miracle" alone, unaided or did flying saucer "people", perhaps visitors from other galaxies give them a helping hand because they had mastered the new technology and consequently spoke the same or at least similar technological language? Could this be possible? Another question could be, did the Nazis discover some long-hidden deep secrets during their lengthy and exhaustive expeditions to the Himalayas and ancient Tibet? Intriguing and fascinating volumes have been written about these mysterious activities which had the active support and blessing of men such as Heinrich Himmler. It has been reported that the S.S. had an extremely large collection of occult books and medieval transcripts of alchemy and sorcery. Apparently over 20,000 volumes were, at one time, housed at the Ordensburg, Sonthofen, in Bavaria.

Perhaps there are elements of truth from all these stories. Did the Nazis establish secret bases in Antarctica? Did they perfect there a far-advanced flying saucer programme? Did they accidentally discover during their many expeditions that there is indeed an "Inner Earth"? (Nordic legends and Sagas have long recounted very inspiring tales of a perfect society of blue-eyed, blond Germanic giants who dwell in the inner earth). Was the world not astounded when it became known in 1945 that many of the Nazi leaders had been early members — 1918-20 — of the Secret Order of Thule!? It is known that Dietrich Eckhardt, Hitler's brilliant poet friend, had introduced him to this organization in Munich. The great expounder and father of geo-politics, Haushofer, friend and mentor of Rudolf Hess (Hitler's comrade and cell mate of Landsberg) Hess himself and Hitler were all steeped in the ancient mysteries of the Nordic world. It is therefore quite conceivable that the Nazis were the outer earth representatives of the "inner earth" or "outer space" blond, blue-eyed giants who spook through Nordic, Inca, Aztec and even North American Indian legends.

Perhaps Erich von Danniken has uncovered the tips of an iceberg? Are we about to have shattered our comfortable world picture that God created the earth in 7 days etc. etc. And so, again and again we have to come back to the same questions which can only be answered by the same answers. Every government on earth seems to be frantically engaged in suppressing the UFO story. Films are confiscated, pilots instructed to intercept and shoot to kill UFO's. People, are railroaded into hospitals and eventually insane asylums because they have seen or even been contacted by UFO's. Why? Why? Why, the UFO crews themselves give most of the answers to the questions. If they were from other planets and had come here to investigate or make contact with earthlings, they would hardly waste their precious time and tremendous expense and effort just to fly around and treat us to pulsating lights in some remote swamps or hills in the backwoods of the world. They would do what we would do if we had some crews of astronauts investigating some distant planet. Our astronauts would have been given some detailed orders, such as go and make a flypast, take photos, films and make visual observations. Test for radioactivity, air oxygen content etc. Radio and teletype all your findings back to earth and then return home. Even more conceivable would be that orders would be given for them to land, if they found conditions "bearable", and especially if they had the technology (which UFO's obviously have) and investigate everything in sight and take soil and rock samples; if you find "beings" talk with them, film them and perhaps even kidnap one.

Now let us look at how the flying saucer people have behaved:

Technologically they are certainly very advanced, move at tremendous speeds, change direction at will, (often denying every known law of motion or gravity. They can seemingly appear and disappear from human vision or radarscreens with great ease. Theoretically and also practically they could land, take samples, kidnap people and leave for home, and almost unimpeded! So we must assume the obvious. These UFO's from other planets, (and on purely a mathematical probability there are habitants on other planets), have come, have seen, have sampled and returned home. Why would any representatives of any civilization advanced enough to come the tremendous distances involved, just play cat and mouse with a few hillbillies in Mississippi? The answer is self evident, they just would not bother with such a farce and over a period of 30 years!

So there has to be an equally simple answer to why UFO's behave the way they do. They have to be either from earth itself which can only explain their lack of curiosity and also accounts for their linguistic skills. Reinhold Schmidt states the crews of the flying saucer he flew with, spoke German, and those Adamski and others met, spoke English. They apparently looked like us and pretty well behaved as we do — undoubtedly because they are "from us".

Now it is not inconceivable that in the never-ending stream of time our race has either gone from here "out there" or we have been landed here or stranded here from "out there" eons of time ago. Legends and sagas of old can supply many pointers.

Could it mean that the German nation is indeed a colony, either from the German-speaking "Saturnians" with whom Reinhold Schmidt conversed or are they the outer-earth beach head of the inner-earth civilization previously mentioned? Is this perhaps the answer to the vexing question of why the Germans are "different"? Is this the explanation for their superb performance and genius as soldiers? Are they leading the world in precision engineering and in technology because they have dwelling amongst them a disproportionate number of "Saturnians" or "Atlantians"? Could this be the reason why they always rise stronger and Phoenix-like from the ashes of defeat? Was Hitler planted on this planet earth to pull back Western civilization from the brink of degenerate self-extinction — peacefully, if at all possible — through war, if necessary?

Should the above question be answered in the affirmative, then "The Last Battalion", when the time is ripe, will spring into action. With racial strife and economic disaster looming, how far away can "Der Tag" actually be? And finally, will the "Saucer Nazis", as a last resort, invade strategic areas militarily?

Members of "The Last Battalion" are already amongst us as soldiers, labourers, teachers, students, scientists — in fact, in all walks of life. Male and female, young and old. So look at your neighbours and your friends — how many of them do you think belong to "The Last Battalion"? Time will tell!

AF BANS PHOTO RELEASE

The Air Force last night banned publication of a photograph of an unidentified flying object seen over Ohio by hundreds of persons and chased 86 miles by police.

Police Chief Gerald Buchert, of Mantua, Ohio, about 25 miles east of Cleveland, said he photographed the object from the front lawn of his home.

Buchert, according to an Associated Press dispatch, said the Air Force told him not to release the photograph or permit pictures to be taken of it. He said the object looked like "two table saucers put together."

An East Palestine, Ohio, police officer and Portage County Sheriff's Deputy W. L. Neff said they "played tag" with the mysterious object for 86 miles through eastern Ohio before losing it near Conway, Pa.

PHOTOGRAPHED UFO—Mantua, O., Police Chief Gerald Bucher, left, gives information on unidentified flying object to Deputy Sheriff Dale Spaur, center, and radioman Robert Wilson after Bucher and several other police officers chased the object 85 miles from Mantua to Freedom, Pa. During the chase Bucher photographed the UFO. The photographs will not be released until viewed by federal authorities.

Flame-Shooting Phantom Plane
Airline Pilots See Wingless 2-Decker

ATLANTA, July 24.—(AP)—Two Eastern Airline pilots said they met a wingless two deck plane early today southwest of Montgomery, Ala. They said the strange ship shooting red flames and with a blue glow underneath the fuselage, passed the E. A. L. plane at 5,600 feet headed toward New Orleans.

The pilots said the stranger looked like a "Buck Rogers rocket ship."

SEEN AT 2:45 A. M.

The two pilots—Captain C. S. Childs and co-pilot J. B. Whitted—were flying the Houston-to-Atlanta-to-Boston run. They left Houston, Tex., at 8:30 p. m. last night. This morning at 2:45 o'clock, 20 miles southwest of Montgomery they sighted the strange ship.

After reaching Atlanta at 2:49 a. m. EST., the two pilots told of their strange experience. Captain Childs said that they first sighted the object up ahead when nearing Montgomery.

"It was in line almost with our flight," he said. "We veered off to the left and the object turned to its left. When it came nearer to us, within better sight, its fuselage appeared to be about 100 feet in length and about four times the *circumference* of a B-29 fuselage.

2 ROWS OF WINDOWS

"It had two rows of windows, an upper and a lower. They were square. Out of the rear of the ship red flames were shooting 25 to 50 feet. There was a blue glow underneath the fuselage. The ship appeared to be doing between 500 and 700 miles an hour, heading toward New Orleans.

"Of the 20 passengers on board Childs said only one was awake and saw the other ship. He gave this ppassenger's name as C. L. McKelvie, Henelton Pike, Columbus, Ohio.

The E. A. L. ship went on from Atlanta to Boston today on its regular run.

At Montgomery, Maxwell and Dannelly army fields said they knew nothing about the report.

Radar Tracks Zipping Objects Near Air Base

8-2-65

OKLAHOMA CITY (UPI)—Air Force radar tracked four unidentified flying objects zipping along in a diamond formation at high altitude in a 50-mile radius of the sprawling Tinker Air Force Base Sunday night, authorities said.

At least eight law enforcement officers spotted the objects during the two hours immediately after the first sighting report which came just before sundown.

The sightings followed by less than 48 hours a Wynnewood, Okla., *policeman's* report of a UFO that emitted red, white and blue light near Wynnewood. The object was tracked on two radar screens early Saturday before it disappeared and then reappeared about 29 miles south of Tinker Base, officers said.

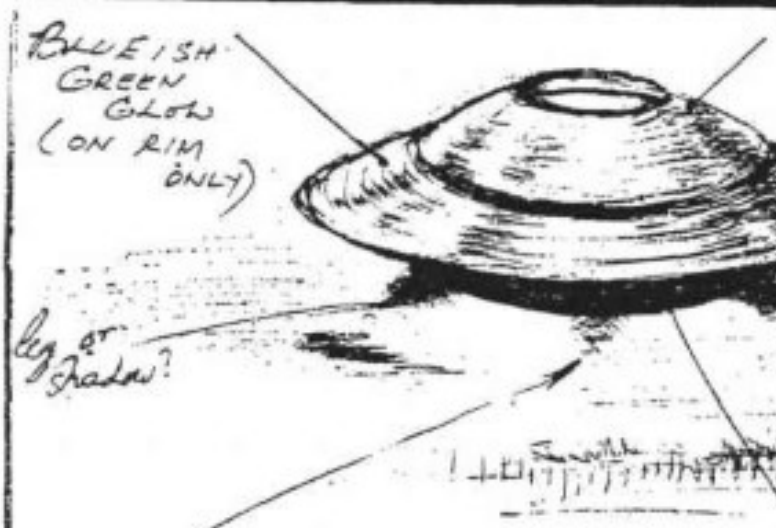
Wynnewood is about 29 miles south of Purcell, where the UFO's first were sighted Sunday night.

The Oklahoma Highway Patrol said a security officer at Tinker informed the patrol that the base's radar picked up from one to four UFO's at various times during the evening.

The objects were moving erratically, at an altitude of about 22,000 feet, the patrol quoted the officer as saying.

A base spokesman later would neither confirm nor deny that radar had tracked the objects. He said only that the Air Force would investigate the UFO reports.

Paper Unknown Oct. 28, 1955



Donald E. Keyhoe, former Marine Corps officer and author of books on flying saucers, on an Air Force statement that flying saucers don't exist:

"It is an insult to the hundreds of radar operators who have confirmed that the flying saucers are solid objects, maneuvering at fantastic speeds under intelligent control."

U.F.O. reports from around the world and from pretty well-known people

Sydney, Australia WEDNESDAY, DAILY TEL

THE THING ON TH

THE SKETCH by Mr. Denis Crowe of the object he saw on Monday nig
the saucer shape as silvery grey on top and darker grey beneath wi
what might have been three or four

GLOWING IMPI

A green, glowing object that took off at high s
on Monday night in no way resembled conventional
said last ni

watched the object in flight for 10 seconds before it disappeared in cloud over Manly.

Mr. Crowe at his home in Coolong Road, Vaucluse, told a *Daily Telegraph* reporter last night:

"It took off with a noise like air forcibly released from a balloon.

"The noise was quite unlike any made by jet engines."

Mr. Crowe said that the object a giant disc, was bathed in a glow.

He saw no sign of movement within the craft or any portholes or doors.

He said he became aware about 5.30 p.m. on Monday of a glow coming from the beach.

He went to investigate and saw that the glow emanated from a huge disc resting on the beach.

Near disc at take-off

He was within 50 or 60 feet of the disc when it took off.

"Its diameter appeared to be about 20 feet," he said.

"I estimate its height at nine feet, including what appeared to be legs protruding from the bottom.

"Its rim was glowing a greenish blue, while the top and bottom halves were dullish silver-grey.

"A hollow in the top could have been a glass dome."

Mr. Crowe said that as the object took off, a yellow or orange glow appeared beneath.

After a take-off run of only 50 or 60 feet, the craft climbed rapidly in the direction of Manly.

"I looked around, hoping to see someone else who saw what I saw, but about a dozen of my dogs," Mr. Crowe said.

"While the object was stationary, they were all barking loudly at it.

"After it took off, they were all strangely silent."

Mr. Denis Crowe

Mr. Crowe said that when he returned home he sat down to collect his thoughts.

He had dinner, then wrote down what was still vividly in his memory, and sketched the object as he recalled it.

The sketch is reproduced above.

[Mr. Crowe, an Englishman who has been in Australia for more than four years, was formerly a technical and illustrative artist with British aircraft companies.]

"At first I wondered whether I should say anything about what I had seen," he said.

"The natural reaction of most people might label me a crackpot.

"But I could not keep silent.

"I felt I had a moral obligation to speak of what I had seen."

UFO Is Reported In Western Area

ARKANSAS GAZETTE, Thurs., Aug. 12, 1965.

SANTA ANA, Cal. (AP)—An unidentified flying object described as round, bright and with a long orange tail was seen by scores of Southern California residents Tuesday night and by at least three airline pilots flying over Arizona's Grand Canyon.

Viewers said the object moved rapidly from west to east in about 10 to 20 seconds. It appeared to descend rapidly, they said, then it would level and disappear to the east.

Three pilots reports a similar sighting and described it as a "large ball of fire with a tail, traveling west to east."

Similar reports came in from airports at China Lake, Palmdale, and Edwards Air Force Base, Cal., and the Albuquerque, N. M., Air Route Traffic Control Center.

Paper Unknown Feb. 21 1956

Huge Flying Saucer Reported Over Paris

Paris (U.P.)—The French government sought today to solve the mystery of the "phantom of Orly" a gigantic flying-saucer-like object which whirled across the airport's radar screen at supersonic speed last Friday.

It was the third time in less than a year that the "phantom" has been charted on radarscopes at the busy international airfield outside of Paris. The object was described as about twice the size of the largest known plane, moved at times at an estimated 2,000 miles an hour, and hovered around the airport for about four hours.

Mystery Object Over Hawaii

HONOLULU (UPI)—An unidentified flying object, traveling west at a "very high altitude and a high rate of speed," was sighted by hundreds of persons in the Hawaiian islands.

Two Air National Guard pilots said they saw the object north of the island of Kauai during a routine training mission in jet fighters at an altitude of 40,000 feet. Honolulu newspapers and radio stations were flooded with calls.

Capt. Jon Parish said he thought the object was "possibly a rocket or some sort of space object flying a predetermined course." Lt. George Joy said he thought it was the Milky Way at first, but then noticed that it left a visible vapor trail.

Witnesses in Honolulu said the object looked like a crescent-shaped moon falling into the sea. They said it was bright, and some said it appeared to be on fire.

ALASKAN TELLS OF MYSTERIOUS STREAK IN SKY

KETCHIKAN, April 15.—(AP) — A mysterious reddish orange streak across the sky over Annette Island was reported to the coast guard at 2 a. m. today.

Earl Leding said he sighted what seemed to be a flaming object hurtling westward at tremendous speed as he was returning by boat from Metlakatla, the Annette Island native community.

He said he and Ray Haldane saw the streak for about 40 seconds before it disappeared.

Navy Radar Spots Mystery Objects

PHILADELPHIA INQUIRER — JANUARY 6, 1965

WASHINGTON, Jan. 5 (AP). — The Air Force is investigating the reported sighting of two high-speed unidentified flying objects by Navy radar operators at Patuxent Naval Air Station, Md.

The Navy said Tuesday that the operators observed "two objects on their scope approaching at approximately 4800 miles an hour from 30 to 40 miles south" of the base at 8:30 P. M. Dec. 29.

The objects approached the naval air station, executed a tight turn and disappeared from the scope, the Navy said.

About the fastest aircraft in existence is the X-15 experimental plane, which has flown at 4104 miles an hour. The X-15 is based on the West Coast. It has a very short range.

7/8/65

See 'UFO'

BUENOS AIRES (UPI) — Argentine sailors at two Antarctic outposts saw a multi-colored "unidentified flying object" dawdling across the sky Saturday, the Navy Department announced Wednesday night.

"The object was discus-shaped and predominantly red and green in color, with occasional flashes of yellow, blue, orange and white. . ." The Navy announcement said.

"It was moving generally eastward, but at times it went west . . . at some moments, it appeared to hover . . .

"It was in view for 15 to 20 minutes, allowing ample time to photograph it . . . (the object) was seen by members of the naval detachments at Deception and Orcadas."

Eerie Object Seen Over Antarctica

'65

BUENOS AIRES, July 7. — (Reuters) — Argentines at two Antarctic bases have confirmed reports by British and Chilean scientists of the appearance four days ago of an unusual celestial body over the frozen subcontinent.

The object, observed and photographed by the Argentine Navy men last Saturday night, was shaped like a double-convex lens. It was colored mainly red and green, a Navy statement said.

The object made no noise, and moved generally eastward at changing speeds before disappearing.

An earlier report from a British Antarctic base said the object made geomagnetic instruments wild.

Ten-Gallon UFO Sighted at Sault

SAULT. STE. MARIE, Ont. (CP) — An unidentified flying object shaped like a "ten-gallon hat" was sighted here Friday night.

Darlene Wagner, 15, said she saw the object about 10:20 p.m., silently descending to the top of an oil storage tank across the road from her home. It landed on the oil tank.

The girl said the object was shaped like a hat, the crown glowing red, the brim blue. There were flashing blue and white lights at each edge of the "brim."

Object Filmed By X15 Still Big Mystery

Aug. 9, 1962

Aug. 9, 1962

EDWARDS AIR FORCE BASE, CALIF. (UPI)—A possibility the X15 encountered strange phenomena in space arose Thursday with scientists unable to identify a mysterious object both sighted and photographed by Maj. Bob White on a soaring flight by the rocket ship.

Scientists said Wednesday they could give no explanation whatsoever for the objects that appeared near the X15 on July 17 when White skyrocketed to a world airplane altitude record of nearly 60 miles.

"It is impossible to explain the object's presence at this time," space agency scientists said.

The National Aeronautics and Space Administration, after intensively studying White's sighting report and films from a tail movie camera, on the X15, released photographs of an object that darted above and behind the plane.

The photographs, taken from the movie films, show an object that looks like a fluttering piece of paper and which scientists describe as being "grey-white."

White, from his cockpit near the nose of the rocket ship, reported seeing what looked to him like a piece of paper the size of his hand "going along with the ship" at an altitude of 270,000 feet—over 50 miles high.

July 16, 1952

Pilots Tell Of Saucers Flying In Formation

MIAMI, July 16.—(UP)—Two veteran air-line pilots added to the flying-saucer lore today accounts of seeing eight huge discs zipping in formation at supersonic speed near Norfolk, Va.

W. B. Nash, 35, and W. H. Fortenberry, 30, pilots of Pan American Airways, said the "glowing, orange-red" saucers maneuvered too sharply for human endurance at a speed of "far above 1,000 miles per hour."

"Whoever was in those things," the pilots declared, "had capabilities far beyond our own. Those things absolutely did not contain any human being as we know them."

Nash and Fortenberry said they were flying their DC-4 with ten company officials aboard southward between Newport News, Va., and Norfolk Monday night when the saucers appeared 6,000 feet below them, at about 2,000 feet altitude.

Mystery object

SANTA MARIA, Azores (UPI) — An airport spokesman Saturday said a mysterious flying object apparently stopped all electro-magnetic watches at the Santa Maria Airport when it flew slowly over this island Friday. He said a white cylindrical object was seen flying northwest at an altitude of 33,000 feet and attempts to identify it were unsuccessful.

THE AUGUSTA CHRONICLE-HERALD
SUNDAY, JULY 11, 1965

Pilot believes he saw manned space-ship

Evening Press 23/9/59

THE pilot of a Pan-American airliner, flying almost four miles up between New York and Paris, this morning, reported that he sighted what he believed was a space ship with people on board.

In a brief message from the clipper, Captain J. Cone, said it was visible for only 30 seconds and that the object had vertical tail fins. It was travelling very fast in a south-westerly direction between the stars, Elnath and Castor.

The message was flashed to a U.S. coastguard cutter.

There were 119 people including 12 crew members on board the jet liner, which later landed at Paris. It was flying at an altitude of 20,000 feet when the object was sighted.

Gave position

Other brief details given in the message gave the object's position as 53.40 degrees north, 58 degrees west, which would be slightly north-east of Goose Bay, Newfoundland, about 2,000 miles west of Ireland.

The report has set off speculation in international circles studying space aeronautics, the dominant view being that it was a secret Russian attempt to send men to outer space, probably to the moon.

It is expected that a report will be sent to the United States Government for investigation.

On DEW line

The object was sighted almost on the D.E.W. line, the distant early warning radar screen which protects the entire north-west coast of America and Canada from attack.

Mystery Object Buzzes Planes

TOKYO, March 21 (Reuters). —Two Japanese civilian pilots reported their planes were buzzed Thursday by an unidentified flying object, an air safety officer in southwestern Japan said Sunday.

A spokesman for the Air Safety office at Takamatsu on Shikoku Island said the planes were a Convair 240 airliner and a private Piper Apache plane.

The newspaper Mainichi Shimbun quoted the airliner pilot as saying an object about 15 yards in diameter and radiating a greenish luminescence approached the plane at about 20 miles an hour, wheeled abruptly and flew alongside for about three minutes before

PAPER UNKNOWN Dec. 4, 1965

Unidentified Objects Sighted by Astronauts

SPACE CENTER, Houston, Tex., Dec 4 (AP)—Twice in the early part of their space flight, astronauts Frank Borman and James Lovell reported seeing objects that were not explained immediately. On the second orbit, Borman said, "We have a bogey at 10 o'clock high."

There was some static in the transmission and the space center had to ask three times for explanation. Borman said they could see the spacecraft booster "as a brilliant body against the sun," slowly tumbling and that three of four miles ahead of the spacecraft there were "what looks like hundreds of little particles."

In addition, he said, there was the "bogey." That's an airman's term for another object.

On the third revolution, while burning fuel to raise the orbit, Lovell reported "we hit something."

Space Center: "You hit something during the burn?"

Lovell: "Something came forward by the right window. Look-

British Radar Tracks Air 'Object'

LONDON, Nov. 19.—(AP)—An object described by observers as huge and glowing and probably metallic has been tracked by radar high over England twice this month, the War Office disclosed last night.

Official reports of the sightings have been made by members of two army radar crews. They estimated that the object's altitude was 60,000 feet.

The reports were on November 3. The first report said the object was kept in sight from 2:30 to 3:10 p. m. A similar report was made that day by two flying officers of the Royal Air Force. They were at 20,000 feet in a jet plane, they said, when the object passed far overhead at "tremendous speed."

N.Y. NEWS MARCH 25, 1946

They're Up There Again

Bangor, Maine, March 24, (UPI)—A Bangor man said today he fired four shots at a glowing, cigar-shaped unidentified flying object late last night and believes he hit it with at least one bullet.

John King, 22, said the craft responded by zooming skyward, almost straight up, and swiftly vanished to the North. He said he thought he saw a similar object some distance away mom-

Report Flying Object In Alexandria Area

ALEXANDRIA (AP) — Three state policemen and several other persons reported they saw an unidentified flying object about 30 miles south of here last night.

Troopers P. E. Lemoine and H. J. Roy said the object "definitely was not a plane" and described it as

UFOs Spotted In Minnesota

MINNEAPOLIS (AP) — Unidentified Flying Objects were spotted over parts of Minnesota and North Dakota Monday night.

Dozens of police officers on patrol between 12:20 and 2:30 a. m. reported sightings in the Minneapolis-St. Paul area. According to various reports, the objects "bobbed, dipped, hovered, stopped, jerked along and sped away."

An officer in suburban Shorewood radioed his dispatcher: "Boys, I hope you don't think I'm crazy, but I just got passed by a star."

The airport control tower said it had seen nothing on radar. The tower said also that a number of B-52 military aircraft were in the area.

Sky Object Tracked by AFB Radar

OKLAHOMA CITY (AP) — Tinker Air Force Base officials reported tracking an unidentified flying object by radar early Saturday before it suddenly disappeared.

The object was first sighted by Lewis Sikes, a Wynnewood policeman. He said it appeared to emit a red, blue and white light.

The Highway Patrol told Tinker authorities of the sighting and Tinker picked up the object on radar. Carswell Air Force Base at Fort Worth, Tex., also located the object on radar.

The object was [illegible] to a location 29 miles [illegible] Tinker before it disappeared.

Tulsa Daily World, Sunday, August 1, 1965.

'Saucers' Fly Beside Plane

DETROIT — (AP) — The pilot of an American Airlines DC-6 passenger plane said Wednesday three mysterious objects that looked like shining saucers appeared to accompany the plane for 45 minutes last night on its nonstop flight from Newark, N. J., to Detroit.

Capt. Peter Killian of Syosset, N. Y., who has flown passenger planes for 15 years, said "I have never seen anything like it before."

Killian said other members of the crew and the 35 passengers also saw the flying objects. The plane left Newark at 7:10 p.m.

* * *

KILLIAN and co-pilot John Dee of Nyack, N. Y., said they lost the three strange objects in the haze when they started their descent for landing at Detroit's Metropolitan Airport while the plane was over Cleveland, Ohio.

The three bright whitish lights first were sighted while the plane was flying at 8,500 feet between Philipsburg and Bradford, Pa.

Did Hillary see Chinese rocket?

ENGLAND

KATMANDU, Thursday. — Sir Edmund Hillary, the New Zealand explorer, said today that he had seen "phenomena" across the Nepal-Tibet border in the Mount Everest region which could have been anything, including a Chinese rocket.

He said that while camping in a glacier in October members of his Himalayan expedition saw a streak of vapour trail and a flash of fire moving in a zig-zag.—Reuter.

Air-Line Pilot Sees Mysterious Flying Objects

CHICAGO, July 18.—(UP)—A veteran air-line pilot reported seeing four flying objects moving at high speed over Denver last night.

Capt. Paul L. Carpenter of American Airlines said he and his crew spotted the objects after a flight ahead of them radioed them to be on the look-out.

Carpenter said the objects looked like planets and had a yellowish tinge. He said he saw one by itself, then two others and finally a fourth. He estimated their altitude at 25,000 to 30,000 feet and said he thought they were traveling at about 3,000 miles an hour.

UFO Watch Ordered

MEXICO CITY (AP)—The airport commander here, Luis Angel Jara Monroy, has ordered control tower men to keep watch for flying saucers. Public relations chief Ricardo de Zaldo said he had no doubt some strange objects were seen by the hundreds who phoned in one night but he doubted they were from other

...branch by branch."

The boy, Raymond Grant, was taken home, suffering from shock.

ENGLAND

Flying saucer 'hisses'

Men on the tarmac at London Airport were certain last night that they saw a flying saucer. One described it—"white, with a blue flame from its tail. Speed about 600 miles an hour, and it hissed."

Mr Fred Perrior, airport porter, said it was a foot long and six inches wide, and it kept a straight course.

But control tower officials neither saw it nor heard the hiss.

THE PEOPLE 11/12/60

I've seen flying saucer—Priest

ENGLAND

AN Anglican missionary reported to his headquarters yesterday, "I've seen a flying saucer with men inside it.

"The men waved and exchanged signals with us," said Father W. R. Gill, of Boianai Anglican Mission, Papua, in a report which reached Brisbane yesterday.

Radar Crews Get Solid Fix on UFOs

HOUGHTON (Mich.)—(UPI)—Personnel at the U.S. Air Force radar base in the Keweenan Peninsula yesterday reported "solid radar contact" with seven to 10 unidentified flying objects moving in a "V" formation over Lake Superior.

The objects were moving out of the southwest and were heading north - northeast at about 9,000 miles per hour, the men said. They were 5,200 to 17,000 feet high.

One of the men at the base said three other radar stations, in North Dakota, Minnesota and Luther Air Station in Canada, also reported spotting the objects. He said another station reported electronic jamming of its radar.

Seven other objects were spotted over Duluth and jet interceptors gave chase, he said, but they could not maintain the speed of the UFO's and were easily outdistanced.

The radar personnel, Air Force enlisted men, asked that their names not be disclosed.

2 SOUTH AFRICAN POLICEMEN REPORT SIGHTING OF 'SAUCER'

JOHANNESBURG, South Africa—South African police and scientists investigated Thursday a report that a flying saucer-type object had landed on a main highway near Pretoria, the country's administrative capital.

Two patrolling police officers reported seeing the flaming "saucer," about 30 feet in diameter, shortly after midnight. One of them, Koos de Klerk, said that the shiny copper-colored object resembled a giant spinning top.

The two men claimed that, as they approached the object, it took off silently at great speed with flames shooting out of its underside.

Scientists who examined the spot where the officers said that they saw the object are reported to have found that a six-foot wide section of the tarred road had been badly burned. Grass on either side of the highway also was reported slightly scorched.

In Conquest of Cosmos

Earthlings, Planet Men To Join Forces, Red Says

London, Sept. 29 (AP).—A Russian scientist predicted today that space-probing earthlings eventually would meet up with beings from other worlds.

And together they would go on to conquer the cosmos.

"Soviet science already commands the means to send cosmic rockets to Mars and Venus," claimed Moscow radio.

To be sure of getting to Venus a rocket will have to be set off precisely at 11.5 kilometers (7.46 miles) per second —"somewhat greater" than the speed of Russia's rocket which hit the moon, the broadcast said.

In man's conquest of the cosmos, Moscow radio reported, astronomer Feliks Segal believes the space travelers first will colonize the moon.

Then they will conquer the rest of the planets. Finally they will venture forth into other solar systems.

In a broadcast beamed to North America, Moscow radio said the moon at present was no place for man to make a home. It has no atmosphere and man could not breathe there. Daytime temperatures rise to 130 degrees centigrade but the nights are unbearably cold, the thermometer dropping to minus 160 degrees.

Moscow radio said one Russian scientist estimates that one inhabited planetary system must exist for every million stars.

"Consequently there must be about 150,000 inhabited planetary systems in our galaxy.

"On some of them life exists in lower forms. But there must be planets, too whose inhabitants may even be higher than man in point of development.

"Some of them may even have begun to make flights into space. Therefore we should have meetings with them.

"If such meetings do take place, they may result in the co-ordination of the efforts of man and these other intelligent beings in the great work of combating the elemental forces of nature."

Strange Air Object Seen In N.M.

ALAMOGORDO, N.M. (UPI)—A cigar-shaped unidentified flying object was reported seen Friday night near the place where the "manhigh" Air Force space balloon landed Wednesday.

The object was reported by John Romero, identified as a missile engineer, on the White Sands Proving Ground. But he said it had a fan-shaped tail and four pin-point-spots of lights on the side like portholes.

THE NEWARK STAR-LEDGER, FRIDAY, FEBRUARY 20, 1959

Says 'saucers' seen in Far North

By JOHN LESTER
Staff Writer

Unidentified Flying Objects, more commonly known as Flying Saucers, again have been seen "maneuvering and landing" in Northern Alaska and the North Pole area, UFO authority Lee R. Munsick of Morristown told members of the Denville Rotary Club yesterday.

Speaking at a luncheon meeting at the Rockaway River Country Club, Munsick, formerly assistant director of the National Investigations Committee on Aerial Phenomena, told Rotarianism these most recent sightings in thein Frozen North took place within t ehpast two weeks, "as nearly as can be determined at this time."

The Alaskan sighting involved a single disc-type craft that was seen by a small party of trappers about 200 miles east of Umiat, Munsick said.

The men estimated the UFO was about two miles away when they firgt noticed it, Munsick reported, that it rose and descended to within a few feet of the ground several times, then flew slowly in a tight circle before disappearing.

They described it as "red colored."

Munsick attributed this to the fact that there are numerous instances on record of UFOs' glowing when in motion, a deep orange at low speeds, nearly white at high speeds.

The Polar sighting was made by two Norwegian soldiers, although no further details are available.

The Norwegian embassy, Munsick said, claimed to have no record of this sighting but added that all information on UFOs and their sightings were considered classified.

This latest North Pole sighting is at least the fourth in which members of the Norwegian military have figured as far as is known, the speaker said.

In September, 1955, he recalled, a representative of the Norwegian Gneral Staff revealed that "special details" assigned to observe the Arctic region "are now convinced" it was being used as a base by UFOs, especially during bad weather "when we are forced back to our bases."

INTRODUCTION

Sometimes reality can be stranger than fiction. It is therefore unnecessary to add more fantasies to the genuine historical facts in the field of Nazi occultism, especially when it comes to their weird expeditions and their pseudo-scientific researches.

The true amateur of sensational and strange stories can still be fully satisfied with Himmler's Witch Project, or the Hollow Earth Theory, or the various moons of the World Ice Theory that fell on our planet and drowned the Atlanteans. This is real history and some high-ranking Nazis did believe in these theories, no matter how sensational they may sound to modern ears.

It does not add anything to the uncanny spell of such stories to pollute them with material that cannot be verified or, even worse, with pure lies coming straight out of the imagination of poor authors in search of quick money and fame. These made-up stories are usually rewritten in a thousand ways on the Internet, and everyone ends up adding their own personal touch or interpretation, feeding on each other as makeshift sources.

Even if we happen to be dealing with esoteric matters on the fringe of myth and reality, one should not depart from the proper scientific methods which were suggested by Sagan. We should only work on experimental data, observations and measurements. Facts should be independently confirmed by documented references. Logic should be the basis of all rationale, and every link in the chain of our submitted observations should hold together. One can make hypotheses on the link between two separate phenomena, just because they were close in time, place or shape, but these still have to be confirmed by some relevant material, such as geographical and physical evidences. Take, for instance, the case of the alleged battles that would have taken place after 1945 in Antarctica between Allied forces and very special Nazi aircrafts, looking like UFOs and flying out of underground lairs.

Finally, one should use the rule of Occam’s razor: where there are competing hypotheses to explain the same facts, use the simplest, though you may find another one to be more attractive. The point is not to write a screenplay for a blockbuster, but to find out what really did happen.

Among many untrue statements, the yet fascinating book The Morning of the Magicians written by Pauwels & Bergier in 1960, stresses rightfully that the Nazi era was like a breach in space and time that they called "The Absolute Elsewhere." What happened during these almost 12 years of dictatorship, at the heart of Europe in one of the most civilized and industrially advanced countries, does not match the moral, philosophical and religious values that prevailed everywhere else at the same time in the world. There is therefore a need to revisit all historical facts linked to Nazi "oddities" that one rarely finds in mainstream historians' books.

True occultism did exist in Nazi Germany but was not widespread. It was mainly centered on Himmler's personal fantasies and his small circle of high-ranking officers. Himmler was, though, the very powerful Reichsführer of the feared SS, and as such could introduce occult teachings and new religious practices in the training of his elite soldiers as he did, for example, at the Wewelsburg castle. He founded an almost occult and pseudo-scientific institute called the Ahnenerbe that led expeditions as far as Tibet and searched for the Holy Grail in the South of France. Last but not least, Himmler was very much interested in the persecution of witches during the Middle Ages.

Fantasies, urban legends, literary inventions and pure lies came after the war at the beginning of the ‘60s. Any book that dealt with Nazis and the occult, Satan, UFOs or secret treasures was assured to be sold at thousands of copies. Among the purely commercial approach of fake historians and storytellers, there were a few "honest" though fanatic people who managed, by their writings and teachings, to develop a kind a semi-religious version of Nazism that has formed the basis up until today for neo-Nazi movements throughout the world. We shall therefore deal more deeply with such themes as the Black Sun and the Vril force that pervade many of these Nazi New Age creeds.

This book aims at separating historical facts, however esoteric and strange they can be, from post-war fabrications and commercial lies. The amateur of mysteries and dark secrets will not be disappointed, though, since in this quest reality is often stranger than fiction.

HISTORICAL ODDITIES

Not all that is strange is necessarily of the occult; and not all that is esoteric is necessarily strange, but things can remain hidden for a number of reasons.

There is hard historical evidence of odd things that did happen during the Nazi era; these topics are rarely touched by mainstream historians because they may not feel at ease with the classical "all evil/all good" dichotomy between the Axis and the Allied forces. This is probably due to the Nuremberg Trials held by the Allied forces just after the Second World War.

Suffice it to consider that the bad guys did not discriminate in their ranks as much as the US Army did with its Negro troops, or that whatever technical achievement the villains acquired has boosted the post-war research and development of both the USA and the USSR. This is particularly true in the fields of aeronautics and missiles.

Non-Whites & Jews in the German Army

Although Nazism applied racial theories against non-white people, it welcomed volunteers from almost all races in some of its organizations. According to Bryan Mark Rigg, in his book Hitler's Jewish Soldiers, there were up to 150,000 Jews, or partially Jewish soldiers, in the regular German armed forces. Some of them were even awarded very high decorations, and others became high-ranking officers, like generals and admirals. These Jews considered themselves nonetheless German above all, and not Jews.

Field-Marshal Erhard Milch

The most astounding example is Field-Marshal Erhard Milch, who was a "half-Jew," and whose birth certificate was falsified by none other than Goering, who had claimed to Nazi protesters that "I decide who is a Jew and who is an Aryan."

In fact, there was an exception to the racial laws of Nuremberg, called the concept of “honorary Aryan.” The whole Japanese people as well as the Finns, who are not of Indo-European descent, were proclaimed “honorary Aryans.” Some Jews were considered as such too, but on a very small scale, being mostly veterans from WWI who won military medals for their bravery during the fights.

There were also a few Black people living in Germany at that time. Some were sterilized when Nazis came to power, while others were harshly discriminated against by the population.

African serving in the Free Arabian legion

Afro-American POW soldiers were usually treated much worse than white American soldiers. Although rare, there have been some confirmed instances of Blacks being enlisted within Nazi organizations, such as the Hitlerjugend (Hitler Youth) and the Wehrmacht. There were even a few Blacks in Berlin that were kept in pretty good conditions so that they could be used in propaganda movies.

Sikh soldier from the Indische Legion
controlling French citizens (1944)

In the German army, there was an influx of volunteers from many nationalities and races. Indians served on the Atlantic Wall in France under German uniform in the Indische Legion, all the while keeping some ethnic insignias of their own, just like Black and Arab soldiers were deployed throughout the Free Arabian Legion in North Africa.

Non-Germanic soldiers were enlisted in the Wehrmacht as Foreign Volunteers, whereas “Aryan” candidates usually joined the Waffen-SS.

All in all, there were around 120 different nationalities in the Waffen-SS and the Foreign Legions together, representing many races and religions alike. There were even a few American and British volunteer recruits among the POWs.

Spring of Life and Baby Abductions

The Lebensborn, meaning Spring of Life in German, was not a breeding organization taking care of Aryan children, as it was claimed after the war. Its aim was to lower the very high abortion rate in Germany after WWI (800,000 per year); to take care of orphans during wartime; and to offer social help for children born out of wedlock, may they be German or not and may they be in Germany or in an occupied country alike. The women, of whom 60 percent were not married, were allowed to give birth anonymously and have their children adopted by Aryan families.

The strict conditions to be eligible for the Lebensborn benefits were of course in accordance with the Nuremberg racial laws, and therefore they applied only to the members of the so-called Nordic race or Aryan race.

Nurse taking care of Aryan children
in a Lebensborn center

Though not directly involved, the Lebensborn helped host some of the abducted Polish children who were meant to be Germanized. A total of around 200,000 Polish children, none older than 10 and all bearing "racial value," were taken from their homes and brought to Germany to be raised by German families according to the national-socialist ideology. On a lesser scale, similar abductions were reported in other occupied countries as well.

It appears that the Lebensborn was only the tip of the iceberg regarding the broader problem of children considered to be Aryans throughout Europe. Besides abductions, many children were born from the illegitimate relations between German soldiers and women in occupied countries. In France alone, the number of such children, called enfants de la guerre (children of war) is estimated to be as high as 200,000. There were as many as 40,000 in Belgium, 20,000 in the Netherlands, 12,000 in Norway and 4,000 in Finland. After the war, these children were very often harshly discriminated against as "traitors."

Lake Toplitz: the Nazi Abyss

Lake Toplitz is located in the mountains close to Salzburg, in Austria. It is possible to access its shores only by foot, since the only small road close to it is private property. The lake itself is pretty narrow, only 400 meters wide; it's not that long (2 km), but it is quite deep (108 m). Because of these particular characteristics, Germans used this site to test their torpedoes.

Towards the end of the war, Nazis wanted to bring Hitler to this natural alpine fortress and organize a last-ditch guerrilla attempt against the Allied troops, which were closing in. However, Hitler committed suicide on April 30, 1945, and this place was used to hide the last secrets of the Third Reich as an absolutely last resort to prevent them falling into Allied hands.

Lake Toplitz dark and deep waters

During the very last days of WWII, a SS car squad brought mysterious crates close to the lake. Since no vehicle could go further, they knocked at the door of a 21-year-old girl named Ida Weisenbacher, who still lives in a small house close to the lake. "It was five o'clock in the morning, we were still in bed when we heard the knock on the door," remembered Weisenbacher. "'Get up immediately! Hitch up the horse wagon, we need you.'"

She hurried up and guided them to ride their wagon pulled by horses to the lakeshore. "A commander was there. He told us to bring these boxes as fast as possible to Lake Toplitz," added Weisenbacher. The boxes were labeled with bold-painted letters and numbers. After carrying three full wagonloads to the lake she could later testify: "When I brought the last load, I saw how they went on to the lake and dropped the boxes into the water. The SS kept shoving me away, but I saw the boxes were sunk into the lake."

After the war many people tried to dive in to find these Nazi treasures, but the odds were low and the danger was high. The bottom of the lake was carpeted with logs, sometimes standing like an underwater forest made by falling trees from the steep slopes of the mountain. In 1947 a US navy diver became entangled there and drowned. Then in 1959 a team, financed by the German magazine Stern, managed to retrieve £72 million in forged British currency, hidden in those boxes, together with their money printing press. The fake currency was produced during a secret counterfeiting operation, code-named Operation Bernhard, which was personally authorized by Adolf Hitler to weaken the Allied economies.

In 1963 another diver drowned, and explorations became forbidden until 1983, when a German biologist accidentally discovered more forged British pounds, in addition to numerous Nazi-era rockets that had crashed into the lake. At the turn of the new millennium, other expeditions costing up to US$600,000 were launched in the depths of the lake, one of which brought back some more fake currency. A French company managed to dry some of those soaked banknotes in order to show them at an exhibition.

Some claim, sometimes with good reasons, that there could be more to find there, since it is most likely that any heavy treasure would probably be hidden under the log forest which lies at the bottom of the lake.

Werewolves

The name Werwolf (German for Werewolf) was initially a novel written by Hermann Löns: Der Wehrwolf (1910). The latter spelling literally means "the wolf that defends" in German. This book was read by the Free Corps fighters after WWI, and held as an example. Some go so far back as to see the Werwolf 's origins in the late Middle Ages and the Holy Vehme Courts, which were a secret society of normal citizens taking revenge on criminals who acted negatively towards the community. The criminal was sentenced and often hung on a tree as a manner of advertisement.

Werwolf insignia on pennant

By March 1945, when the Final Victory was seen as impossible, minister of propaganda Joseph Goebbels fostered the idea of a clandestine guerrilla warfare that would assault ceaselessly upon the Allies, even after their victory.

The truth is that the Werwolf was firstly intended as a uniformed unit and not an intellectual concept of resistance. Though some acts of "terrorism" against enemies of Nazism were accounted for as late as 1948, many put into question the fact that they actually were linked to a secret Werwolf organization. The only confirmed consequence of the propaganda made around the Werwolf was the overestimation of the phenomena by the Allies, which led to greater hardships for the German population.

The actual Werwolf was initiated by Heinrich Himmler in the summer of 1944, and then entrusted to SS General Hans-Adolf Prützmann. Their recruits, comprised of some 5,000 SS men and Hitler Youths alike, were trained with guerrilla tactics that were similar to what the Germans saw being used by the Soviet partisans in the occupied territories of the East.

On March 23, 1945, Dr. Joseph Goebbels urged every citizen of occupied Germany to act as a Werwolf. Although the partisans trained by Prützmann were completely annihilated in 1945, the Allies still adopted harsh measures with the Germans. The Soviets in particular killed thousands of young boys suspected to be Werwolf members, with no real proof or proper court trial.

Nonetheless, the Werwolf could be considered as a masterpiece of Dr. Joseph Goebbels' successful propaganda, since it mobilized many Allied resources against a quite non-existant danger.

The Underground Reich

In just a few years, Nazi Germany occupied many European countries, and managed to introduce noticeable changes in their daily landscape. Some of them are still visible today, such as the bunkers; others are spread underground through extended networks of tunnels and chambers. What was the purpose of such constructions, and did they hide agendas of the strangest kind?

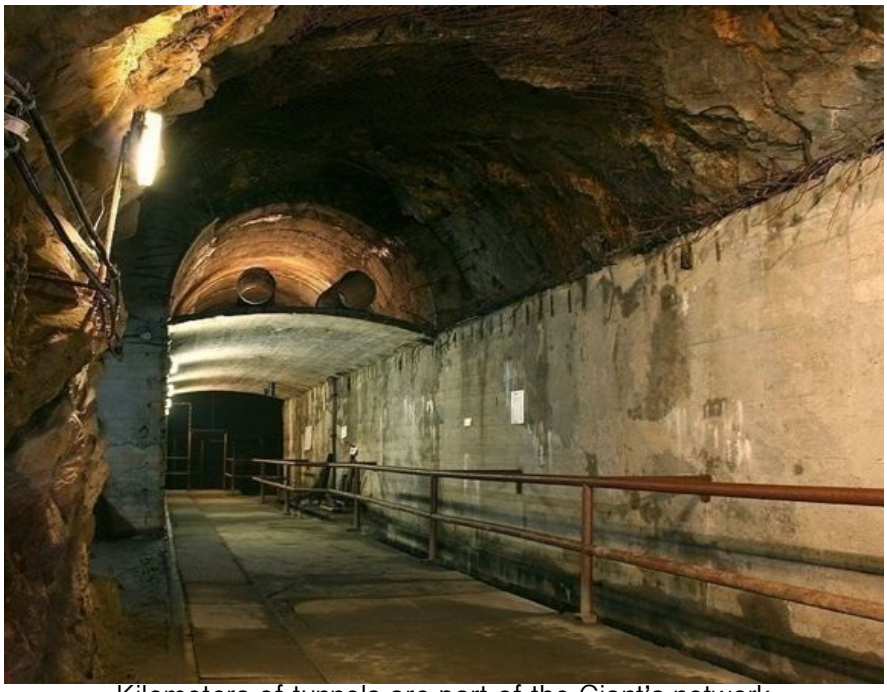
Many know from WWII movies about the impressive chain of bunkers along the Atlantic Wall, which was meant to prevent any attempt of the Allied forces to land by sea. Others may remember pictures of Hitler's headquarters in East Prussia (Wolfsschanze aka The Wolf's Lair) or in Ukraine (at Vinnitsa: Werwolf aka The Werewolf). But who had ever heard of the underground cities in the Jonas Valley, or of the underground networks of factories at the Dora concentration camp?

They had built no less than fourteen headquarter-ready bunkers for Hitler, of which he actually used ten. Some of them were well known, but others are barely mentioned in the history books. For example, most French are not even aware that there exists a large bunker complex just 60 km from Paris, in the city of Margival adjacent to Soissons. Except for the people who live very close to it, nobody else had ever visited Hitler's Polish headquarters of Stępina or Strzyżów, referred to as the Anlage Süd, (Southern Installations). Hitler met Mussolini there on August 27, 1941. Based on the information that I was able to personally gather from the local elderly, villagers were asked to stay home and close their windows in order not to see the Duce and the Führer while they stayed at Stępina, although they were allowed to stay put in their homes.

The same old people told me that just after the war, Polish secret service agents discovered that there was a multi-level structure right under the bunker that may be four to five underground floors. Nobody could know for sure, since the Germans flooded the whole building thanks to a nearby river. Polish divers tried to locate the breach in the structure from which the river poured in, but always failed in doing so. Pumping up the water was therefore not an option. Rumors have said that rich North Americans of Polish descent would try in the near future to invest the necessary money in order to stop the leak and drain the bunker and its underground floors. Yet nobody knows exactly what they expect to find down there because of the lack of archives on the matter.

Stępina Train Bunker where Mussolini's train was hosted

Even more mysterious were the vast network of tunnels and bunkers, which were so big that they sometimes looked like underground cities. Their real purpose has not always been clear up to this day.



The less mysterious and yet probably the most gruesome among them was the Dora concentration camp near the city of Nordhausen, with its Mittelwerk factory.

The majority of Nazi covert activities took place in their underground facilities beneath Kohnstein Mountain, where they had buried their entire factory that produced the famous V2 rockets. The existence of these rockets was discovered after the Allied air raid on the Peenemünde island's U-boat facilities, on August 17 and 18, 1943, which destroyed most of its infrastructure.

Mittelwerk factory

Der Riese (German for “The Giant”) is another very extensive complex of underground tunnels and bunkers in the Owl Mountains and under Książ Castle in Lower Silesia, which was part of Germany at that time, but is now in Poland. It was built in 1943 to serve as another headquarters for Hitler. Its underground bunkers were located in eight different places and took thousands of forced laborers to build. According to Albert Speer, Minister of Armaments and War Production of the Reich, "These projects required 328,000 cubic yards of reinforced concrete, on top of the masonry involved, and they entailed 277,000 cubic yards of underground passages, 36 miles of roads with six bridges, and 62 miles of pipelines. The ‘Giant’ complex alone consumed more concrete than what was allocated for the entire population to build their air-raid shelters in 1944." The total cost was almost five times higher than the Wolf's Lair bunker.

Kilometers of tunnels are part of the Giant’s network

The works were never fully completed before the war ended, and since the Polish secret service confiscated the blueprints and all the relevant confidential information, nobody really knows what its exact purpose was to this day. People assume that

it was meant to be the biggest of all Hitler's headquarters, and a shelter for the underground factories, but this assumption could never be confirmed for sure. SS General Hans Kammler was in charge of all these underground facilities, but since he disappeared in 1945 close to Prague, in Czechoslovakia, his alleged death became surrounded by many controversies, the most likely being that he was shot by Russian troops in the woods surrounding the Czech capital city. Others claim that he bargained with the US Army to barter his knowledge about German Wonder Weapons in exchange for his immunity in the USA. This theory would not be implausible if he had made it through to the Americans before being captured by Soviet troops, since Kammler was a man who knew even about the A9 rocket, known as the Amerika rocket, that was going to be built in these 30-meter high tunnels with the purpose of reaching New York City.

Książ Castle in Poland

It has been calculated that over half of the underground galleries and chambers have yet to be discovered, because a SS team blasted many of their entrances. This is how the Warsaw Voice reports what the post-war Polish researchers had estimated: "There are 35 stoneware pipes meant to carry liquid. Where to? We don't know. We measured their depth and tried to use smoke to find out whether the pipes were connected inside, and where they ended. We put two lit flares in each opening – the smoke was evidently sucked inside. In one case, we could hear what sounded like an air-lock working ... smoke from 26 flares went inside and didn't really come out anywhere. How great must be the capacity of those pipes, or even the underground tunnels, if they could take in such a quantity of smoke!"

There seems to be even more tunnels, suggested by the fact that some have been bricked up. Researchers went on claiming, "In some places, pipes come out the surface of the mountain from nowhere, and in others, narrow-gauge railway tracks stick out of piles of rock; such tracks were used to remove the excavated material. There are also empty chambers with no direct connection to the tunnels accessible today, nor to any surface structures. Some elements suggest that the tunnels in the Owl Mountains could have had a multi-level structure, very seldom seen in other German facilities around the same period. This could confirm the presumption of some amateur explorers that there might still be some things in the corridors which are still inaccessible today. The question as to what exactly, still remains unanswered. The obvious interest shown in these facilities after the war, by the special services either in the Soviet Union, in East Germany, or in Poland could do nothing to dispel these doubts."

The Jonas Valley - It's now worth mentioning the most mysterious of all underground facilities: the 25 tunnels dug in the mountains of the Jonas Valley (Jonastal) in Germany. Tens of thousands of prisoners worked there to complete this gigantic enterprise, many of them starving to death or losing their lives in the process. The secrecy surrounding this operation was so strict that even nowadays no one can say for sure what their actual purpose was. The tunnel entrances have been blasted in order to prevent access to the public for security reasons. Some claim that it was one more huge headquarters for Hitler, others that it was a site for testing nuclear bombs, or to host factories producing the Amerika rocket meant to reach American soil (Hitlers Bombe by Rainer Karlsch, 2005).

Jonastal: 25 tunnel entrances can
be seen entering the mountain

Last but not least, adventurous minds claim that the Amber Room treasure, called the Eighth Wonder of the World, would be buried there. It was a room pertaining to Catherine's Palace, called Tsarskoye Selo in Russia, and was a true marvel of art and craftsmanship. The most likely theory is that is was brought to Königsberg by the Germans after they stole it, and that it was destroyed there by none other than the advancing Soviet troops. Königsberg is now a Russian exclave bearing the name of Kaliningrad.

True or not, there are still very strange stories being told about the underground Reich, and the author of this book heard one such tale recounted by a reliable good friend. This friend's grandfather was one of the very first French soldiers fighting on German soil, where he heard that American soldiers had found a very deep tunnel, probably in the Harz Mountains where the Jonastal is located. He claimed that they were ordered to go inside to find out what it was meant for. The deeper they went inside, the longer the tunnel appeared to be. They allegedly had even found two dead SS soldiers, probably by starvation, holding onto their MG42 machine guns in a desperate effort to try to prevent any Allied intrusion. Where it gets even stranger is that they were ordered to blast the tunnel after nearly 14 kilometers, and not even try to get any farther. Did the US generals know more, or were they simply afraid of what they could have found?

Wonder Weapons

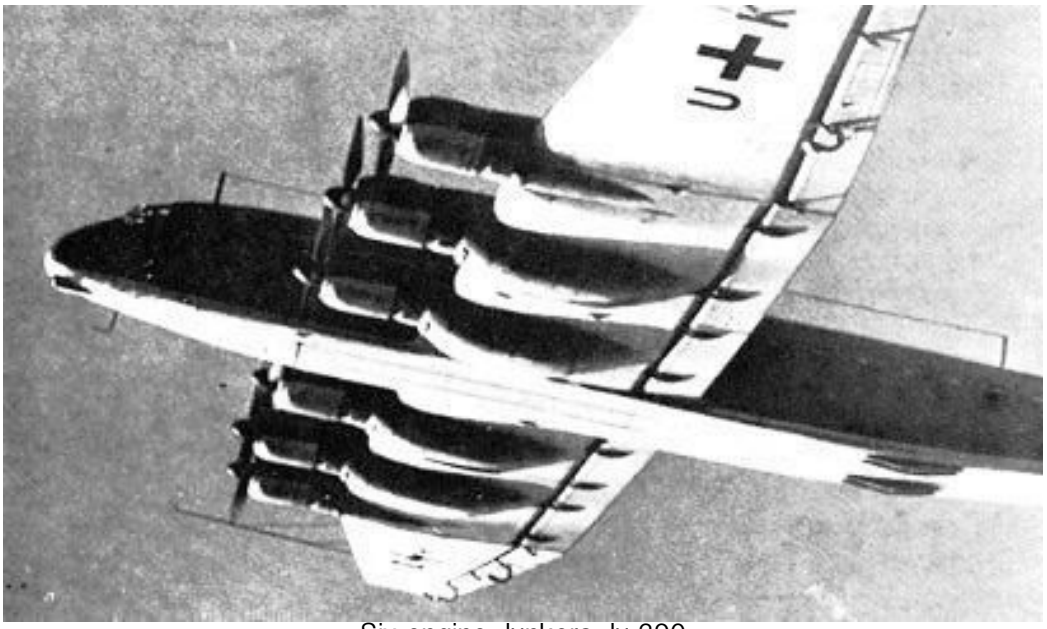
The Wonder Weapons (Wunderwaffen in German) were real cutting-edge weapons, as well as a new means of propaganda in the hands of Dr. Joseph Goebbels. They were technologically so ahead of their time that they gave birth to a full new myth. Some of them were proven to be quite useful, like the V2 rockets, while some others may have been just as efficient if they had been produced on time and in sufficient quantities to really turn the tide of the war around. The most famous example is probably the Me 262 jet-engine aircraft; moreover, there were some Wonder Weapons which never developed beyond the stage of blueprints or prototypes.

Silbervogel: Wind tunnel model, picture taken in 1935.

Many innovative projects were cancelled before they even started, or they were never completed by the time the war ended. We are talking about different types of aircraft carriers, U-boats with all-electric engines using an air-independent propulsion device, both able to carry ballistic missiles and super-heavy tanks like the Ratte (The Rat) which would have weighed 1,000 metric tons. German scientists had also planned some rocket-powered aircrafts, reusable A5-type rockets, A11-and A12-type satellite launchers, a Silbervogel sub-orbital Amerika bomber that could be launched from the mid-Atlantic Azores islands, manned surface-to-air missiles, a sun gun with a concave mirror that could focus reflected sunlight on a specific target on the Earth and possibly destroy an entire city, a gigantic static V-3 cannon to bombard London from their Northern France location, and finally, the infamous German nuclear project, which failed for lack of unified research management.

Below are listed some of the Wunderwaffen that made it to the field of battle, even though some were only in small quantities:

The **Type XXI U-Boot**, also known as the "Elektroboot", was the first submarine designed to operate primarily submerged rather than as surface ships that could submerge, providing a means to escape detection or to launch a surprise attack.



Type XXI U-boats in Bergen, Norway

The **Panzer VIII Maus** was completed in late 1944 and it was the heaviest tank ever built.

Panzer VIII Maus with crew members

The **Junkers Ju 390** was one of the aircraft candidates, along with the Messerschmitt Me 264 and Focke-Wulf Ta 400, which was submitted for deployment in the Amerika Bomber project.

Six-engine Junkers Ju 390

The **Messerschmitt Me 323 Gigant** was in fact the biggest land-based transport aircraft of the war.

Messerschmitt Me 323 Gigant

The **V-1 flying bomb** (Vergeltungswaffe 1 in German, standing for the Retaliation Weapon 1) was the jet-powered predecessor of our modern-day cruise missiles.

V-1 missile on a launch rail at Imperial War Museum Duxford

The **V-2 rocket** (also called Aggregat-4 or A4), was a ballistic missile specifically targeted to hit London and Antwerp.

V2-Rocket in the Peenemünde Museum

The **Horten Ho 229** was a prototype fighter/bomber combination, designed by Reimar and Walter Horten, and it was the first wing-powered jet aircraft in the world.

Horten Ho 229

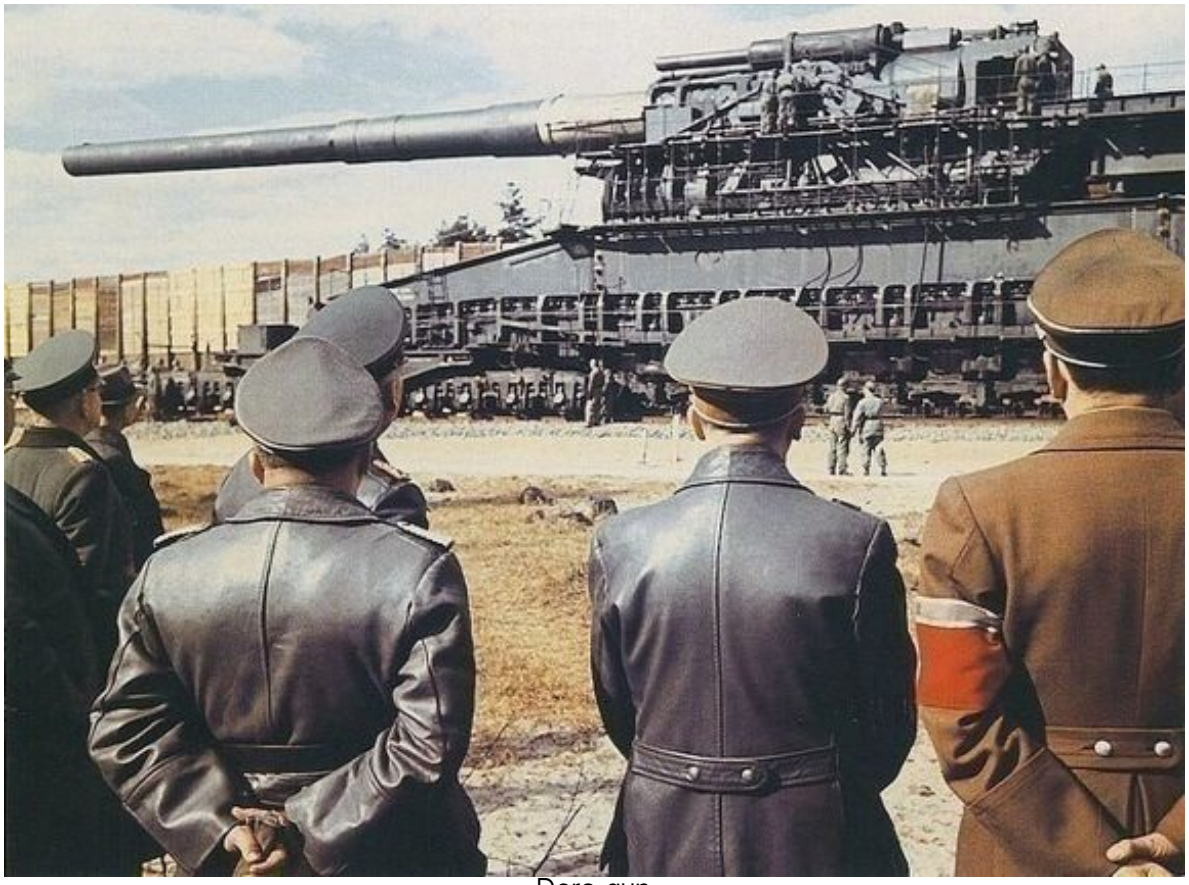
The **Flettner Fl 282 Kolibri** ("Hummingbird") was a single-seat, open-cockpit intermeshing-rotor helicopter. It was the first series production helicopter in the world.

German helicopter Fl 282 Kolibri

The **Fieseler Fi 103R** was a manned version of the V-1 flying bomb, intended for attacks in which the pilot was likely to be killed.

Fieseler Fi 103R, code-named Reichenberg

The **Me 163 Komet** was a rocket-powered fighter aircraft, which was the only one ever to be deployed.



The **Me 262 Schwalbe** ("Swallow") was the world's first operational jet-powered fighter aircraft, which was much faster than its counterpart Allied fighters.

Me 262A at the National Museum
of the US Air Force in Dayton

The **Dora** was the name of one German ultra-heavy railway gun which weighed 1,350 tons. It fired shells that weighed seven tons, with a 47-kilometer range.

Dora gun

The **StG 44** (Sturmgewehr 44) is considered by many historians to be the first modern assault rifle.

StG 44

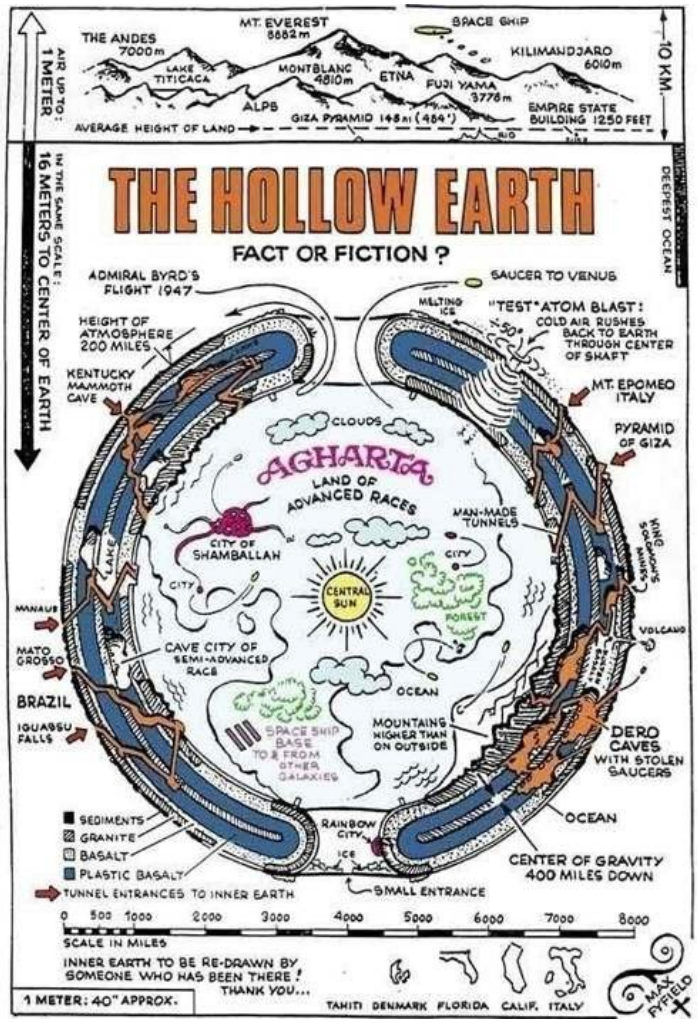
The **Zielgerät 1229** (ZG 1229), aka Vampir, was an infrared device developed for the Sturmgewehr 44 assault rifle, designed to offer the night-vision advantage.

Vampir infrared device for night vision

The **Sarin Gas** was discovered in 1938 by two German scientists who were attempting to create a strong pesticide. In mid-1939, the formula for the agent was passed to the chemical warfare section of the German Army Weapons Office, which ordered that it be brought into mass production for wartime use. A number of pilot plants were built, and a high-production facility was still under construction by the time World War II ended. Although sarin could be incorporated into artillery shells, for some reason Germany decided not to use nerve agents against Allied targets too close to home. This gas was used with devastating effects in a Tokyo subway during the 1995 attack of the Aum Sect.

NAZI OCCULTISM

Nazi occultism is a concept where it is difficult to separate historical facts from post-war fantasies. The latter are numerous, especially from the ‘60s onward. Two books helped this surge in Nazi occultism: Pauwels and Bergier's The Morning of the Magicians (1960) and Trevor Ravenscroft's The Spear of Destiny (1972). After these, any book that tackled the Nazi occultism theme was sure enough to make strong sales, well above 50,000 copies for the worst among them.



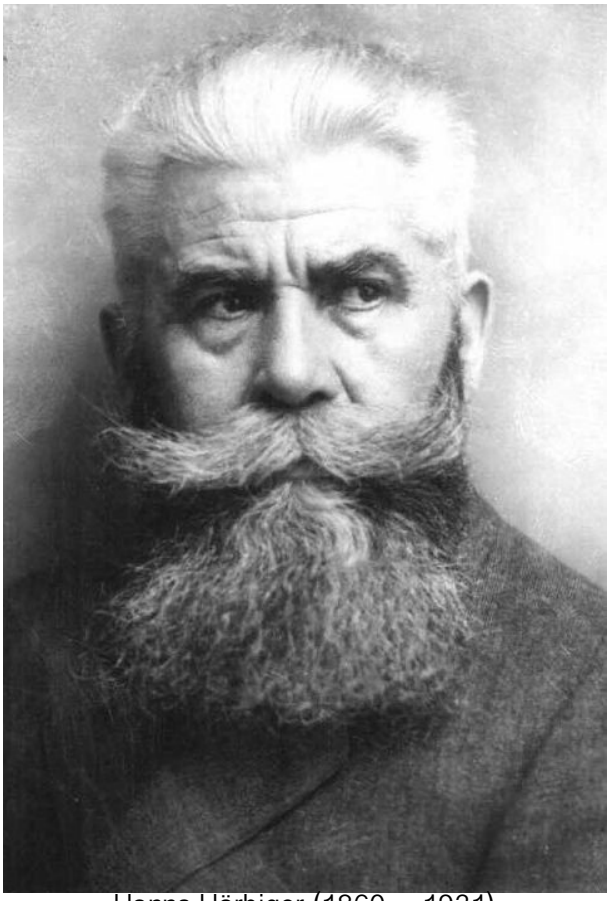
The only researched academic book to have seriously studied this field is The Occult Roots of Nazism (1985, Nicholas Goodrick-Clarke). It links the late 19th century ariosophist theories to the Thule Society, and possibly to the very beginnings of the Nazi Party. The only proven aspects of Nazi occultism are Himmler's known interest in the matter and the researches he ordered.

It is nonetheless obviously true that the twelve years of the Nazi era are like a breach in the fabric of history. The Nazi standards and values may be seen as the archetype embodiment of an evil empire compared to our own civilization, but they are above all values from the Absolute Elsewhere, as Pauwels and Bergier put it rightfully in their best-seller.

At this stage, it is hence more than necessary to determine the real facts concerning Nazi researches, expeditions and beliefs before we can properly evaluate post-war fantasies and cheap Internet Nazi myths. Let’s stress, though, that these myths are still best-selling as many readers prefer anything but the truth as long as it thrills them like a good TV series would.

The Hollow Earth Theory

Although this theory is merely a notion which was dismissed by the scientific community as early as the late 18th century, it still has advocates today.



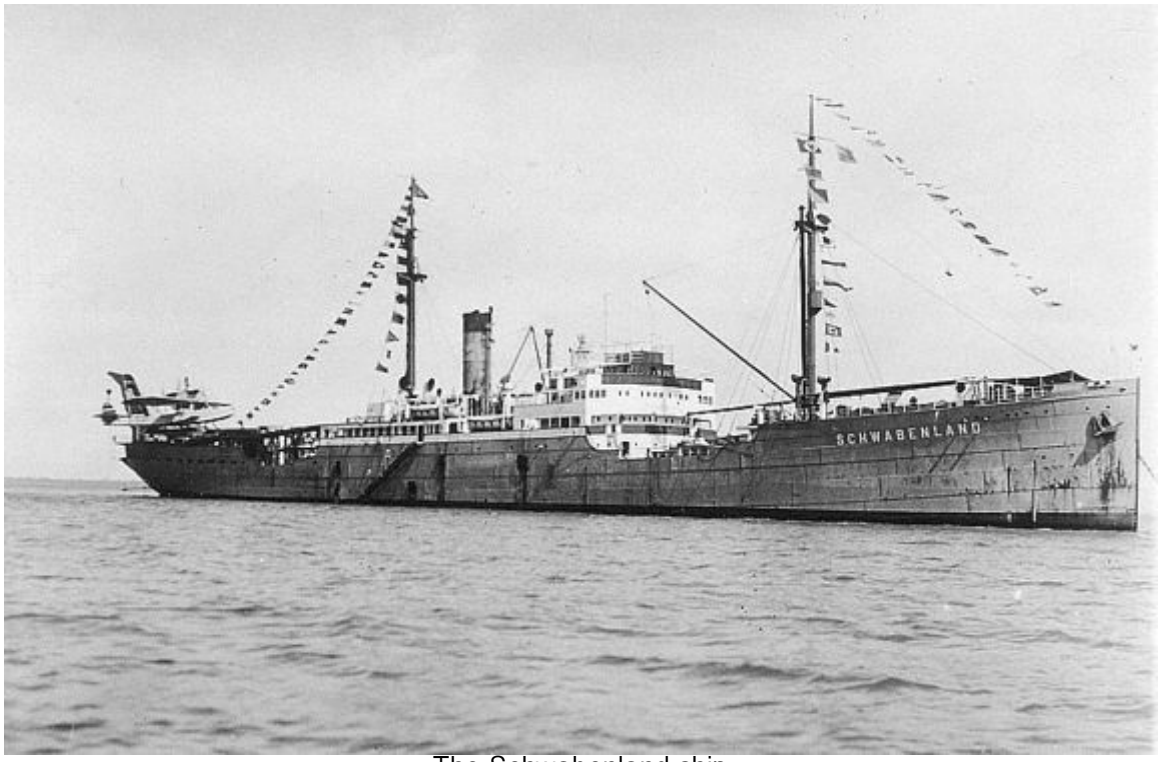
During the Nazi era, the Hollow Earth Theory had followers in Germany but not more than in any other Western country during that time. In 1838, Edgar Allan Poe wrote a novel, The Narrative of Arthur Gordon Pym of Nantucket, telling us of an awe-inspiring voyage inside the earth by a ship that entered through an alleged hole in the South Pole; in 1871, Edward Bulwer-Lytton published his famous fiction called The Coming Race about some superior creatures, called Vril-ya, that dwelled in the subterranean world; in 1864 Jules Verne wrote of A Journey to the Center of the Earth where prehistory still existed; in 1922 Ferdinand Ossendowski mentioned in his Beasts, Men and Gods the existence of an underground kingdom, with Agarthi as their capital city ... the very residence of the King of the World.

According to the book written by Pauwels & Bergier, The Morning of the Magicians (1960), German scientists were testing life inside a hollow universe on Rugen Island of the Baltic Sea. They even tried to use infrared rays to detect British navy ships, since the alleged inverted curvature of the Earth would have permitted the monitoring of their whereabouts. One does not wonder anymore why it failed so miserably.

The only proven link with Nazis is their fondness for tunnels, including underground bases and bunkers, that stretched sometimes for hundreds of kilometers, like those close to the Dora concentration camp in the Harz Mountains of Germany, or in the huge complex called Der Riese (The Giant) in what today is southwestern Poland.

World Ice Theory

The World Ice Theory (WEL or Welteislehre in German) is a cosmological theory coming straight from the mind of Hanns Hörbiger, an Austrian mechanical engineer whose daily work was far away from astronomy.



Hanns Hörbiger (1860 – 1931)

Hörbiger got his knowledge from "visions" that he had seen around 1894 while sleeping. His theory states that ice is the base material of all events in the universe. Ice allegedly determined the shape our planet through the influence of "ice moons" that fell on Earth at various times throughout history, causing floods that wiped out entire ancient civilizations like Atlantis.

Himmler and Hitler were first enthusiastic about the WEL theory because of its alleged weather forecasting abilities. The Führer went so far as to adopt it as the Nazi Party's cosmology, but later the Propaganda Ministry ordered Hörbiger to stop all related publications. WEL did not survive WWII except among some minor neo-Nazi groups.

Neuschwabenland

New Swabia (Neuschwabenland in German) is the region of Antarctica under Norwegian influence, which was named after the boat Schwabenland of the German Antarctic Expedition of 1938-1939. This boat could carry and catapult two aircrafts.

The Schwabenland ship

There were two German expeditions before 1938 with the idea of crossing right through Antarctica: the Gauss expedition from 1901 to 1903 and the Filchner expedition from 1911 to 1912.

Germany decided in 1937 to put a whaling fleet to sea for economic reasons. After successfully returning home to Nazi Germany, which was in dire need of whale fat for its industry, they launched their infamous 1938-1939 expedition. Their hidden agenda was to find a good location for a German naval base.

Because of the initial lack of information and the secrecy of the operation, conspiracy theories emerged about the Nazi survival bases under the ice in New Swabia and their subsequent destruction by the British and American troops (the notorious High Jump Operation led by Admiral Byrd). One enigmatic clue comes from two statements made by Admiral Dönitz, first after the expedition returned in 1939 and then later in 1944; he allegedly claimed, "My U-boat operators discovered a real earthly paradise" and then that "Germany's submarine fleet is proud that it created an unassailable fortress for the Führer on the other end of the world...." During the Nuremberg Trials, Dönitz would have spoken of "an invisible fortification, in the midst of that eternal ice."

Official insignia of the 1938-1939 expedition

Once more, we have to deal with post-war fantasies, as this is very accurately debunked by Colin Summerhayes in his serious and well-researched article called Hitler's Antarctic Base: The Myth and the Reality, first published in the Polar Record Magazine, issue 43, of the Cambridge University Press (2007). He concludes that "Using background knowledge of Antarctica,

and information concerning these activities that has been published since the early 1940s, it is now demonstrated that: the two U-boats U-530 and U-977 could not have reached Antarctica; that there was no secret wartime German base in Dronning Maud Land; that SAS troops did not attack the alleged German base; that the SAS men in the region had civilian jobs at the time; that Operation Highjump was designed to train the US Navy for a possible war with the Soviet Union in the Arctic, reason why not to attack an alleged German base in Antarctica; and that Operation Argus took place over the ocean more than 2,000 km north of Dronning Maud Land. Activities that were classified have subsequently been declassified, and it is no longer difficult to separate fact from fancy, despite the fact that many may find it fancy not to do so."

Furthermore, there is the famous myth surrounding U-530 and U-977, two German submarines which surrendered at Mar del Plata (Argentina) weeks after the end of the war. If we are to believe cheap books on that matter, these U-boats carried none less than Hitler and Eva Braun to an Antarctica underground lair, with plenty of supplies to prepare the advent of the Fourth Reich or the construction of UFOs. Once more, let's refer to Colin Summerhayes' scientific approach that states clearly:

"Consideration of dates, times and speeds suggests that neither U-530 nor U-977 had time to visit Antarctica. But sailors can lie, and ship's logs can be forged. The question we ask here is: was such a visit physically possible under the conditions prevailing at the time?

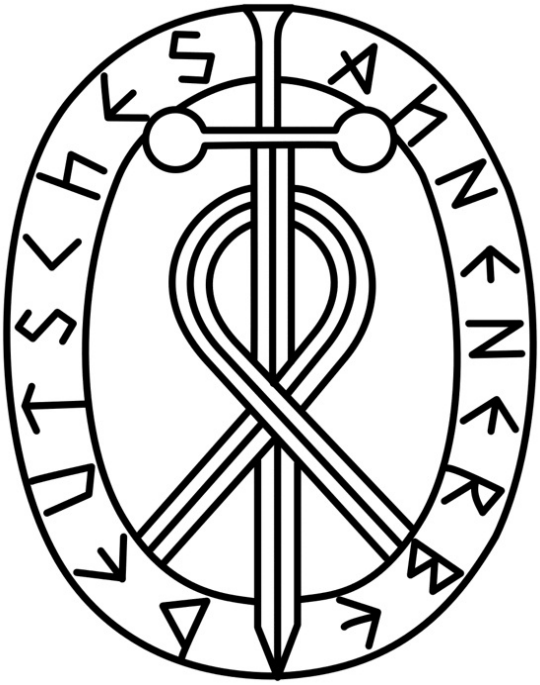
All previous considerations have omitted to note that June, July and August are mid-winter months in the southern hemisphere. Could a submarine reach the coast of Dronning Maud Land, surface, and unload onto the ice shelf in mid-winter? The first obstacle would be the notorious Southern Ocean itself. The second obstacle would be the pack ice 1-2 m thick that surrounds Antarctica during the winter. Satellite data collected by NASA (Gloersen and others 1992), and by India (Vyas and others 2004) show that off Dronning Maud Land the pack ice extends around 500km out from the coast in late May and June, and 1,665 km from the coast in July, August and September […]

Could U-boats surface through 1–2m of pack ice?

Because of their low freeboard, World War II submarines could easily be damaged by pack ice. […]

Supposing that U-977 had reached the coast, what circumstances would have met the crew?

The 24-hour darkness and the cloud cover would vastly increase the danger in navigating in ice close to a poorly mapped coast. Even seeing the 'coast' would have been difficult, because it comprises the 10-30 m high ice cliff at the edge of the ice shelf, which would be more or less invisible in the dark from the low deck of a submarine, not forgetting that the icy seas would be strewn with icebergs […]. [It] means that it would have been physically impossible for U-530 or U-977 to have gone anywhere near the coast of Antarctica in June, July or August 1945.



[Even if that had been possible] anyone landing from a submarine would have faced the most extraordinary difficulties in trekking 250 km across ice penetrated by hidden crevasses, in the dark and without navigational aids to a lair in the mountains where the temperatures would have been lower, down to -50○C (Ohta 1999) and the weather worse."

People who still hesitate should read this article in full, easily to be found on Google, since it proves in detail that all that was written before were pure fantasies, if not even gross lies. A scientific approach is always preferable than some unsubstantiated claim based on "anonymous insiders" and "government conspiracies."

The Ahnenerbe

In 1935 Himmler met with racial experts and founded an organization called “Deutsches Ahnenerbe, Studiengesellschaft für Geistesurgeschichte” ("German Ancestral Heritage, Society for the Study of the History of Primeval Ideas"). In short it was just called the Ahnenerbe. The most prominent and final chief of the organization was Wolfram Sievers, who was condemned to death at the Nuremberg Trials.

The goal of the Ahnenerbe was to study and research the ethnological, anthropological and cultural history of the Nordic race, the so-called Aryan race. They organized expeditions in different parts of the world to search for the birthplace of the Aryan race, and proof that it once ruled the world. The outbreak of WWII put an almost complete end to all faraway expeditions.

Official insignia of the Ahnenerbe

The Ahnenerbe had different departments, and although most of them were dedicated to archeology, they had a meteorological section based on Hanns Hörbiger's World Ice Theory, and they even had a musicology section.

These expeditions were numerous:

Karelia, Finland (1935): the goal was to record old sorcerers' and witches' chants, supposed to hold remnants of ancient Aryan pagan incantations.

Bohuslän, Sweden (1936): the team set off to the most ancient rock art site in the country, where ideograms were carved. Wirth, the then-president of the Ahnenerbe, tried to prove that he had found a prehistoric alphabet among these petroglyphs, but was using a less-than-rigorous scientific method.

Italy (1937) and **Middle East** (1938): Two researchers, Franz Altheim and Erika Trautmann, went to Italy and then to Romania, Turkey, Greece, Lebanon, Syria and Iraq in order to prove that the success of the Roman Empire was due to its Aryan racial base.

Germany (1937-1938): researchers excavated ancient fortresses and found prehistoric caves with Cro-Magnon artifacts. Some other SS studied the famous Extern Steine that would hold the proof about advanced Germanic prehistoric tribes, with a highly organized and a sophisticated solar religion.

France: the same researchers went to visit well-known prehistoric caves in France. Furthermore, during the war the SS tried to steal the Bayeux Tapestry (showing the invasion of England by the Normans) since this would have proven the superiority of the Germanic tribes.

The most mysterious case is that of Otto Rahn, an SS sent as a civilian to southwestern France pre-war to look for the Holy Grail, allegedly kept by the Cathars of Montségur. Rahn wrote interesting books about these legends. The strange part is that he died, literally frozen to death in the mountains, once he was back in Germany. Some suspect that it could have been neither an accident nor a suicide.

Spain: a recent archaeological exhibition in Bremen (Germany) "Dig for Germania. Archaeology under the Swastika" shows how the Nazis launched an expedition during WWII to find the Holy Grail. Truth turns out to be stranger than fiction. The exhibition tells how SS Reichsführer Heinrich Himmler allegedly visited Spain because he believed the grail was at the Montserrat Abbey near Barcelona.

He believed that finding the grail "would help Germany win the war and give him supernatural powers." Many undercover SS scientists searched in vain for the grail. The SS budget for such projects was vast inside the Ahnenerbe as the Nazis intended their finds to rewrite history and prove Germans to be the master race.

Tibet (1938-1939): Much has been said about this expedition. It would have had an esoteric and occult agenda to establish contacts with Bon Pö monks, who practiced shamanic black magic, enabling the Nazis to win the war. The only element of truth is that Himmler was very enthusiastic about Asian mysticism, and he wished to recruit "true Ahnenerbe scientists" like Edmund Kiss in order to test Hanns Hörbiger's World Ice Theory in Tibet.

SS of the Ahnenerbe with their Tibetan hosts having a traditional meal

The truth, as stated by Ernst Schäfer in a 1994 Italian documentary called Il Nazismo Esoterico, is far less mystic than all the fantasies that flood the Internet with conspiracy theories. Schäfer stated clearly that there was nothing occult in this expedition, and that all other claims were nonsensical. Proofs should be brought by fantasy tellers, and not by their listeners. That is the way science and justice should work.

Ernst Schäfer led a normal expedition with many difficulties due to his passage through British India, just before the coming war, but he and his team only focused on geology, ethnology, botany, and zoology. They brought back to Germany many pictures, film rushes, samples of plants and animals, measurements and precious gifts from their Tibetan hosts, like a complete edition of the Tibetan sacred text, the Kangyur, in 108 volumes, and other ancient texts, one of which is an alleged document regarding the Aryan race. It has also been said that the Schäfer team brought back a statue called the "Iron Man" made of meteoritic metal, and probably as old as 1,000 years, dating from the pre-Buddhist Bon religion.

Poland (1939): Wolfram Sievers convinced Himmler to loot certain museum pieces, like the famous Veit Stoss altarpiece in Cracow, but in many cases Goering's men were quicker. The Ahnenerbe was mainly left with scientific devices and historical artifacts bearing little commercial value.

Crimea (1943): Himmler sent his men of the Ahnenerbe to go after the Gothic relics that were supposed to exist in this region, which then would have confirmed the presence of past Aryan tribes. All they found were just a few relics that dated back to ancient Greek colonies established in the region and stone-age artifacts.

Ukraine (1943): Strange and mysterious botanic experiments were held in that region, perhaps in an effort to discover a resistant variety of wheat that would enable the Reich to feed its wartime population.

Cancelled expeditions

Once the war started, the Ahnenerbe had to cancel its planned expeditions because the British fleet was everywhere. Cancelled expeditions included: Tiwanaku (Bolivia), which was set out to prove that these wonderful gigantic pre-Columbian constructions could only have been built by ancient Aryan migrants; Behistun (Iran) to study the inscriptions pertaining to the Aryan origin of the Iranians, ordered by Shah Darius-I, which were found on top of a steep cliff; Canary Islands, where legends reported that the ancient inhabitants had blond hair, and where they had found mummies with these characteristics; and Iceland, to study ancient farming and architectural practices, as well as their folklore.

"Gateway of the Sun" at Tiwanaku

Human experiments

The most infamous attributes of the Ahnenerbe were their experiments on human beings, to test how far a human could resist in freezing waters, to try new medications, and so forth. Even a collection of Jewish skulls was ordered to facilitate racial measurements. These experiments made the whole Ahnenerbe a criminal organization, as sentenced by the Nuremberg Trials, which condemned Wolfram Sievers to death. It has been said that a Tibetan ritual chant was performed upon his dead body.

Much has been said about the Ahnenerbe, and the weirdest conspiracy theories have been propagated through the Internet and some cheap esoteric articles here and there. They are far from the truth, and they include tales about Nazi vampires, übersoldaten, parallel universes only accessible to Nazi UFOs, etc. Though it is pure fiction, the most respectable work in that field is Steven Spielberg's Indiana Jones movie that portrays how eager Nazi secret agents were to get ahold on the Ark of the Covenant and the Holy Grail.

The Wewelsburg

The Wewelsburg is a castle from the Renaissance era in North Rhine-Westphalia, Germany, close to the city of Paderborn. The overall shape of the castle is triangular, and dates back to the beginning of the 17th century, although some earlier strongholds had been built around that same place ever since the 9th century. It is worth mentioning that during the 17th century many women were held prisoner in the dungeon under the accusation of witchcraft, and they were consequently tortured and then burned at the stake.

Wewelsburg Castle

In 1934 Reichsführer Heinrich Himmler signed a lease of 100 years for one Reichsmark a year, with the intention to renovate the whole castle as an SS leadership school (SS-Führerschule). The works began first with volunteers of the Reichsarbeitsdienst, who were then replaced by forced labor from a nearby concentration camp. The bedrooms carried names of the Grail legend and King Arthur's adventures. The guests could also enjoy the use of a big dining room, an auditorium, a library and even a photographic laboratory.

They trained in such fields as ideology, early history, archeology, mythology and astronomy. Though it was already close to the defeat, Himmler had thought about building a planetarium and recruiting an astronomer to teach the high-ranking cadre of the SS. The teachings later became more oriented towards a special type of esotericism, made up of ancestral cults and practices (see Ahnenerbe), study of the runes and racial theories, as well as the worshiping of nature. This whole education was to serve as a kind of new and mysterious pagan cult, based on the legend of the Holy Grail and the Knights of the Round Table. New religious rituals were invented for this purpose, with the help of Karl Maria Wiligut, at least in the beginning, since his reputation and mental health was later questioned by many, even inside the SS.

Such rituals included SS marriages, most of the ancient pagan festivals like the Yuletide, and the winter and summer solstices. Himmler, who admired Ignatius of Loyola's book, Spiritual Exercises, allegedly practiced meditation with his higher-ranking generals (Obergruppenführer), although no hard evidence could ever be found except for the testimony of SS General Walter Schellenberg at the Nuremberg Trials. He described a curriculum consisting of "spiritual training and meditation exercises."

The most esoteric part of the castle was its North Tower, which was not destroyed even by the explosion at the end of the war, and is therefore supposed to store "powerful magical energies." It was to be the very spiritual center of the Aryan world, extending then to the adjacent cities around the castle, which were to be drastically modified according to the grandiose blueprints that were found after the war. The North Tower had a stone-lined room called the Obergruppenführersaal (SS Generals' Room) where the floor was inlaid with a Sun-Wheel symbol made of interlaced swastikas and sig runes, later to be called the Black Sun (see chapter on "The Black Sun"). On the walls were hanging the generals' coat of arms, and in the center of the room stood an oak Arthurian round table for the twelve senior SS generals. In the underlying crypt, or "Land of the Dead," were also twelve matching urns that were intended to receive the ashes of the generals when they died. The Obergruppenführersaal was used only once in 1941 before Operation Barbarossa, which was the invasion of Russia.

Himmler had asked in 1938 to have a safe that only the castle commandant and he would know about. In the same mysterious confidential way, all Death's Head rings (Totenkopfring) of dead SS men had to be returned to a shrine in the castle.

Due to the Allied advance, namely of the US Army, an SS commando was sent on March 31, 1945, to destroy the castle and hide all the Death's Head rings in a secret location in the neighboring mountains. These were never found, despite the zeal of generations of treasure hunters.

Hexen Files

In 1935, Reichsführer Heinrich Himmler decided to build up a secret team of researchers, in charge of gathering information about the persecution of the witches and their trials throughout the ages. His SS gathered information not only in Germany but from other countries as well. They worked mostly undercover in German libraries and archives, pretending to look for their own genealogies. The 38,846 files were stocked in a Hexenkartothek (a witch file library). Each file stored information as to why a given witch was imprisoned, the details of her trials, and the types of torture that she was submitted to.

Chronicle of Schilling of Lucerne (1513), illustrating
the burning of a woman in Willisau (Switzerland) in 1447

The aim of these files was to prove the wicked involvement of the Catholic Church and beyond, of a Jewish conspiracy that was meant to destroy ancient Germanic creeds. The Christian faith had allegedly fought old pagan rituals in their most sacred places, like the famous Extern Steine close to the Wewelsburg castle, where ancient rites were performed from the oldest times man can remember. Pagan priests and priestesses were therefore burned as sorcerers and witches. The cellars of Himmler's beloved Wewelsburg were used until the 17th century to imprison persons suspected of being "witches and werewolves."

Germany was indeed one of the European countries that murdered the greatest number of so-called witches, counting them by the tens of thousands. It is worth mentioning that Himmler was told by SS genealogists that among his ancestors there was a witch who had been burned at the stake. The Brothers Grimm would contribute to have the legend about the persecution of the witches live on in their nationalist tales.

Researches in the field of witch persecutions were carried on until 1944, despite the ongoing war and the closing in of Allied forces from the West as well from the East. The last order related to this occult quest, given by Himmler in 1944 to his staff, was to try to prove that Von Stauffenberg, the main perpetrator of the bomb plot against Hitler, had among his ancestors witch persecutors.

None of the planned publications and books on the subject went through. What is left over from this incredible occultist search in the middle of the 20th century are the files of the Hexenkartothek: the originals are nowadays in Poznań (Poland), and a copy of them can be found on microfilms at the Bundesarchiv in Berlin. They are not of much interest to modern scholars, since they were not collected according to the best scientific methods.

This case is real and has deep roots in the occult, but one must not deduce that Himmler wanted to cast spells on the Allies. His goal was only to prove a Christian-Jewish conspiracy against the ancient Aryans.

Hitler and Magic

Much has been written in the field of pseudo-esotericism and a makeshift evil genealogy of Hitler was made up in the later part of the 20th century, namely: he was Satan's medium, he sold his soul to the devil, he negotiated with Unknown Superiors from Shamballah, with extra-terrestrials from Aldebaran, etc. Most of these claims were Allied propaganda aiming at discrediting him. Some even said that he was involved in abnormal sexual practices, BDSM and the like. The truth is always stranger than fiction, though. This is the case with a book from Hitler's private library.

In the spring of 1945, the 101-St. Airborne Division found Hitler's library packed in crates and hidden in a salt mine near Berchtesgaden, where he had his Berghof Alpine chalet. In fact, there were only 3,000 books out of the estimated more than 16,000 that he was supposed to own in different locations. These books were later sent in the early ‘50s to the United States Library of Congress.

The most serious authors, like Nicholas Goodrick-Clark, now dismiss the idea that Hitler was seriously interested or involved in occultism. There are nonetheless occult and esoteric books in Hitler's library from such authors as Adamant Rohm, a "magnetopathic doctor"; Carl Ludwig Schleich, a Berlin physician using local anesthesia; and Joseph Anton Schneiderfranken, aka Bô Yin Râ, who wrote books on reincarnation. The strangest and most marked book, though, is without doubt the one called Magic: History, Theory and Practice (1923) by Ernst Schertel.

Ernst Schertel, an early advocate in the ‘20s of the German nudist movement, tackled themes linked with magic, demons, eroticism, sadomasochism, and flagellation.

He dedicated a copy of his book to Adolf Hitler and sent it to him in 1923. This fact was made known to the public only in 2003, in an article published in The Atlantic Monthly by Timothy Ryback, the author of Hitler's Private Library: The Books That Shaped His Life.

Among the passages Hitler marked, one can find the following: "False images are necessary for the recognition of truth"; "He who does not have the demonic seed within himself will never give birth to a magical world"; and “Satan is the beginning…."

As a "reward," Dr. Ernst Schertel was sent into a concentration camp, and stripped of his PhD during the time that the war lasted. Isn’t all of this obviously hard proof of Hitler's involvement, or at least his interest in the occult? Hitler read a lot of books during his life, and if he were once interested in occultism it was rather during his early years while in Vienna, where he was supposed to be a regular reader of the racist occult magazine Ostara. Later in his life and even in Mein Kampf, he made fun of astrologers, mediums, seers and all "the occult rubbish" Himmler was so much involved in.

Wotan and the Aryan Archetype

Finally, let's mention the famous Swiss psychoanalyst Carl Gustav Jung's esoteric interest in archetypical explanations of Nazism, since they are closely related to a semi-religious paradigm. It is therefore no wonder that Jung maintained a dense correspondence for some time with Miguel Serrano, the Chilean Nazi diplomat, about psychology and more esoteric topics about Jung's archetype theory.

Wotan aka Odin, the Norse God

In his essay, first published in 1936 in Zurich as Wotan in the Neue Schweizer Rundschau, when writing about Nazism in Germany, Jung suggests, "Perhaps we may sum up this general phenomenon as Ergriffenheit – a state of being seized or possessed. The term postulates not only an Ergriffener (one who is seized) but also, an Ergreifer (one who seizes). Wotan is an Ergreifer of men, and unless one wishes to deify Hitler – which did indeed actually happen – he is really the only explanation."

Furthermore, in the book Black Sun, Nicholas Goodrick-Clarke writes how Carl Jung showed "Hitler as possessed by the archetype of the collective Aryan unconscious, and could not help obeying the commands of an inner voice." Hitler referred often indeed to his "inner voice" and to the Providence that helped him during many difficult moments of his life.

Carl Jung thought of Hitler as an archetype, often manifesting itself to the complete exclusion of his own personality. "Hitler is a spiritual vessel, a semi-divinity; even better yet: a myth. Benito Mussolini is a man ... the messiah of Germany who teaches the virtue of the sword. The voice he hears is that of the collective unconsciousness of his race". This brings us to all the underground theories about Hitler as a medium of Higher Powers, as it was brought up by less-serious authors.

POST-WAR MYTHS

There are just a few serious books on Nazi occultism. The reliable references on this subject are mainly and almost exclusively those of Nicholas Goodrick-Clarke's in The Occult Roots of Nazism and of Joscelyn Godwin's in Arktos, The Polar Myth in Science, Symbolism and Nazi Survival. They address the question from an erudite and academic point of view, but they nonetheless have the merit of drawing the line between the historical facts and the fantasies, or shall we say the pure lies, made up by hoaxer charlatans.

Our position is that people interested in Nazi esotericism deserve the truth, and that they prefer to see a myth they hung on to be rightly debunked, rather than waste time on useless quests. Like Sagan once said: "It is not whether we like the conclusion that emerges out of a train of reasoning, but whether the conclusion follows from the premise or starting point, and whether that premise is true." As Colin Summerhayes from the Scott Polar Institute summarizes perfectly in his article Hitler's Antarctic Base: The Myth and the Reality: "The burden of proof should fall on the shoulders of those making the claims. It is not sufficient to propose an idea and then claim that the hypothesis is untestable, because the evidence for it has been covered up."

The Allies discovered the horror of the concentration camps, and faced something they were not prepared to see in the 20th century, especially in a very civilized country like Germany was thought to be. Why all these murders? Why this barbarian ruthless will to exterminate? Why did the Nazi regime give priority to their train convoys of Jews, even as the war was coming to an end, when the German army was in such need of transportation to stop the Allied forces from advancing? What hidden agenda did they have behind this?

These almost twelve years of the Third Reich followed rules that were completely different from the rest of the civilized world; and the same is true of their philosophies, their goals, and their very concepts about how they viewed human life and history. Pauwels and Bergier, though they also narrated many unsubstantiated stories about that era, invented a very relevant wording for what happened: they called it "The Absolute Elsewhere."

The Morning of the Magicians

The Morning of the Magicians is a book written in France by Pauwels and Bergier in 1960. It was a best-seller, and it was subsequently translated in many languages. The content of the book was mainly thrilling stories, and as such they were mostly unsubstantiated on a historical and scientific level.

They tackled many subjects like ancient astronauts, spiritism, and out-of-place artifacts, and they dedicated a whole section to Nazi esotericism. In the way they presented this "breach in the fabric of history," they happened to have forerunners from ever since the early '30s, when there were mostly French books that associated Hitler with evil dark forces, or even the devil incarnate himself.

Pauwels and Bergier mixed quite unknown but true facts about the Nazi era with some pure fantasies made up of their own imagination. They mentioned the now well-known Hörbiger's theories about the Ice World, its falling moons and the subsequent sinking of Atlantis; the Hollow Earth Theory; the Thule Society and the inevitable Vril Society.

We took the trouble to quote some pertinent experts' opinions, but Pauwels and Bergier invented a completely different life for Professor Haushofer, who was allegedly a member of the secret society of the Green Dragon in Japan, and who committed the Japanese harakiri ritual to end his life just after the war was over, exactly as he would have promised to his Asian initiators.

Our hallucinating authors mentioned the presence of "Tibetan" dead bodies, wearing German uniforms without any insignia, in the ruins of Berlin in 1945. There is however not a single historical proof of this happening; at best, they could have been misled by the documented participation of foreign volunteers from Central Asia, who had been "liberated" by the Nazis from the Stalinist regime.

Asian Volunteers from Turkestan
in the German Army (Normandy)

Finally, The Morning of the Magicians is one more book that quotes Rauschning's Hitler Speaks as if it were the Bible; more particularly, it talks again about this now-famous account that Hitler was hearing voices, waking at night with convulsive shrieks, and pointing in terror at an empty corner of the room while shouting, "There, there, in the corner!"

According to most modern researchers, Rauschning's book was a fraud. Hänel, a Swiss scholar who studied the book in detail, notes that:

- Rauschning's claim to have met with Hitler "more than a hundred times" was a lie, since the two actually met only four times, and never alone;

- Certain words which he attributed to Hitler were simply inspired from many different sources, including the writings of Ernst Jünger, Nietzsche, and the French writer Guy de Maupassant in his short novel Le Horla.

M. Emery Reves, the publisher of the original French edition of Hitler Speaks, claimed that he commissioned the book from Rauschning in 1939 for 125,000 francs in advance, and they agreed on the fabricated stories about Hitler to be written in that book.

Hermann Rauschning (1887 – 1982)

Nowadays no serious historian quotes Rauschning's book anymore. This is particularly the case of Hitler's best academic biography writer Ian Kershaw, who said, "I have on no single occasion cited Hermann Rauschning's Hitler Speaks, a work now regarded to have so little authenticity that it is best to disregard it altogether."

Hitler’s Death

Nazism is at the origin of many modern myths, because it contains many of the necessary ingredients for them to arise. First of all, when the Russians finally reached Hitler's bunker ... it was empty. The very person that had been identified as the Devil on Earth had disappeared at the last moment, giving birth to many survival theories, to the point that even the FBI and the KGB kept investigating the matter for many years far after the war was over. The FBI closed the case of his death in 1956, though, after many interrogations in the USA and in South America, not neglecting the weirdest trails, whereas the KGB always remained suspicious especially because Stalin was unwilling to acknowledge that his nemesis had committed suicide in the Berlin bunker.

Being quite paranoiac, Stalin ordered his secret police, the NKVD, precursor to the KGB, to study every last vestige of the private life of the only opponent whom he considered “great enough” to be his match; he therefore asked them to write a one-copy book for his eyes only. This book was recently found by German researchers in Moscow and later translated into English under the title The Hitler Book: The Secret Dossier Prepared for Stalin from the Interrogations of Hitler's Personal Aides, 2005, by Henrik Eberle.

Many other books have Hitler fleeing to South America and dying there very old, sometimes well after 110 years. The last book, written by the well-known Jerome R. Corsi, a longtime addict of conspiracy theories, claims in his last work, Hunting Hitler, that Hitler was helped by none less than the CIA to flee to Argentina in exchange for valuable technological knowledge.

According to Brazilian Simoni Renee Guerreiro Dias’s own investigations in her recent book Hitler in Brazil – His Life and His Death, he escaped to her country and not Argentina, where he lived with his black lover until the age of 95. The main proof is a very blurry color picture, allegedly taken in the ‘70s, of Hitler flirting with his Negro mistress “in order not to attract attention” by any racist behavior.

The story of Hitler’s and Eva’s remains has long been traced by the Soviets, who had a political agenda of their own, and not admitted this evidence to the West, pretending on the contrary that the Führer was being shielded by the former Western allies.

A special Soviet elite intelligence unit, the SMERSH (literally in Russian: "The Death") found on May 2, 1945, Hitler’s, Eva’s and two dogs’ remains in a crater close to the bunker. By May 11, 1945, the SMERSH had already confirmed that the dental remains were Hitler’s without a doubt, thanks to his personal dentist’s assistant whom the Russians had found, looking for her for days throughout ruined Berlin.

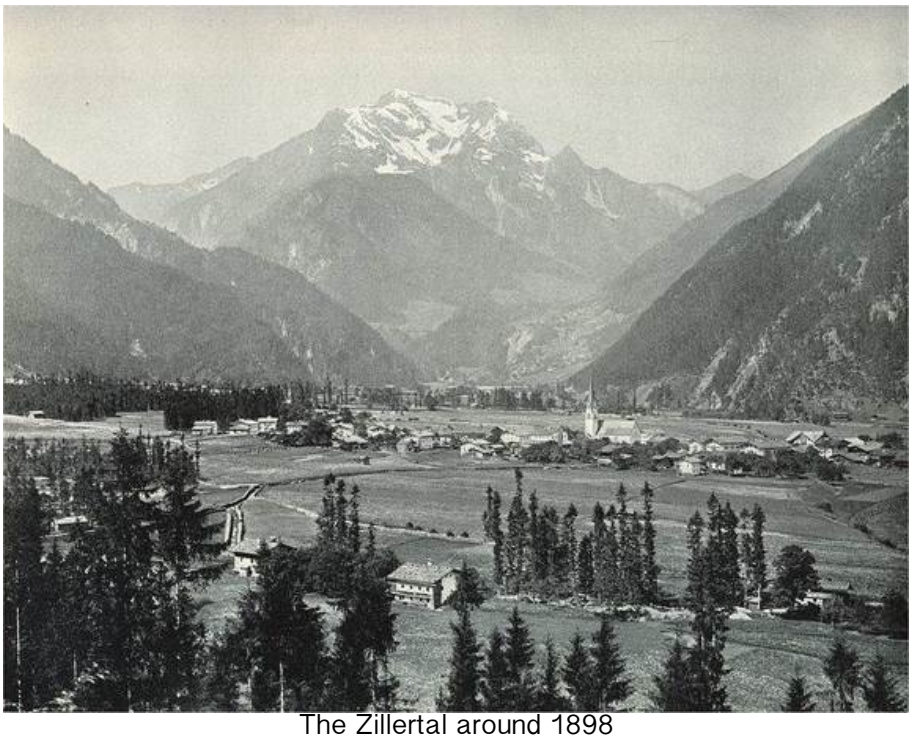
In 1946, the remains of Hitler and Braun were repeatedly buried at night and exhumed in the morning by SMERSH on their way to a Soviet barrack in Magdeburg (Communist East Germany), where they rested there, buried in crates, until 1970. At that time, German-Soviet treaties reminded that the USSR had to hand over their facilities to the East German government. That is when former KGB director and future president of the USSR Yuri Andropov asked permission, in a letter dated March 13, 1970, addressed to then-president Leonid Brejnev, to destroy once and for all the remains of these historical figures so that they would never be used as a neo-Nazi shrine in the future.

On April 4, 1970, a special secret KGB team, following detailed burial charts, "exhumed five wooden boxes containing the remains of 10 or 11 bodies (maybe including the Goebbels family corpses) ... in an advanced state of decay." These final remains were once more burned and reduced to ashes and then thrown into the Biederitz river, near the Elbe, in a city called Schönebeck, 11 km away from Magdeburg.

Hitler was obsessed with not falling into the hands of the Russians alive, nor being publicly exposed in a humiliating way like Mussolini was after his death. This way of disappearing in the bunker was somehow also a willful way of staging his grand finale for history.

The Mystic Treasure of the SS

The treasure of the SS is a great secret according to Saint-Loup, a French author of many books about the history of the French volunteers of the Waffen-SS Division Charlemagne, who fought Bolshevism in the Soviet Union. Saint-Loup is a pen-name for Marc Augier, a French collaborator, a great sportsman and a journalist.



Saint-Loup in 1942 in Smolensk in German uniform

In many of his books, Saint-Loup presents the SS as a noble order, much like a modern version of the Teutonic Knights, forgetting the atrocities they committed during WWII.

He gives them an aura of heroism, and makes them the guardians of the Aryan race in a "decadent" post-war world. What makes them especially attractive is that they possess the great secret of the Aryan race, the one and only who is able to save the white race from vanishing from the surface of the world.

That great secret was, according to Saint-Loup, carved on stone tablets by the Cathars in the 13th century in France, at the time of the fall of the Montségur castle. They are an Aryan equivalent to the stone tablets on which Moses wrote the Ten Commandments, except that the Jews try to keep and understand these, whereas the Aryans do not know where theirs came from and are unsure about their content.

The Aryan tablets were allegedly found by Otto Rahn before WWII, and hidden somewhere in the mountains around Montségur, in the French Pyrenees. Otto Rahn was a specialist of Roman languages and literature, as well as an SS who reported directly to the infamous Ahnenerbe and Reichsführer Heinrich Himmler. He brought the tablets back to Germany, and was found frozen to death in the Bavarian Alps sometime after that, though he was an excellent mountain climber.

The Zillertal around 1898

When the Allies closed in on the Alpine Fortress, Saint-Loup claims that on May 2, 1945, a special SS unit made only of officers from various European nationalities gathered in Tyrol, Austria, at the crossroads of Innsbruck-Salzburg and Gmünd-Zell am Ziller. The day before, three high-ranking SS officers (a Frenchman, a Norwegian and an American, since there was even a few of the latter in the Waffen-SS as well) were taken probably to Tibet by a long range aircraft that landed on the Munich-Salzburg highway.

The rest of the SS unit was waiting for something really important, and therefore all necessary measures were taken to hold the advancing Allied armies. Eventually, a special convoy coming from Berchtesgaden, Hitler's Alpine chalet, transferred to the SS unit a crate made of lead. Their mission was to dump this crate at the top of the Zillertal glacier. It contained the Aryan tablets transmitted by the Cathars. These tablets contained a purely pagan message, addressed to the coming generations of Aryans. They were hoping that the crate would slowly flow down the valley at the pace of the glacier, and eventually reappear down below between 1990 and 1995.

The secret contained inside the lead crate was so important that it had to be read by absolutely all Aryans. If not, the whole white world would definitively be wrecked to havoc.

According to Saint-Loup, the secret was that the Aryans should always follow the holy rule of not mixing their blood with "inferior races" in order to not to be wiped out from the surface of the earth. This gnostic and Manichaean belief was that all non-whites and especially all Jews had to be considered evil and that the Holy Grail was a metaphor for pure Aryan blood.

Fantasy Wonder Weapons

The real German Wonder Weapons were so ahead of their time that they seemed like they came from the future. This is nevertheless not a good reason to make up stories about their origin that are not only ridiculous in their conception but also totally fraudulent in nature.

Die Glocke – One of the weirdest and most fraudulent of these post-war fictions is certainly Die Glocke (in German, The Bell). Igor Witkowski, a Polish journalist, claimed in 2000 that he had access to secret SS files talking about the purported existence of Die Glocke, in his book called the Prawda O Wunderwaffe (The Truth About the Wonder Weapons).

As usual with this kind of fantasy, Witkowski cannot name the Polish intelligence source that gave him this information, “for obvious security reasons.” This did not prevent British author Nick Cook from using this fantasy material very seriously as historical truth in his book called The Hunt for Zero Point, and reaching for the usual eager-to-believe-anything audience of science-fiction amateurs.

This prompted Joseph P. Farrell to use Witkowski's claims as well to reignite the overall lowering interest that readers were beginning to show on Nazi occultist hodgepodge. Funny how all these English-language writers who came forth as “we have the secret information" had to wait for years after an unknown Polish journalist first made revelations about Die Glocke. None of these authors bother to share their sources; neither do they refrain from frantic science-fiction fabrications (the “What if…” game).

Die Glocke was allegedly invented by Nazi scientists, helped by Jewish prisoners, as a way to travel through time and space using anti-gravitational science.

The Henge in Poland

It was built in the underground facilities of Der Riese, which truly existed as we already saw above, and was "made out of a hard, heavy metal approximately 9 feet wide and 12 to 15 feet high, with a shape similar to that of a large bell." The anti-gravitational effect was reached by two counter-rotating cylinders, filled with a mercury-like substance.

Witkowski claims that the metal-and-concrete ruins in Poland called "The Henge," close to the Wenceslas mines, would have served as a test rig for the experiments related to Die Glocke. In fact, such structures can be found in nearby places in the same Polish region, but are nothing more than the cooling towers of power plants.

The funny part is that none of these writers agrees on how the story ends. Farrell makes the Nazis kill no less than 60 scientists that contributed to the project to maintain its secrecy.

Cooling Tower in Siechnice, Poland. Does it ring a bell?

Witkowski claims that Die Glocke ended up somewhere in South America. Cook, for his part, states that it was taken over by the Americans probably as part of Operation Paperclip. There are even well-known and usually serious TV channels that dramatized these versions, where they showed a Glocke chained to The Henge, trying to fly away during a Doctor Evil-like experiment with many stunning 3D special effects.

Once more, of course, the evil SS General Hans Kammler is part of the plot, and according to the different versions of the story, he either negotiated with the Americans, or he literally disappeared from the face of the Earth ... maybe even from our space-time reality!

Strahlkanone – There was at least one real project meant to send a lethal light ray against the Allied forces, something that one might call a "laser gun" nowadays. Nothing is known precisely about this mysterious plan, except that a certain professor Ernst Schiebold from Leipzig once managed to get funds from the Nazi government, to materialize this fantastic wonder weapon. More recently, his ex-secretary testified on German television about the reality of the project, but she admitted that she was never allowed to get into the bunker where the actual experiments took place. Once that project was stopped, nobody heard of Professor Schiebold anymore.

Alleged picture of a similar project: a Schallkanone ("Sound Gun").

This is not the typical case of a genuine "fantasy wonder weapon," but it lacks the thicker documentation required to distinguish facts from fiction. It is atypical enough to belong to the category of "intended wonder weapons" that did not succeed in turning the tide of the war against the Allies, because they were still at the earlier stages of being either prototypes or blueprints.

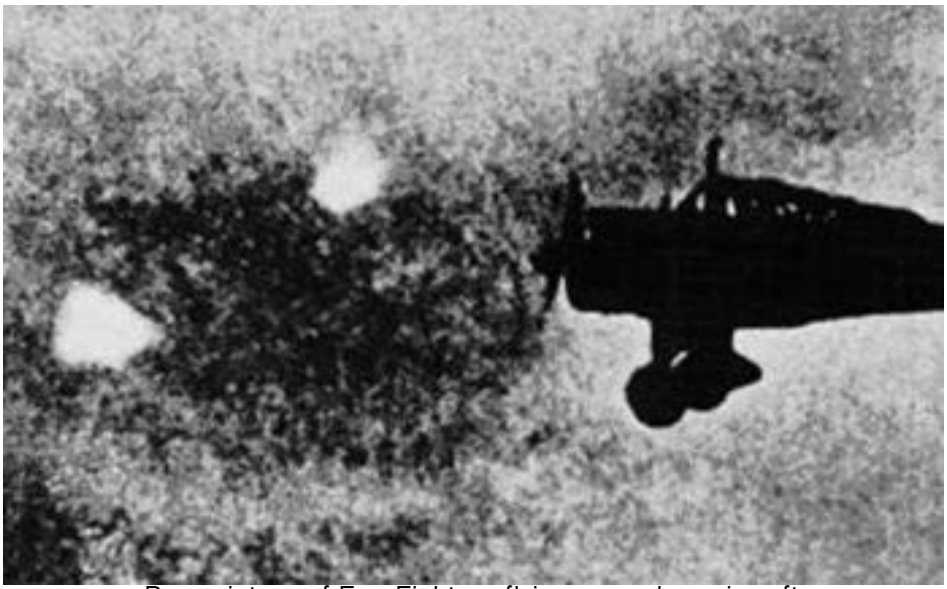
Nazi UFOs – In Internet sci-fi underground lore and in the thriving world of conspiracy theories there circulate unsubstantiated claims that the Third Reich somehow managed to produce futuristic flying devices, far ahead of the scientific capabilities of their times. These so-called Nazi UFOs have even names: Rundflugzeug, Feuerball, Diskus, Haunebu, Hauneburg-Geräte, V7, VRIL, Kugelblitz, Andromeda-Geräte, Flugkreisel, Kugelwaffen, and Reichsflugscheiben. Many blueprints of these devices can be found on the Internet, all of them grossly concocted in German with "original Nazi fonts" and precise measurements to

add a realistic touch.

These Nazi UFO fantasies stem mainly from 3 origins:

1 – The allegedly wider scopes and achievements of the real 1938-1939 German expedition to Antarctica in Neuschwabenland; Colin Summerhayes of the Scott Polar Institute scientifically debunked all claims that there ever were German bases in Antarctica (see chapter on Antarctica Expedition 1938-1939).

2 – The great advances that the Nazis possessed in rocketry, and the purported findings of Dr. Viktor Schauberger in the field of breaking new means of propulsion (his famous "Repulsine" engine). Some scientists proved, however, that his Repulsine was no more than a water turbine on which he was working to cool aircraft engines at the Messerschmitt plants.

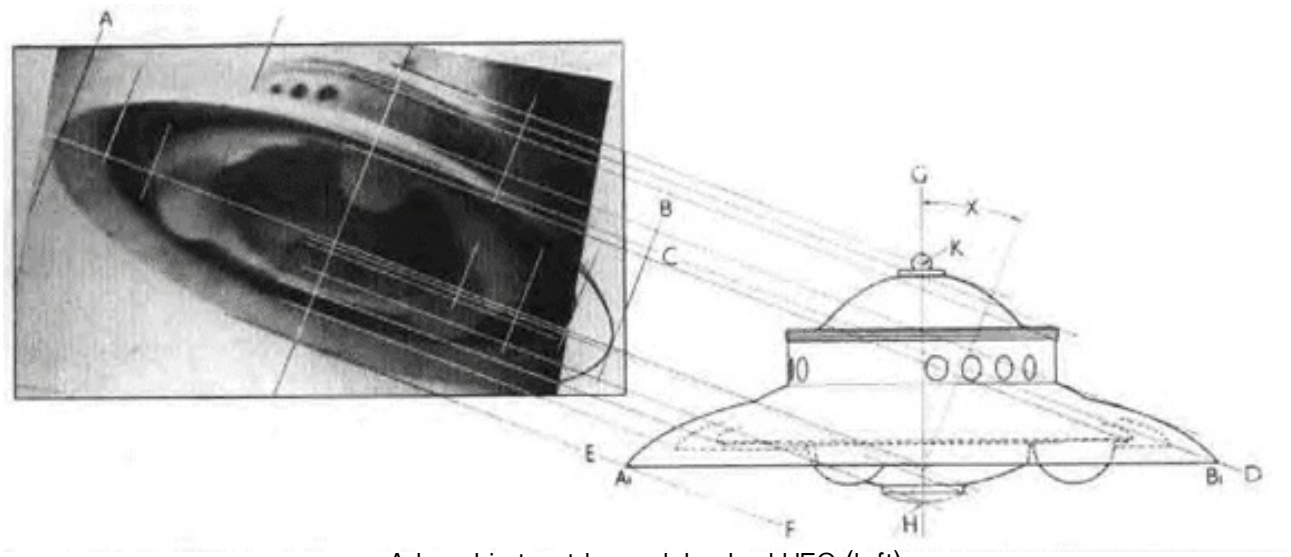


Real Repulsine device

Repulsine appears sometimes with
a Luftwaffe cross as a Nazi UFO

3 – The Allied sightings of so-called "Foo Fighters," allegedly German secret weapons designed to harass an aircraft through electromagnetic disruption. Though real, the German pilots saw the same phenomena, and asked themselves what they could be, and where they possibly came from.

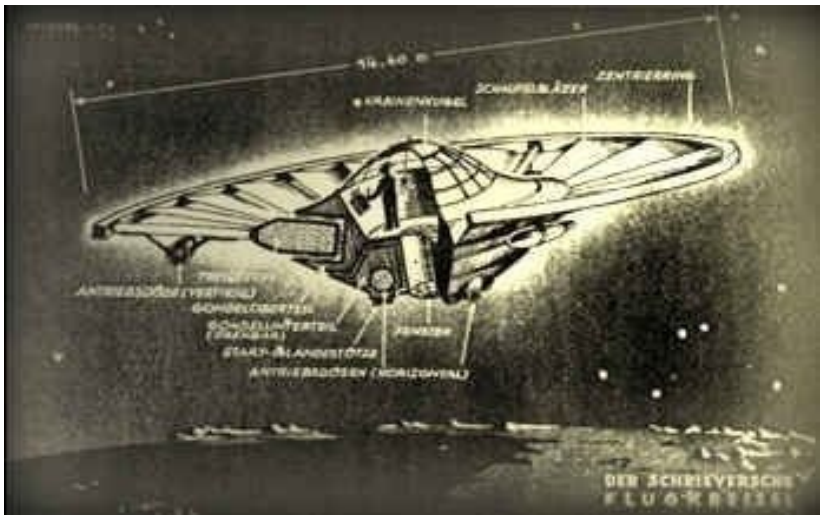
Rare picture of Foo Fighters flying around an aircraft



Unfortunately for true amateurs of such mysterious stories, there are just unsubstantiated books and unscientific websites that address this subject. The eagerness of the writers to make money or, in the best cases, to prove their claim, lead them more often than not to put together unrelated facts, and draw hasty conclusions from similar events which either did or didn't take place at that same time or place. Their sources are either anonymous "deep throats" for "obvious security reasons," or based on other such books and websites as serious as their own. They feed on one another, and people who dare criticize them are usually considered to be part of "government cover-up operations" at worst, or very skeptic shrinks at best.

Some of the first reports on flying saucers, like Kenneth Arnold's in 1947, had even the US military involved, since its alleged shape was indeed very close to that of the Horten Brothers' Flying Wing. They eventually concluded that although the Germans were far ahead of their time in aeronautics, their plans were only blueprints or unreliable prototypes by the time the war was over.

A little bit later in the UFO wave, a Polish-American citizen named Adamski claimed to have made encounters of the third kind, like having made actual contact with ETs. These first extraterrestrials had this very odd feature of resembling the "perfect Aryans"; they were tall, blond and blue-eyed, though pretending to come from Venus.



Adamski even took a picture of their spacecraft, but the only problem is that it was later proved to be a ... simple street lamp. This finding has not prevented this picture from being used and re-used on the Internet as a model for so-called Nazi UFOs, sometimes digitalized as a 3D model with the Luftwaffe cross on it.

The first links made between UFOs and Nazis are the work of the Italian professor Giuseppe Belluzzo, a scientist and former Minister of National Economy under the Mussolini regime. He claimed in 1950 that "types of flying discs were designed and studied in Germany and Italy as early as 1942."

Adamski street lamp debunked UFO (left)
and a Nazi UFO (right)

There have also been subsequent claims that underground FIAT factories, mainly located in vast tunnels around the Lake of Garda in Italy, were used to produce Nazi UFOs. These stories were propagated by the Italian Renato Vesco who claimed, among others, to have studied at a German Aeronautical Institute during the war, but was later discredited because of discrepancies concerning his very young age at that time.

Rudolf Schriever's flying device as
it appeared in Der Spiegel (1950)

In 1950 the famous German magazine Der Spiegel tackled the subject of possible Nazi UFOs for the first time, and reported the dubious stories of former engineer Rudolf Schriever and his round flying device. Schriever did indeed show discrepancies in later versions of the same story, notably in 1952 during another interview.

True enough, some prototypes that never achieved mass production status, like the Sack AS-6, had a shape very close to those of the after-war UFO sightings.

Prototype of the Sack AS-6

The soar of Nazi UFOs is nevertheless historically attributed to writers like Jan van Helsing, Norbert-Jürgen Ratthofer, and Vladimir Terziski, who developed the background stories and added to them detailed features, in order to become the sophisticated myths of the '80s and '90s we still know today. They mixed up the Thule and the Vril societies, invented the Vril girls (among whom we find the famous Maria Orsitsch) who made make-believe contact with aliens from the Albebaran star system, thanks to their long hair that acted as antennae. From these contacts and a crashed UFO found in the Black Forest in 1936, they would have reverse-engineered alien technology in order to produce all the flying machines that you can find in the Antarctica sky today!

Some of these writers had even rightist political agendas, and surfed on the Nazi occultist wave initiated by Pauwels and Bergier in the early '60s. This is mostly the case of the Vienna Circle with Wilhelm Landig at its head that we already mentioned. On the other hand, a famous Holocaust denier by the name of Ernst Zündel almost admitted in an interview that he used the UFO madness to draw attention on his books and beliefs. He even tried to organize a trip to Antarctica for a $9,999 fee per seat to locate the polar entrance to the Hollow Earth, but the project did not go through. Finally, right wing extremists like Miguel Serrano seem to genuinely believe in their own stories, and have largely contributed to the Nazi sub-genre of UFO sightings and SS esotericism.

In popular culture, we find such harmless works as Robert Heinlein's book Rocket Ship Galileo (1947); it was a popular book for children that got special public attention for showing a Nazi base on the moon, among other adventures. In the same vein, the recent sci-fi comedy movie Iron Sky (2012) staged vengeful Nazis living on the dark side of the moon, ready to re-conquer the Earth to establish a Fourth Reich.

The author of this book can only humbly report one strange case that a friend shared with him. It is not confirmed by other independent sources. This friend's grandfather was among the first French aviators to fly over and bomb German soil even before ground troops set foot on it. He said to my then 16-year-old friend that he saw aircrafts or "space crafts" from "other worlds" on the German airfields, things like he never saw before in his entire life. He added that there were plenty of them and, that scared him tremendously since the Allied propaganda had promised to quickly defeat the Third Reich. He took many pictures of these "machines" and duly reported them in his flight book. He showed these pictures to my friend after the war sometime in the '70s.

When his grandfather eventually died, nobody in the family ever found these pictures again. They were just gone. Could it have been the work of the French secret service?

Worth mentioning is his grandfather's fear in 1989 when he saw on television that the Berlin wall had collapsed. The whole family was rejoicing loudly at this progress of freedom, whereas he stayed still in front of the TV set, bleak and scared, just whispering aghast: "Oh no! It is coming back!"

The Amerika Bomber Project – The Amerika Bomber project was a German plan to bomb American soil, especially New York City, thanks to a customized long-range aircraft capable of returning safely back home. The project was eventually abandoned for being too expensive and too resource-consuming compared to the relatively small explosive payload it could deliver crossing over the Atlantic.

The possibility of dropping a nuclear bomb would have given more credit to the project, but it would have taken even more time and resources; the Germans did study nuclear fission and they used heavy water from Norway for their experiments, but these researches were spread among so many different administrations that it made it practically impossible for the high command to gather compelling evidence of its feasibility.

In 1955, there was a public allegation that such a round-trip drop could be made to New York by a six-engined Ju 390 aircraft, as published in the British magazine called the RAF Flying Review (see chapter about Wonder Weapons). The story was based on "unspecified German aircraft records" that claimed the aircraft had flown over New York City for one hour; it was, however, revised later to a more humble version, which claimed that the Ju 390 made a 32-hour reconnaissance flight in late 1944, departing from near Bordeaux (France) and coming as close as 19 km (12 mi) to New York. The pilots allegedly even took pictures of the New York skyline.

After the war ended, aviation historian Dr. Kenneth P. Werrell cast serious doubts on this story, where he emphasized that the pictures taken by the pilots had never been found. At a later date, Werrell studied meticulously all available data regarding the Ju 390's range, and he thought that it would have been a most unlikely thing to do.

Six engines Ju 390 on the ground

The final blow to this exciting aviation mystery was given by the German authors Karl Kössler and Günter Ott in their book about the Junker aircrafts. Like Werrell, they thought that a return flight was not feasible, and they even proved that there never was a flight from which the New York skyline was visible. The reason is simple: France was the "closest" location to fly to America, but the only customized version of the Ju 390 available for such a flight (the Ju 390 V1) was not on French soil at that moment, since it was in Prague (Czechoslovakia) from November 1943 until late March 1944.

These German authors offered one more reason why this could not have been done, namely because the Ju 390 V1 prototype was unable to take off with the fuel load necessary for a round-trip flight to America. As for the second and last model of the Ju 390, named Ju 390 V2, it was not completed prior to October 1944.

The Genocide

The first Allied soldiers who liberated the death camps had no words to describe what they had witnessed. This was a massive irruption of horror and barbarian practices of a primitive era. The comparison with the torments and tortures during the Inquisition in the Middle Ages can only be evoked for the way the victims were put to death, but the main difference with these Dark Ages was the magnitude of the plague that had struck these innocent victims: they could be counted by the millions.

Most historians saw this as the mere and logical consequences of the eugenics of the Nazi anti-Semitism that lied at the core of the national-socialist ideology. This can be true. But there remains at least one question that cannot be answered by pure Nazi fanaticism: Why did the Germans give priority to trains transporting Jews to death camps over their own army convoys, full of soldiers and tanks, right when the tide of war had turned and they needed these resources more than ever on the Russian front?

The first ones to tackle the subject, though not necessarily the most serious authors, were Pauwels & Bergier in their Morning of the Magicians. They linked the Thule Society with certain magic practices that could reach the Powers, and thus be anointed to dominate the world while being protected against all possible dangers. This pact was supposed to last for a thousand years, until the next Big Flood. In return, these Powers demanded that each member of the Thule Society who made a mistake die from his own hand. In the mind of the highest-ranking Nazis in charge of perpetrating the genocide, these sacrifices would serve to get the attention of the Powers, and have them on their side against their enemies. In the mid-20th century, they behaved in the same way as did the Mayans in pre-Colombian America, sacrificing human lives to the sun.

In 2003, David Brin & Scott Hampton published The Life Eaters through DC Comics. This is a sci-fi comic that belongs to the alternate history or uchronia genre. A uchronia always chooses a turning point in history and asks the question, "What if it did not turn out the way it did?"; like, "What if Hitler had won the war?" or "What if the Confederates were the victors of the Civil War?"

On D-Day, June 6, 1944, the Allied armada approaching the landing beaches of Normandy is wiped out by the lightning attack of the Norse gods, who came to fight side by side with the Nazis. Some say that the ancient Norse gods died with their last believer. The purpose of the occultist Nazis is to resuscitate them, by feeding them with the millions of souls of the victims they exterminated in their death camps.

All these fantasies are directly linked to the extent of the murders and the genocide, and yet they could not be understood by the victors: how could a very civilized nation like Germany do it ... if not under an evil spell?

Nazism Becomes a Semi-Religious Movement

The birth of a new religion needs a cosmogonical myth of creation, a God or a deified prophet, a clergy, a ritual and of course, followers who possess a strong enough holy Faith for proselytism. It is a much more subtle step, and it takes a much longer time to crystalize those ingredients in a successful alchemy than, for example, the more simple "Cargo Cults" that developed in some islands of the Pacific Ocean particularly during WWII.

These religious ingredients were not all present at the time of Jesus, but they developed in the decades and even the few centuries after His earthly disappearance. The Catholic Church gave a structure and a hierarchy through its bishops, formalized the dogma and the canon laws much later in time. This was especially the case in 325 AD, during the Council of Nicaea convened by the Roman emperor Constantine, who was acting mainly for political reasons. This process could of course be demonstrated with all other religions, or sectarian movements alike. Some go even so far as to state that a new religion is just a sect that has been proven to be historically successful.

National-socialism was not really seen in its time as a religion, even by its most fanatic followers. The fact that Himmler did try to revive ancient pagan Germanic creeds was not linked to the ideological content of national-socialism. On the contrary, the post-World War II period saw the emergence of different esoteric currents, claiming that there had been more to the Third Reich than what was studied by mainstream historians.

These esoteric currents are mainly linked to Savitri Devi and Miguel Serrano, though there are also less famous authors from the far right and neo-pagan movements that contribute to what could be called the "semi-religious developments of Nazism." Let us add that the majority of neo-Pagans are not neo-Nazis nowadays.

Savitri Devi, who had French, Greek and English blood, was born Maximiani Portasis. She studied chemistry as well as philosophy in France, where she obtained her PhD in Lyon. She can be rightfully regarded as the major post-war thinker of "esoteric Hitlerism," aiming clearly at creating a religious movement from Nazism. According to her, Hitler's death in 1945 could be seen as martyrdom or a voluntary, Christ-like self-sacrifice. When the Russians entered Hitler's bunker, it was indeed empty, giving birth firstly to all kinds of escape speculations, and secondly to a semi-religious myth.

Savitri Devi aka Maximiani Portasis

This is how Savitri Devi writes in her book called Pilgrimage: "…National Socialism is infinitely more than a mere political creed; the fact is that it is a way of life, a faith in the fullest sense of the word – one could say a religion, however different it may at first appear, from every existing system thus labeled in current speech. Religions are not as easy to uproot as mere political creeds."

Savitri Devi, who stood for Indian independence from British rule, merged somehow her esotericism with Hinduism, considering Hitler to be Kalki, the tenth and final Avatar of Vishnu. For her, he was undoubtedly "the god-like Individual of our times; the Man against Time; the greatest European of all times."

Hitler's death, in this way, could be seen as the beginning of a new religion, aiming at the spiritual and physical resurrection of the Aryans, in order to rule the world again as the elected people.

Miguel Serrano is the next most important figure, who contributed to this religious trend of Nazism after 1945. He was a

Chilean diplomat and had therefore many opportunities during his career to meet with people like Léon Degrelle, Otto Skorzeny, Hans-Ulrich Rudel, Marc Augier (aka "Saint-Loup"), Julius Evola, Wilhelm Landig, Herman Hesse and Carl Jung.

While younger, in 1941, Miguel Serrano was initiated into an esoteric order in Santiago, Chile, practicing ritual magic linked with the Holy Masters who dwelled somewhere in Tibet. They were admirers of Hitler, whom they regarded as a bodhisattva incarnated on Earth to counter the evil effects of the Kali Yuga age.

Serrano's theories basically state that our material world is ruled by the Demiurge (Jehovah), who populated the planet with primitive beings doomed to be endlessly reincarnated, always at the same low level of existence. This purely gnostic and Manichaean view admitted of course their counterpart of good gods (the Hyperboreans of extraterrestrial origin), who tried their best to elevate the conscience and moral level of the Demiurge's poor humanoid creatures.

Like the ancient astronaut theories, he lamented that the Nephilim (Fallen Angels), or renegade Hyperboreans, took advantage of their relationships with the Demiurge's human creatures to have sexual intercourse with them. This miscegenation diluted their light-bearing blood, emerging from the Black Sun, and their divine energy power called Vril. To the Demiurge's delight, i.e., the tribal deity Jehovah of the Jews, this diminished the conscious awareness for the divine on this planet, making it easier for him to control.

Miguel Serrano as a diplomat in India in 1957

Serrano states thus that "There is nothing more mysterious than blood. Paracelsus considered it a condensation of light. I believe that the Aryan, Hyperborean blood is that but not the light of the Golden Sun, not of a galactic sun, but the light of the Black Sun, of the Green Ray." (See chapter on the Vril for explanations on the Green Color).

In this context, Hitler was seen as an emissary of the Higher Gods who vanished in his bunker in 1945, but who waits underground somewhere in Antarctica, to emerge in the future with a fleet of UFOs, beat the Forces of Darkness (i.e. the Jews) and start a Fourth Reich.

The Black Sun

History of religions, esotericism and pseudo-sciences provide not a single aspect of the Black Sun, but many. Beyond these differences, the question is to know if one deals with different facets of the same theme, and if so, if they can be structured into a single one, or if the Black Sun is just a generic name for unrelated phenomena. Nowadays the Black Sun refers almost exclusively to a neo-Nazi symbol that can be found inlaid in the marble floor of the Wewelsburg castle in Germany.

The Egyptians – Alchemy, like Freemasonry, plunges its roots into Egyptian mythology. The solar cycle is probably at the origin of one of the oldest myths that inspired the ancient Egyptians and mankind, as can be seen in the duality of Ra/Osiris. Ra dies after 12 hours of reign and resuscitates as Osiris during the next 12 hours, after which the latter dies to be reborn as Ra. Osiris stands for the Black Sun, and this natural cycle is tuned to the rhythm of our daily biological physiology, as well as to our souls reincarnating from a body to another.

The Mesoamerican mythology – The Mesoamerican myths are shared by, among others, the Aztecs, the Mayans, the Mexicas and the Toltecs. One prominent god common to these people is Quetzalcoatl, literally "feathered serpent," who incarnates one of the many mystical beliefs of the Black Sun in Central America. After his shining passage through the sky during the day, he would dive into the underworld with a blackened aura.

The Aztecs compared the passage of the sun into the underworld with a butterfly, which is an archetype for transformation and reincarnation. The only event when the Black Sun would appear during the day would be a solar eclipse. He would then be identified with the earth goddess Itzpapalotl, also called the "Obsidian Butterfly" (obsidian is a very dark volcanic stone), who would eat men during that exceptional cosmic event.

Whereas the Aztecs believed in five successive worlds corresponding to five suns, the fifth being ours, the Mexicas held the Black Sun for such an ancient sun that was the female origin of everything. It could be seen as a fecundity symbol coming from the womb of death, i.e., a metempsychosis or reincarnation principle.

The alchemical Sol Niger – Alchemy, hermeticism and gnosis tell us of the existence of two opposed Manichaean beliefs, corresponding, in our case, to two suns: an apparent material one (or "material gold") and a hidden one (or "philosophical gold"). The material sun of our planetary system, which consumes itself through a simple nuclear fusion based on hydrogen, could as such possibly be seen as a "Dark Sun," but still not a black one.

The strict alchemical principle of Sol Niger (literally: "Black Sun" in Latin) refers to the first stage of the Magnum Opus (i.e., the Great Work, at the end of which production of gold is obtained), also called the Nigredo or blackening phase.

Considered from an operative view point, the Magnum Opus resembles greatly to the physical principle of nuclear fusion, but one should not neglect the speculative or mystical aspect of this alchemical process that may also refer to an internal spiritual transformation, popularized under others by Paulo Coelho in his book The Alchemist.

The Egyptian and historically unrelated Mesoamerican myths of the Black Sun referring to death, rebirth and fecundity suppose the underlying alchemical intermediary concept of Putrefactio (putrefaction or rotting in Latin).

A Black Sun can be seen in the colorful alchemical manuscript called Splendor Solis ("The Splendor of the Sun"), allegedly written in 1532/1535 by Solomon Trismosin, the spiritual father of Paracelsus. This sun is only partially visible, could be setting or rising, in a desolated dried landscape of leafless trees, though remaining golden rays of light can be seen radiating weakly out of it. This Black Sun stands for putrefaction in alchemy. The accompanying text says that dissolution is required in alchemy in order to obtain a black matter like the nigredo phase does.

Salomon Trismosin - Splendor Solis 1532-1535 at the
Kupferstichkabinett of the Staatliche Museen zu Berlin

Putrefaction, or death, is needed in order to give way to life and rebirth, while the unconscious reconciles with the conscious. The culmination of this conciliation corresponds to the making of the Philosophical Stone, where the Putrefactio or Nigredo is the first part of the process. It is a phase where the pure should be separated from the impure, or as Carl Gustav Jung put it in the field of psychoanalysis, to integrate the shadow to one's self, i.e., the dark side inside of us.

Some alchemists saw all of this also as the association between the woman/moon and the man/sun into a Black Sun, or a mystical wedding.

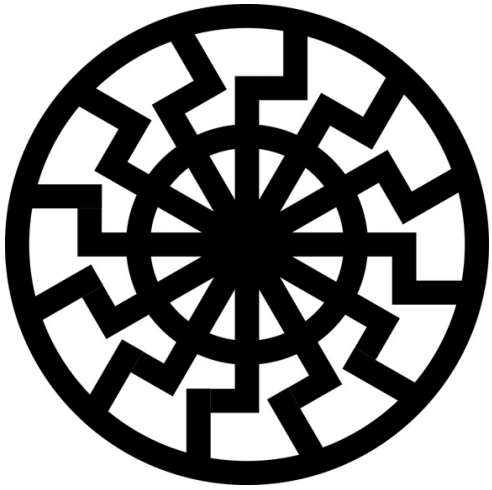
Theosophical Nemesis – In The Secret Doctrine (1888), Helena Blavatsky, founder of theosophy, mentioned a central invisible sun in the Milky Way. It would act as a center of attraction on our sun, and an energetic source for the universe. Its energy was seen as a "creative light," though invisible, and which the Jews of the Cabala would call "the Black Light."

Interestingly enough, this matches exactly the modern astronomical theory of the existence of Nemesis, which would be a hypothetical hard-to-detect brown dwarf star. The hypothesis was made in 1984 by paleontologists David Raup and Jack Sepkoski, who claimed that they had identified a statistical periodicity in extinction rates over the last 250 million years, which could be explained by the regular passing of Nemesis.

The Wewelsburg Sonnenrad – The castle of Wewelsburg was built in 1603 in North Rhine-Westphalia in Germany. In 1934, one year after the Nazi rise to power, Reichsführer Heinrich Himmler leased the castle for 100 years from the Paderborn district in order to make an ideological center for the Black Order of the SS.

The castle became an almost religious place where esotericism, runes, pagan lore, and racial theories were studied by a handful of high-ranking SS, i.e., an elite within the elite. Himmler adapted the legend of King Arthur and his Knights to a new Grail mythology, based on Germanic paganism.

The Black Sun in the Gruppenführer hall of
the Wewelsburg lies exactly above the swastika
on the ceiling of the crypt underneath.



In the center of the marbled floor of the Gruppenführersaal (SS Generals' Hall) on the first floor of the castle lies an inlaid dark green Sonnenrad (“sun wheel” in German). The axis of the Sonnenrad was made out of a pure golden disk that was supposed to become the center of whole "Germanic world empire" from 1941 on. The design resembles that of Early Medieval Germanic brooches (Zierscheiben), possibly worn on Frankish and Alemannic women's belts. Its shape bears a solar significance, showing a twelve-spoke sun wheel looking like a decorative disk of the Merovingians that represented the passage of the visible sun through the months of the year. The design also reminds one of the round table of Arthurian legends where each spoke of the sun wheel represents one "knight" or one officer of the "inner" SS.

Close-up of the now famous Black Sun symbol

It is most likely that this symbol was embedded during the Third Reich but it is only after the Second World War that it was

called Die Schwarze Sonne (Black Sun in German), though there is no evidence at all that Himmler's SS linked this symbol with that of the Black Sun. The very association between both seems to be a post-war esoteric interpretation that is still in use in certain scenes of neo-Nazism and Odinism.

Neo-Nazi Black Sun symbol

According to Jean-Michel Angebert (Les mystiques du soleil, 1971) the swastika is actually the Black Sun, i.e., a principle of hidden energy in a multi-dimensional universe beyond the visible world. It is close to Iamblichus' philosophy based on gnosis. Without going so far, the sun wheel possibly had a relation to Germanic sun-based mysticism which was propagated by the SS; the sun was interpreted as "the strongest and most visible expression of God."

Here we find again the opposing traditional concepts of physical objects versus their spiritual expression: the marble Black Sun symbol from Wewelsburg vs. the inner light of a mystical universal and its creative energy. In the same way, the material cup of the Grail can be opposed to the alchemical properties of the beverage it holds, i.e., spiritual immortality. We can draw the comparison even further with the Sol Invictus ("Invincible Sun"), which was the official sun god of the later Roman Empire, who seems to have inspired Himmler's sun mysticism.

In 274 AD the Roman emperor Aurelian made it an official cult, alongside the traditional Roman cults. But like the inner light of the Black Sun, or the immortality and/or mystical knowledge hidden in the Grail, the Sol Invictus stood for a spiritual sun, a metaphysical concept, only accessible to initiates, not just the physical sun visible to the exoteric crowds.

All these stories surely added up to the myth that Castle Wewelsburg was an esoteric center, hiding not only rare historical artifacts (like the fake Celtic Cauldron of genuine pure gold recently found in the Chiem Lake in Germany) brought in by the Ahnenerbe but also the deepest spiritual secrets about the origins of the Nordic race.

Weisthor, Himmler's Rasputin – Karl Maria Wiligut, aka Weisthor, headed a Department for Pre-and Early History that was created within the SS Race and Settlement Main Office (RuSHA). There, he developed the plans for the rebuilding of the Wewelsburg into a pseudo-religious center for the SS elite.

During the 1920s, he designed his own runic alphabet with mostly alternative meanings from the mainstream Futhark and wrote with them 38 verses called the Halgarita Sprüche.

He claimed to have memorized these verses as a child, when taught by his father. Werner von Bülow and Emil Rüdiger of the Edda-Gesellschaft (Edda Society) claimed some verses are connected with the Black Sun, like verse number 27 which would be a 20,000-year-old "solar blessing" according to Willigut:

Wilugoti Haga tharn
Halga fuir santur toe.

which translates, according to Werner von Bülow, more or less as follows, and taking into account that this language exists probably only in Weisthor's brain:

"Legend tells, that two Suns, two wholesome in change-rule UR and SUN, alike to the hourglass which turned upside down ever gives one of these the victory The meaning of the divine errant wandering way dross star in fire's sphere became in fire-tongue revealed to the Earth-I-course of the race of Paradise god willing leaders lead to the weal through their care in universal course, what is visible and soon hidden, whence they led the imagination of mankind polar in change-play, from UR to SUN in sacrificial service of waxing and waning, in holy fire Santur is ambiguously spent in sparks, but turns victorious to blessing"

Karl Maria Wiligut aka Weisthor

These confused and almost incomprehensible verses are supposed to stress that Santur would be a burnt-out sun and the source of power of the Hyperboreans. These were purportedly the ancestors of Germanic tribes living in the North Pole, when its climate was mild and its landscapes were green. Hyperborea had its capital city, Thule, and was once identified with Iceland. Furthermore Santur allegedly still orbits in the vicinity of our planet as a Black Sun and sends powerful hidden energy. The latter recalls the Nemesis hypothesis and the invisible creative energy that a Black Sun is supposed to radiate.

The Vienna Circle – In the 4th district of Wieden in Vienna, Austria, ex-Waffen-SS Wilhelm Landig founded a group in 1950 called the Vienna Circle or, after him, the Landig Group. The group gathered the first time at Landig's apartment and held discussion on esoteric and völkisch (nationalist and racialist) mysticism. They revived and promoted the mythology of Hyperborea which was, as we saw, allegedly the home of the Aryans' ancestors in the Arctic.

Wilhelm Landig

According to Nicholas Goodrick-Clarke (Black Sun, Esoteric Nazism and the Politics of Identity, 2002), the Landig group

invented the concept of the Black Sun that flourished in neo-Nazi groups during the 1990s. It was through Wilhelm Landig's own novels that this Nazi revival was made possible. He wrote for this purpose a trilogy: Götzen gegen Thule, Rebellen für Thule and Wolfszeit um Thule.

Erich Halik, a prominent member of the Vienna Circle, was the first to link the esotericism of the inner SS elite with the Black Sun concept, but not yet to the Wewelsburg symbol. Landig called the Black Sun "a substitute Swastika and mystical source of energy, capable of regenerating the Aryan race." The visible sun would be merely a symbol of an invisible anti-sun: "Everything that can be comprehended by human senses is material, the shadow of the invisible spiritual light. The material fire is – seen in this way – also just the shadow of the spiritual fire."

Landig revived old völkisch pseudo-scientific theories about Atlantis, Hörbiger's Hollow Earth and Aryan mysticism. In his trilogy, he locates in the Arctic the Aryan positive forces of the Black Sun, which according to him is represented by a disk that is not black, but of a deep purple that will turn white when Germany eventually overcomes this titanic world struggle. Interestingly enough, Landig states that the Black Sun refers to the Babylonian religion, which in turn would come from the Aldebaran star, which "shines within us and gives us the power of understanding." For Landig, the Black Sun is the symbol for an esoteric order inside the SS, and it "shines above the Midnight Mountain an invisible light because it shines within." The Midnight Mountain seems to be present in the myths of different people throughout the globe like the Chinese and the Indians, the latter calling it Mount Meru.

Furthermore, Landig circulated stories about Nazi flying saucers assembled in an underground base in Antarctica (see Neuschwabenland expedition), from which US Admiral Byrd could not extirpate them.

The Black Sun of Tashi Lhunpo (Die schwarze Sonne von Tashi Lhunpo) is an occult Nazi thriller written in 1991 by Russel McCloud, a pen name for Stephan Mögle-Stadel. It tells of the assassinations of the president of the European Bank and a leading member of the UN Security Council, which are linked by a brand mark of the symbol of the Black Sun on the foreheads of the victims. This is the very first time that the symbol of the Sun Wheel, as found at the Wewelsburg castle, is linked with the Black Sun myth itself. If it contradicts the deep purple disk of Landig's trilogy, it evokes nonetheless very well a universal creative source of energy, with its black circle and twelve radial sig runes. The only problem is that it seems to be a pure fiction, Stephan Mögle-Stadel being just a journalist enjoying writing a thriller.

Nonetheless the neo-Nazi scene adopted the Wewelsburg Sonnenrad as the one and only true symbol of the Black Sun, and a legal substitute to the swastika, which is forbidden in many European countries.

More Post-war Nazi Fantasies – According to Nicholas Goodrick-Clarke, "In the early 1990s, the Austrians Norbert Jürgen Ratthofer and Ralf Ettl developed new Nazi UFO myths involving ancient Babylon, Vril energy and extraterrestrial civilizations in the solar system of Aldebaran. These colorful ideas are integral elements of a dualist Marcionite religion propagated by Ralf Ettl through his Tempelhofgesellschaft (Temple Society) in Vienna, identified as a secret successor to the historic Templars, who had absorbed Gnostic and heretical ideas in the Levant". Ratthofer and Ettl state in the DVD UFO – Geheimnisse des Dritten Reichs (1990) (UFO – Secrets of the Third Reich), "Within the SS the Thule Society created a separate secret organization called the 'Black Sun' with the 'Geheimnis Schwarze Sonne' as its logo."

In 1997 Peter Moon wrote The Black Sun: Montauk's Nazi-Tibetan Connection in which he shows for the first time in Nazi occultism a picture of the "Signet of the Black Sun." This is allegedly the symbol of "the innermost secret society of Nazi Germany: the Black Sun."

As a matter of conclusion, the Black Sun can be seen as a multi-faceted myth with an ancient background, though it is not demonstrated that its various historical phases of development refer to the same concept. It is possible, though, to identify many common elements to these myths, which could contribute to unveiling parts of a unique and original truth.

Signet of the Black Sun

The Black Sun seems to be an invisible counterpart of our visible sun, which is able to bestow its influence onto planets, things and living beings. It hides from mortals, though keeping tuned with their very biological rhythms, but can be seen by souls in the Netherworld. Its alchemical and psycho-analytical meaning is that of a spiritual force, able to lead a deep internal transformation prior to a total rebirth or reincarnation.

Nazis were after the spiritual secrets of the Nordic race, and they could have envisaged the Black Sun, at least in a very confidential inner circle of the SS, as a universal pervasive force of creative energy that shines "from within." Some went so far as to state that this force would "allow souls to experience many levels of reality simultaneously."

This definition of the Black Sun resembles strongly that of the Vril force, for which documentation is scarce if not mostly unreliable. Likewise, it is said that our planet is hollow and illuminated by a central Black Sun, dispensing a greenish light.

The Vril

The Vril, as well as the secret society bearing its name, is now a traditional stopover in the meanders of so-called Nazi esotericism. Compared to the Black Sun, the Vril's very existence is really controversial, and sometimes we shall have to depart from historically verifiable facts in order to enter a twilight zone between myth and reality. But how unreal are the myths?

In the Beginning Was a Sci-Fi Novel – Many sects actually begin with the sayings or visions of a single man, whereas others are based on a holy book or even a novel. This is the case of Scientology, but it could be applied to some extent to other very successful religions. The Vril was first mentioned in a book entitled The Coming Race, written by Sir Edward Bulwer-Lytton in 1871. Though the term "science fiction" did not exist at that time, it would well fit to this book as well as to Jules Verne's. He also wrote Zanoni, an occult fiction, and the famous Last Days of Pompeii.

The plot centers on a traveller who lost his way in an old mine in Great Britain, only to find himself the guest of an antediluvian subterranean race called the Vril-ya. Neither gods nor angels, they look, however, far superior to humans by their height, their intelligence, their cold wisdom and their supernatural powers like telepathy. They harness an "all-permeating" fluid called Vril. Through training their will, they can master this universal, invisible, creative energy that can heal, transform or destroy, besides acting as a fuel for transportation devices and lighting of the underground. The latter was of a light green luminescence.

The hero and narrator is taught the most accessible history of the Vril-ya by Zee, his host's daughter. He learns that when the underground caves are not sufficient for their breeding, the Vril-ya will have to conquer the surface world, destroying mankind if necessary. Vril is indeed so powerful that a Vril-ya child could reduce a city of tens of millions of inhabitants to ashes in a matter of seconds.

The narrator studies the Vril-ya language and draws the conclusion that they are "descended from the same ancestors as the great Aryan family, from which in varied streams has flowed the dominant civilization of the world."

Sir Edward Bulwer-Lytton

Somehow the Vril-ya have much in common with Lovecraft's Unknown Superiors: telepathy, mastery of unknown forces and an antediluvian ancestry.

Black Sun & Alchemy – One ought to be cautious with all that refers to esotericism, since one fake myth reinforces the other, especially on the Internet. Nonetheless, the idea exists that Bulwer-Lytton only based his novel on more ancient myths and archetypes, which were popular among Middle Ages alchemists. The life force underlying the Vril was indeed already known since antiquity as Prana, Chi, Ojas, Astral Light, Odic Force and Orgone. Some advocates of the Hollow Earth Theory have even said, more recently, that Vril came from the Black Sun hidden force that would be an irradiating Prima Materia ("primordial matter" in Latin), at the center of our planet.

Green is the Symbol of the Vril – The green light that illuminates the Vril-ya's underworld reminds of many other occurrences of that color: Goethe's tale The Green Snake and the Beautiful Lily; the Holy Grail that could be an emerald fallen from Lucifer's forehead; the Greenland, named in the 10th century by Erik the Red, in remembrance of the Primordial Earth, though

60 percent of the island was by then already covered by white ice; Osiris was seen by certain Egyptologists as a green irradiating god; the Mesoamerican Quetzalcoatl Great Priest drew their might from an enormous magical emerald and the god himself was green; the famous Emerald Tablet (tabula smaragdina) of the hermetic tradition of the alchemists; eventually, some green lunar stones would possess a "levitation" power enabling witches to fly in old Scottish lore or, hidden under cathedrals, would have prevented bombs from falling onto them during WWII in Germany.

Quetzalcoatl

Let us have a special mention for the Order of the Green Dragon and the Monk with the Green Gloves.

The Order of the Green Dragon was a Japanese secret (political/mystical) society dedicated to mastering the human body, which in turn permitted access to a "great power." Higher initiates were required to be able to germinate a seed by telekinesis.

While a military attaché in Tokyo before WWI, Karl Haushofer would have been one of just three Westerner members of the Order. Haushofer was one of the founders of geopolitics (the theory of Lebensraum or vital space) and allegedly also a member of the Vril Society. He never was a member of the Nazi Party, and was even married to a Jewish woman despite many contrary assertions in neo-Nazi esoteric literature.

The Vril Society profess to have sent expeditions to Tibet before WWII, and as late as 1942, to meet the Bon Pö monks of Agarthi. In the '20s, Tibetan monks formed the Society of Green Men in Berlin and Munich. Their High Priest was a man called the Monk with the Green Gloves. Hitler would have visited him for his clairvoyant gifts.

The Society of Green Men, helped by the Order of the Green Dragon, allegedly helped the Nazis to try to turn Aryans into God-Men. Pauwels and Bergier, in their Morning of the Magicians, a very unreliable source but the only one on this subject, report that during the fall of Berlin, the Russians found many dead bodies of Asians in German uniforms who apparently committed suicide in a ritual way.

According to the same source, Haushofer would have committed the same kind of suicide, except that this is historically untrue. Historian H. A. Jacobsen proved that all what was written in The Morning of the Magicians about him, the Thule Society, and the Vril Society is simply fiction.

The Vril Society – Louis Jacolliot (1837–1890) was a French consul in Calcutta, India, when he wrote Les fils de Dieu (1873) and Les Traditions indo-européennes (1876). Both books stressed the existence of the Vril that appeared a bit earlier in Bulwer-Lytton's novel The Coming Race (1871). Jacolliot is supposed to have met the Vril among the Jains in Mysore, and Gujarat in the country where he lived as a diplomat and judge.

Madame Helena Blavatsky, the founder of theosophy, was also impressed by Bulwer-Lytton's book. She found a confirmation of the racial aspects of her theories in respect to the origin of mankind, of which she wrote in her books Isis Unveiled (1877), and again in The Secret Doctrine (1888). The physical and spiritual superiority of the white race was later on mixed with anti-Semitism, and the first studies of the Indo-European peoples by the German nationalists gave thus birth to ariosophy (Aryan +

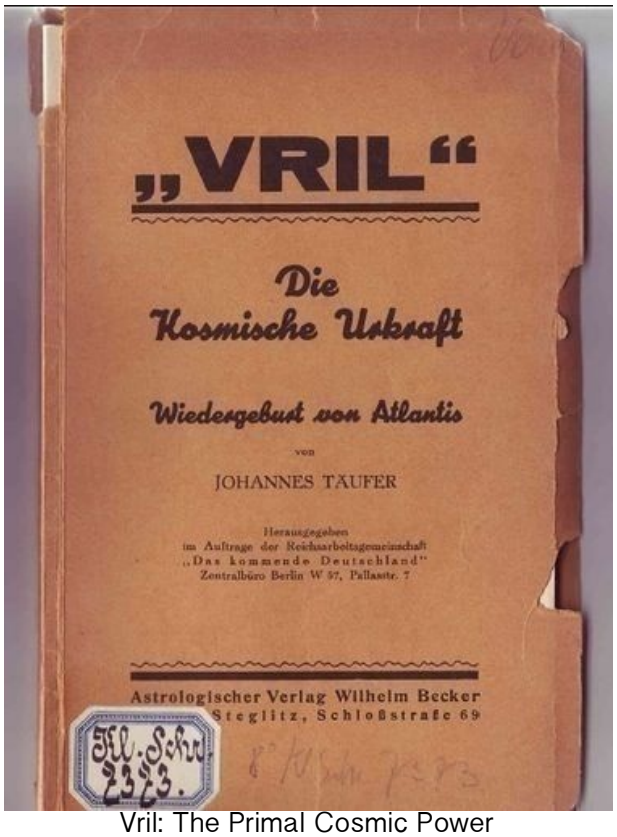
theosophy). It was mostly the works of Guido von List and Jörg Lanz von Liebenfels.

Both Louis Jacolliot and Madame Blavatsky supported Bulwer-Lytton's Vril myth so well, and many contemporaries actually believed in the existence of this green force.

According to Joscelyn Godwin (Arktos: The Polar Myth in Science, Symbolism, and Nazi Survival), the only primary source of information on the Vril Society is Willy Ley.

Willy Ley was a German rocket engineer who fled Nazi Germany in 1933. In 1947, he published an article called "Pseudoscience in Naziland" in the magazine Astounding Science Fiction. He explained that the Nazis did obtain many technical successes because they systematically tried every option possible in all scientific fields and beyond. This included the pseudo-sciences of the Hollow Earth, the Welteislehre (The World Ice Theory) and even magic at the fringe. Among these weird theories there really existed, according to Ley, a group interested in Vril:

"The next group was literally founded upon a novel. That group which I think called itself Wahrheitsgesellschaft (Society for Truth) and which was more or less localized in Berlin, devoted its spare time looking for Vril. Yes, their convictions were founded upon Bulwer-Lytton's The Corning Race. They knew that the book was fiction; Bulwer-Lytton had used that device in order to be able to tell the truth about this "power." The subterranean humanity was nonsense, Vril was not. Possibly it had enabled the British, who kept it as a State secret, to amass their colonial empire. Surely the Romans had had it, enclosed in small metal balls, which guarded their homes and were referred to as Lares. For reasons which I failed to penetrate, the secret of Vril could be found by contemplating the structure of an apple, sliced in halves.



(Left to right) Heinz Haber, Wernher von Braun,
and Willy Ley

No, I am not joking, that is what I was told with great solemnity and secrecy. Such a group actually existed, they even got out the first issue of a magazine which was to proclaim their credo (I wish I had kept some of these things, but I had enough books to smuggle out as it was)."

Professor Nicholas Goodrick-Clarke (Black Sun: Aryan Cults, Esoteric Nazism, and the Politics of Identity, 2002) tells a different and more probable account based on the findings of Dr. Peter Bahn in his 1996 essay, Das Geheimnis der Vril-Energie (The Secret of the Vril energy): "The reality of the Vril Society was a good deal less impressive. Its formal name was Reichsarbeitsgemeinschaft ‘Das Kommende Deutschland’ (Reich Working Group ‘The Coming Germany’); one of hundreds of little occult societies in Weimer Germany, it was sponsored by the astrological publisher Wilhelm Becker. The group put out a magazine, which apparently folded after one issue.

In 1930 it also published two pamphlets, Vril: Die kosmische Urkraft (Vril: The Primal Cosmic Power) and Weltdynamismus (World Dynamism), claiming to reveal the secrets of Atlantean free energy technology. A section of the latter pamphlet shows a bisected apple as a symbol of the free energy field surrounding the earth. While this confirms Ley’s account, it does nothing to back up the extravagant claims made for the Vril Society’s activities and influence by later writers."

Vril: The Primal Cosmic Power

Last but not least, some went so far as to claim that the Nazis wanted to change Nordic Germans into a super-race, to become equals with the supermen inside the earth. They would have tried to use different methods of meditation to obtain this transformation. These methods were allegedly based on tantric Buddhism and Tibetan Bon Pö pre-Buddhist "black" shamanism as well as on Ignatius Loyola's Spiritual exercises.

The existence of a Vril Society was mentioned for the first time as such in 1960 by Bergier and Pauwels in their best-seller The Morning of the Magicians. It looked like other secret societies that pretended to have existed at that time, like the Thule Society and the Golden Dawn. They quote the excerpt of "Pseudoscience in Naziland" where Dr. Willy Ley wrote about that strange society and link it to the ritual suicide of the Tibetan monks in Berlin's final days. For the latter, the most likely is that they were Asians from "liberated" Soviet republics enrolled in the Nazi struggle against communism. There were also well known similar cases of Indians serving in German uniforms on the Atlantic Wall bunkers in France.

Van Helsing's Myths of the '90s – With German author Jan van Helsing, aka Jan Udo Holey, the Vril myth reaches its climax, but surely not the historical truth. Van Helsing wrote about modern secret Nazi UFO bases in Antarctica as the achievement of a long underground activity that began in the '20s among members of secret societies.

Maria Orsitsch (Marija Oršić in Croatian) was allegedly a powerful medium and member of the Vril Society. Her father was a Croatian immigrant from Zagreb, while her mother was Austrian.

She would have met in 1917 with Karl Haushofer, Baron Rudolf von Sebottendorf (Thule Society), prelate Gernot of the secret Societas Templi Marcioni (The Inheritors of the Knights Templar) in the Schopenhauer café in Vienna. They would have been admirers of the Hermetic Order of the Golden Dawn, and disciples of secret Asian lodges, hence the presence of Tibetan monks in Berlin and Munich. As we already saw, this is pure fantasy, at least as far as Karl Haushofer is concerned.

They studied secret texts of the Knights Templar and were linked to the secret fraternity Die Herren vom schwarzen Stein ("The Lords of the Black Stone"), the existence of which is to be found nowhere else.

Maria would have gotten acquainted in Munich with members of the Thule Gesellschaft, and started her own female medium group called first Alldeutsche Gesellschaft für Metaphysik. They all had long ponytails that they believed acted as cosmic antennas, to receive alien communication.

In 1919 a few members of all these secret societies met at a small alpine lodge close to Berchtesgaden. There, Maria Oršić and another medium by the name of Sigrun claimed to have received telepathic transmissions from Aldebaran star in a secret Templar writing, containing technical blueprints for the construction of flying machines. The language used to code the message would have been nothing less exotic than ancient Sumerian, "that sounded like German" (sic).

Maria Orsitsch aka Marija Oršić

What follows is a series of different Vril UFOs (Vril-7, Haunebu I, II etc.) and the project to reach one day Aldebaran itself by traveling with these. Of course a multidimensional channel, independent from Einstein's Relativity equations, would lead them to the star of their dreams.

Maria Oršić disappeared in 1945, leaving behind her a letter to all the members of her lodge, where she wrote "niemand bleibt hier" (no one stays here). It is speculated that she and her friends escaped to Aldebaran and if not, at least to Nazi Antarctica, which is much closer indeed!

One can safely say that Vril is at least a controversial subject. It is not necessary to make it ridiculous by inventing unsubstantiated stories, with no references and no hard evidence at all to support them. Truth finders do respect good research work, and dismiss parrots which echo rumors and urban legends. All genuine myth hides a truth, and deserves to be treated seriously and with respect.

Vril is a word that was probably invented by Bulwer-Lytton in his novel, since it is the first time when it was mentioned. Nonetheless, the concept of a hidden universal creative force that can be harnessed and mastered is not new. It has predecessors in history of religions, philosophy, occultism, and could possibly be newly interpreted in the light of quantum physics.

The Vril Society was very likely the group called Reichsarbeitsgemeinschaft "Das Kommende Deutschland." It surely looked after the Vril and its mastery. It has, however, no proven links with the Thule Society which, based on known evidence, did exist but had already disappeared by then. Karl Haushofer was not a member of the latter, neither was Rudolf Hess, and they most probably never reached the attention of leading Nazis. It is true, though, at least regarding the Thule Society that they were deeply involved in fighting the short-lived Soviet republic of Bavaria after WWI.

On the other hand, the legend of Maria Oršić is based on nothing, since not even her birth certificate could be found. Of course, some will argue that the people of Aldebaran took it with them or, as can be read in fantasy books pretending to hold some truth, that the Vril members erased all tracks behind them for "security purposes."

EPILOGUE

One may wonder why books, movies and even video games about WWII are still so successful, especially when they tackle Nazism and its dark side. Maybe because WWII was the last historical event of global proportion, and we presently live after the End of History, in a postmodern world controlled by the Empire of the Good. Evil, negation, fights, and ideologies were only necessary when the foundations of our civilization were at stake. It is no more the case since 1945. Everywhere in the world we see people aspiring to achieve the same levels of material comfort, based on the same moral and economical individualistic values. “Evil” is no longer a real threat but one is asked to believe in its present existence more than ever.

In this perspective, occult Nazism is the evil of Evil and Hitler incarnates Lucifer. Postmodern man wants the thrill of past history but in an asepticized version, without the risk and the pain. He wants to be a "rebel," supported by the law, the government, “well-meaning” NGOs and all new moral institutions. A Rebel Without a Real Cause, fighting long-gone ghosts. In other words, modern man pretends to be unique while his billions of clones play the hero at no cost, never putting their lives at stake as they pretend to.

The attraction of occult Nazism comes from these feelings, because no bigger event than WWII ever happened in our post-historical world. Most of the small wars that have occurred after WWII, like the Vietnam War, did have casualties but they were not meant to change the world. They were meant to draw a red line between the West and the communist empire, to make them understand that it should not be trespassed. It was more of a backyard quarrel. No less, no more.

The more evil vanishes away, the more we feel purposeless since it was the very fuel of history, that necessary dialectical "other" that we could fight. Modern man replaces evil with "mock enemies" and fake events, such as comparing Saddam Hussein to Hitler by making up stories of weapons of mass destruction. We like to be scared, knowing that a Hollywood happy ending always waits for us around the corner.

This is the reason why occult Nazism became a myth after WWII. All the ingredients are there: bad guys, witches, magic, esotericism, and the fight against irreconcilable ideologies in an environment of a new history in the making.

That being said, many authors identified a juicy gap in the market and began to write nonsense, or, far more dishonest, to make up stories that would even give birth to urban legends and new myths on the Internet. Spreading like rumors, each myth relied on the previous one and added new fantastic elements. Some are jokes, some are commercial traps but none of them is the truth.

As far as history is concerned, there was a genuine Nazi occultism and many other unknown odd facts that were related to the Third Reich. We dealt with them in this book because they are interesting enough, and they bear a deep meaning that does not require making things up, or creating a fantasy. They are in itself a testimony of no ordinary times. They are, like Nazism, a breach in the fabric of history that left its contemporaries in awe.

Introduction

Before we begin to examine the large and diverse array of secret weapons produced in Germany before and during World War II, we should perhaps define what is meant by the term 'secret'. Most weapons are developed in secret - or at least, under conditions of stringent security - whether in times of peace or war, if only because, as the old adage has it, forewarned is forearmed. In Germany's case, there was an added imperative: the Versailles Treaty which, at the end of World War I, forbade her to develop (and even to possess) certain categories of weapons, such as aircraft and tanks. Development programmes for these weapons had to be carried out in absolute secrecy, since the ultimate risk (though probably a small one by the time these development programmes were under way) was the occupation of Germany by the victorious Allies. In many cases, up until the moment that Hitler signalled his intention to revoke the Treaty unilaterally, the projects were actually based outside Germany: in Holland, the Soviet Union, Sweden and in particular Switzerland.

In the strict sense, then, when we address the topic of German secret weapons of World War II, we are faced with an enormous task. But the term 'secret weapons' has a more precise meaning in general use: it implies something which goes beyond the development of a piece of more or less mundane equipment in conditions of secrecy. It implies a genuinely new concept, something truly out of the ordinary, which simply could not work without a new understanding of physical science or chemistry; a new mastery of technology; or some great leap of creative, imaginative invention. In the place and at the time in question, there was certainly no lack of those.

WUNDERWAFFEN

Perhaps the alternative term frequently used in Germany at the time - *Wunderwaffen* - comes closer to defining the true nature of these secret devices, for they were often truly things of wonder, being either completely new and hitherto undreamed-of outside a small select group, or achieving previously unthinkable levels of performance thanks to breakthrough innovations in science and technology. Some of them, it is true, were 'ideas whose time had come', in that the basic principle was understood, but had not yet been successfully applied, and in these cases, teams of scientists and engineers in America, Britain and Germany (and sometimes elsewhere: there were several significant advances made by Italy) were engaged in a headlong race to get the first reliable working version onto the battlefield. The development of the jet aircraft and of radar, not to mention the development of nuclear fission, stand out amongst those. But in other areas, particularly in rocketry and the invention and perfection of the all-important guidance systems, Germany stood head and shoulders above the rest.

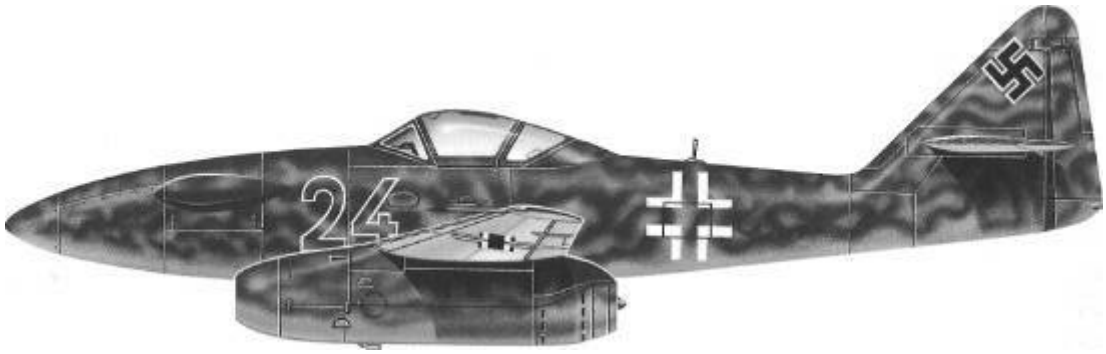
Left: The Junkers Ju 287, with its forward-swept wings, was just one of a number of futuristic designs developed by German scientists and engineers in World War II.

Above: A borderline secret weapon: the 'Goliath' was an explosives-filled wire-guided tank and a typically innovative approach to dealing with bunkers and armour.

Her scientists made an enormous and outstanding contribution, not just to the German war effort, but to modern civilisation. However, there were areas where German science and technology were deficient, most importantly - arguably - in the field of electronic computing machines, which were not weapons themselves but something without which the bounds of technological development would soon be reached. However, all too often these deficiencies arose as a result of demand chasing insufficient resource, and time simply ran out for the scientists of the Third Reich before a satisfactory result could be produced.

TOO LITTLE, TOO LATE

Time and again in the course of this work we will come upon development programmes which were either cancelled before they came to fruition or which were still in progress at the war's end. Many of them, of course, did not get under way until 1944, when the spectre of defeat was already looming large in Berlin and many essential items were in increasingly short supply. We can only speculate upon the possible outcome of an earlier start on the course of the conflict. Others were cancelled simply because they did not appear to offer the likelihood of spectacular results, and in those cases we can, all too often, detect the hand of Adolf Hitler. In general, we can note what can only be described as a wrong-headed insistence on his part that big (and powerful) was always beautiful (and irresistible). This major flaw led him to push for the development of weapons such as the fearsome - but only marginally effective and very expensive - PzKpfw VI Tiger and King Tiger tanks, which would have been far better consigned to the wastebin from the very outset, and the resources squandered upon producing them - and then keeping them in service - redirected into more appropriate channels such as the more practical PzKpfw V Panther.



In a very real sense, Hitler himself motivated and ran the German secret weapons programme. There seems to be a direct and very tangible link between this programme and his psyche, and we are perhaps left wondering whether the *Wunderwaffen* would have existed without him. On balance, it seems certain that they would have done, given the creative imagination of so many German scientists and the readiness of many of her military men to accept innovation, but it is equally certain that without Hitler's insistence, many weapons systems which made a very real impact upon the course of the war would either not have been developed at all, or would, at best, have been less prominent.

Nonetheless, without the genius of many German scientists and the brilliance of German technologists and engineers, the entire programme would have been stillborn. Many of the weapons produced for the first time in Germany and employed in World War II went on to become accepted and very important parts of the broader armoury, and several have made an enormous impact on life as a whole outside the military arena. The more spectacular failures have a certain grandeur, despite their shortcomings, and even the outright myths - and there were many, some remarkably persistent - frequently had an underpinning of fact.

CHAPTER ONE

Jet Aircraft

Thrust-powered flight was an early alternative to the airscrew propeller - in 1928, only a quarter century after the Wright brothers first took to the air, Fritz Stammer flew in a rocket-powered glider. By the time a further decade had gone by, both rocket- and jet-powered aircraft had become a reality, and a central plank in Germany's attempts to win control in the air.

The German Air Force, the Luftwaffe, was held in high esteem in National Socialist Party (henceforth, Nazi) circles, and it perhaps enjoyed better access to the ultimate seat of power, namely Adolf Hitler, than the Army or the Navy. This was not just because it had at its head one of the Fuhrer's closest associates, Hermann Goring, but also because for almost all of the war, it had sole charge of the front-line defence of Germany against the combined onslaughts of the British and American air forces, bombing by night and by day.

Certainly, when it came to the allocation of funds for research and development, the Luftwaffe was at the head of the line; as a result, more developments were made in the field of aeronautics in the Third Reich than in any other. That there was something approaching chaos in the way individual projects were initiated, approved and evaluated is a constant source of wonder, because in a country which prided itself on its logical, methodical approach to problem-solving, there was no logic or method in evidence! As one expert has commented, the relationship between the individual aircraft and engine manufacturers and also between them and the Luftwaffe and the *Reich-sluftfahrtministerium* (RLM - the German Air Ministry) looked like tribal warfare.

Those projects which came to fruition were amongst the better-known wartime developments, and not just in Germany, but that only tells half, or far less than half, the story. The vast majority fell by the wayside, some due to lack of time; others, quite properly, because they were flawed; still others because they were simply too fanciful and apparently far-fetched. Most of the more interesting new aircraft

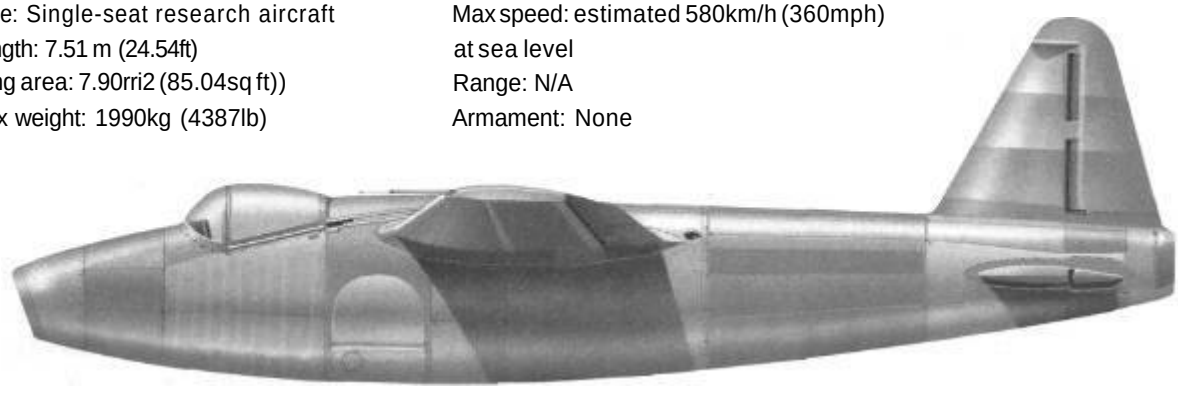
Above: The stark shape of the Messerschmitt Me 262.

Left: The Heinkel He 162 made use of appropriate technology- in this case, plywood; its wing and tailplane assemblies were manufactured in furniture factories.

developed during World War IT in Germany were to be powered by either turbojet or rocket motors, in both of which German scientists and engineers excelled, but as we shall see, the jet engine programme in particular was to get off to a very slow start. Had the optimism of the jet pioneers been justified, we might well have seen a different outcome to the war, a prolongation, perhaps, into the autumn and winter of 1945, which might have resulted in the nuclear bombs used against Japan being dropped on German cities, too. When it was so evident that the jet aircraft was going to be so vitally important, it comes as something of a surprise to see that the timescale of its development was so extended. As a result, although Germany had a very clear lead in the field, she squandered it, thanks largely to poor overall control of the research and development programme.

THEHEINKELHe178

The name Heinkel deserves to figure high in any list of notable achievements in aviation, for it was from Ernst Heinkel's design studio, and specifically from the drawing boards of twin brothers Siegfried and Walter Günter, that the first practical thrust-powered aircraft - the rocket-propelled He 176 and the turbojet-powered He 178 - were to come. Heinkel himself, with partner Hellmuth Hirth, had enjoyed considerable success with the Albatros aircraft, especially the B.I, during World War I. He struggled through the dark days of the 1920s and came to prominence again with a commercial aircraft, the Giinter-designed He 70 and, using that as a stepping-stone, produced arguably the most effective bomber of its day, the He 111, which first flew in early 1935. Heinkel continued to develop successful piston-engined aircraft, but his interest also turned to the emerging technology of rocketry. There had been thrust-powered flights - Fritz Stammer flew a solid-fuel rocket-powered glider for the first time on 11 June 1928 - but it took almost a further decade and the development of liquid-fuelled motors to make it a practical proposition, as we shall discover in Chapter Two when we come to examine rocket-propelled aircraft.



Rocket motors, while they could hardly be called 'tried and tested' by 1938, were simple in the extreme; far more complicated, but offering huge advantages in terms of fuel economy and controllability, was the revolutionary new turbojet powerplant on which Heinkel's engineer, Joachim Pabst von Ohain, and his assistant Max Hahn, were working in secret. Lured away from Göttingen University, where they had done their pioneering work, the pair produced a first demonstration prototype, the HeS 1, which ran only on hydrogen (and was only barely controllable) to produce about 250kg (55()lb) of static thrust, in September 1937. By the time six more months had passed, they had made considerable progress, and had produced the petrol-fuelled HeS 3, which developed 500kg (HOOlb) of thrust. This, they believed, was a practical - if only marginally - powerplant, and the next step was to produce an airframe in which to mount it.

The result of their efforts was the He 178, the world's first jet-propelled aircraft. It was a shoulder-wing monoplane with its cockpit well forward of the wing leading edge, where it sat above the ducting

Below: The Heinkel He 178, despite its shortcomings, was the first jet-powered aircraft to fly successfully, on 27 August 1939, 20 months before Britain's Gloster E.28/39.

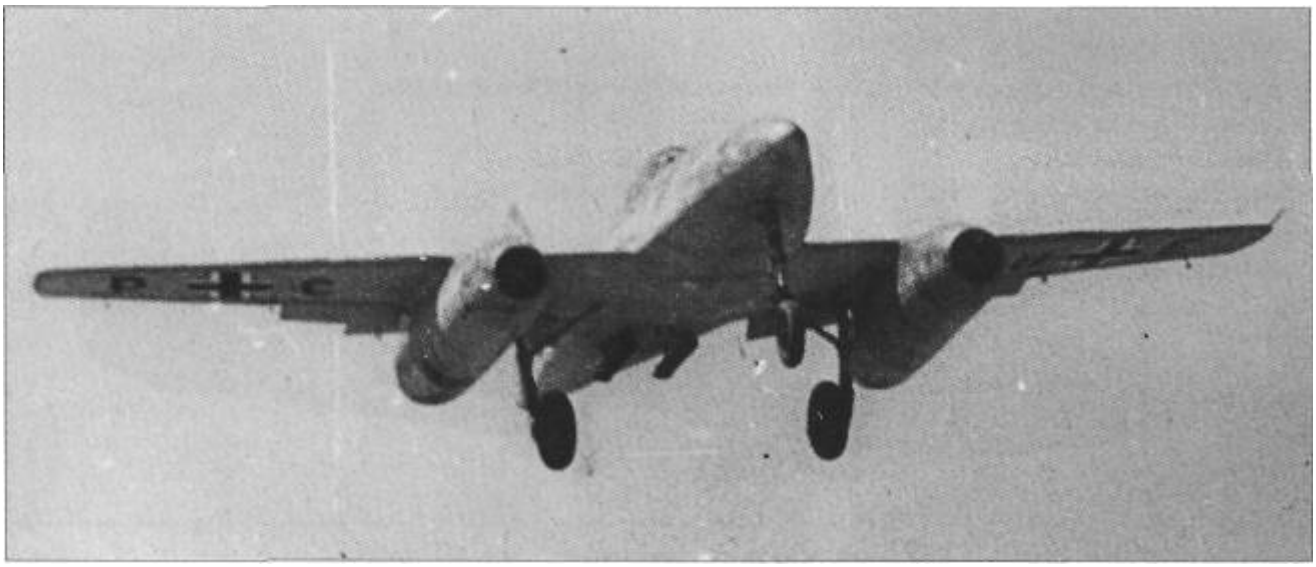
HEINKEL He 178

Type: Single-seat research aircraft
Length: 7.51 m (24.54ft)
Wing area: 7.90rri2 (85.04sq ft))
Max weight: 1990kg (4387lb)
Max speed: estimated 580km/h (360mph) at sea level
Range: N/A
Armament: None

HEINKEL He 280

Type: Single-seat prototype interceptor
Length: 10.40m (34.125ft)
Span: 12.20m (40.00ft)
Max take-off weight: 4310kg (9502lb)
Max speed: 900km/h (560mph} at 6000m (19,700ft)
Range: 650km (404 miles)
Armament: 3 x 20mm MG 151 cannon

Above: The second Heinkel jet, the He 280, was successful, but lost out in competition with the Messerschmitt Me 262. Just nine examples were built



which brought air to the engine (which, along with its tailpipe, occupied most of the rest of the fuselage). It made its first true flight on 27 August 1939, having 'hopped' along the runway three days earlier. This pre-dated the maiden flight of the Gloster E.28/39, powered by Frank Whittle's engine, which had in its turn pre-dated Chain's original effort, by over 20 months. The He 178 was demonstrated to the RLM on 1 November. Almost incredibly, there was virtually no official interest, and it (along with the He 176) was consigned to the Berlin Air Museum, where both were destroyed in an air raid in 1943.

THE HEINKEL He 280

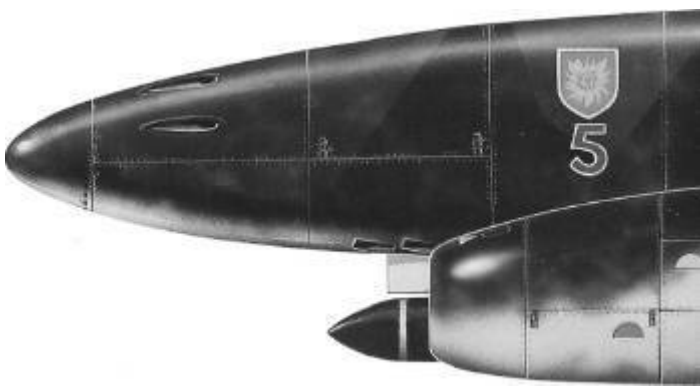
Heinkel abandoned the He 178 largely because of technical problems associated with mounting the engine within the fuselage, but did not give up hope of developing a turbojet-powered fighter. New blood in the shape of Max Mueller arrived from Jumo to pep up the jet engine development programme. He worked on the the HeS 30, which became the 109-006. The 109- prefix was employed, somewhat confusingly, for both pulse-jet and turbojet engines and also for rocket motors; the three-figure designator following was allocated chronologically, and there is no logical distinction between one manufacturer and another. Thankfully, there were few enough engine types, so one soon became familiar with the rather impersonal system.

Simultaneous with Mueller's work was that of Pabst von Ohain who developed the HeS 3 as the HeS 8 (109-001). Both engines were to be tested in an all-new airframe, the He 280. This was a twin-engined aircraft, its powerplants slung beneath the low wings in nacelles and with a high tailplane with a fin and rudder at each tip. It made its first powered flight with von Ohain's engines on 2 April 1941, and was demonstrated to the Luftwaffe and RLM three days later.

Now the reaction was different. The immediate result was that Heinkel's engine division expanded in size with the addition of his old partner Hirth's company (which made piston engines and turbo-chargers amongst other things). Mueller and his team moved to the Hirth factory at Stuttgart, and von Ohain stayed at Rostock-Marienehe to work on a further development of his engine, the 109-011, which was projected to give 1300kg (28661b) of static thrust. There was understandable rivalry between the two teams and both made considerable progress, but for some unaccountable reason, the RLM decided to order work on the 109-006 to be discontinued, even though it was already producing 900kg (19841b) of thrust. Meanwhile, development of the Oil continued at Stuttgart, but even by the end of the war, it had never run except on a test bench and just 20 had been completed. Testing of the He 280 continued with both Jumo 004 and BMW 003 engines, but when it eventually came up against the Me 262, it fared badly. There are suggestions that the decision to adopt the Me 262 was at least partly politically motivated, since, as we have noted, the relationship between the various German planemakers themselves, and with the RLM and the Luftwaffe, was a political minefield. The nine prototypes constructed were later used for testing new wing and tail designs and Heinkel later worked on other jet aircraft designs, most of them centred on the

stillborn Oil engine, but none came to fruition until the submission which became the He 162 (qv) was accepted.

THE Me 262 'SCHWALBE/STURMVOGEL



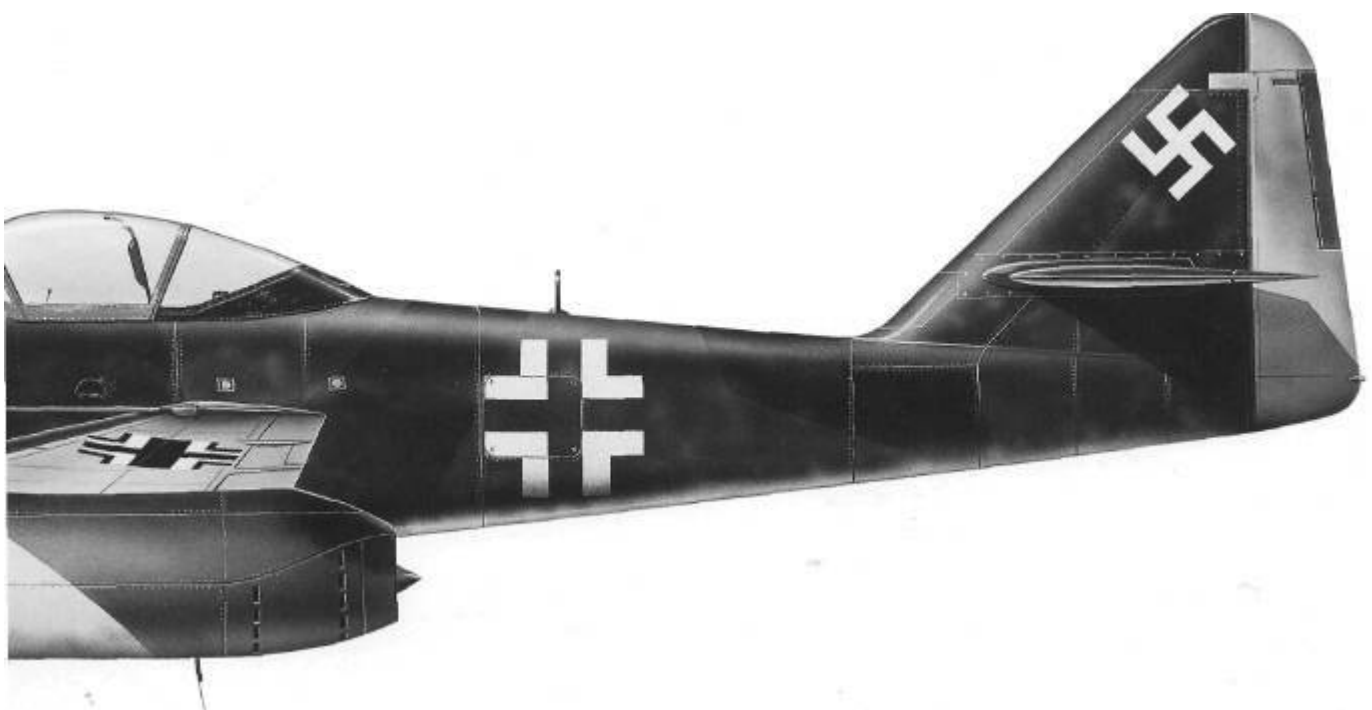
The best known of the aviation projects which actually came to fruition is the Messerschmitt Me 262, the aircraft chosen over the He 280. By modern standards, this was a fairly conventional all-metal fighter aircraft with gently swept low-set variable-chord wings, powered by twin Junkers Jumo 004B-1 turbojet engines. It became the first jet-powered aircraft to enter operational service, on 3 October 1944, and was thus a landmark in aviation history. We shall examine the development history of the Me 262 in more detail than other aircraft, both because it was so significant and because it will give us an insight into the methodology of aircraft development in the Third Reich, revealing that it was by no means a smooth process.

The Me 262 started life as a loosely defined project of the RLM, inaugurated in 1938, with Hans Mauch and Helmut Schlep working on the powerplant and Hans Antz on the airframe. Schlep, recently returned from college in the United States, had already convinced Junkers Motorenwerke (Jumo - the engine division of the forcibly nationalised planemaker) to start work on designs for axial-flow turbojets, and BMW, initially sub-contracted by Junkers, had also begun to develop a more sophisticated design of its own. In the meantime, Antz had interested Messerschmitt's chief of development, Robert Lusser, in examining the possibilities of producing an airframe to carry such a powerplant. Before the end of the year, the project had moved up a gear, and Messerschmitt

Above: A pre-production version of the Me 262 gets airborne with the help of solid-fuel rocket motors. Such 'RATO' (Rocket-Assisted Take-Off) units were widely used to assist heavily loaded aircraft into the air.

Below: In all, some 1430 Me 262s were to be produced in seven different variants. This bomber variant, the Me 262A-2a 'Sturmvogel', was operated by KG 51 out of Prague-Ruzyn in late 1944.

MESSERSCHMITT Me 262A-2a/Ul
Type: Single-seat bomber
Length: 10.61 m (34.79ft)
Span: 12.50m (41.01ft)
Max take-off weight: 6775kg (14,936lb)
Max speed: 870km/h (541 mph) at 7000m (23,000ft)
Range: 845km (525 miles)
Armament: 2 x 30mm MK 108 cannon;
1000kg (2200lb)bombload



was instructed, somewhat baldly, to begin development work on a fighter aircraft which was to have an endurance of one hour at 850km/h (530mph). Responsibility was placed in the hands of Woldemar Voigt (of whom more later), who examined both single- and twin-engined arrangements before concluding that a single centrally mounted engine layout would present more problems than it would solve. His view was coloured by the performance of the He 178. Instead Voigt suggested a design with engines in each wing root, which crystallised into Project 1065 in Messerschmitt's Augsburg design office. Detailed design drawings were produced as early as 7 June 1939, and a wooden mock-up then made. On 3 March 1940 Messerschmitt was awarded a contract to produce three airframes, designated as the Me 262, for flight testing.

It was envisioned that the aircraft's power would come from two BMW P.3302 engines, delivery of which had been promised for the end of 1939, and their non-appearance was only the first of a long series of setbacks associated with the powerplant. In fact, the prototype BMW engine, now known as the 109-003, did not run until August 1940, and then it produced only 150kg (3301b) of static thrust instead of the 600kg (13201b) promised. A year later it was still only producing 450kg (9901b), which was by no means enough to get the Me 262 into the air. It was to be mid-1943 before an 003 engine produced sufficient power to be viable, and a further year before production units became available, and in due course it was decided to reserve it for the Heinkel He 162 (see below). In addition, the BMW engine had proven too big to fit into the wing-root mount, and the design team had hurriedly modified the Me 262 to carry it in under-wing nacelles, though this, in turn, simplified main spar design. Some sources suggest that this factor, not the diameter of the BMW engines, underlay the decision to adopt nacelles rather than faired-in mountings, even at the expense of increased drag.

FIRST ALL-JET Me 262 FLIGHT

The Jumo 109-004 was always to have been a less sophisticated design, sacrificing ultimate potential for a 'fast track' into production. It, too, had its problems, however. The prototype ran in November 1940, but it was January 1942 before all the snags were ironed out, and its first flight, slung under a Messerschmitt Bf 110, took place on 15 March. The first pilot-production engines, 004As, which produced 840kg (185()lb) of static thrust, were rolled out in early summer, and were fitted to the Me 262 V3, which made

the first all-jet Me 262 flight on 18 July 1942 in the hands of Fritz Wendel. The aircraft had flown as early as 18 April 1941, but with a single 1200bhp Jumo 210G piston engine in its nose, and by that time an aircraft which was ultimately to be its closest competitor, the Heinkel He 280 (qv), had already flown on the power of two 500kg- (HOOlb-) thrust HeS 8 turbojcts. Orders for 15 Me 262s were placed, expanded to 60 by early October, by which time the second prototype had also flown, and the first Jumo 004B engines, with similar performance characteristics to the -As, were going into production.

PROPELLED BY AN ANGEL

On 22 April 1943, Adolf Galland, the operational head of the Luftwaffe, flew the aircraft himself (and returned to say it felt 'as if an angel were pushing me'), and was instrumental in convincing the RLM to switch most of Messerschmitt's production from the Bf 109 to the Me 262, the formal order for general production being issued on 5 June. On 26 June the production prototype, -V5, with a nosewheel undercarriage, took to the air. A blow fell on 17 August 1943: production of the Me 262 was just getting into full swing when the USAAF bombed the Messerschmitt factory at Regensburg, destroying much important tooling. The company's development programmes were transferred from Augsburg to Oberammergau as a result, with further attendant delays. By November, the future looked less bleak, with prototypes flying with pressurised cockpits and carrying armament (the as yet imperfect MG 108 30mm cannon) and with Junkers finally getting the 004B engine into series production, but then another quite different problem arose in the shape of direct interference from the Führer himself.

Senior Luftwaffe personnel, aware that they were losing the fight to limit the success of the RAF and USAAF bombing campaign, had begun to advocate that the production of bomber aircraft in the Third Reich should cease and that all efforts should concentrate on fighter types. Goring agreed, but Hitler recoiled at the very suggestion and would have none of it. Instead, he decided that the Me 262 would be perfect to carry a 500kg (11 OOlb) bombload to England to continue his pet campaign of harassment and nuisance raids, and he ordered the aircraft to be modified and developed for this purpose alone, even though it was hardly suitable and no adequate bombsight was available, nor was one ever produced.

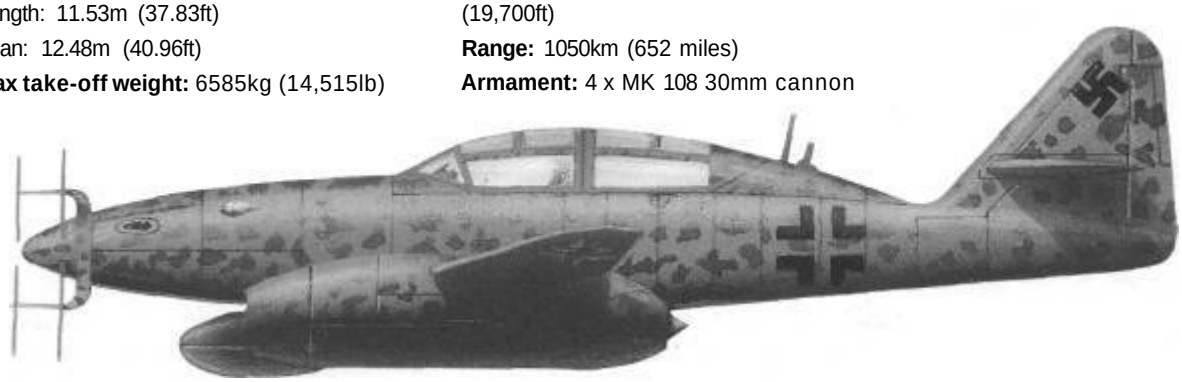
It was May 1944 before Hitler agreed to allow production of the 'Schwalbe' ('Swallow') fighter version to continue, and then only in parallel with the

Below: The two-seater Me 262B-1 was normally employed as a night-fighter, but these aircraft lacked the distinctive 'toasting-fork' antenna on the nose, which, incidentally, slowed the night-fighter down.

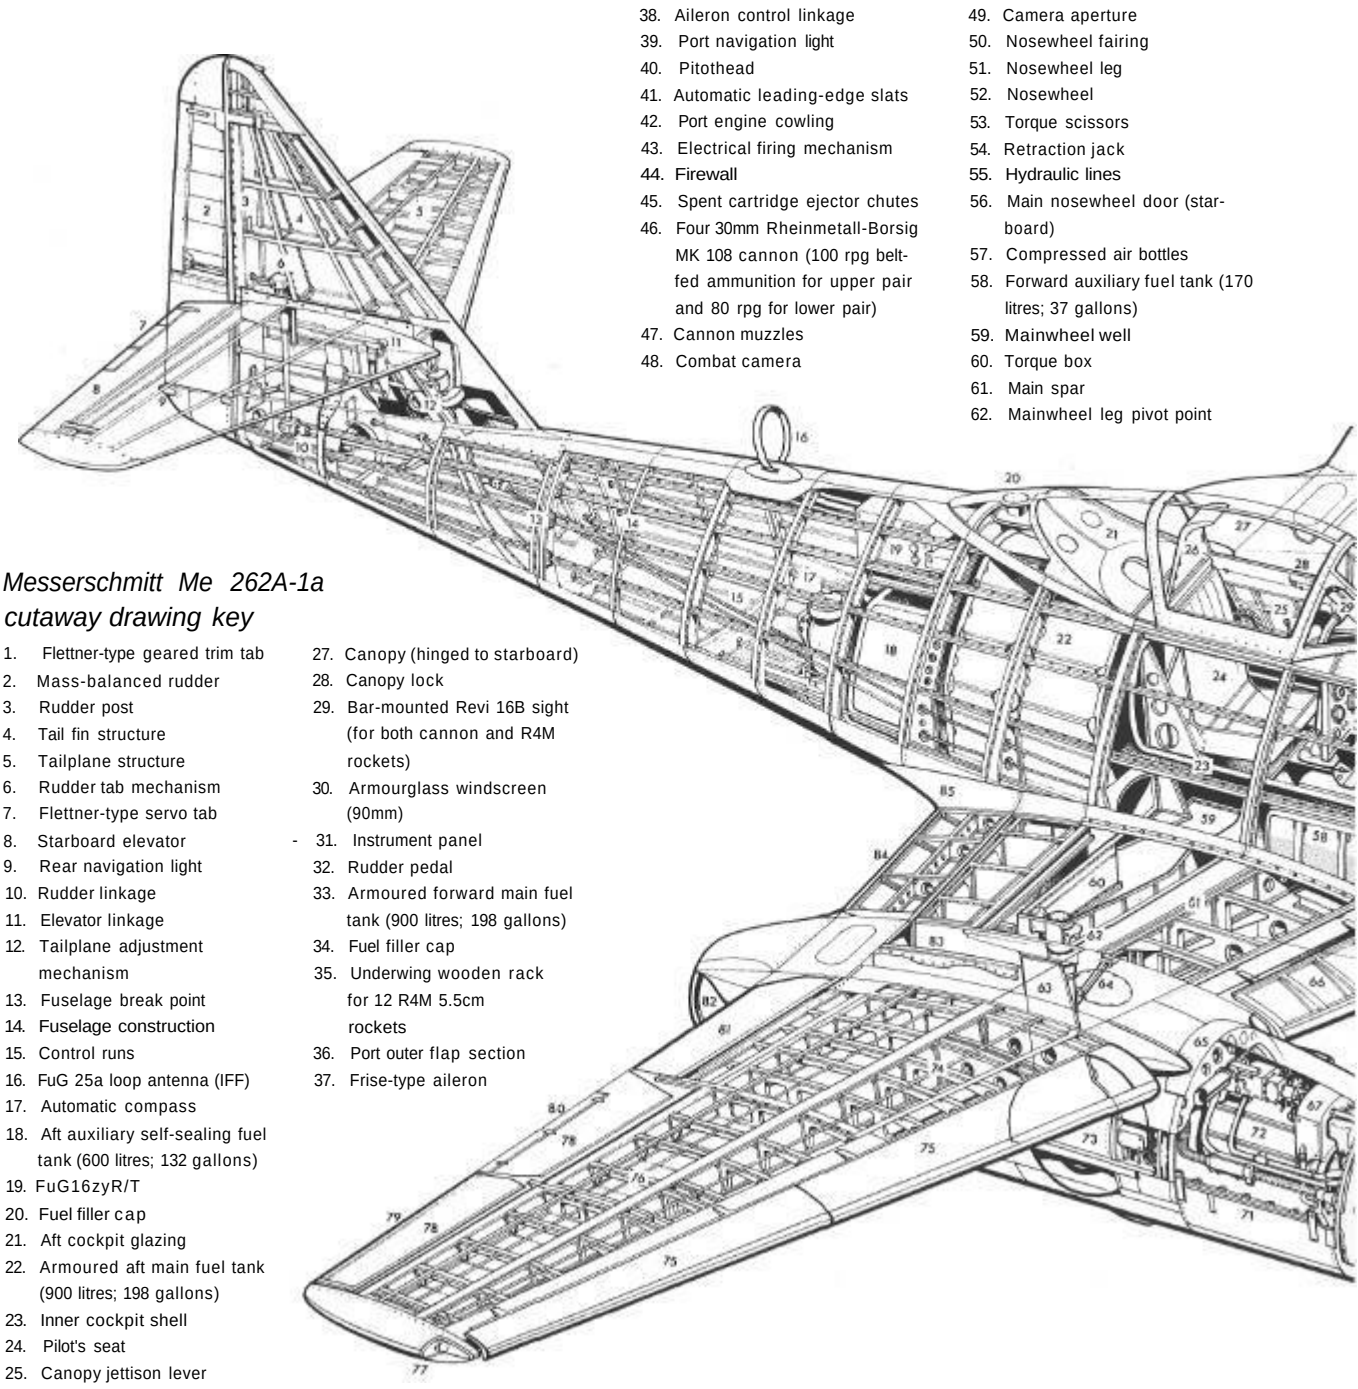
Above: This Me 262A, 'White 10' (the distinctive markings are largely obscured), was flown by Leutnant Kurt Bell of III/EJG 2 during the making of a Luftwaffe training film. Note the aircraft's pristine appearance.

'Sturmvogel' ('Storm Petrel') bomber, at the rate of one fighter to 20 bombers. Furthermore it was 4 November before he gave permission for it to go into unlimited production. By then, 13 pre-production Me 262A-Os had been completed, in addition to 12 development prototypes, and 60 more were scheduled to roll out during the following month. There was still much 'fine tuning' to be done, and versions of the aircraft, both bombers and fighters, were testing in a variety of forms, but more importantly, pilot training had begun. It was still to be five months before the Me 262 was ready to go to war, but essentially by mid-1944 the development emphasis had switched from Messerschmitt to the Luftwaffe, although the firm was still heavily involved, developing the two-seater trainer and night-fighter versions, as well as alternative forms for the stillborn *hochgeschwindigkeits* (HG - high speed) version.

In the final analysis, the Me 262 was simply too little, too late. The German jet scored its first confirmed combat victory in the hands of Leutnant Joachim Weber - his victim was a PR XVI Mosquito of No. 540 Squadron, RAF - on 8 August 1944, four days after the British Gloster 'Meteor' Mk 1 had made its combat debut (though admittedly, the latter's debut 'victory' had been over a pilotless VI (lying bomb). That bare statistic is a telling indictment, for the British had not flown their prototype jet aircraft, the E.28/39, until almost 21 months after Heinkel's He 178 had taken to the air.



Me 262 VICTORIES



Some 1430 Me 262s were to be produced, in seven main versions, but probably no more than a third of them actually saw combat (and over 100 were lost, many in accidents on landing) over a seven-month period. By the spring of 1945 they were operating under very difficult circumstances but were still downing American bombers in significant numbers, particularly when equipped with 5.5cm R4M 'Orkan' ('Hurricane') unguided rocket projectiles, despite a never-cured tendency to snake at high speed, which made aiming somewhat unpredictable. The total number of victories scored by Me 262s is uncertain, but is authoritatively put at more than 735. The highest-scoring pilot was Oberleutnant Kurt Welter, with over 20 victories, and 27 other Luftwaffe pilots became jet aces, with five or more victories each, including

Below: The Me 262B-1 night-fighters of 10/NJG 11 were assigned to the defence of Berlin. One of the unit's pilots, Feldwebel Karl-Heinz Becker, accounted for seven Allied aircraft. Note the radar array on the nose.

MESSERSCHMITT Me 262B-la/Ul

Type: Two-seat night-fighter
Length: 11.53m (37.83ft)
Span: 12.48m (40.96ft)
Max take-off weight: 6585kg (14,515lb)
Max speed: 813km/h (505mph) at 6000m (19,700ft)
Range: 1050km (652 miles)
Armament: 4 x MK 108 30mm cannon

Generalleutnant Adolf Galland, who formed and then commanded the ad hoc unit known as 'Jagdverband *T* after being implicated in the January 1945 'revolt' of Luftwaffe fighter unit leaders.

Was the Messerschmitt Me 262 worth the time and effort it took to develop, when all was said and done? The answer is a qualified 'yes', but the situation, most experts agree, would have been very different had the two major hold-ups - the late delivery of the engines and the Fuhrer's meddling - been somehow speedily dealt with. Had the Luftwaffe's fighter squadrons been able to operate it in significant numbers from, let's say, mid-1944, the outcome would probably have been very different. Tt would not have won the war for

Left: Despite its revolutionary wing form, the Me 262 was constructed along entirely conventional lines, the only limiting factor of the powerplant being the need to keep the airframe components out of the exhaust stream.

Germany, but it might well have prolonged it by some months by making inroads into the Allies' (especially the Americans') strategic bombing campaign, thus helping to maintain German manufacturing production levels. The question of whether that would have been a good or a bad thing lies outside the scope of this work.

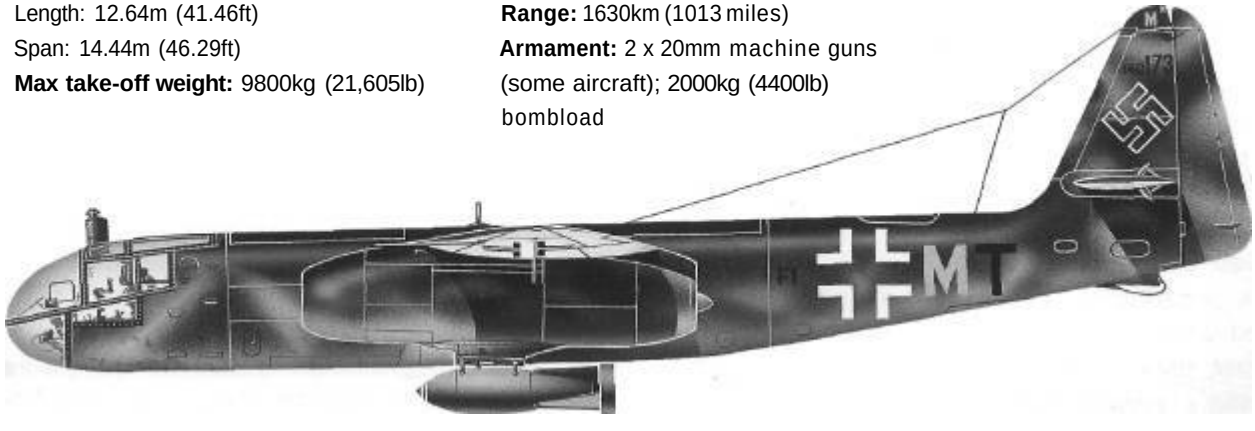
THE Ar 234 'BLITZ'

The only other jet-propelled German aircraft to see serious combat during World War II came not from one of the major manufacturers, but from a relatively minor player. Prior to the development of the Ar 234 'Blitz' ('Lightning') bomber (also known as the 'Hecht' - 'Pike'), the Arado company had only ever been involved in the production of light aircraft. Many of them, such as the Ar 196, were produced as floatplanes, designed to operate from warships, though that is not to say that its products were anything less than excellent. In 1940, the RLM issued a specification for a high-speed reconnaissance aircraft to be powered by two jet engines, either Jumo 004s or BMW 003s. Arado responded with a design - the E.370 - for a shoulder-wing monoplane with engines in under-slung nacelles, which was accepted as the Ar 234. Two prototypes were constructed over the winter of 1941-42, but it was February 1943 before the first pair of engines, the Jumo 004Bs, were delivered, and 15 June before the aircraft first flew. It was entirely conventional for the period, save in one respect: the fuselage was very slim and instead of a wheeled undercarriage, it used a take-off trolley and landed on skids. This was clearly unacceptable in an operational aircraft since it made manoeuvring on the ground next to impossible, so midway through the prototype programme, the fuselage was marginally widened beneath the wings, and main wheels and a retractable nosewheel were installed. Arado engineers also developed a rocket-powered interceptor, the E.381, which was to have been carried as a parasite beneath the fuselage of the Ar 234. Nothing came of the idea.

Most of the early Ar 234s were completed as reconnaissance aircraft, and flew many successful missions at 700km/h (435mph) at between 9000m (29,530ft) and 12,000m (41,000ft), where they were largely immune to attack, but a bomber version with either one or two seats, and able to carry 2000kg (4400lb) of bombs, was also produced. It was February 1945 before the first of these aircraft, assigned to KG 76, were operational. One was shot down by American P-47 Thunderbolts near Segelsdorf on 24 February, and fell into Allied hands. The most important missions KG 76 undertook were those aimed at the destruction of the Ludendorff Bridge over the

Rhine at Remagen between 7 and 17 March, when Ar 234s made repeated and often suicidal attacks supported by Me 262 bombers of KG 51. A night-fighter version of the Ar 234 was produced in small numbers, and operated from March 1945 with some success. Later Ar 234 variants had a variety of different powerplants, and a four-engined version using 'siamesed' nacelles was also produced in prototype. Maximum speed at medium level of the latter was over 850km/h (530mph), which was beyond the level-flight capabilities of any Allied fighter, but still by no means fast enough for absolute safety. The limiting factor on its performance was not, however, the engines: it was the design of the wing. Straight wings have a finite maximum speed, after which compression causes local airflow to exceed the speed of sound, resulting in potentially catastrophic instability. Arado's engineers discovered this the hard way, but soon designer Riidinger Kosin came up with an alternative planform: a crescent wing, starting out with its leading edge sweeping back from the wing roots, the curve returning so that the wingtip sections were at right-angles to the body axis (a form which was later used in the British Handley-Page 'Victor' bomber). Wind tunnel tests showed this to be much more effective, but the war ended before a prototype could be constructed. And even while the Ar 234 was in development, engineers elsewhere were looking at much more advanced concepts.

Left: The Arado Ar 234 - this is the production-B variant - with its long, slim fuselage and wings, was the only real alternative to the Me 262, but was nowhere near as successful in operational terms.



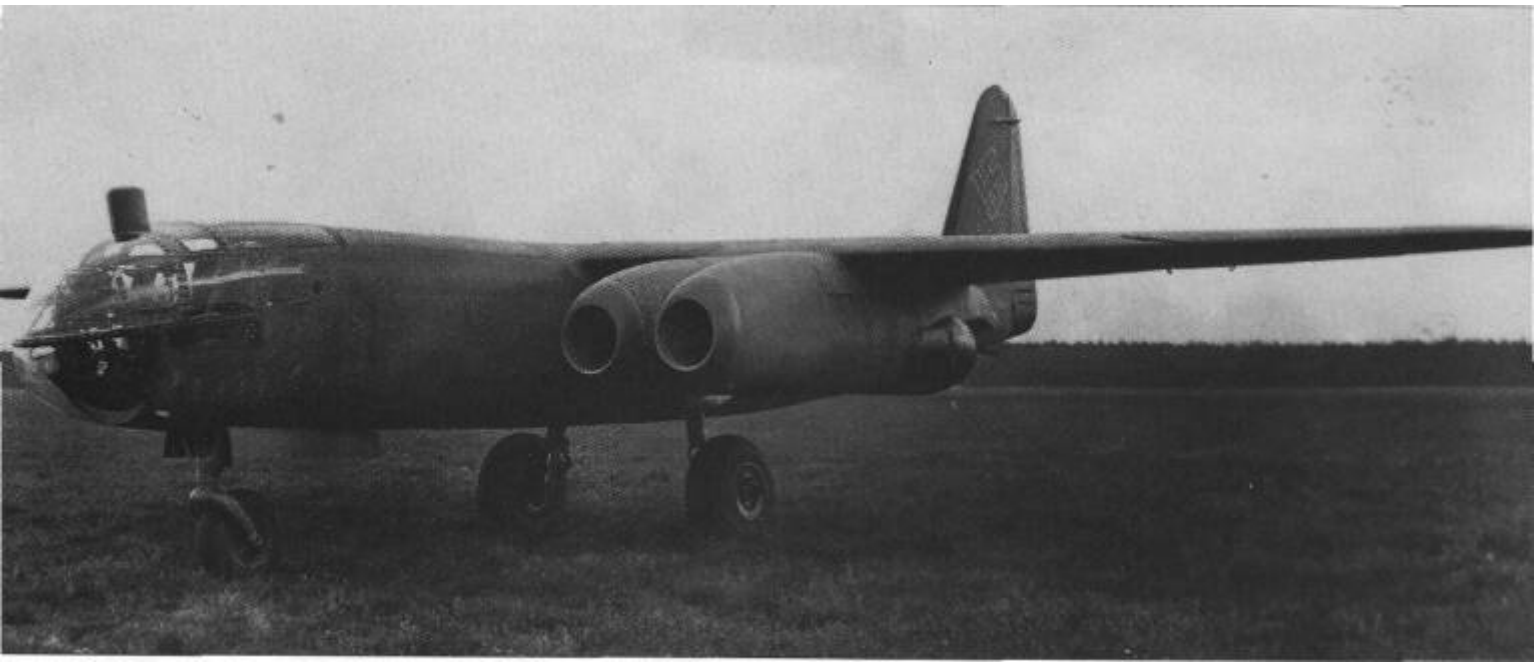
THE JUNKERS Ju 287

There is no space here to go into the complex aerodynamics of wing form in any depth, save to say that as early as the mid-1930s, it had been accepted - following the work of the *Deutsches Versuchsanstalt für Luftfahrt* (DVL - the German Aviation Development Establishment) - that straight wings had a finite speed limit thanks to the rise in drag caused by air compressing at their leading edge. As we have seen, this was the main factor in limiting the speed of the Ar 234. An interim solution was to sweep the leading edge backwards but keep the trailing edge straight, thus producing a variable-chord wing, and this was adopted with piston- and jet-engined aircraft alike. The Me 262 had a wing essentially of this form (although it did have a small sweep to its trailing edge outboard of the engines) as did the altogether more pedestrian Douglas C-47/DC-3 transport. At this time, no aircraft had flown with a wing that had steeply swept leading and trailing edges, even though it was known from wind tunnel testing that such a wing would benefit not only from decreased compressibility but also from a reduction in the ratio between its thickness and its chord (the distance between the leading and trailing edges).

In June 1943, at about the time when the Arado Ar 234 first flew, a development team at Junkers, under Dr Hans Wocke, produced a design for an advanced bomber using a double-swept wing form, but with one

Below: A total of 210 examples of the Arado Ar 234B were produced; just one remains, on display in the Smithsonian Institution's National Air and Space Museum in Washington D.C.

ARADO Ar 234B-2
Type: Single-seat tactical light bomber
Length: 12.64m (41.46ft)
Span: 14.44m (46.29ft)
Max take-off weight: 9800kg (21,605lb)
Max speed: 742km/h (461 mph) at 6000m (19,700ft)
Range: 1630km (1013 miles)
Armament: 2 x 20mm machine guns (some aircraft); 2000kg (4400lb) bombload

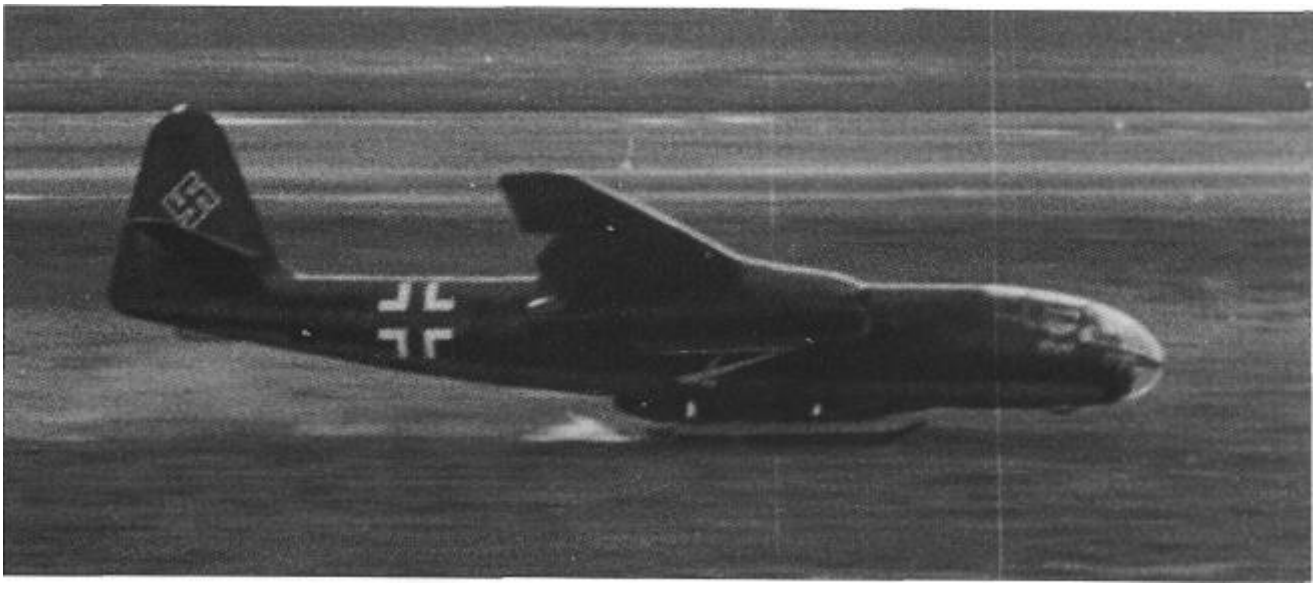


Above: Surrounded by Junkers Ju 88Gs, this Ar 234B was captured by US forces at Manching in Bavaria in April 1945. The state of its cockpit bears out the assertion that the full glazing offered no protection against flying debris.

further innovation. The wing was to be swept not back, but forward, conferring all the advantages outlined above but also resulting in greater stability, except under certain well-defined circumstances. Wocke's project was championed by Siegfried Kneymeyer who was already a leading advocate of the abandonment of all piston-engined aircraft manufacture (save for the Junkers Ju 88) in the Reich.

A CHANGE AT THE TOP

In November 1943, Kneymeyer took over from Ernst Udet as Chief of Technical Air Armament at the RLM, and thus had considerable influence. The following March, prototype development of Wocke's new aircraft, designated the Ju 287, was ordered, and construction of a flying testbed began, using the fuselage of a Heinkel He 117. It was to be powered by



Above: The Ar 234B was found to be underpowered, and the obvious solution was to double up on the powerplants to produce the Ar 234C. Both reconnaissance and night-fighter versions were built alongside the bomber variant.

four 004B engines of 900kg (19841b) thrust each, two suspended from the wings, the other two mounted on the fuselage sides, just below and aft of the cockpit. It would have two Walter 501 rockets to assist take-off.

The prototype aircraft made its maiden flight on 16 August and proved to be predictable in flight, though wing flexing was more of a problem than had been anticipated and when it yawed the trailing wing tended to lift and create a rolling moment. On the whole, however, results were positive, and work went ahead on the construction of a second prototype with a purpose-built fuselage, to be powered by six BMW 003 turbojets, four wing-mounted and two mounted on the fuselage. In July, however, a new *Führerdirectiv* instigated the *Reichsverteidigungs* programme, which ordered all development work not concerned with

Below: An early Ar 234 screeches down the runway as it lands on its skids. Such a landing arrangement was out of the question for operational purposes, so the fuselage was widened and main wheels and a nosewheel fitted.

Above: The Junkers Ju 287, with its forward-swept wings and nose-mounted engines, was one of the more radical aircraft of World War II. This is the sole example built, the -V1 prototype. It was later captured by Soviet troops.

fighters and interceptors to be stopped, and accordingly no further progress was made with the Ju 287 V2, though the Ju 287 VI continued to fly occasional tests. Tn March 1945, the project was suddenly revived and the Ju 287 ordered into production. Construction of the Ju 287 V2 recommenced, and plans were made for a -V3, with a pressurised three-man cockpit, 4000kg (88001b) bombload, and remotely controlled guns, to be powered by four Heinkel Oil engines of 1300kg (28661b) thrust. Two Jumo 012 engines of 2780kg (61201b) thrust or two BMW 018 engines of 3400kg (74801b) thrust (neither of which had actually been completed) were posited as an alternative. Both the Ju 287 VI and the still-incomplete -V2 fell into Soviet hands in May 1945; the former was flown as found, while the latter was completed with swept-back wings and is said to have achieved speeds of around 1000km/h (620mph). Hans Wocke later produced a civil aircraft, the HFB 320 'Hansa', with a swept-forward wing.

THE He 162 'SPATZ'/'SALAMANDER'

By 1944, with the situation looking increasingly black for Germany, there was a vocal school of thought which advocated the development of almost disposable weapons, to be used, in the last resort, by barely trained personnel. Rather more practical was a design which Heinkel produced in response to an RLM requirement for the *Volksjäger* (People's Fighter), a cheap and expendable fighter aircraft weighing less than 2000kg (44001b), to be powered by a single BMW 003 jet engine, with an endurance of 30 minutes and an armament of two 30mm cannon. This craft was to be flown by volunteers from the Hitlerjugend. Design studies were 'invited' from Arado,

Blohm & Voss, Focke-Wulf, Junkers, Heinkel and Messerschmitt on 8 September 1944, to be considered a week later; the prototype aircraft was to fly before the year's end.

Only Messerschmitt declined the invitation. The Blohm & Voss design (P.211) was considered the best, but for some reason, the Heinkel submission (P. 1073) was chosen, placing the engine in a nacelle mounted atop the fuselage; the engine discharged its exhaust between twin rudders, and by that means avoided all the problems of intake and exhaust ducting. By 23 September, a mock-up had been built and work began on the prototype the following day (six days before an official order was delivered). By 29 October a set of final drawings had been produced. Almost amazingly, the prototype flew for the first time on 6 December - three weeks before the deadline - but on a second flight on 10 December it crashed during a high-speed low-level pass, killing its pilot, Flugkapitän Peters, when the starboard wing disintegrated. It was later discovered that a fault in the formulation of the phenolic resin used to bond the plywood from which the wings were fabricated had caused the failure.

By the year's end, a variety of faults in stability had shown up in the second prototype, though these were all cured by mid-January (even if only to the point where an experienced pilot could fly the aircraft; it was still very much of a handful for a novice, though the same was true of the Me 262). By the end of the month, weapons' testing had shown that it would be necessary to replace the 30mm MK 108 with the 20mm MK 151. With that, the Heinkel 162 'Spatz' ('Sparrow', as it was called within the firm; it later became known semi-officially as the 'Salamander') went into production at most of the existing Junkers and Heinkel factories (where the duralumin semi-monocoque fuselage was constructed) and in small furniture factories, where the wings and tail assemblies were produced. Final assembly took place at the Heinkel works at Rostock-Marienehe, at the Junkers works at Bernburg, and at the vast underground factory of 'Mittelwerke GmbH' near Nordhausen. Once again, it was too late, of course, though some 275 aircraft were actually completed and around 800 more were ready for assembly. The *Volksjäger* rarely saw combat, though it was claimed that

Above: The Heinkel He 162, the 'People's Fighter', was to have been operated by barely trained volunteers from the ranks of the Hitler Youth, but it proved very difficult to fly.

Below: The He 162A was straight winged, but designs were drawn up for a version with swept-back wings and another with forward-swept wings. Neither was built.

HEINKEL He 162

Type: Single-seat interceptor fighter
Length: 9.05m (29.71ft)
Span: 7.20m (23.625ft)
Max take-off weight: 2700kg (5952lb)

Max speed: 835km/h (519mph) at 6000m (19,700ft)
Range: 1000km (620 miles)
Armament: 2 x 30mm MK 108 or
2 x 20mm MG 151 cannon

one aircraft - in the hands of Leutnant Rudolf Schmitt of 1/JG 1 based at Leek near the Danish border in Schleswig-Holstein - did shoot down a low-flying RAF Typhoon on 4 May 1945 (the claim was not allowed; the credit went to a nearby flak unit instead) and one was shot down, killing the pilot. Nine other members of JG 1 died and five were injured in flying accidents during conversion from the Fw 190; the He 162 was still very unforgiving. Post-war evaluation by Allied air forces indicated that with a little more development work, it would have been entirely viable, however, and would almost certainly have made a considerable impact, if only it had been available 12 - or even 6 - months earlier.

THE EMERGENCY FIGHTER PROGRAMME

Expedients like the *Volksjäger* were not the only option under consideration in mid-1944. It was becoming increasingly obvious to the Luftwaffe's

Below: He 162 components were manufactured all over Germany and sent to three central locations for assembly. In all, some 275 aircraft were completed, and components for around 800 more were on hand at the war's end.

High Command that it had effectively missed the boat, and that the jet and rocket-powered fighters which were about to enter service would soon be ineffective against a new generation of Allied aircraft such as the B-29 Superfortress with its 11,000m (36000ft) plus ceiling. Just before the end of the year, Kneymeyer issued a specification for a new generation fighter to all the principal producers, with the stipulation that the aircraft should be powered by the HeS Oil engine. Roughly, the performance parameters were a top speed in-level flight of around 1000km/h (620mph) at 7000m (23,00()ft) and a ceiling of 14,000m (45,900ft); it was to be armed with fourMK 108 30mm cannon. By February 1945, three proposals had been received from Messerschmitt, two from Focke-Wulf and one each from Blohm & Voss, Heinkel and Junkers. On the last day of the month, a selection committee sat and chose Focke-Wulf's Project T to go into development as the Ta 183.

THE FOCKE-WULF Ta 183

The two projects from Kurt Tank's design department were the work of a man who has been described as the most important aerodynamicist in Germany at the time, Hans Multhopp. They were essentially similar in character: a fuselage which was no more than a shroud for the single engine, its intake duct and exhaust tube, with the pressurised cockpit and weaponry sited above it, which was to be supported on stubby swept-back shoulder wings (constant-chord in Project I, variable-chord in Project II), with a tail unit cantilevered out behind. The tail unit itself was the factor which differentiated the designs. That of Project I was entirely innovatory: a T-tail, with the horizontal control surfaces located at its upper end; that of Project II was conventional, with the tailplane located low down. Otherwise, considerable attention was paid to ease of manufacture with the sort of resources which could be expected to be available, and the result of that was a projection that each aircraft would require a total of 2500 man-hours (the Me 262 probably never got far below 10,000). No single Ta 183 was ever built, Focke-Wulf's factories having been overrun by late April, but it is widely held that the Soviet Army took a complete set of plans, and the design team of Mikoyan and Gurevich is said to have used them as the basis for the MiG-15, powered by a Russian copy of the British Rolls-Royce 'Nene' turbojet engine. SAAB in Sweden later produced a very similar-looking aircraft as its SAAB-29, this time powered by a copy of the de Havilland 'Ghost'.

THE MESSERSCHMITT P. 1101

Another of the aircraft entered for the Emergency Fighter Competition was also to form the basis of a type built elsewhere, but this time rather more openly. The Messerschmitt company had in fact anticipated the need for a replacement for the Me 262 (who was in a better position to know that aircraft's limitations?) and construction of a prototype to replace it, designed by Woldemar Voigt, had begun in July 1944 as the P. 1101. This was in one particular a remarkable aircraft, for it was constructed chiefly to determine the best angle of wing sweep; its variable-chord wings could be reset (on the ground, not in flight) to any angle between 35 and 45 degrees. Otherwise, the aircraft was conventional in the new mould, with a single engine located deep within the fuselage and exhausting below the extension boom which supported the tail assembly.

The prototype was about 80 per cent complete when it was discovered by the Americans on their arrival in Oberammergau, and it was put on display in the open along with other 'interesting' developments from the Messerschmitt studio. It was still there, deteriorating rapidly, when it was spotted by Robert Woods, Chief Designer at Bell Aircraft, who contrived to have it sent it to the United States, where it was eventually restored and completed, with the help of Voigt himself, as a non-flying mock-up. It formed the basis for the first ever variablc-geometry-winged aircraft, the Bell X-5, the sweep angle of which could be changed in flight to one of three pre-sets: 20, 40 and 60 degrees. This aircraft made its first flight on 20 June 1951, the geometry of the wing being varied in flight for the first time on 15 July.

THE MESSERSCHMITT P. 1110 AND P. 1111

The other two submissions Messerschmitt made were less well developed but somewhat more radical. The P. 11 10 did away with the nose air intake, locating the engine much further back in the airframe, with the duct openings on the fuselage shoulders, just forward of the trailing edges of the constant-chord swept wings. The P. 1 1 1 1 was more adventurous: an all-wing design of near-delta planform with a heavily swept tail fin and rudder, the air intakes of which were located in the forward part of the wing roots. A proposal submitted too late for the competition was a variant of this design, with a wing of narrower chord and a butterfly tail. Under ideal circumstances, all three designs would probably have been built in prototype form and flown against each other, but as it

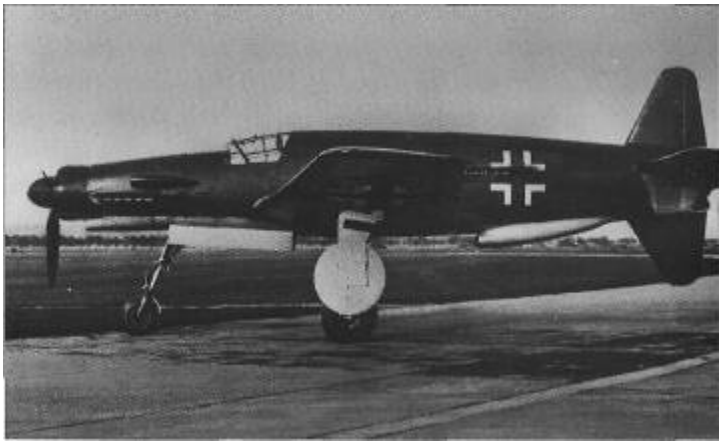
DORNIER Do 335

Type: Single-seat fighter-bomber
Length: 13.85m (45.44ft)
Span: 13.80m (45.28ft)
Take-offweight: 9600kg (21,164lb)

Max speed: 765km/h (475mph) at 6500m (21,325ft)
Range: 2060km (1280 miles}
Armament: 1 x 30mm MK 103 cannon; 2 x 15mm MG 151 machine guns

was, none ever progressed beyond a partially completed wooden mock-up.

Above: Besides its 30mm forward-firing cannon and 15mm machine guns, the Do 335 could carry a 1000kg (2200lb) bombload, half in its weapons bay and half on hardpoints situated beneath its wings.



THE OTHER CONTENDERS

The other submissions to the Emergency Fighter Competition were all tailless designs too, which goes to show, perhaps, how far that concept had been accepted in Germany by the end of 1944. Of these designs, Blohm & Voss's P. 212 was perhaps the most radical, with twin stubby fins and rudders at the wingtips, supporting a winglet - half a tailplane,in fact - the rear surfaces of which formed elevators and also acted as additional ailerons. Like all Blohm & Voss's late wartime designs, the P. 212 was the work of the Director of Development, Dr Richard Vogt, who is credited with something like 200 different ideas for new aircraft, virtually none of which even made it to prototype. The design Heinkel submitted as P. 1078C was for a more straightforward flying wing. The wing itself was to have had considerable anhedral, with the tips turned down through 40 degrees over their last 5()cm (20in) or so.

The Junkers P. 128 had a more conventional wing planform, wider but with a narrower aspect-ratio and set at shoulder height, although it had its engine intake ducts located under the wing at about halfway through their chord length. It had fin lets with rudders, located about halfway between wing root and wingtip, which protruded both above and below the wing surface. All this was the work of Heinrich Hertel, a comparative newcomer to Junkers who, until 1939, had worked with Heinkel on the He 176 and the He 178. He left Heinkel largely, we are told, because he had little faith in rocket power, so it was somewhat ironic that he was given the job of re-designing the Me 163 'Komet' (qv) to produce the Ju 248.

Cursory though this analysis has been, we have touched upon all the major German aircraft manufacturers save two: Dornier and Henschel. Claudius Dornier was, if anything, more conservative than even Tank or Hugo Junkers, and would have nothing to do with jet propulsion. His main contribution to aviation innovation lay in his development of a twin-engined fighter-bomber with its powerplants in a single axis:

Below: The Dornier Do 335 'Pfeil' was potentially the fastest piston-engined aircraft ever built, with one 1800bhp Daimler-Benz DB 603 engine in the nose and another in the tail.

Above: Total production of the 'Pfeil' ('Arrow'} remained small, butthat did not prevent the German Air Ministry from ordering prototypes in configurations to satisfy a variety of roles.

one in the nose, driving a tractor propeller; the other in the tail, driving a pusher. The Do 335 'Pfeil' ('Arrow', known unofficially as the 'Ameisenbär' - 'Anteater') was potentially the fastest piston-engined aircraft ever built, yet still exhibited most of the manoeuvrability of a single-engined fighter. It showed no bad manners when flying on only one engine, and could even take off with one inoperative. The only drawback to the arrangement was that it required special measures to abandon the aircraft in an emergency. The rear propeller and upper tail fin were jettisoned, then the canopy was blown off before the pilot could attempt to bale out (though at least one example was fitted with an ejection seat, the first in operational service). Initially, there was considerable resistance to its development from the RLM for the somewhat inconclusive reason that Dornier built not fighters but bombers, and the company had to undertake to build an intruder version before permission to continue with the project was forthcoming. The first prototype made its maiden flight in September 1943, powered by two ISOOhp DB 603 engines. By the end of the war, a version with 2100hp engines was flying. Several proposals were in process of consideration at the war's end, including swapping the rear engine for an HeS 011 turbojet and linking two aircraft together by means of a short central wing section, like the Heinkel He 111Z 'Zwilling' (Twin'; see Chapter Three). Henschel's most important work was to be done in the Held of guided weapons, though the company did propose a turbojet-powered dive-bomber,

Above: Despite its appearance, the Heinkel He 177 was actually a four-engined bomber - each nacelle housed a pair of Daimler-Benz DB 601 engines, each producing 1000bhp, linked to a single propeller.

the Hs 132, which was very well received by RLM. It was somewhat similar in form to the He 162, with a single turbojet mounted in a nacelle above the fuselage and a similar tail assembly (the similarities were not accidental), with a narrow-diameter cigar-shaped fuselage just big enough to accept a pilot in the prone position. The company also worked on a contender for the Emergency Fighter Competition, the Hs 135, with a compound delta wing like that later incorporated into the SAAB 'Draken'.

THE GERMAN HEAVY BOMBERS

Of course, jet and rocket engines powered only a small minority of the new aircraft produced in Germany during World War II. Most of them had 'conventional' piston engines, but the development of these aircraft, too, was far from smooth. During the first three years of the war, at least, German aero-engine manufacturers failed to come up with really powerful piston engines and that caused airframe designers to adopt some quite novel solutions to the problem of attaining high performance levels, both in fighter aircraft and in the elusive heavy/strategic bomber development programme.

Even though the Luftwaffe was a tactical, close-support air force, there was a programme aimed at developing a strategic bomber during the early years of the Third Reich. This resulted in the development of aircraft such as the Junkers Ju 89/Ju 90 and the stillborn Dornier Do 19, but it died with the Luftwaffe Chief of Staff, General Wever, in a plane crash on 3 June 1936, and was not resurrected until halfway through World War II. Even at that relatively late date, there was no suitable powerplant available for aircraft capable of carrying a 2000kg (44001b) bombload to a target 1600km (1000 miles) away at a speed of 500km/h (310mph), and the solution adopted was to couple two engines together to turn a single propeller. The choice fell on the lOOObhp DB 601, linked to form the DB 606 (and later variants had more power, culminating in the DB 613, which had 3600hp available for take-off, with water injection and emergency boost). It was a far from satisfactory solution, and for a long time, the 'siamesed' engines tended to overheat and first vaporise and then ignite petrol in adjacent fuel tanks, with disastrous results.

Both the most important heavy bomber projects - the Heinkel He 177 'Greif ('Griffon') and the Junkers Ju 288C - had pairs of siamesed engines as their powerplant. They were designed to carry both conventional bombloads in internal bays and external racks but also guided glider bombs such as the 'Fritz-X' or the Henschel Hs 293 (see Chapter Seven); odd

suggestions for the Ju 288C included some other, more outlandish features, such as fitting it with the Düsenkanone 280 or the Gerät 104 'Munchhausen', single-shot guns of 28cm and 35.5cm calibre respectively (see Chapter Six). The Ju 388, which had even better performance, was planned as both a heavy bomber and a bomber destroyer, using Hs 298 and Ruhrstahl X-4 guided air-to-air missiles, and was also to have been employed in towing the Me 328 pulse-jet-boosted glider fighter to operational altitude. The only one built in significant numbers was the He 177, over 1000 of which were produced. One was modified to carry the German atomic bomb and many were fitted with forward-firing 5cm and 7.5cm anti-tank guns to be deployed on the Eastern Front. However, it was never entirely successful, even after five years of development. The Ju 288 did not get past the prototype stage. Some 65 Ju 388s of all types were built.

A high-altitude reconnaissance version of the He 177 was developed, powered by four (separate) DB 610 engines of 1750hp and with a new high aspect-ratio wing and a new twin fin tail. Known as the He 274, the prototype was built in Paris at the old Farman works, which were overrun in July 1944 before it could be completed. It was finished by the French and flown from December 1945. An improved version of the bomber, also with four separate engines and a twin fin tail, was built as the He 277, but only eight were completed before the Emergency Fighter Programme was put into effect on 3 July 1944.

Above: Like so many German aircraft projects, the He 177 was a case of 'too little, too late'. By the time it was ready to go into production, the Luftwaffe had little chance of operating a strategic bomber with any degree of success.

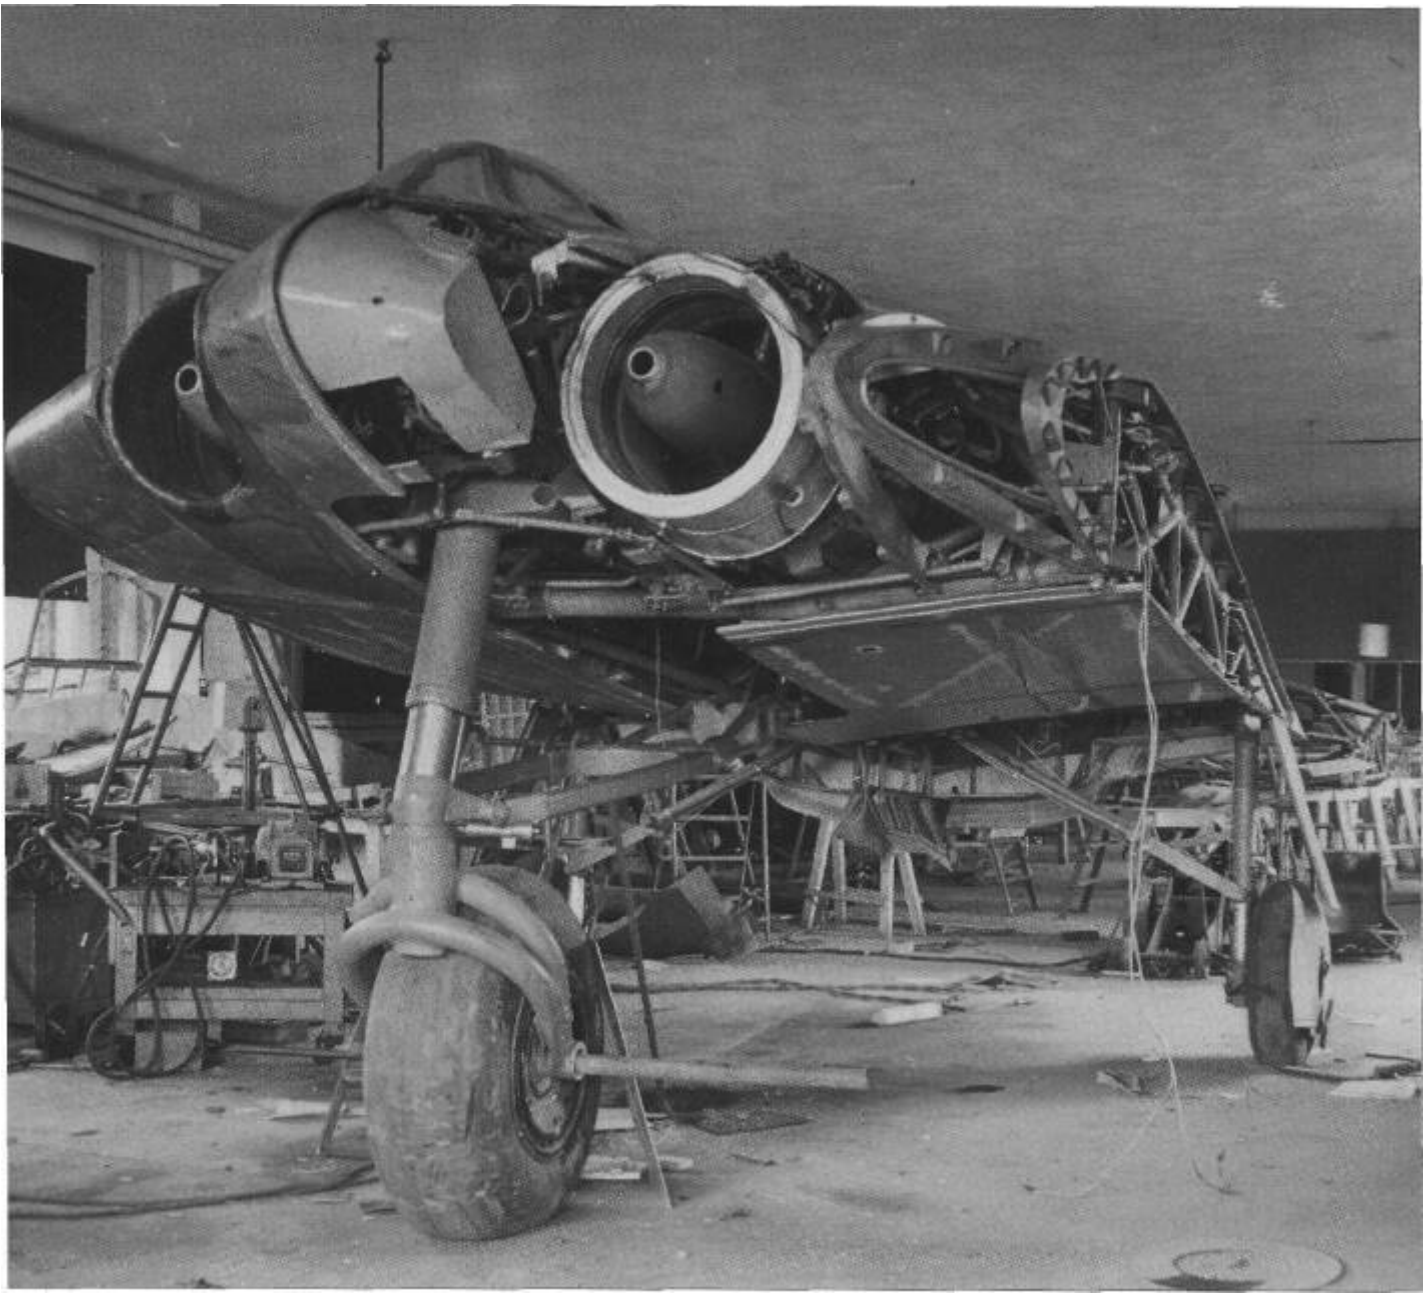
THE 'AMERIKABOMBER'

Although they were developed in considerable secrecy, these aircraft do not really meet our criteria for secret weapons, though some 'conventional' piston-

Below: The sole example of the Me 264, the original 'Amerikabomber', first flew in December 1942. Such close attention was paid to its aerodynamic properties that the joints in the wings and fuselage were filled with putty.

engined bombers do. The Luftwaffe, we may recall, was intended as a tactical, rather than a strategic, air force, unlike the USAAF and the RAF, and it never operated really large, long-range bomber aircraft, like the American B-17 Flying Fortress or B-24 Liberator, or the British Lancaster, in any substantial numbers. It had aircraft, like the Focke-Wulf FW 200 'Condor' and the Junkers Ju 290 (though the former was designed as a civilian airliner and the latter was a hasty transformation of another), which were capable of flying very long distances, but these were intended primarily for ultra-long-range maritime reconnaissance, and while they did carry bombs (and variants of both carried glider bombs), they were unsuitable for use in combat conditions. Thus, when the USA declared war on Germany in December 1941, the Luftwaffe found itself without the means of attacking its new-found enemy, and the RLM immediately issued a specification for a suitable aircraft.

Three companies responded: Focke-Wulf with the Ta 400; Messerschmitt with the Me 264; and Junkers with the Ju 390. The Ta 400 was never built; the latter, which was little more than a Ju 290 stretched in wings and fuselage with two more engines, was reasonably straightforward, and the first prototype flew in August 1943. The second protype had a still longer fuselage and carried FuG 200 Hohentweil search radar and five 20mm cannon. On a test flight from Mont de Marsan on the Atlantic coast of France, near Bordeaux, it once approached to within 20km (12.4 miles) of New York before returning safely to base, thus validating the operational concept. A third prototype, this time a version able to carry 1800kg (39701b) of bombs, was begun but never completed.

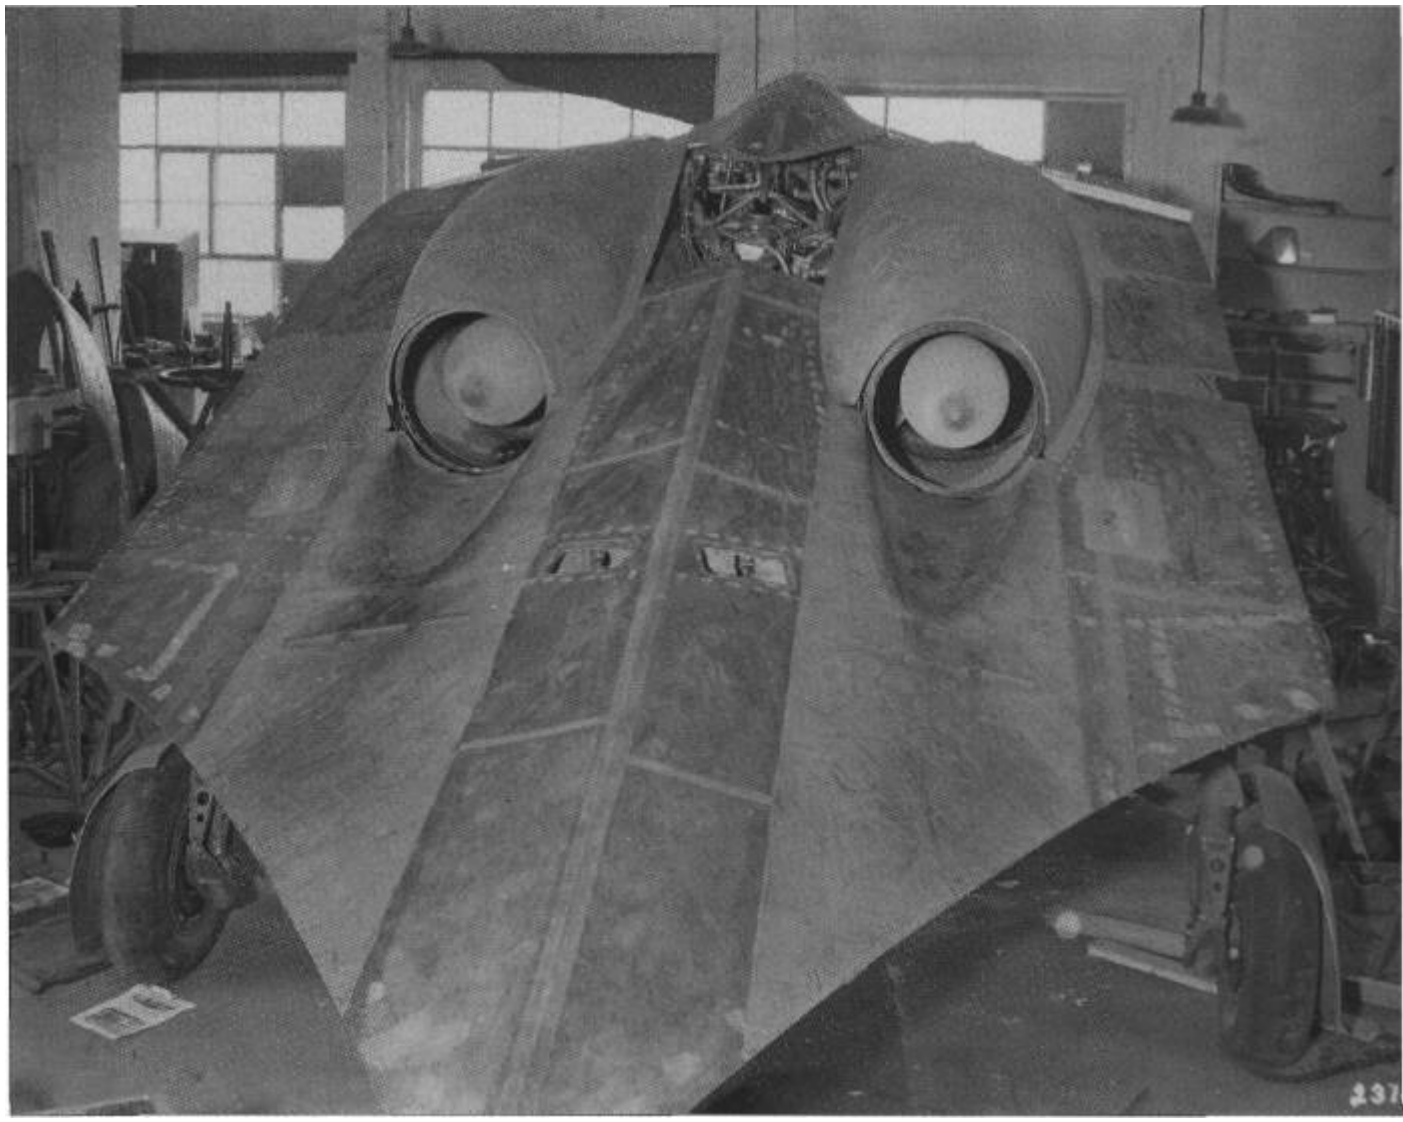


In fact, certain individuals at the RLM had begun to contemplate the possibility of bombing New York long before the United States entered the war, and Willy Messerschmitt for one had begun to think about a design for a suitable aircraft. His company was thus well placed to satisfy the requirement when it was issued in December 1941, and the prototype Me 264 made its first flight just 12 months later. With enough fuel to reach New York and return safely (a flight of anything up to 30 hours!), it could carry 3000kg (66001b) of bombs, and still had enough capacity to carry 1000kg (22001b) of armour plating. It had two complete three-man crews with a sleeping area and galley, and an elaborate defensive armament of four 13mm machine guns and two 20mm cannon. Under overload conditions, the aircraft could be fitted with up to six solid fuel rockets to assist it to take off. A bewildering array of variants and variations were suggested, including one to tow an Me 328 glider fighter for protection, and another which would have been the flying testbed for a steam turbine powerplant. Two prototypes were begun; the first was destroyed in an air raid just as it was about to begin ground tests, but the second was completed and flew, being allocated to Transportstaffel 5, which operated other large aircraft types in the transport role. A version with greater wingspan and six engines was contemplated, but never produced. Thus the first round of the 'Amerikabomber' contest made no more than a token impact, but there was to be a second, as we shall see.

THE '3x1000' BOMBERS

Focke-Wulf, which produced the best German piston-engined single-seater fighter-bomber of the war, the Fw 190, had a genius in its Technical Director, Kurt Tank, but a very conservative one. As a result, the company was a latecomer to jet propulsion; too late, indeed, to see any Focke-Wulf jet fly in other than prototype form. One of those jets - the Fw Ta 183 (qv) - was to prove to be very influential indeed to post-war development. In 1943, however, the company did produce a series of designs to an in-house requirement known as '3x1000' for an aircraft to deliver a 1000kg (22001b) bombload to a target 1000km (620 miles) away at a speed of 1000km/h (620mph). The first two designs had swept wings, one of variable chord and one of fixed chord, and a conventional tail assembly, but the third, which was much more radical in nature, was for a tailless 'flying wing', and shows very clearly the influence of Alexander Lippisch, who acted as a consultant to Tank from time to time. None of the designs was ever realised. Messerschmitt proposed a design to meet the same requirement, the P. 1107, which had moderately swept-back wings and a butterfly tail. Two basically similar designs were projected, the second of them with much greater range, but neither was realised.

THE HORTEN BROTHERS



The second of those two aircraft, the P. 1107B, would probably never have had trans-Atlantic range, but during the plan's currency the prospect of bombing the United States - which was now heavily involved in the war against Germany, on the ground in Italy and in the air from bases in the UK - reared up again. Once again, design proposals for an appropriate aircraft were solicited; this time a very different profile emerged, and one which shows just how far aerody-

Above: The first prototype of the Horten Ho IX was completed as a glider, but the second was fitted with twin Jumo 004B engines and logged speeds in excess of 800krn/h (SOOmph). The Ho IX became the Gotha Go 229.

namics had progressed in Germany. The three main contenders were all of delta wing planform, which was clearly emerging as the shape of things to come, either with or without vertical tail surfaces. Alexander Lippisch was by no means alone in advocating it: the Horten brothers, Walter and Reimar, were just as committed and had been producing flying examples of delta wing aircraft, both gliders and powered aircraft, since the early 1930s.

The Mortens' first glider had been a wide delta, with its leading edge swept back at 24 degrees and its trailing edge straight, but the Ho II had its trailing edges swept back, too. Four examples of the latter were built as gliders, and then one was fitted with a 6()hp Hirth motor driving a pusher propeller. Thanks to Walter Morten's friendship with Ernst Udet, the Luftwaffe procurement chief, this was put through a quasi-official trial at the hands of one of the best-respected test pilots of the day, Hanna Reitsch. She reported that its handling characteristics were favourable, that it was not vulnerable to spin or stall,

Above: Gotha engineers had misgivings about the ultimate stability of the Go 229, and planned to halt the programme. They were overtaken by events, however, and produced only one prototype, with four more under construction.

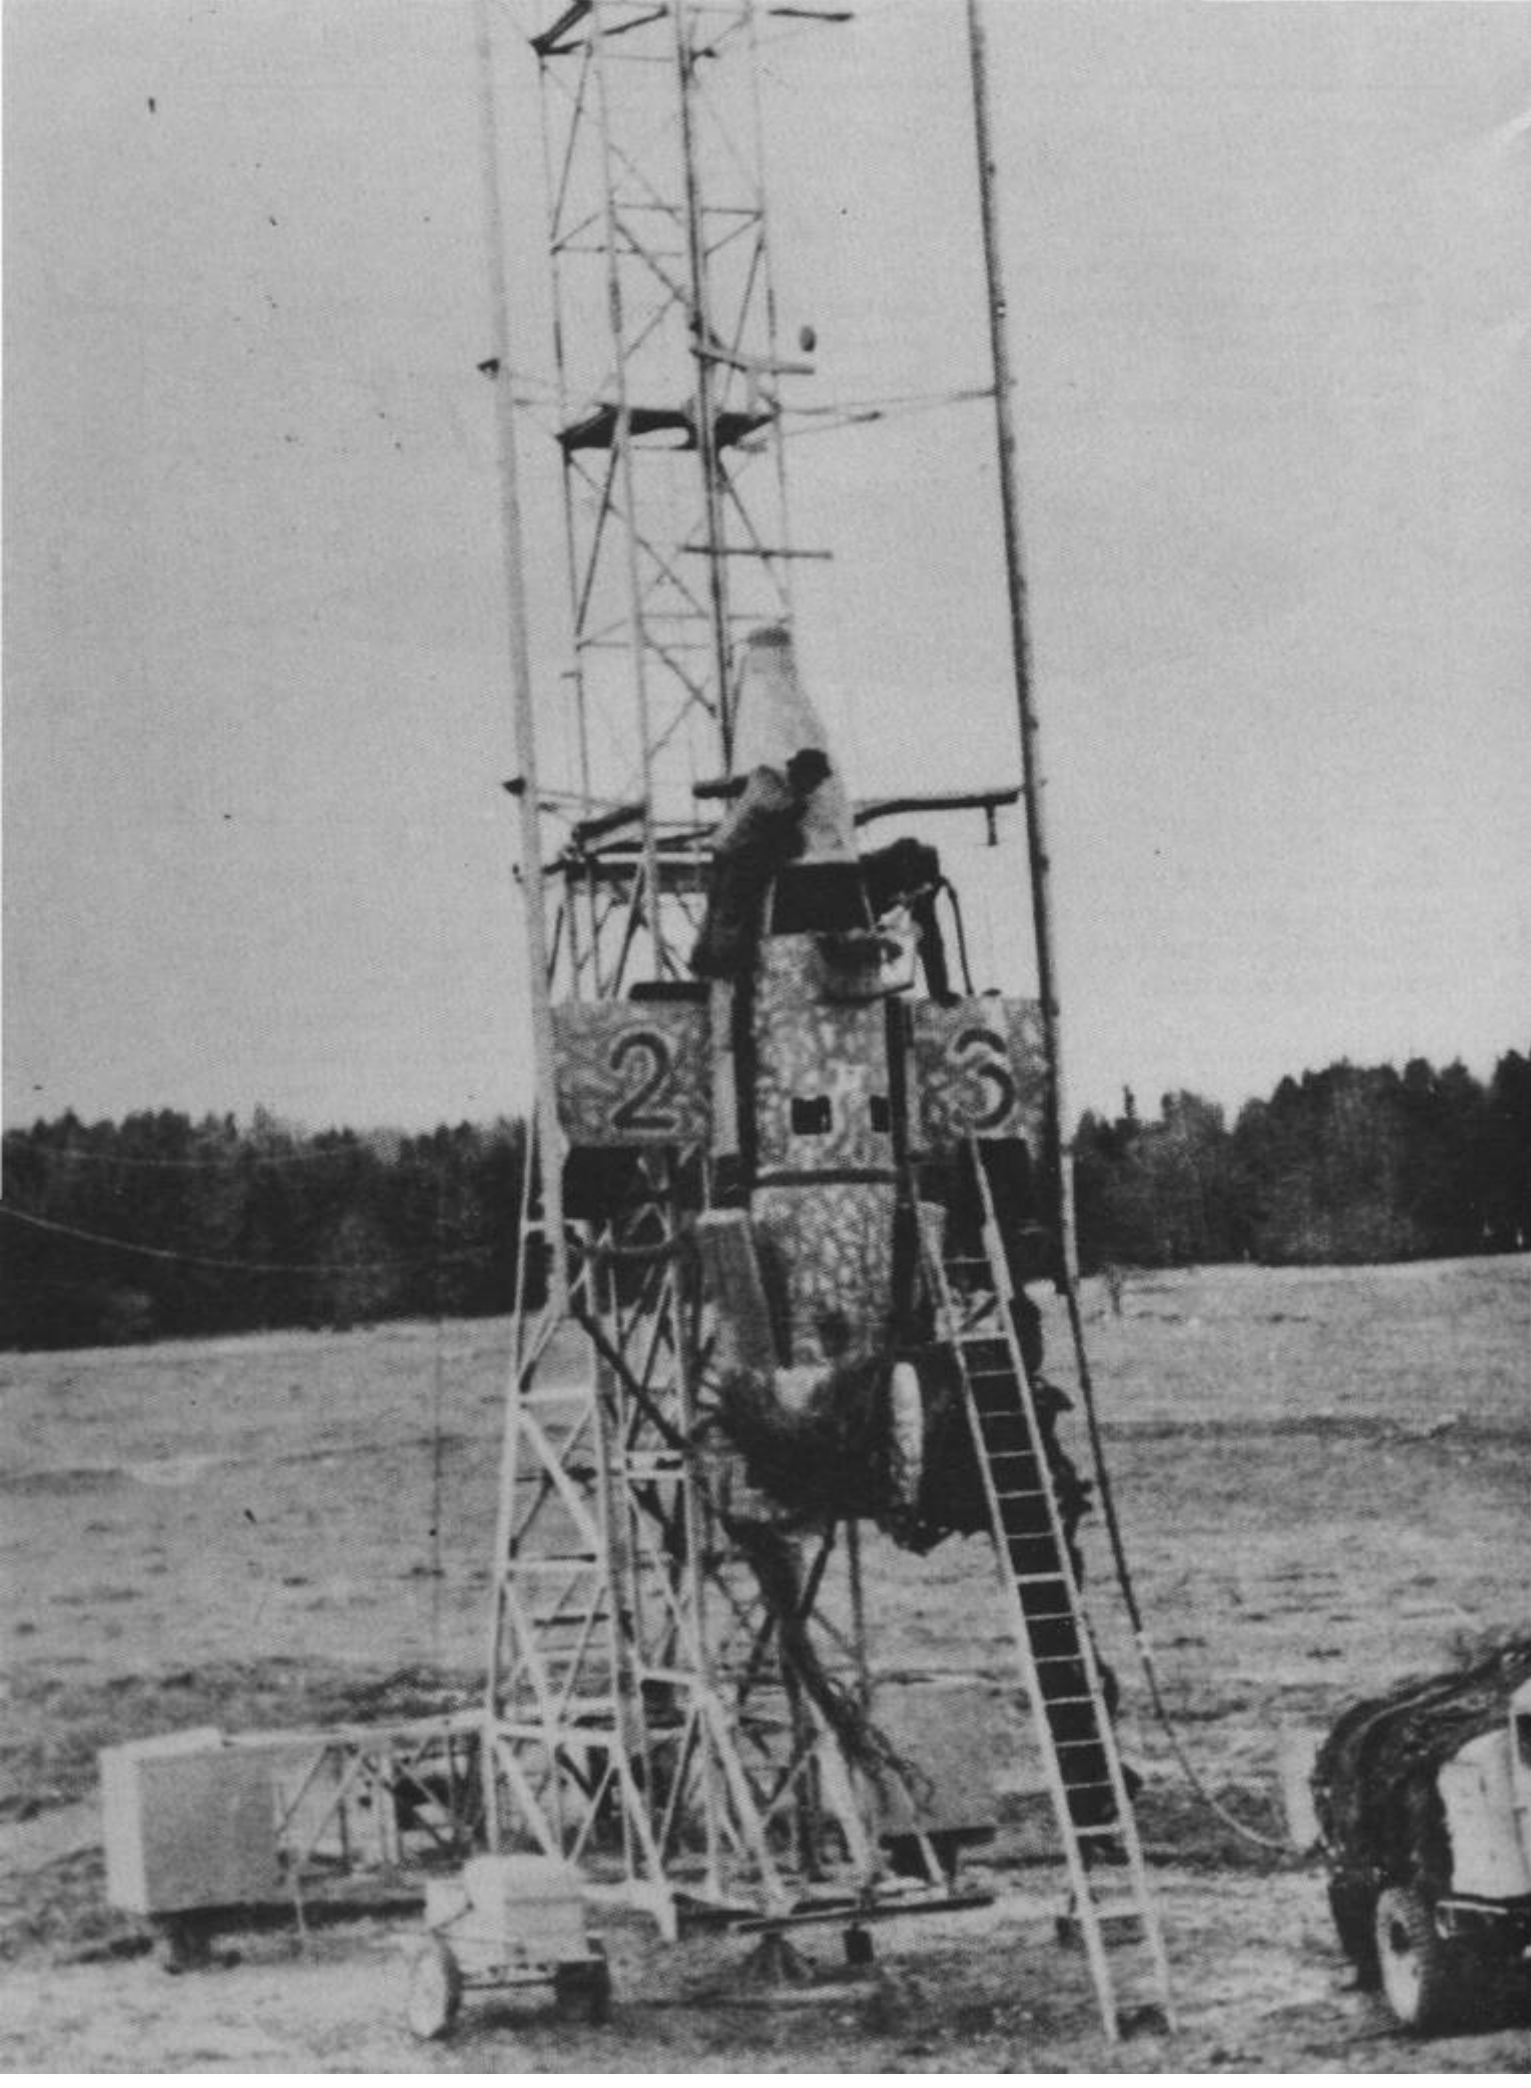
but that it was not very manoeuvrable. A series of designs, each better executed and more radical than the last (and each of them tailless), followed, and by the time of the Ho V, power had become the norm. By 1940, the Hortcns were operating a Luftwaffe design studio known as 'Sonderkommando 9' at Göttingen, and soon produced plans for the Ho VIII (a 60-seat transport aircraft, powered by six pusher propellers), and the Ho IX, a turbojet fighter with twin Jumo 004B engines. The first prototype of the latter was completed as a glider, and the second as a powered aircraft. It was destroyed in an enforced single-engine landing, but not before it had logged speeds in excess of 800km/h (500mph). It was to go into production as the Gotha Go 229, with four MK 103 30mm cannon and a 1000kg (22001b) bombload. Only one prototype, with the more powerful Jumo 004C engine, was completed before the war's end, though four more were begun. Calculations suggest that the Go 229 would have had a top speed of over 1000km/h (620mph) and indeed, it was presented to Hermann Goring as a contender for the '3x1000' project, but engineers at Gothaer Waggonfabrik were far from happy with its straight-line stability as it had a tendency to 'Dutch roll', yawing around the vertical Z axis while rolling from side to side around the X axis. The engineers planned to halt construction after the sixth prototype. The Hortens agreed, and produced a new design with a very pronounced, almost exaggerated, V-shaped fin, the leading edge of which came almost to the nose and included the cockpit. Lippisch

HORTEN Ho IX (GOTHA Go 229)

Type: Single-seat fighter-bomber
Length: 7.47m (24.51ft)
Span: 16.78m (55.05ft)
Max take-off weight: 8500kg (18,740lb)

Max speed (projected): 1000km/h (620mph) at 6100m (20,015ft)
Range: N/A
Armament (projected): 4 x 30mm MK 103 cannon; 2000kg (4400lb) bombload

Above: The Ho IX/Go 229 would probably have been capable of speeds in level flight in excess of 1000km/h (620mph), which would have made it by far the fastest production aircraft of its day.



produced several very similar designs. But the Hortens did not give up the tailless concept either, and also produced for a single-engine interceptor, though by the time they reached the third evolution, this, too, had become a delta with a conventional fin tail.

RE-ENTER THE 'AMERIKABOMBER'

By the time the Ho IX/Go 229 project was underway, the RLM had resurrected the 'Amerikabomber' programme, but the planemakers selected - Arado, Focke-Wulf, Heinkel, Junkers and Messerschmitt - had made little progress. Siegfried Kneymeyer then contacted the Hortens and asked them to turn their attention to a bomber with trans-Atlantic range. Not surprisingly, they came up with a flying wing, essentially an enlarged Ho IX, which they called the P. 18. All the would-be contenders were summoned to a conference at the RLM in February 1945, and the Horten design was selected for production. The brothers were instructed to work with designers from Junkers and Messerschmitt, but the proposed consortium soon fell apart when more conservative elements insisted on adding a large fin and hinged rudder to the design. Reimar Horten then went directly to Goring with a modified plan for the P. 18B, employing four HeS 011 engines in place of six Jumo 004s or BMW 003s, saving 1000kg (22001b) with little loss of thrust. The aircraft, he confidently predicted, would have a range of 11,000km (6835 miles) at 850km/h (530 mph) and fly at an altitude of 16,000m (52,500ft) with a 4000kg (88001b) bombload. He was told to go ahead and build it, but by that time the war had only 10 weeks to run and it is doubtful whether detailed plans were drawn up, though they may have been later, as both brothers continued to work in aviation for the rest of their lives, Walter eventually becoming a leading light in the new Luftwaffe, Reimar in the aircraft industry in Argentina.

THE JUNKERS P. 130/P. 140

Junkers had, in addition to Hans Wocke, two other extremely talented designers in Ernst Zindel and Heinrich Hertel. These three soon responded to the new-found interest in all-wing aircraft and proposed one such of their own as Project 130. It is suggested that Hertel had produced the Ju 287 design only as a means of gaining experience in the sort of aerodynamics required by the P. 130, but it is worth bearing in mind that he had acquired some relevant experience with the Ju 322 (see Chapter Three). Similar in character to the Hortens' P. 18B, the P. 130 had a shorter range (around 5800km; 3600 miles), and was apparently intended to operate against targets in Soviet Asia and in England from bases in Prussia. The 'committee-modified' version of the P. 18A, with the addition of the long triangular tail fin, became the Junkers P. 140, with the range to carry 4.06 tonnes (4 tons) of bombs to New York. Like the P. 18B, it was ordered into production, but work had hardly begun before the underground factory in the Harz mountains where it was to have been built was overrun.

CHAPTER TWO

Rocket-powered Aircraft

Rocket-propelled interceptor aircraft were very attractive to the German Air Ministry, for they seemed to offer a realistic possibility of being able to threaten the high-flying Allied bombers which, by 1944, were decimating the country's industrial base. This was particularly true since they did not require fossil fuel, which was in very short supply by that time, and could be constructed cheaply, largely from plywood; a considerable effort was put into developing such aircraft, but ultimately to no avail.

Had we been considering the history of thrust-powered flight in something like chronological order, rather than in terms of the impact the new technology had on the course of aviation in World War IT, we would have examined the rocket before the jet. In fact, there is little conflict here, for the first effective demonstrations of the two types occurred almost simultaneously and in the same place: in the last months before the outbreak of war, at Ernst Heinkel's factory at Rostock-Marienehe. While neither type was actually conceived as a weapons platform, and even though neither did what was hoped of it, thanks to a series of poor design decisions, both demand inclusion here because of the influence - both positive and negative - they exerted. We have seen how the jet-propelled He 178 was deficient because its designer failed to solve the problem of how to induct air to the engine efficiently. This, it must be said, would have been hard to foresee. The main fault of the rocket-powered He 176, on. the other hand, was glaringly obvious, at least to the cognoscenti. Unfortunately, there were few of them around in 1939.

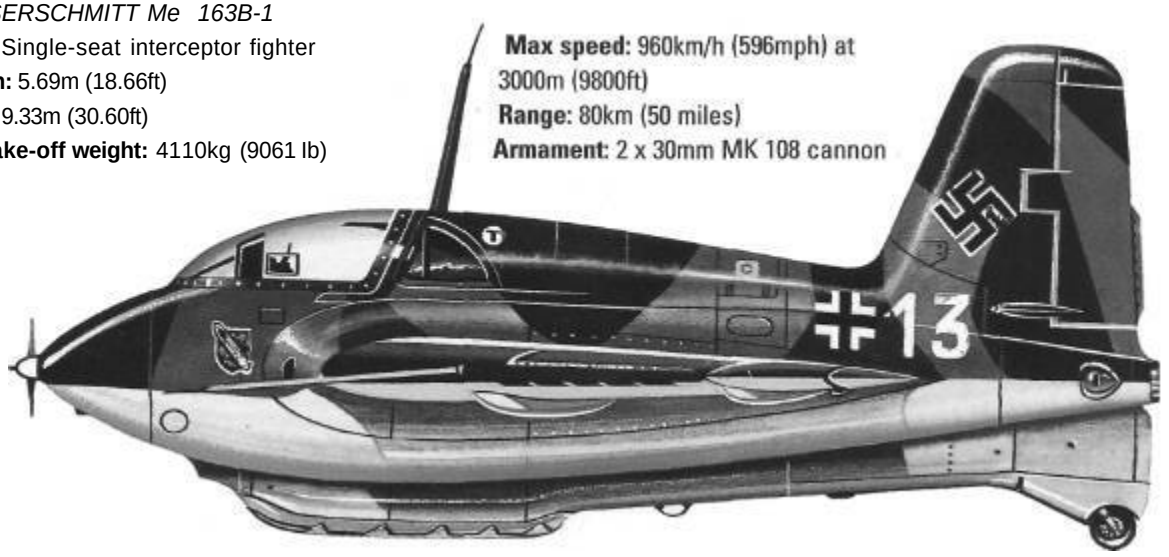
Above: The Messerschmitt Me 163B-1 'Komet'.

Left: The Ba 349 had four solid-fuel booster rockets and a liquid fuel sustainer motor, Launched vertically, it was to have climbed to 14,000m (45,900ft) in one minute.

THEHEINKELHe176

The rocket-propelled aircraft designated the He 176 by the *Reichsluftfahrtministerium* (RLM - the German Air Ministry) was powered by a Walter Rl motor

using hydrogen peroxide. Earlier versions (more accurately, existing He 112 fighters with auxiliary motors) had used a power unit developed by Wernher von Braun (qv), which used liquid oxygen and alcohol, a rather more volatile mixture. The near-explosive decomposition of hydrogen peroxide into superheated steam when it comes into contact with a catalyst such as calcium, potassium or sodium permanganate was to become a mainstay of German propulsion programmes in a number of very different areas, as we shall see. The He 176 flew for the first time on 30 June 1939. The aircraft probably never exceeded the standard it had been designed to beat, 700km/h (435mph), which was below the world speed record of the day. It was essentially too heavy both for its powerplant and for its short, stubby wings. The RLM showed little interest in it, favouring the design which would become the Messerschmitt Me 163 'Komet' (qv). Heinkel abandoned the project.

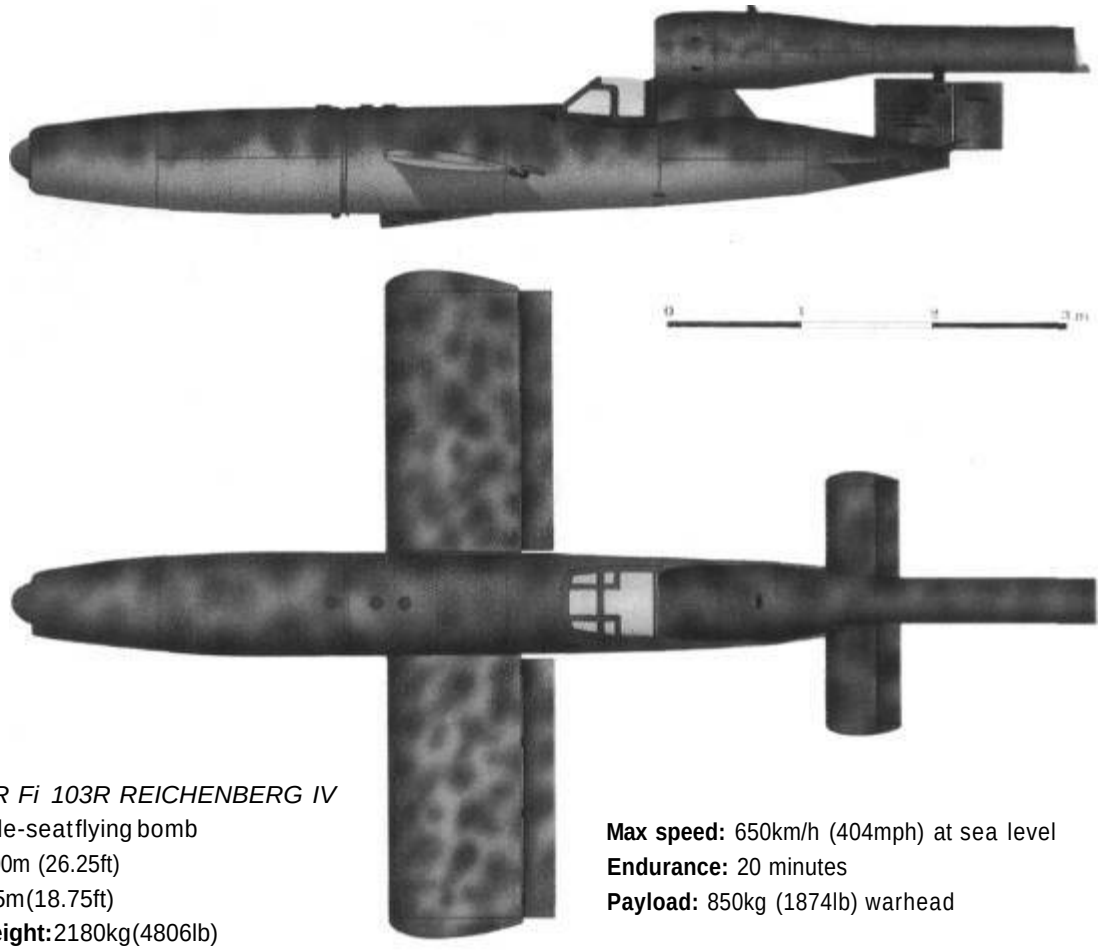


ALEXANDER LIPPISCH

Alexander Lippisch was a self-taught aerodynamicist who had worked at Zeppelin/Dornier after World War 1, then at Rhön-Rossitten-Gesellschaft (RRG - which developed gliders for meteorological research, amongst other things), and later, when RRG was absorbed into it, at the *Deutsches Forschungsinstitut für Segelflug* (DFS - German Glider Research Institute). Lippisch maintained that had Heinkel had even a narrow understanding of the nature of gliders, he would have realised that he needed a large wing area (and a small wing loading) to make an aircraft such as the He 176 fly adequately, as it had only very marginal power reserves. Instead, Heinkel had given his proto-rocket aircraft short, stubby wings which were really little more than control surfaces, and his experiments failed in direct consequence. Lippisch went further than that, of course. Like the Horten brothers, he was a staunch and unremitting advocate of the tailless, delta-pianform flying wing, and was the first to fly such a design, in 1931. Three years before that, however, Lippisch had produced a rocket-propelled glider for automobile manufacturer Fritz von Opel, who saw the new technology mostly in terms of its ability to attract crowds, but who was interested enough (and rich enough) to provide seed money for would-be pioneers. Opel lost interest in the early 1930s, after rocket-powered gliders had been the death of a number of pilots. Lippisch's 'Ente' ('Duck') became the first rocket-powered aircraft to fly, with Fritz Stammer at the controls, on 11 June 1928. By 1933, Lippisch had designed a variety of

Below: The Messerschmitt Me 163 'Komet' interceptor first went into action in August 1944. It accounted for only about a dozen Allied bombers in six or seven months.

MESSERSCHMITT Me 163B-1
Type: Single-seat interceptor fighter
Length: 5.69m (18.66ft)
Span: 9.33m (30.60ft)
Max take-off weight: 4110kg (9061 lb)
Max speed: 960km/h (596mph) at 3000m (9800ft)
Range: 80km (50 miles)
Armament: 2 x 30mm MK 108 cannon



delta-wing gliders and had begun to fit small engines to them. He collaborated with Focke-Wulf and with Gerhard Fieseler, and with the latter, built the two-seat, twin-engine (pusher and tractor) Delta III 'Wespe' ('Wasp') and Delta IV, only to see both crash at the cost of one pilot's life within a fortnight. RLM promptly banned tailless aircraft, and it was some time, and then only at the urging of Professor Walter Georgii, the Director of DPS, before the ban was lifted. A modified Delta IVb followed, with the RLM designation DPS 39, and in 1939, orders were issued for the construction of a version to be powered by a Walter rocket motor. DPS built the wings, which were of near-delta planform, and Heinkel built the rest of the airframe, alongside the He 176 with which it shared its powerplant. The design's concession to the RLM was the small wingtip rudders, but after wind-tunnel testing, Lippisch concluded that these would only cause flutter and, ultimately, main spar failure. Thus, the DPS 194, its successor, acquired a single, central fin and rudder. Using as its 'fuel' T-Stoff (an 80 per cent aqueous solution of hydrogen peroxide plus oxyquinoline as a stabiliser) and Z-Stoff (an aqueous solution of sodium and potassium permanganates to promote decomposition), the Walter RI-203 rocket was to propel the prototype at speeds of up to 500km/h (310mph). It was clear from the outset that this was a major achievement and Lippisch was ordered to Messerschmitt's Augsburg research centre with his research and development team in January 1939. There the DPS 194 metamorphosed into the Messerschmitt Me 163 'Komet' ('Comet').

Above: 'White 13' - an Me 163B-1a of 1/JG 400, which operated from near Leipzig between July 1944 and April 1945, defending the Leuna-Merseburg refinery complex.

THE Me 163'KOMET'

The 'Komet', which preceded the jet-propelled Me 262 into service by a little over two months, was a radical and adventurous approach to the problem of how to defeat the heavily armed and protected bomber aircraft which were flown in formations designed to create an impenetrable defensive box. Its designation, all of them were decided by the RLM, is somewhat misleading, for Messerschmitt AG actually had little to do with its development, which remained in the hands of its creator. In the spring of 1941, the prototype of the new aircraft began gliding trials; towed to a height of up to 8000m (26,250ft), it was soon achieving speeds of up to 850km/h (530mph) while retaining a high degree of controllability, and during the summer it was sent to the rocket development establishment at Peenemiinde-West on the Baltic coast, to be fitted with a rocket motor - an improved model of the Walter Rl incorporating a degree of thrust control but still using T-Stoff and Z-Stoff as its fuel. The development programme at Peenemünde was fraught with accidents, some fatal, as time after time the volatile fuels spontaneously exploded. On one occasion, an entire building was demolished. However, it also resulted in the Me 163 VI breaking the world speed record repeatedly until the test pilot, Heini Dittmar, finally exceeded 1000km/h (620mph), almost killing himself in the

FIESELER Fi 103R REICHENBERG IV
Type: Single-seat flying bomb
Length: 8.00m (26.25ft)
Span: 5.715m (18.75ft)
Launchweight: 2180kg (4806lb)

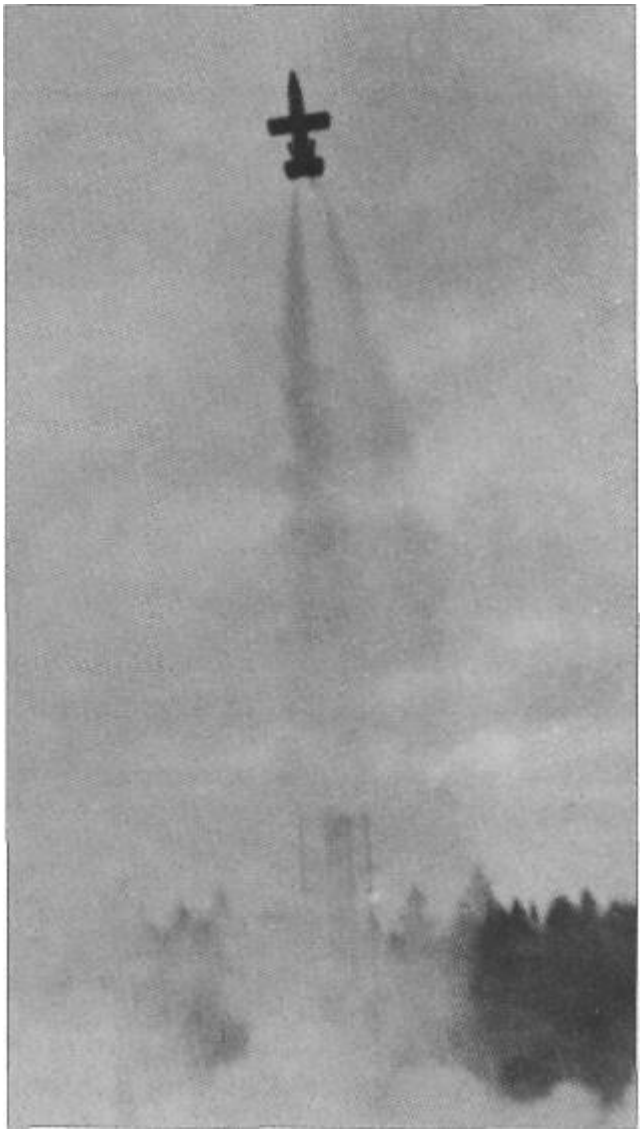
Max speed: 650km/h (404mph) at sea level
Endurance: 20 minutes
Payload: 850kg (1874lb) warhead

Above: The Reichenberg IV, as the manned version of the VI flying bomb was known, was little more than a fantasy, though prototypes did fly.

process when the aircraft became suddenly uncontrollable as compression shock (shocks caused by airflow over the wing surface locally exceeding the speed of sound) induced negative lift and massive vibration. In the event, Dittmar managed to regain control and land successfully. The RLM, impressed, ordered prototypes of an operational aircraft, the Me 163B, to be armed with a pair of MG 151 20mm cannon and powered by a more powerful 509-A2 rocket motor using the somewhat less unpredictable combination of T-Stoff and C-Stoff (30 per cent hydrazine hydrate, 57 per cent methanol, 13 per cent water) as its fuel and producing 1500kg (33001b) of thrust. Around 2.032 tonnes (2 tons) of propellant (very nearly half the entire weight of the aircraft) was enough to take it to its operational ceiling of 12,100m (39,700ft) in 3.35 minutes, and the pilot then had a further four and a half minutes of powered flight available: thus, he would actually have been gliding, unpowered, during most of his mission.

Two Me 163B-las were handed over to a special Luftwaffe unit early in 1943 to allow pilot familiarisation to begin, though it was July before training actually commenced. The high landing speed of the 'Komet' (around 220km/h; 140mph) combined with the fact that the pilot was committed to it from the outset, having no power available to allow him to regain height for a second attempt, resulted in many accidents, most of them fatal. The first operational unit, equipped with Me 163B-la aircraft, with a pair of 30mm cannon in the wing roots and a considerable degree of armour protection for the pilot, began forming at Wittmundhaven in May 1944, and first went into action as 1/JG400 on 16 August. It scored its first success some days later, when Leutnant Hartmut Ryll downed a B-17 near Leipzig. In all, some 300 Me 163s in various versions were constructed (and rights to it were sold to Japan, where five powered and over

50 unpowered versions were built before the war's end), but the aircraft was only a very limited success, accounting, it is believed, for little more than 12 American B-17s. An improved version, known originally as the Ju 248, was produced at Junkers and then taken over by Messerschmitt as the Me 263. It was somewhat larger, had a wheeled undercarriage rather than skids, and was powered by a Walter 509C motor. It was produced in prototype form only.

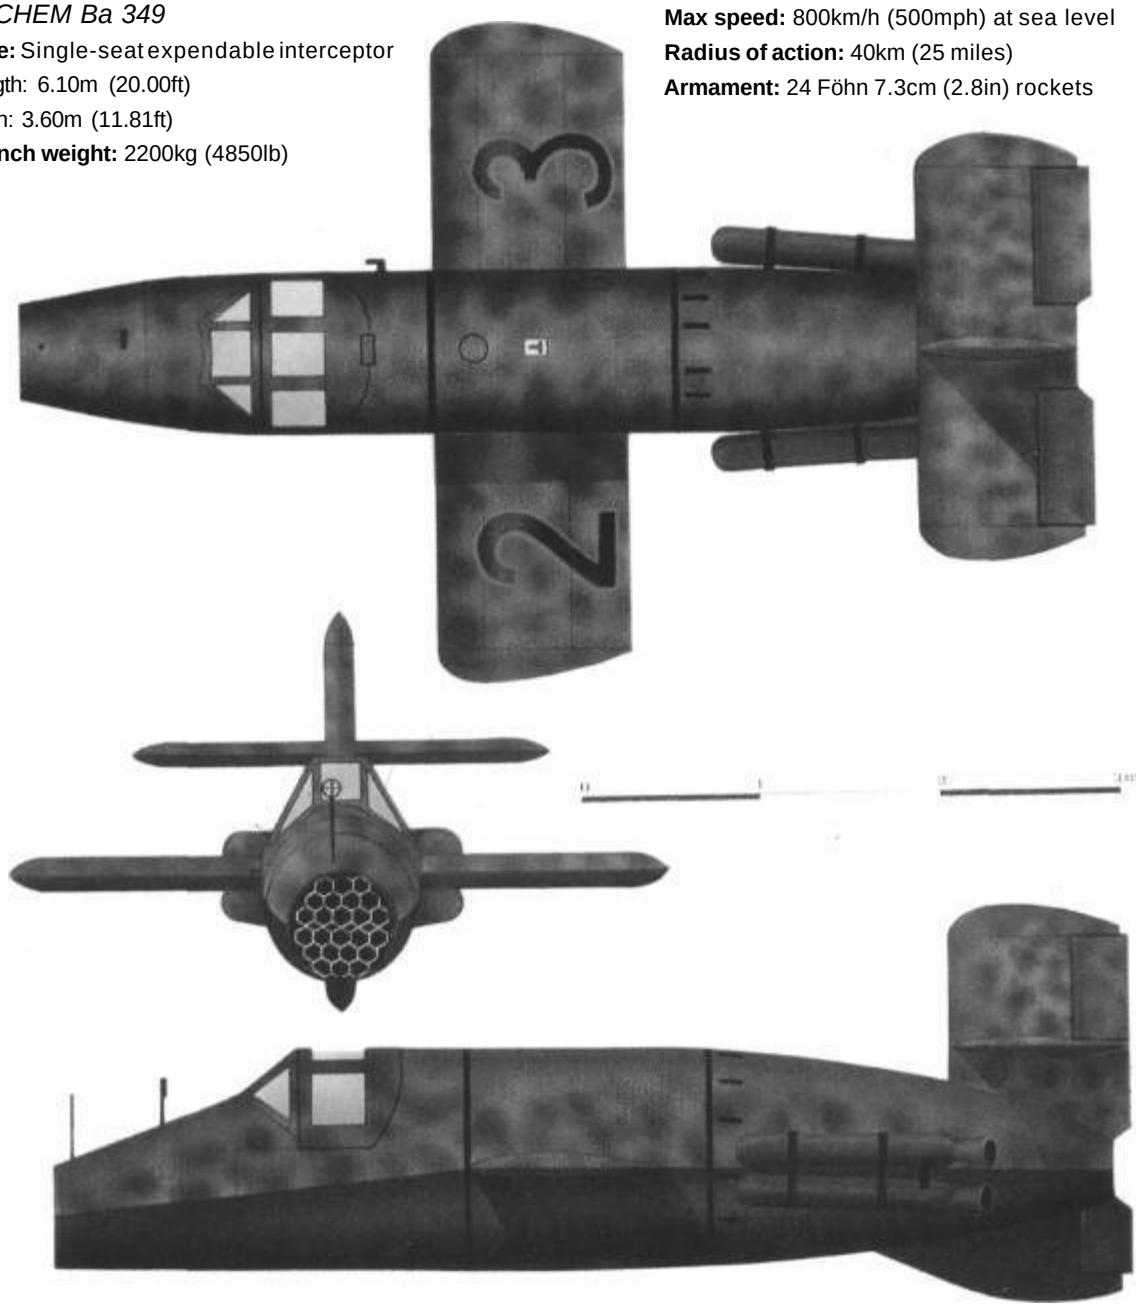


THE SELBSTOPFERMÄNNER FIGHTERS

In fact, like the Me 262, the 'Komet' was too little, too late. So desperate was the situation in Germany by the summer of 1944 that individual fighter pilots had taken to ramming Allied bombers, and units such as IV/JG3 and TI/JG300 were formed as *Sturmgruppen* (assault groups) with that as an accepted fall-back tactic using Fw 190A-8/R2s fitted with frontal armour. They had a measure of success: between 7 July 1944 and the end of March 1945, when they ceased to operate, they accounted for around 500 Allied bombers, but only 10 of them by ramming. In April 1945, Sonderkommando Elbe was formed from volunteers; they trained for 10 days in ramming tactics, and then went into action. In all, they rammed and downed eight, but at a high cost to themselves: a total of 77 Bf 109s and Fw 190s. If such potentially self-sacrificial *Selb-Stopfermänner* tactics were to be employed, then clearly a much less sophisticated aircraft, using little in the way of strategic materials, could be employed instead of some of the best piston-engined fighters of the entire period.

At this point we need to take a very short diversion to consider the nature of *Selbstopfermänner* tactics. It was never the stated intention to require or even ask aircrew to commit suicide in Germany in the way that it was in Japan, and great pains were taken to maintain that the very reverse was actually the case. The *Selbstopfermänner* were expected only to employ their aircraft as weapons in the last resort (though recruits to the *Sturmgruppen* were required to take an oath that they would indeed do this if necessary), and to make every effort to ensure that the attack left them with the possibility of escape. As will be noted when discussing the manned Fi 103s, the possibilities of this happening were remote, and it must be concluded that there was a secret agenda, and that the men (and women; Hanna Reitsch was an advocate of such tactics) concerned knew exactly what they were being called upon to do, and that the disclaimers were there only for public relations purposes.

THE Ba 349'NATTER'



The 'Komet' was hardly a sophisticated aircraft. However, according to Dr Erich Bachern the 'Komet' was over-sophisticated. Bachern was an experienced glider pilot and one-time Technical Director of Fieseler AG, which was latterly a manufacturer of wings for Henschel missiles and control surfaces for the A4 and where Bachem had designed the Fi 156 'Storch' ('Stork') observation and light utility aircraft. He claimed that a wooden glider, simple enough to have been built in a carpentry workshop and propelled by a similar rocket motor to that used in the 'Komet',

Right: The launch of the Ba 349 was so violent that the pilot was expected to black out; the climb to operational altitude was under a simple automatic guidance system.

BACHEM Ba 349
Type: Single-seat expendable interceptor
Length: 6.10m (20.00ft)
Span: 3.60m (11.81ft)
Launch weight: 2200kg (4850lb)

Max speed: 800km/h (500mph) at sea level
Radius of action: 40km (25 miles)
Armament: 24 Föhn 7.3cm (2.8in) rockets

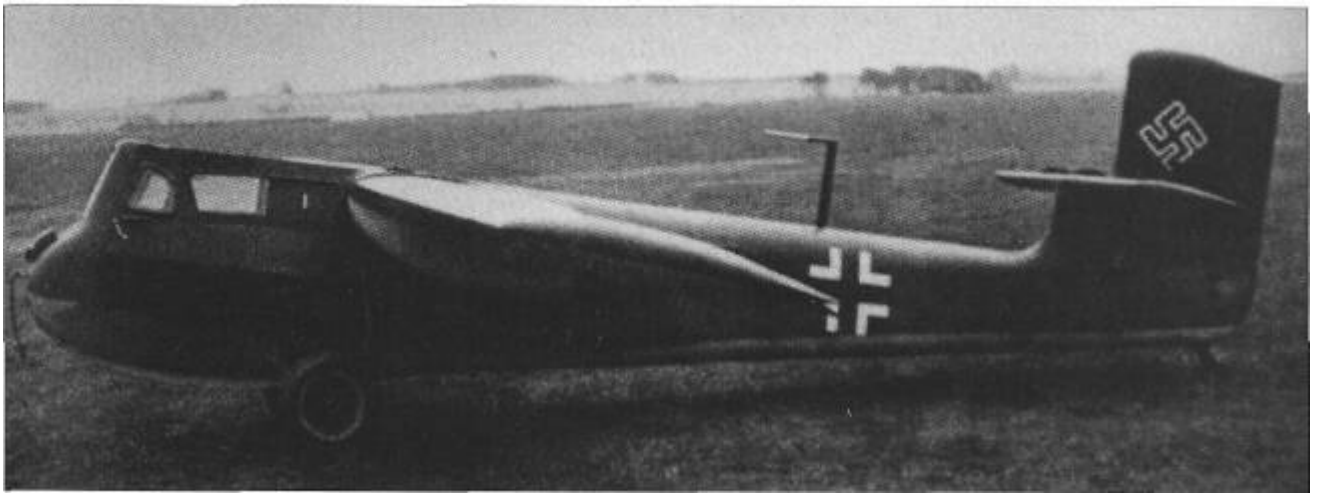
Above: The 'Natter' was conceived as the simplest means of getting a man within range of the high-flying bombers. The array of rockets in the nose were its sole weapons.

aided by four solid-fuel boosters so that it could take off vertically, would do the job equally well. It would climb to 14,000m (45,900ft) in little over a minute under control of a simple automatic guidance system, whereupon its pilot, by now hopefully having regained consciousness after blacking out under the forces generated at take-off, would take over and make a diving attack on the enemy bomber formation on his way back to earth. He would bale out to land by parachute only when he had fired his only armament (the 24 Henschel Hs 217 'Föhn' 7.3cm or R4M 5.5cm unguided rockets contained in an array in the nose), and had reduced his speed to around 250km/h (155mph), while the 'aircraft' from the cockpit back also descended by parachute in the hope of recovering the rocket motor for re-use. From 22 December 1944, a series of 11 unmanned launches were made on the power of the booster motors alone, and on 23

February 1945, a single, unmanned test launch took place using the Walter motor as well. Some days later a manned launch was ordered by the SS *(Schutzstaffeln:* the Nazis' private army) which, by that time, had control of all secret weapons projects, even though the unmanned programme had not been completed and there were grave doubts about the aircraft's viability. The pilot, one Lothar Siebert, was killed when the Ba 349 power-dived into the ground from a height of 1500m (4900ft) after having rolled on to its back. The testing programme continued, and perhaps 20 aircraft (some reports say 36) intended for operations were produced, but none flew in combat. It is thought that two examples remain, both in museum storage: one in the USA, the other in Germany.

Ernst Heinkel proposed a very similar aircraft to the Bachern 'Natter' ('Viper'). The P. 1077 'Julia' (it never received an RLM designator) was also to have been powered by a Walter 509 motor and four solid-fuel Schmidding 533 boosters. It was to have taken off from an inclined ramp, to climb to 15,000m (49,210ft) in 72 seconds, and to have been armed with two MK 108 cannon. It was a high-wing monoplane with almost square-planform wings with considerable anhedral at the tips, and drawings showing two different tail assemblies - one with a single dorsal fin and high-set stubby tailplanes; the other with a single high tailplane terminating in dorsal/ventral fins - were produced. It is probably better considered as a manned missile than an aircraft. There is no account of how the pilot was supposed to complete the mission and return safely to earth.

There is some question whether the 'Natter' actually fits our criteria for *Selbstopfermänner* aircraft at all, since the pilot was expected to break off his attack and turn for home before ejecting (indeed, he was provided with an escape system), but there is less doubt in similar concepts put forward by Zeppelin and DPS, both of which proposed what were essentially motor-assisted gliders to be towed into attack position by aircraft. The Zeppelin proposal - the 'Rammer' - had a solid-fuel rocket motor; the DPS aircraft, which went into development as the Messerschmitt Me 328, had an Argus pulse-jet like that which powered the Fieseler Fi 103 flying bomb (qv). There were high hopes of the latter, in particular, but like the Ba 349, it never got past the prototype stage. There was a third, very similar, project, the Sombold So 334 'Rammschussjäger', which, despite its name, was not actually intended to ram. It, too, was powered by the Walter 509 motor and armed with rockets, and was to have been towed to operating height. Like the Me 328, it started out as a parasite escort fighter project but never got further than a wind tunnel model. Blohm & Voss proposed a pure glider fighter, with no powerplant at all, as the Bv 40. Armed with 30mm cannon and towing a proximity-fuzed bomb on a cable, the Bv 40 was to have been towed to a position above the incoming bomber 'box' by a Bf 109 and then released. Its limited acceptance was perhaps indicative of the state of mind in Germany by 1944 when prototypes were built and tested.



THE ZEPPELIN'RAMMER'

The Zeppelin 'Rammer' never received an RLM designation, which is an indication that perhaps it was not taken entirely seriously. It was to have been a small conventional aircraft with straight, constant-chord wings and tailplane, and was to have been towed to its operational altitude by a Bf 109 or a Bf 110 and cast loose, whereupon it would start its Schmidding 533 solid-fuel rocket motor and head for the bomber formation, first firing its load of 14 R4M 5cm rockets and then trying to ram or sideswipe the bomber aircraft, using its hugely strong wings. The wing's leading edges were to have been covered in 3cm- (1.18in-) thick steel, and they were to have had three continuous parallel main spars, fabricated from thick-walled steel tubing, running from tip to tip to slice through fuselage, tailplane or wings. The pilot, who flew the aircraft in the prone position, was not expected to take to his parachute, but was to have landed the aircraft on any convenient piece of open ground so that it could be recovered and re-used. It is thought that no prototype nor even a mock-up of the 'Rammer' was actually constructed.

THE MESSERSCHMITT Me 328

The history of the Me 328 - which, like the 'Komet', started life as a DPS project - began in 1941, rather earlier than those of the other 'last-ditch' fighters. It was concieved as an escort fighter, to be towed by a Heinkel He 177 bomber on a semi-rigid bar (the 'Deichselschlepp' system, which was also under consideration for use with manned glider bombers and auxiliary fuel tanks) or mounted on a Dornier Do 217 or a Messerschmitt Me 264 in a 'Mistel'-like arrangement (qv). A variety of versions were projected: a pure glider; with Argus pulse-jets; and with a Jumo 004 turbojet. Only the pure glider and the pulse-jet versions were produced (and then only in prototype form). The ubiquitous Hanna Reitsch was responsible

for completing a test programme on the two prototypes of the glider version, cutting loose from tow planes at altitudes of 3000-6000m (9800-19,700ft). Ground launches, using both cable-type catapults and rocket-assisted rail carriages, were also undertaken, with equal success. Even with reduced wingspan, the aircraft performed very satisfactorily, and it was planned to build up to 1000 for use as disposable bombers, to be flown by volunteers from 5/KG200, the so-called 'Staffel Leonidas'.

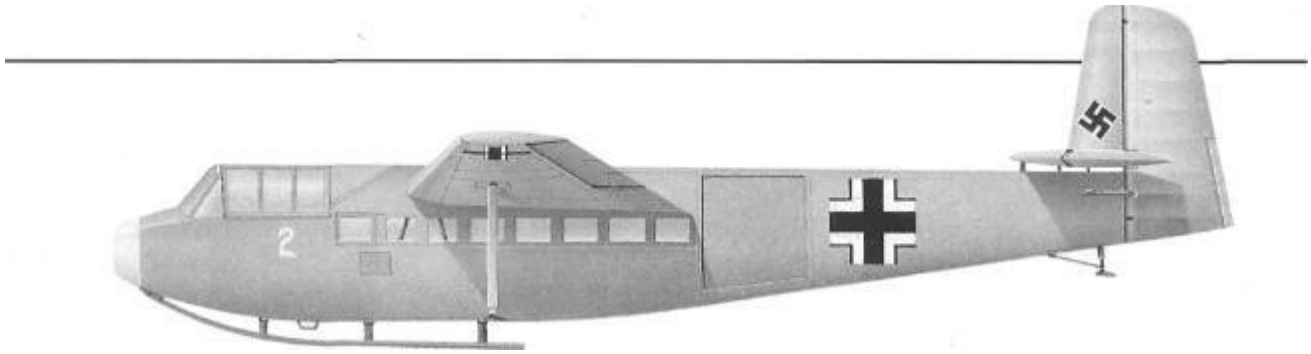
Seven prototypes of the Argus pulse-jet-powered version were built by a glider maker, Jacob Schweyer Segelflugzeugbau. It was intended for use as a fighter aircraft, to be armed with two MG 151 machine guns. Tn static testing it soon became obvious that the same problems which were to plague the early development of the VI flying bomb - notably, excessive vibration - would make the project difficult to bring to a successful conclusion, and the manned flight programme was suspended in mid-1944, after only a few test flights had been made. Nonetheless, planning still went ahead, and a version was projected, employing no less than four Argus 109-014 pulse-jets, two mounted below the mid-set wings in addition to the original pair mounted above the rear fuselage, their jet tubes protruding behind the fin below the tailplane.

Bomber versions of both these aircraft were also proposed (and would actually have made greater sense since the pulse-jet's characteristics were unsuited to its use as a fighter powerplant). At Hitler's insistence, work on the bomber version continued long past the point when anything other than token use could have been made of it. Perhaps the most far-fetched suggestion for a version of the Me 328 was that with folding wings and twin pulse-jets, designed to be launched from a catapult set up on the foredeck of a submarine.

Left: No more than 36 Ba 349s were constructed; none was ever sent into combat, and most finished like these three battered examples in the hands of GIs in Bavaria.

Above: The Blohm & Voss Bv 40 was an unpowered glider and was to have been towed into position above the approaching bombers before making its attack.

THE BLOHM & VOSS Bv 40



The simplest and cheapest - and perhaps the most sensible - proposal for a *Selbstopfermänner* fighter came from Blohm & Voss's Richard Vogt in mid-1943. The Bv 40 was a simple small armoured glider, armed with a pair of 30mm cannon and fitted with a considerable degree of frontal protection, constructed by unskilled workers from non-strategic materials, which was to have been towed to a position above the bomber formations by a Bf 109G and then cast loose to prosecute a head-on diving attack. One proposed innovation was the 'Gerät-Schlinge', which was really nothing more than a towed aerial mine on a long cable, and which was to be exploded when it was within the bomber formation (although the bomb tended to trail directly behind the glider, rather than some way below it, and it was difficult to place as a result). R4M rockets and 250kg (55()lb) bombs, to be dropped into bomber formations from above, were also suggested, as was a version to carry four aerial torpedoes. Six prototypes were constructed, and five flew before the project was cancelled in late 1944. In an attempt to resurrect it, Vogt suggested fitting it with Argus pulse-jets mounted under the wings, but he was unsuccessful, the Me 328 having taken up what small degree of enthusiasm existed for such a solution.

CHAPTER THREE

Hybrid Aircraft and Gliders

During World War II, Germany made extensive use of unpowered aircraft in the transport role, and though they met with diminishing success, they proved a useful addition to the Reich's logistical fleet. In a parallel development, technology developed for glider bombs was applied to the guidance of unmanned powered aircraft too, the flight to the vicinity of the target being under the control of the pilot of a single-engined fighter mounted piggyback on the explosives-packed bomber.

Even after the new German Air Force was established, the unpowered aircraft still occupied an important place in its order of battle, perhaps because almost all Luftwaffe pilots recruited before Germany openly re-armed had learned to fly in gliders. As we have seen, many important new developments in aviation sprang from the *Deutsches Forschungsinstitut für Segelflug* (DFS).

Above: The DFS 230 carried Luftwaffe paratroops into action against the Belgian fortress of Eben-Emael.

Left: The 'Mistel' was a fighter mated with an unmanned bomber, the nose of which was an explosive charge.

THE DFS 230

Gliders were eventually to be developed in Germany in all shapes and sizes and for a variety of roles. We have seen them as both bombers and fighters, but they were actually more effective, at least in combat terms, as troop carriers and transports. The first to see action was the diminutive DFS 230, a conventional glider with straight, high aspect ratio wings, developed from a prototype built by Rhön-Rossitten-Gesellschaft in 1932, which could carry eight combat-equipped soldiers. In a very real sense, the DFS 230 was a secret weapon par excellence, for in its combat debut, when Luftwaffe paratroopers used it to assault and capture the huge Belgian fortress at Eben-Emael on 10 May

Above: The difficult and demanding Troika-Schlepp' - requiring the service of three Bf 11 Os-was the original method of getting a fully loaded 'Gigant' glider into the air.

1940, it achieved complete tactical and strategic surprise, and allowed the Wehrmacht to cross into Belgium virtually unopposed. Despite that success, once their existence was known, gliders proved to be an expensive way of getting infantry into combat, and after a near disaster in Crete, were not employed in that role by the Luftwaffe, although they were used in an even more dramatic way in September 1943, when commandos led by Otto Skorzeny landed 12 DPS 230s on a narrow strip of land in front of the Rifugio Hotel on the Gran Sasso and liberated deposed Italian dictator Benito Mussolini. From then on, it was left to the Allies to employ them, notably in Sicily in July 1943, in Normandy in June 1944, and at Arnhem in September of that year. That is not to say that the Luftwaffe had given up on them by any means.

THE DPS 228 AND DPS 346

DPS later built a single prototype of a cargo-carrying glider, the DPS 331, in 1941, but by that time the main thrust of the Institute's work lay in the development of high-performance experimental sailplanes. The most significant of those was the DPS 228, planned as a high-altitude photo-reconnaissance aircraft, to be transported to an altitude of 10,000m (32,8()()ft) or more and released, a rocket motor then taking it to an altitude of 23,00()m (75,400ft). The rocket motor was then to have been used intermittently to maintain altitude until its fuel was exhausted, whereupon the DPS 228 would glide back to friendly territory. Depending on thermal conditions, it was confidently expected that the aircraft would be able to return from targets over 1000km (620 miles) away. Only a few were constructed. Many test flights were made, all of them it is believed (though there are differing reports) without rocket power, and a new pressurised cabin, with the pilot in the prone position, was eventually developed and tried out just days before the war's end. Both the original cabin, in which the pilot sat upright, and the later version, which was very much more effective, were attached to the rest of the airframe by explosive bolts. Set free, the nose cone deployed a parachute and descended with the pilot still on board until the outside temperature and pressure reached life-supporting levels, whereupon his seat or couch was ejected by compressed air and he made a normal parachute descent.

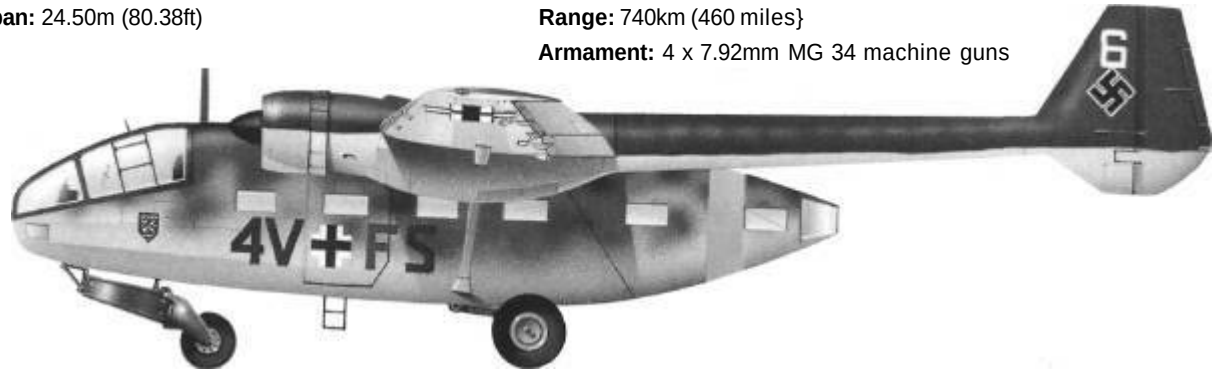
A development of the DPS 228, the DPS 346, was designed as a supersonic trials aircraft. It was to have had two rocket motors, variable-chord swept wings and a Multhopp-style T-tail, but was otherwise similar to the DPS 228 in its later incarnation, although constructed entirely of stressed aluminium rather than wood. An unpowered prototype was to have been built (in wood). It is believed that this aircraft and a number of somewhat modified DPS 346s were constructed in the Soviet Union after the war, and there are persistent but unsubstantiated claims that the former was the first aircraft to exceed the speed of sound with DPS test pilot Wolfgang Ziese at the controls in May 1947, some five months before Chuck Yeager's supersonic flight in a Bell X-l on 14 October.

THE GIANT TRANSPORT GLIDERS

At the other end of the performance scale, two projects to develop heavy-lift gliders capable of carrying up to 22,000kg (48,5001b) of cargo - the approximate weight of a combat infantry company, with all its equipment - were ordered up by the RLM: one of them from Messerschmitt, as the Me 321 'Gigant' ('Giant'); the other from Junkers, as the Ju 322 'Mammut' ('Mammoth'), originally named 'Goliath'. The Messerschmitt aircraft was ultimately to be the most successful by far, with about 200 built, but the Junkers 'Mammut' was the more interesting of the two, despite being a constructive failure.

THE Me 321'GIGANT'

The Me 321 was conventional in that it had a fuselage to which the high-set wings and empennage were attached. It was constructed from welded steel tubing and wood with a covering of fabric and wood, and its fuselage was rectangular in cross-section, very tall towards the nose (which had clam-shell doors for loading and unloading vehicles) and tapering towards the tail, with side doors at the rear for passengers. The cockpit was located on top of the fuselage, level with the leading edge of the wing, which was straight and tapered, with a span of 55m (180.5ft), braced by struts to the fuselage floor at the point where the fixed wheels were mounted. The tail was composed of a tall fin and a braced tailplane. The aircraft performed perfectly from the first flight, which took place at Leipheim in March 1941, and was quite capable of lifting the design payload. The first examples entered service in May 1941, when a squadron of 18 was formed. Originally, the 'Giants' were towed either by a trio of Bf 110s (the so-called 'Troika-Schlepp') or by a single Ju 290, and later by the specially developed He 111Z 'Zwilling' ('Twin'), which was, in effect, two He 111s joined at the wing, outboard of the engines, the junction being effected at a fifth engine, thus giving one outboard of each fuselage, and three in the wing area between them. Rockets of various types were mounted to assist take-off, and there were plans to mount Argus pulse-jets to increase the aircraft's gliding range after release. The principal work of the 'Giant' was to transport material to the Eastern Front. It had a crew of two and was armed with four 7.92mm machine guns.



Even before the prototype glider had taken to the air, work was in hand to transform it into a powered aircraft. This consisted mainly of strengthening its structure and contriving mountings for engines, initially four supercharged Gnome-Rhone 14Ns, which produced around 1150hp each. The prototype flew in April 1942 and since it was considered to be underpowered, the next aircraft had six engines, as did the aircraft of all subsequent productions. The Me 323, as it was designated, was something of a handful in the air, requiring two flight engineers to keep the engines balanced, and two gunners, with a total of five 7.92 mm (later 13mm) machine guns, plus locations for 10 MG34 infantry machine guns in the fuselage sides. It often needed the assistance of a tow-plane or rocket motors to get off the ground, especially when heavily laden. It could carry around 16.25 tonnes (16 tons) of payload, and had seats for 130 passengers (though many more were carried in evacuation operations, for

Below: The heavily laden 'Gigant' - this is an Me 323 - proved sickeningly vulnerable to air-to-air attack. In April 1943, no fewerthan 20 were shot down in one operation.

GOTHA Go 244B
Type: Transport
Length: 15.80m (51.83ft)
Span: 24.50m (80.38ft)

Max take-off weight: 7800kg (17,196lb)
Max speed: 290km/h (180mph) at 3000m (9800ft)
Range: 740km (460 miles}
Armament: 4 x 7.92mm MG 34 machine guns

Above: Like the Messerschmitt 'Gigant', the much smaller Gotha Go 242 also made the transition from glider to powered aircraft, becoming the Go 244 in the process.

example). It first became operational in November 1942, and was used to supply units of the Afrika Korps from a base in Sicily. Although it was largely successful, it did have its spectacular failures. On 22 April 1943, no less than 21 Me 323s, ferrying petrol, were shot down in a single operation. Production continued until mid-1944, and around 200 examples were built in all.

THE Ju 322 'MAMMUT'

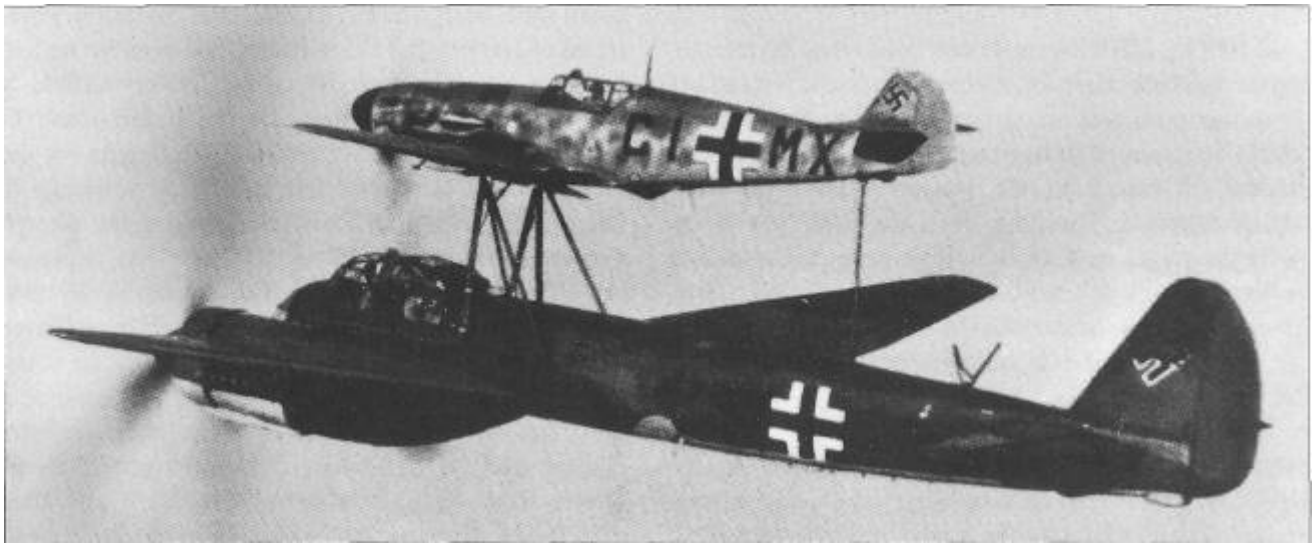
The heavy glider Junkers produced was anything but conventional. Designed by Heinrich Hertel, it was simply an enormous flying wing, inside which it carried almost all of its payload, with a tall fin carried on a boom-like extension at the tail. In overall form it was somewhat reminiscent of the Junkers-G 38, a commercial passenger-carrier which made its first flight in 1929. On RLM instructions, the Ju 322 was constructed entirely from wood. With a span of 62m (203.5ft) and a length of 30.25m (99.25ft) it had a wing area of 925m^2 (9952 sq ft). The centre section of the wing's straight leading edge housed a top-hinged loading door, with a glazed cupola to the port side of it containing the flight deck. The upper surface of the wing was flat, and there was considerable dihedral on the lower surface. At the centre point, it was over 3m (9.8ft) thick. The prototype did fly in April 1941 but by that time its payload had been cut to half of the required 22.35 tonnes (22 tons) as the 'cabin[1] floor was simply not up to the task: a tracked vehicle actually broke through it during loading trials and the aircraft proved to be chronically unstable. It landed safely and was towed back to the airfield at Merseburg. Given a larger tail fin in an attempt to counter the instability, it made a few more test flights before the project was abandoned on the orders of the RLM. It was then cut up for fuel, along with a completed second aircraft and the components of 98 more which were already in the process of construction.

THE GOTHA Go 242/244

Somewhat more practical than either of the giant gliders and more numerous by far was the Gotha Go 242. It was a shoulder-wing monoplane with a simple square-section fuselage culminating in twin booms linked by a cross-plane to form the tail. A loading ramp at the rear of the fuselage pod let down to allow loading and unloading of a small vehicle such as the amphibious Kübelwagen, or 21 fully equipped troops. Over 1500 were built, of which 133 were converted into Go 244s, fitted with two VOOhp Gnome-Rhone engines in forward extensions of the tailbooms.

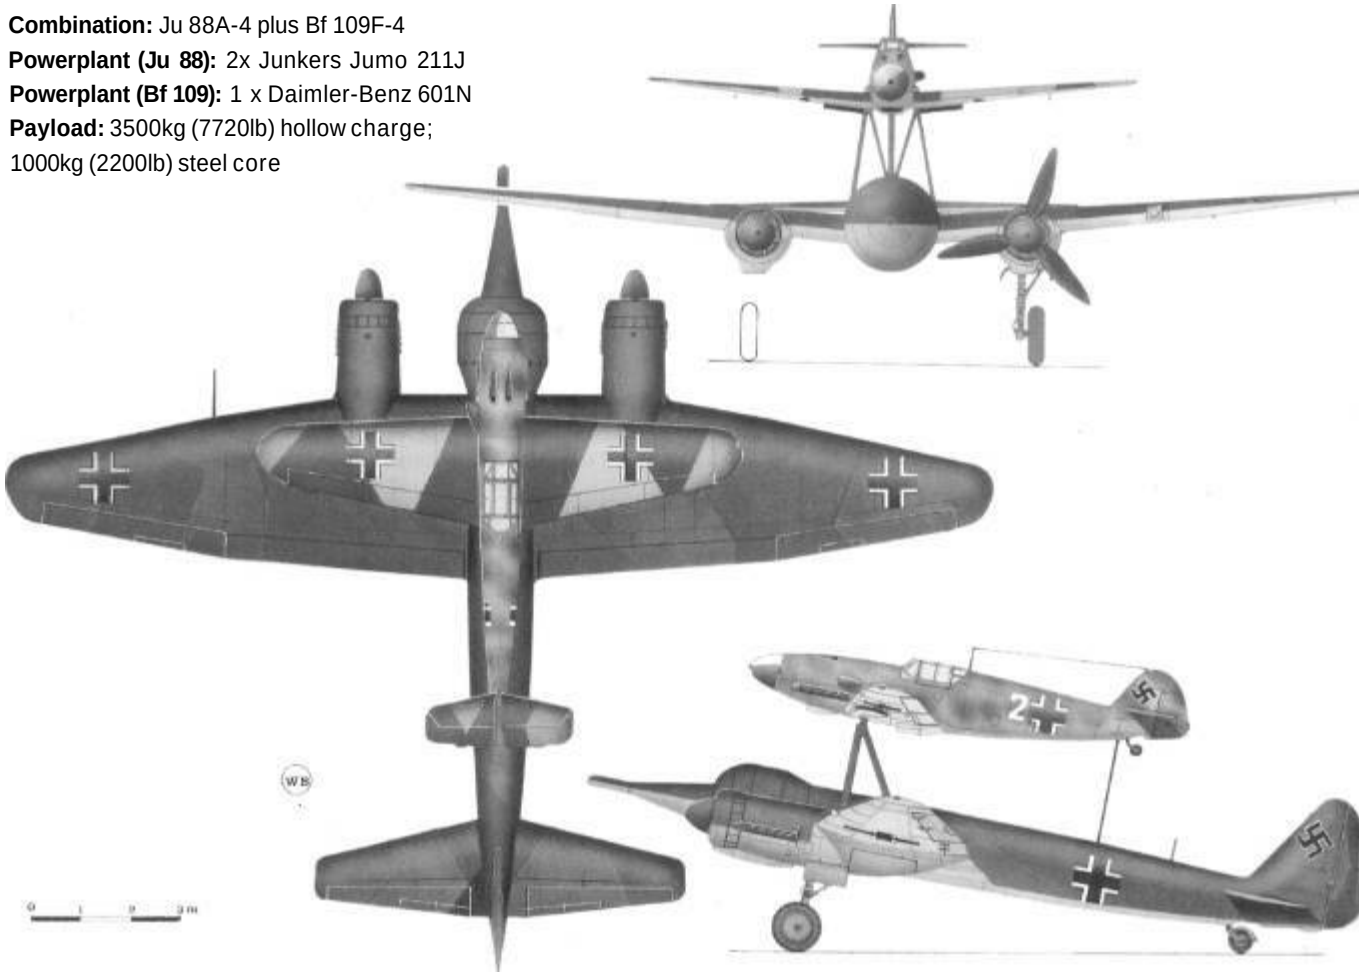
A few of the gliders were converted to allow them to alight on water; they carried a small catamaran assault boat with a 1200kg (26461b) explosive charge suspended between its hulls. The mission profile envisaged for them saw the pilot setting down near an enemy ship and taking to the assault boat, setting off in it at high speed toward the ship and locking the controls before baling out to be rescued later by seaplane or submarine. No such mission ever took place, though it is worth remembering that members of the Italian Navy's Xth MAS flotilla disabled the cruiser HMS *York* with explosive-packed motor boats at Suda Bay in Crete in March 1941, so the idea was not that far-fetched.

HYBRID AND COMPOSITE AIRCRAFT



Engineers on both sides during World War II gave considerable thought to the problems associated with guiding unmanned explosives-packed aircraft to a target. We shall see in Chapter Five how the USAAF used remotely controlled B-17s to complete the destruction of V weapons sites in France in 1944, but long before that, in 1940, the RLM had turned the problem over to DPS. The parameters the Institute was given included supporting parasite fighter aircraft and refuelling heavily loaded bombers in flight as well as guiding a flying bomb to its target zone, and the first tentative solution was to tow one aircraft with another using either a flexible cable or a semi-rigid bar which could contain or support a fuel hose. There was a persistent belief that such a system had merit, and experiments with it continued until 1945, but by late 1941, one of the Institute's teams had begun to work on a means of mounting one aircraft on another, piggyback-style, and in January 1942 the 'Mistel' ('Mistletoe') concept received official approval. Soon, Junkers and autopilot-maker Patin were ordered to collaborate with DPS, and within little over a year, work had begun on assembling a prototype combination of Ju 88A-4 and Bf 109F-1.

'MISTEL' 1

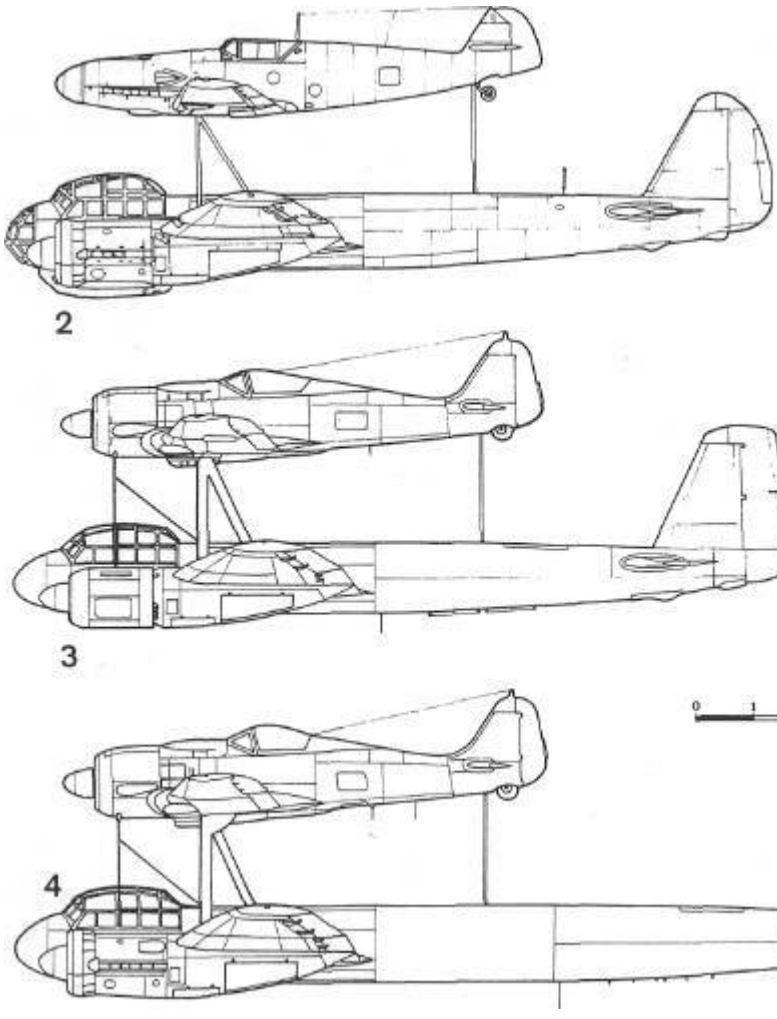


DFS's first task had been to devise a suitable structure to co-locate the two aircraft so that the stresses acting on them would be transmitted between the two main spars, with coupling links which could be sundered either mechanically or explosively. The result was a pair of tripod struts, the apex of which hooked into plates on the underside of the Bf 109's wing roots, the two outer bases of each located on load-bearing plates which traversed the main spar, while the inner legs located on to it directly through the fuselage top. A single pole supported the Messerschmitt's tail and kept the fuselage axes parallel. In later combinations, the fighter sat at a 15-degree nose-down angle.

The steering and control system was located in the rear of the Junker's fuselage and consisted of a master compass, a steering compass and a three-axis autopilot from Patin. This apparatus was used to steer the combination in normal flight via servos and two simple thumb switches in the fighter's cockpit, one for rudder and ailerons, the other for elevators, with the fighter's controls remaining free. However, the two aircraft's control systems could be linked, and thus operated from the fighter by the usual combination of stick and pedals (via servos, once again), at will. Either the bomber's two engines alone, or all three, could be used, depending on the speed and range required, all fuel being supplied from the host aircraft. This was by no means the only modification needed to the bomber component - in fact, the aircraft were virtually gutted and rebuilt - but the amount of work needed on the fighter was minimal. In order to accommodate the explosive 'warhead', the existing Ju 88 nose section, including the glazed cupola which formed the cockpit cover, was removed entirely, and a solid bulkhead built up. The 3500kg (7720lb) hollow charge, with its distinctive proboscis-like extension

Below: One of the earliest'Mistel' combinations (they were known unofficially as 'Vater und Sohn' - father and son) matched the Messerschmitt Bf 109F with the Junkers Ju 88A-4. Testing began in July 1943.

'MISTEL' 1
Combination: Ju 88A-4 plus Bf 109F-4
Powerplant (Ju 88): 2x Junkers Jumo 211J
Powerplant (Bf 109): 1 x Daimler-Benz 601N
Payload: 3500kg (7720lb) hollow charge; 1000kg (2200lb) steel core



Above: The operational 'Mistel' (this page) paired a fighter with a bomber whose nose was replaced with a warhead. Trainers (facing page) retained the standard nose.

and 1000kg (22001b) steel core, could then be mounted on the bulkhead; for training missions, a standard two-man nose section, stripped of all non-essentials, could be mounted in its place. Operationally, the procedure of launching the bomber component was straightforward. The pilot lined the combination up with the target in a shallow dive using his standard reflecting gunsight, activated the automatic pilot, and then broke free. Some elected to attempt to suppress local flak before setting out to return to their base.

'MISTEL TARGETS REVEALED

The first flight of the combination took place in July 1943, and the testing procedure was successfully completed by October, by which time development work on the warhead was well advanced and 15 combinations had been ordered from Junkers, who were responsible for the conversion itself. By April 1944, a small unit, designated 2/KG101, and under the command of Hauptmann Horst Rudat, had been set up and had begun training, initially at the Junkers airfield at Norhausen, later at Kolberg on the Baltic coast. In mid-month, a staff paper outlined the targets for the unit (initially with just five pilots) as shipping in Scapa Flow, Gibraltar Roads and Leningrad, though the latter two were soon rejected as being impractically far away. Scapa Flow was chosen as the first objective, and the aircraft were to take off from Grove in Denmark and cross the North Sea following a line of pre-positioned radio buoys. Planning had reached a fairly advanced stage when the Allies landed in Normandy, and in mid-June, 2/KG101 moved to St Dizier, from where five 'Mistels' took off just after dark on 24 June to attack shipping in the Baie de la

'MISTEL'SI

Combination: Junkers Ju 88G-10 plus Focke-Wulf Fw190A-8

Seine. Four of the five aircraft involved were reported to have hit shipping targets, the fifth pilot jettisoning his host bomber after a mechanical failure.

Over the course of the next four months, more units were trained in the operation of the combination and two more 'Mistel' raids took place, one on shipping in the English Channel, the other on Scapa Flow. Neither was successful. In the course of the latter, three aircraft crashed and the other two failed to find the target. By now, other combinations had been ordered which paired more recent models of the Ju 88 with Fw 190s, and the factory at Bernberg was producing them from new - not re-cycled - aircraft. Attention turned east in November 1944, and training for Operation 'Eisenhammer' commenced, which was a campaign aimed at destroying electrical power stations in the Soviet Union. As the Allied armies closed in on the Reich from east and west, bridges in particular became important targets, and through the spring of 1945, it was against river crossings and bridgeheads that the 'Misteln' were used exclusively. The last operation took place on 16 April 1945.

Many other combinations of aircraft types were projected (and in some cases built) for use in 'Mistel' operations, including Dornier Do 217K/DFS 228, for reconnaissance, the host aircraft acting as a mobile, high-altitude launch pad; Do 217/Fw 190, for pathfinder missions, the fighter protecting the host aircraft; and Ta 154/Fw 190, Me 262/Me 262, Ju 287/Me 262 and Ju 268/He 162 combinations, all of which were proposed for use against high-value targets, where approach speed might have been thought to make ä significant difference. By 1945, DFS was working on remote-control systems using both the radio link and the television guidance system specially devised for the Hs 293 guided bomb (see Chapter Seven). A test aircraft had been prepared, but it was destroyed by fire before trials could begin.

Deutschland

CHAPTER FOUR

Rotary-win g Aircraft

Rotary-wing aircraft were first demonstrated as early as 1907, but it was 1936 before a satisfactory design for a helicopter was developed, in Germany. The Reich's scientists took the lead in this field, and by 1945 had developed operational rotary-wing craft and demonstrated just how effective they could be in combat conditions.

Rotary-wing aircraft can be divided into two basic types: autogiros and helicopters. Autogiros, such as that devised by Juan de la Cierva, derive their lift from their forward momentum, which is supplied by a conventionally positioned propeller, and their rotors are unpowered. They can take off only with a run, they cannot fly except in the forwards direction, and they cannot hover, but they can descend and land almost vertically. Cierva made the first successful flight in an autogiro in January 1923, having found that it was necessary to articulate the blades where they joined the hub. For some years, autogiros seemed set to overshadow true helicopters, examples of which had been flying since 1907, but once Cierva's articulated rotor head arrangement was adopted, the latter surged to the fore once more, although work on autogiros continued, too. By the late 1930s, Germany had become the centre of helicopter development; in the period up to May 1945, almost 20 rotary-wings of different types were designed there, including autogiros,

Above: The Flettner Fl 282 'Kolibri' was a fully operational helicopter despite its somewhat rudimentary appearance.

Left: 'Dare anything' test pilot Hanna Reitsch shows off the Focke Achgelis Fa 61 inside Berlin's *Deutschlandhalle.*

Above: The Fa 223 'Drache' {'Kite') was the first truly viable transport helicopter. This example was constructed in Czechoslovakia after the war, from salvaged parts.

girogliders and manned kites. The only work of any note undertaken elsewhere was that of the Russian emigre Igor Sikorsky in the United States. Sikorsky made his first experiments with rotary-wing flight in 1909, but did not achieve comparative success until 30 years later, though he was to become crucial to the type's development.

THEFOCKEACHGELISFaGI

In the early 1930s, Professor Heinrich Karl Focke began building CiervaC.19 autogiros under licence in Germany - and separately from his partnership with Georg Wulf - and soon began experimenting with helicopters. Focke collaborated with Gerd Achgelis, who flew a Kurt Tank-designed Fw 44 'Steiglitz' ('Goldfinch') in aerobatics displays (as did Ernst Udet), and soon produced a design for a twin-rotor helicopter, the Fa 61. This resembled the Cierva machine in that it was composed of a conventional fuselage with a front-mounted radial engine (a BMW Bramo Sh 14, of 160hp), but differed in having two outrigger-mounted three-bladed rotors, driven by shafts in centra-rotation to neutralise torque effect. There was a small conventionally placed propeller, but only to assist engine cooling. The tail had a fin and rudder and top-mounted stabilisers, and the craft sat on a tail-wheel undercarriage but with a nose wheel to prevent it from nosing over. The rotors had cyclic pitch control (that is, the angle of attack of the individual blades was varied during the rotation cycle) which gave longitudinal and directional control, and differential operation of the two cyclics gave lateral control by inducing asymmetric lift. The Fa 61 made its maiden flight in the hands of Ewald Rohlfs on 26 June 1936, lasting 28 seconds. But by the following year, Rohlfs was setting and breaking records regularly. On the anniversary of the maiden flight, he established a height record of 2440m (8000ft) and an endurance record of lhr:20min:49sec. The following day he set straight-line and curcuit distance records and a speed record of 122.553km/h (76.1 mph) over a 20km (12.5 mile) course. Hanna Reitsch broke the straight-line record with a flight of almost 109km (67.7 miles) between Bremen and Berlin four months later, and in February the following year, she actually flew the helicopter inside the *Deutschlandhalle* in Berlin to demonstrate its controllability. On 29 January 1929, Karl Bode established a height record which was to remain unbroken for some time when he took the machine to 3427m (11,240.5ft).

The Fa 61 was hardly a secret weapon. Indeed, it was developed very publicly and was really little more than a concept demonstrator, but there was much better to come both from Focke Achgelis and from a competitor, Anton Flettner, during the course of the war. The Wehrmacht was quick to appreciate the operational possibilities the type opened up. In 1938 Focke Achgelis began work on a genuine transport helicopter known originally as the Fa 266 'Hornisse' ('Hornet'), and later as the Fa 223

'Drache' ('Kite'). The new aircraft was essentially an enlarged version of the Fa 61, with the same boomed-out twin-rotor layout, but it was much more powerful, with a supercharged 650hp Bramo 323 Q3 'Fafnir' engine, and more flexible and easier to fly, thanks to the introduction of collective pitch control. Previously, ascent had been controlled by the throttle, a very hit-and-miss affair; with the introduction of collective pitch control, the degree of lift was controlled by adjusting the pitch of the rotor blades, and engine speed stayed constant. The fuselage, 12.25m (40ft) long, was fabricated from steel tubes and covered with fabric except on the engine compartment, where sheet metal was used. It was divided into four compartments: the cockpit, with seats for pilot and observer; the load compartment, with a starboard-side door, where self-sealing fuel and oil tanks were also located; the engine compartment; and the tail section, which was a conventional fin and rudder with a top-mounted stabiliser, adjustable for trim.

UNUSUAL ENGINE MOUNTING

The method of mounting the engine was somewhat bizarre. Both it and the gearbox were located in two large-diameter rings, which were attached to four longitudinal fuselage members by adjustable cables, with struts to prevent fore-and-aft movement. There was a gap in the fuselage covering at the forward end of the engine compartment, through which cooling air entered, and another at its after end, whence it escaped. The rotor blades were made from wooden ribs attached to a high-tensile steel tube, and covered with plywood and fabric. The rotor discs were inclined inwards by 4.5 degrees, and slightly forwards, and normal speed of rotation was 275rpm, a 9.1:1 reduction from engine speed.

The 'Drache' (it was also known as the 'Draken': 'Dragon') could carry up to four passengers in the load compartment but during troop manoeuvres in 1944, it carried 12 fully equipped soldiers, the other eight travelling outside on tractor seats on the outriggers. Its total payload capacity was around 1.27 tonnes (1.25 tons). A Fieseier 'Storch' aircraft and a Volkswagen car were lifted in demonstrations, and small field pieces were transported during army manoeuvres; large loads were slung from a winch on a load-bearing beam via a port in the aircraft's floor.

The Fa 266 prototype was completed at the end of 1939 and, by now redesignated as the Fa 223, made its first free flight in August 1940 after more than 100 hours of static and tethered hovering trials. Karl Bode flew it to the RLM test centre at Rechlin in October 1940, and set a batch of new records: a speed of 182km/h (113mph); a vertical rate of climb of 528m (1732ft) per minute; and an altitude of 7252m (23,295ft) where normal operational limits were 120km/h (74.5mph) and 4880m (16,010ft). The RLM promptly ordered 30 for evaluation in the anti-submarine, reconnaissance, rescue, training, and transport roles and it was decided before series production commenced to build standardised aircraft which would be equipped according to the requirements of their mission.

The first prototype, -VI, was wrecked on 5 February 1941 after having made 115 flights, when a power failure occurred while it was in a low hover. In June 1942, the second and third prototypes, along with seven pre-production machines and much of the tooling, were destroyed in an air raid. Production was then moved from Bremen to Laupheim in southern Germany but did not restart until February 1943. More aircraft were destroyed when the new factory was bombed in its turn, in July 1944, and as a result, the number of Fa 223s completed was probably no more than 12. Three were still in operational service at the end of the war; one was destroyed by its pilot and two were seized by the Americans. One of them was subsequently flown to England by Helmut Gersenhauer, the Luftwaffe's most experienced helicopter pilot, and was flown for around 170 hours in trials before crashing from a height of 18.3m (60ft). After the war, development of the Fa 223 continued in France (with Professor Focke's assistance) and in Czechoslovakia, where two were constructed from salvaged parts. That the Fa 223 was not more widely produced, when all concerned agreed that it was a useful addition to the Luftwaffe's catalogue of aircraft, is understandable only within the terms of the struggle for the allocation of resources going on within the Third Reich at the time. Clearly, it had no champion sufficiently powerful to push it high enough up the list of priorities. Had -V12 not broken down when transporting the captured Italian dictator, Benito Mussolini, from the hotel on the Gran Sasso in September 1943 when he was rescued by Otto Skorzeny, perhaps things might have been different!

THE Fa 225

The Luftwaffe's interest in gliders dated back to the time before Germany was permitted an air force, when the only means she had of training pilots was to set up gliding clubs and schools. As well as acting as

Above: The Fa 330 was not a true helicopter but an unpowered girokite; it was designed to be towed behind a submarine as an observation platform.

a valuable means of instructing personnel, gliders were to become important in themselves in a number of roles. The first operational use of a glider to transport troops and equipment directly into combat occurred on 10 May 1940, when Luftwaffe paratroops siezed and held the Belgian frontier fortress of Eben-Emael after landing on it in DPS 230 gliders. This was to be the most effective type in German service during World War II, but it could be employed only where there was a suitable, fairly large, landing site. Focke Achgelis suggested improving on this by substituting a three-bladed rotor unit from an Fa 223 for the wings of a DFS 230, producing what was in effect an externally powered autogiro or giroglider, which, when cast loose, would simply autorotate to the ground at a very steep angle of approach, and would thus be able to land in an area not much larger than itself. It was to be towed behind the Luftwaffe's maid-of-all-work, the Ju 52, and in tests carried out during 1943, it was found to be practicable to land it and come to a halt within 18.3m (60ft). Though the Fa 225, as the hybrid glider was known, worked well enough, by the time it was ready to go into production, the Wehrmacht's operational requirements had changed and the project was shelved.

THE Fa 330'BACHSTELZE'

The Fa 225 was not the only unpowered rotary-wing aircraft Focke Achgelis was to design. Early in 1942, the company was asked to devise a simple single-seat girokite to be towed behind a submarine, from which an observer would be able to monitor a much wider area than would a look-out stationed on the boat itself. The result, the Fa 330 'Bachstelze' ('Water Wagtail'), was simple in the extreme: two steel tubes, the shorter, which supported the rotor assembly, being set at right-angles to the longer, which held the simple rudder assembly and the pilot's seat and rudimentary controls, by means of which he could tilt the rotor head (which gave longitudinal and lateral control) and turn the rudder to change direction. The pitch of the rotor blades could be adjusted, but not in flight. Coarse pitch gave the best flying performance, but made launching rather more difficult. The Fa 330 was launched by setting the rotor turning (by hand if there was a wind; by means of a rope wound around a drum in the rotor head if there was not) and then pushing the whole machine backwards. Recovery was by means of a winch under normal circumstances, but in an emergency, the pilot could release the rotor, which deployed a parachute from its stowage behind the pilot's seat as it flew off. The winch held 150m (492ft) of towing cable, which permitted the kite to fly at an altitude of 120m (395ft); from there, the horizon was 4()km (25 miles) away, a marked improvement over the 8km (5 miles) horizon from the boat itself. Without its pilot, the girokite weighed 82kg (1801b), and could be assembled and dismantled in a matter of minutes. Minimum speed required to stay aloft was 27km/h (17mph).

Something like 200 Fa 330s were produced by Weser-Flugzeugbau and were deployed aboard Type IX ocean-going U-boats, but little is known about their operational history beyond the fact that two or three crewmembers from each boat were taught how to fly them in the wind tunnel at Chalais-Meudon near Paris. They were said to be very easy indeed to operate, and would fly quite happily hands-off for short periods, but were unpopular with their pilots for reasons of self-preservation.

AMBITIOUS FOCKE DESIGNS

Focke Achgelis also produced two very much more ambitious designs, one of them, the Fa 269, for a convertiplane, which would have landed and taken off vertically but then turned the shaft carrying the rotors

through 90 degrees to bring them to the position of pusher propellers. Such an arrangement (but employing more efficient tractor propellers) was not to be successfully introduced until Boeing-Vertol perfected the V-22 Osprey in the late 1980s. The Fa 269 was really little more than a flight of fancy, and it is to be doubted if the technology of the day could actually have realised it. The Fa 284 was much more practical, being, in effect, a stretched version of the Fa 223, with a fuselage which was largely of lattice construction and twin 1600hp BMW 801 engines. Tt was designed to carry heavy loads underslung, in exactly the same way as its 1970s equivalent, the Sikorsky S-60 (CH-54B) 'Flying Crane', did. Some parts are said to have been manufactured before the project was cancelled in late 1943 and plans were drawn up to produce a twin Fa 223, essentially two aircraft joined, in-line, by a short fuselage section. This section is known to have been produced, but the complete aircraft was not.

By far the most adventurous of Professor Focke's designs was presented under the auspices of Focke-Wulf rather than Focke Achgelis. Known as the 'Triebflügel' ('Thrustwing'), this was a tail-sitting VTOL (Vertical Take-Off and Landing) aircraft which derived its lift from three wings which rotated around the fuselage just aft of the cockpit, under the power of tip-mounted ramjets giving about 840kg (18501b) of thrust, the wings being brought up to operating speed by three jettisonable rockets. In flight, the wings would be rotated around their individual axes until they became conventional aerofoils as the aircraft itself rotated until its axis was horizontal rather than vertical. No real development work was ever done on the concept, and the viability of the design is a matter of speculation, but three tail-sitting VTOL aircraft were built post-war, two in the USA and one in France. The American designs, from Lockheed and Convair, were somewhat more conventional, in that they used fixed wings and contra-rotating propellers in the nose, while the French SNECMA 'Coleopter' was powered by a tail-mounted turbojet and had an annular wing, control being achieved through four swivelling fins. All three aircraft flew after a fashion, but all projects were eventually cancelled. The objective has since been achieved by vectoring the thrust of a turbojet in a more-or-less conventional airframe.

ANTON FLETTNER

Having turned his attention to the problems of rotary-wing flight in 1930, Anton Flettner first produced a helicopter with two 30hp Anzani piston engines mounted on the ends of two rotors, each turning a two-bladed propeller. While this arrangement eliminated the problems associated with torque (which the Focke Achgelis designs overcame by means of two contrarotating rotor sets, and which other designers,

Below: The Fl 282 was the most sophisticated of all German helicopters of World War II. This later version - captured by US forces - even had protection for the pilot.

notably Sikorsky, counteracted by means of a powered tail rotor), it was only marginally successful in other ways. When it was destroyed during tethered testing, it was not rebuilt. Flettner next built a two-seat cabin autogiro for the *Kriegsmarine* (German Navy) but the single example of the Fl 184 caught fire in flight and was also destroyed.

THE Fl 185 AND Fl 265

Clearly, Anton Flettner was still searching for a valid way forward, for his next design, designated the Fl 185, was substantially different again, almost a cross between a helicopter and an autogiro, its 140hp Siemens-Halke engine being linked to a single rotor and two variable-pitch pusher propellers located on outriggers. For vertical take-off and landing, the aircraft functioned as a helicopter, the majority of the power going to the rotor, and the two conventional propellers, providing thrust in opposite directions, only counteracting the torque. For forward flight, the rotor autorotated and the two propellers received all the power and gave forward thrust. The Fl 185 flew only a few times before Flettner abandoned it and turned his attention to a new design using synchronised intermeshing contra-rotating twin rotors (like those of the Kaman H-43 'Huskie' of the 1960s) with differential collective pitch control.

The single-seat Fl 265 was very similar in appearance to the Fl 185, with its front-mounted radial engine with cowl and cooling fan, enclosed cockpit and stubby tailfin. However, gone were the Fl 185's outriggers and propellers, and the rotor head assembly, with its paired, inclined shafts, each with a two-bladed rotor, was much more complex. The design was completed in 1937, and the following year, the *Kriegsmarine* ordered six aircraft for evaluation purposes. The prototype made its maiden flight in May 1939, and was later destroyed when its rotor blades struck each other in flight.

Other Fl 265s were used extensively for operational trials with naval units - cruisers in the main, but also submarines - in the Baltic and the Mediterranean with considerable success, and completely validated the concept of deploying VTOL aircraft with warships. Aircraft also operated with army units, both in the reconnaissance and logistical roles, and a Luftwaffe trial involving a Bf 109 and an Fw 190 fitted with camera guns demonstrated that the helicopter was very difficult to shoot down. The two fighters, amongst the best in the world, we may recall, attacked the Fl 265 for 20 minutes but tailed to score a single hit. The outcome of the various trials was that Flettner was ordered to proceed with volume production. In fact, he had already proceeded with the design of an updated version, the two-seat (some prototypes were single-seat) Fl 282 'Kolibri' ('Hummingbird'), and it was this aircraft which went into manufacture.

THE Fl 282'KOLIBRI'

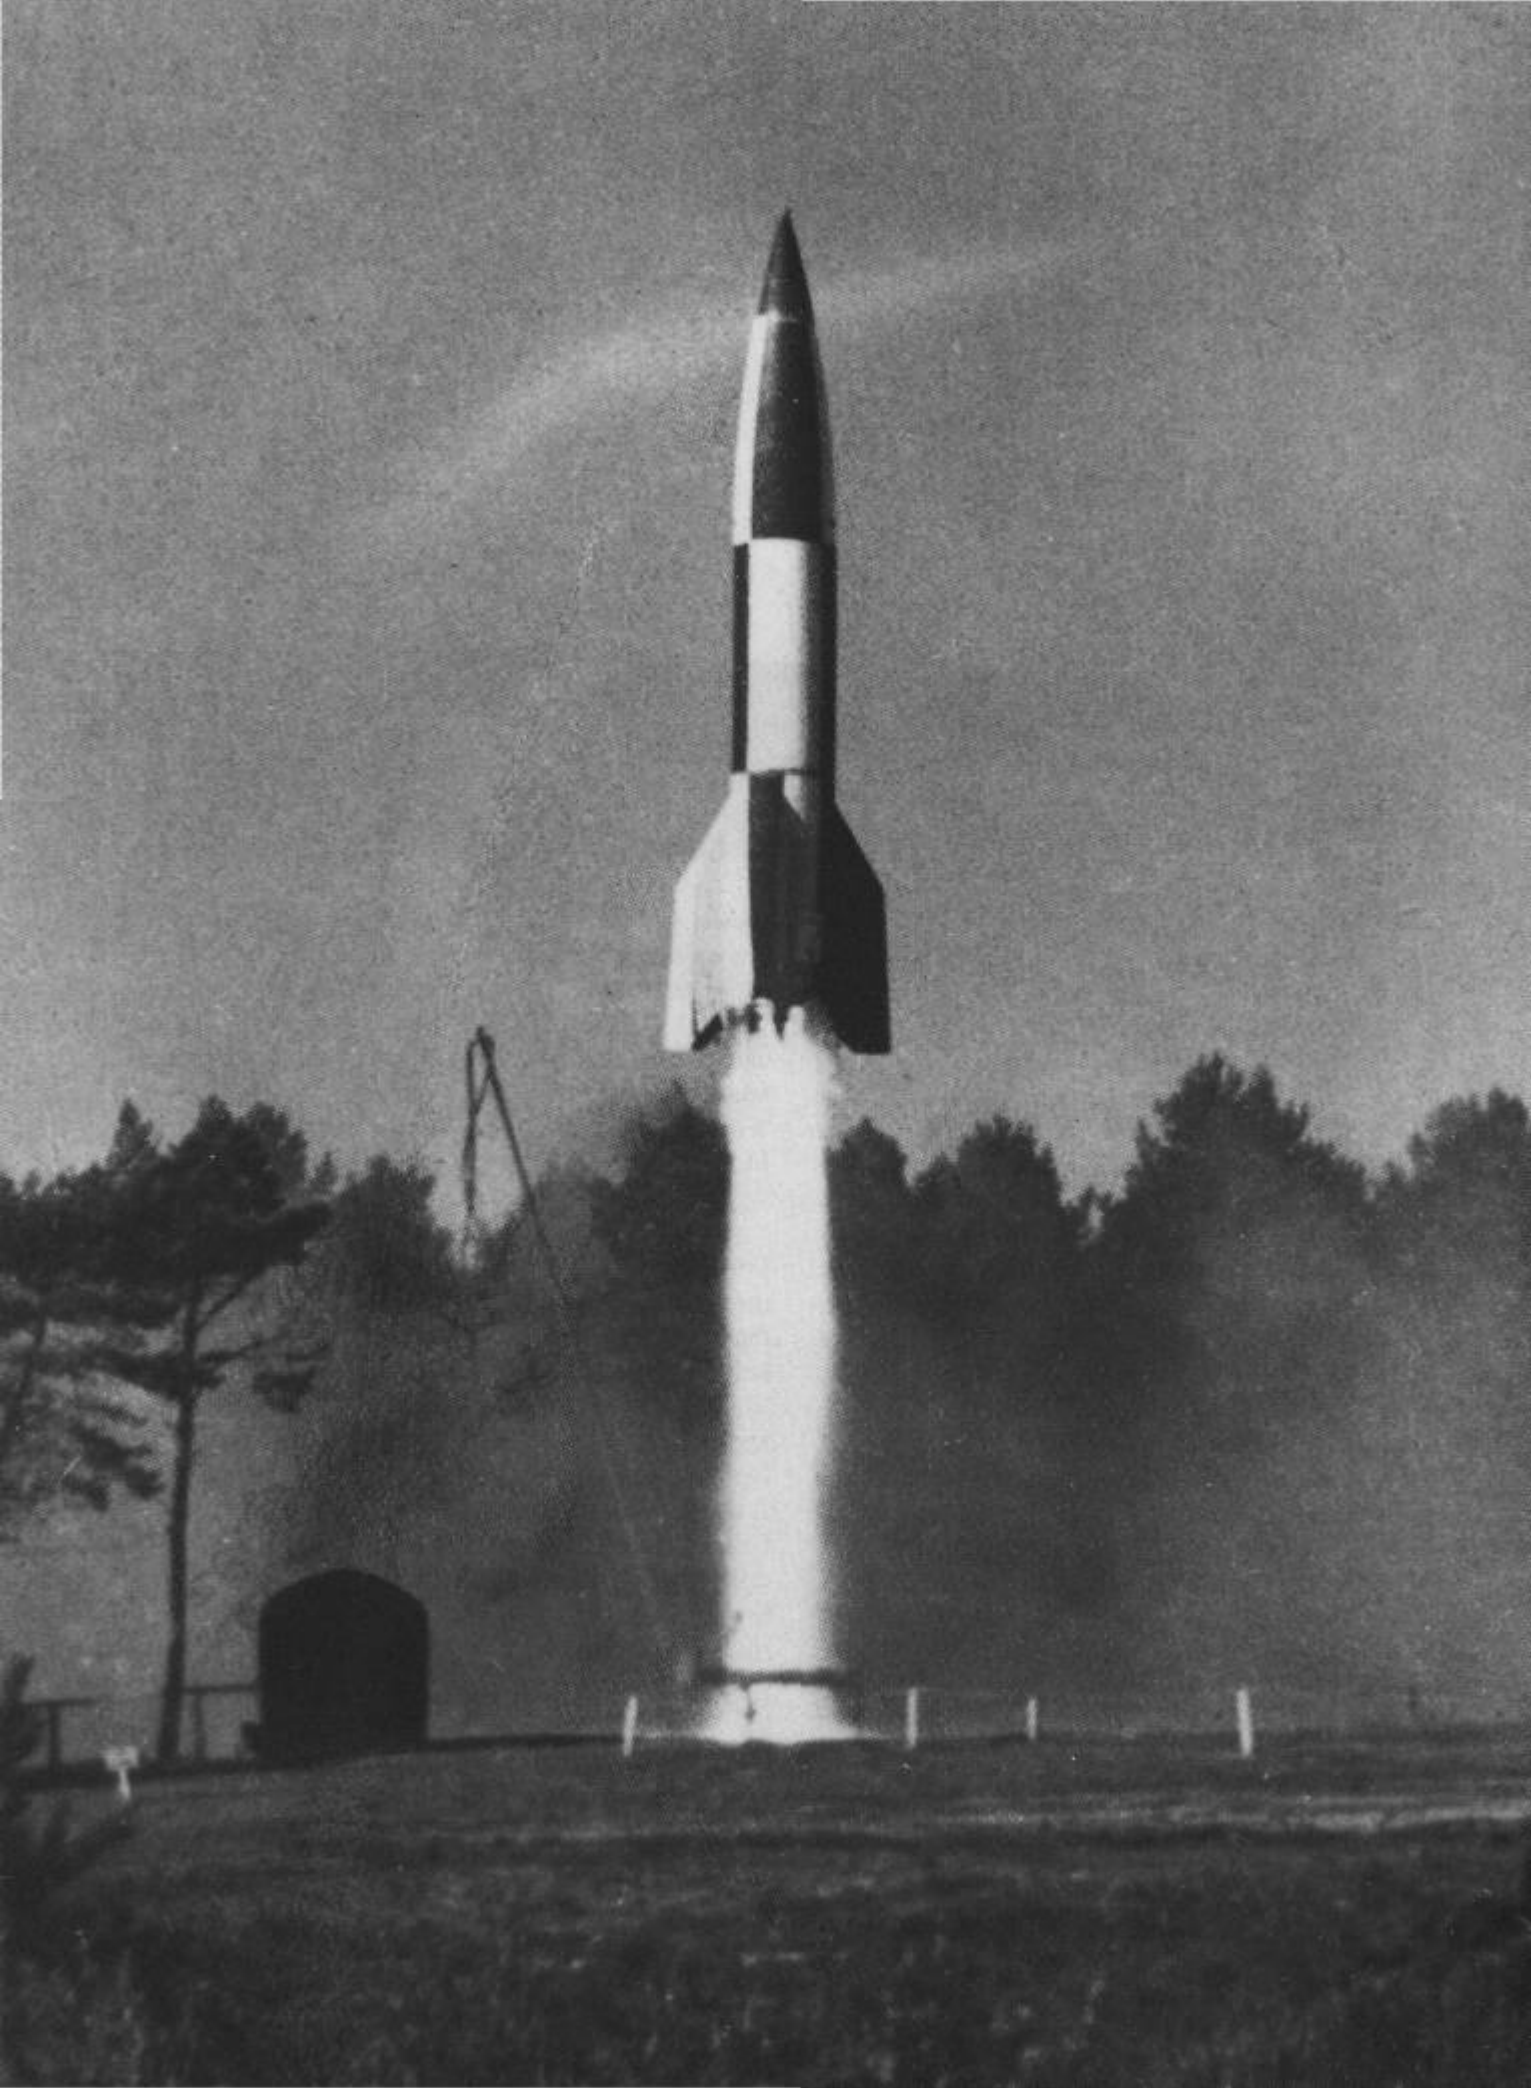
The most important modification Flettner made to the design of the new aircraft was to re-locate the engine behind the pilot's seat, which gave him and the observer a much-enlarged field of view. The drive was taken off the front of the crankshaft through a reduction gearbox and transmitted up and back through a

Below: The Fl 282 was ordered in 1944 after sea trials aboard the cruiser *Köln* had shown it could be flown even in adverse conditions. Only Allied bombing prevented the aircraft going into service.

FLETTNER Fl 282 V21
Type: Single-seat open-cockpit helicopter
Length: 6.56m (21.52ft)
Max take-off weight: 1000kg (2200lb)
Max speed: 150km/h (93mph) at sea level
Range: 170km (106 miies)
Ceiling: 3290m (10,800ft)
Armament: None

Above: An American airman examines the tiny rotor-tip jets which Friedrich von Doblhoff proposed to use to eliminate the effects of engine torque in his WNF 342.

universally jointed drive shaft and a cross-shaft connecting the two rotor shafts, which were set at an inclusive angle of 24 degrees, and inclined forward by 6 degrees. The rotor blades were mounted so that they were parallel when they were at 45 degrees to the aircraft's centreline. The fin and rudder were much larger than in previous Flettner designs, steering being accomplished by a combination of rudder movement and differential collective pitch control.



The 'Kolibri' proved to be very satisfactory indeed, despite a pronounced vibration period as the engine was run-up, with a maximum speed in level flight of 150km/h (93mph), a vertical rate of climb of 91.5m/min (300ft/min), a hover ceiling of 300m (985ft), and a service ceiling of 3290m (10,800ft). Its range, with just the pilot and maximum fuel aboard, was 300km (185 miles). Some 50 pilots were trained to fly it, most of them by Flettner's test pilot, Hans Fuisting. It was extremely manoeuvrable and very stable and at forward speeds in excess of 60km/h (37mph) could be flown hands-off once the controls were balanced.

SEA TRIALS

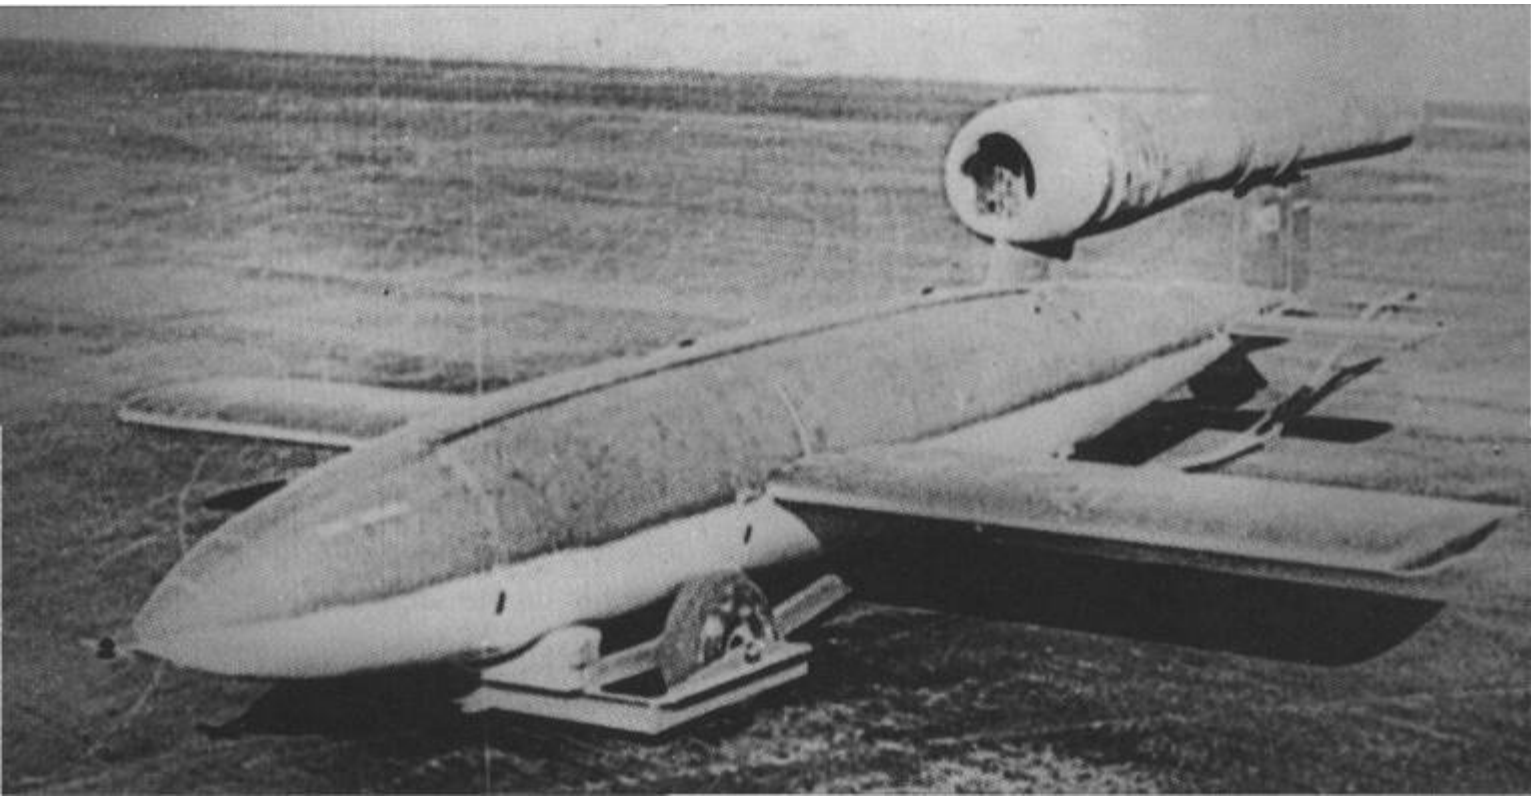
From 1942, trials at sea aboard the cruiser *Köln* demonstrated that the aircraft was usable even in very poor weather conditions, and by the following year, 20 were in service with the *Kriegsmarine* in the Mediterranean and the Aegean. In 1944, an order for 1000 Fl 282s was placed with BMW, which began tooling up for production at its Munich and Eisenach plants, but before manufacture could begin, both they and the Flettner works at Johannisthal were very badly damaged by Allied bombing. Anton Flettner went on to design a 20-seat passenger helicopter, the Fl 339, but never got beyond the development stage.

THEDOBLHOFF/WNF342

Friedrich von Doblhoff is rather less well-known than the other helicopter pioneers in the Third Reich, but the machines which he designed, and which were built by Wiener Neustadter Flugzeugwerke in the Vienna suburbs, represented yet another innovatory approach to the solution of the torque problem. Doblhoff used small rotor-tip jets to drive the blades. A combustible air/fuel mixture was fed to small combustion chambers in the rotor tips using a compressor driven by a conventional piston engine. The mixture travelled by way of the rotor hub and passages in the rotors themselves, before being ignited. The piston engine also drove a small fan which blew air over the tail surfaces for the purpose of steering. Only four prototypes were built; the first three had fixed-pitch blades, and were only ever used in static/tethered tests, but the fourth had a most ingenious (and very complex) arrangement which allowed collective pitch control. The last prototype was behaving well in its trials and had been flown at speeds of up to 45km/h (28mph) when the programme was halted by the arrival of Soviet forces in 1945.

CHAPTER FIVE

Surface-to-Surface Missiles

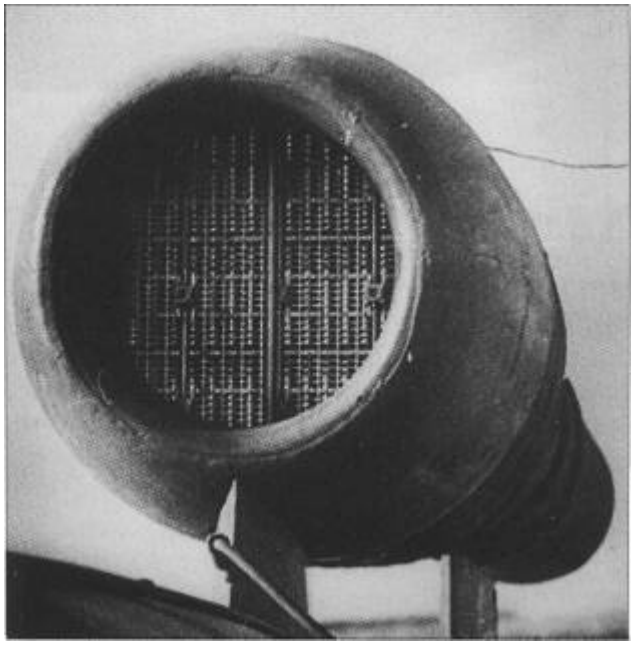


Until the outbreak of World War II, rocketry was hardly a science at all; until then it had consisted of really nothing more than a few scattered and sporadic attempts to shoot small projectiles straight up into the sky, virtually for the sake of it. All that changed when it became clear that the rocket had potential as a long-range weapon of war, and nowhere was this potential better understood than in Germany, where much of the pioneering work on rockets had been done anyway.

Most famous of the German secret weapons of World War II - and by far the most effective - were the surface-to-surface missiles used to bombard the United Kingdom and targets on the mainland of Europe, particularly the port of Antwerp, from late June 1944. As well as the so-called 'Vengeance Weapons', the VI and V2, there were other types (though only one was operational, and then only in a very limited sense), designed to supply data on flight characteristics and to act as concept vehicles for operational types. Not surprisingly, given the success of the V2 ballistic missile, there were plans to develop it still further, though none passed the prototype stage, and most existed only on paper. Many of the scientists and engineers who worked on Germany's rocketry programme went on after the war to become prime movers in the rocketry and space exploration programmes of both the United States of America and the Soviet Union, and were thus instrumental in both putting man into space and establishing a technology which has become a mainstay of modern civilisation.

Above: The Fi 103 R-the manned VI.

Left: This A4 - or V2 - was captured by British forces and fired by British scientists near Cuxhaven in 1945.



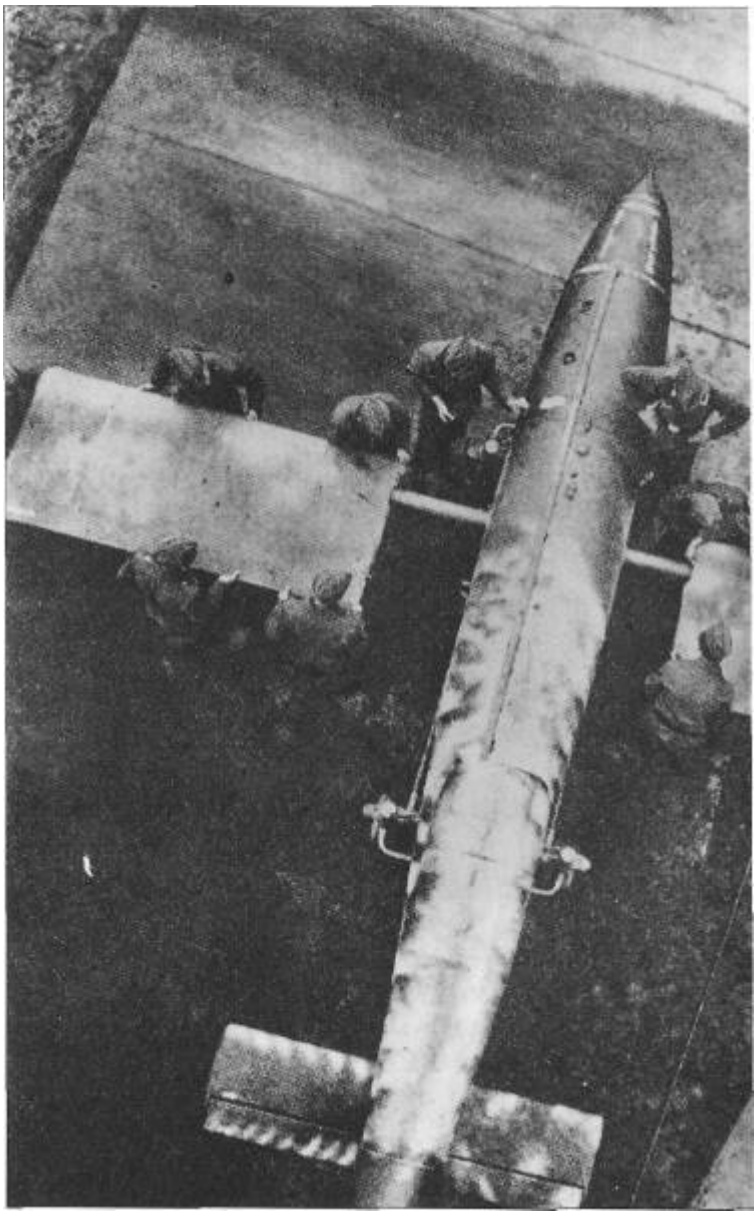
THEFIESELERFM03-THEV1

The Vergeltungswaffe l (the revenge, or retaliation, weapon), or V1, had a plethora of names. To the Luftwaffe, it was the Fliegerabwehrkanonezielgerät 76 (Flakzielgerät 76, or just FZG 76), but that was a cover-name: *Fliegerabwehrkanonezielgerät* means 'anti-aircraft gun aiming device' or conceivably 'anti-aircraft gun target device'. Its official codename was 'Kirschkern' ('Cherrystone') and it was also known as 'Krahe' ('Crow'); while to the RLM it was the Fi 103; and to the airframe manufacturers, Fieseler, it began life as P. 35. To the British public it was the Buzz-bomb, the P-Plane or the Doodlebug, while the RAF knew it as 'Diver'. In effect a first-generation cruise missile, it was an unmanned air-breathing jet aircraft with an explosive warhead and a simple guidance/targeting device, and to relate its history from the very start, we need to go back to 1928.

Paul Schmidt worked primarily in the associated fields of fluid dynamics and aerodynamics, but in 1928 he began experimenting with a simple form of thrust engine known as a pulse-jet. In essence, a pulse-jet is a tubular combustion chamber with a matrix of small, rectangular, spring-loaded flap-valves at the front, into which a suitable fuel (it need be no more exotic than petrol, and low-octane petrol, at that) is injected. The device must be accelerated by

Above: The infamous V1 self-propelled guided bomb. The proto-cruise missile carried a warhead of 830kg (1832lb) of amatol to targets up to about 240km (150 miles) away.

Below: The Argus pulse-jet - small flaps in the aperture were forced open against a spring by air pressure and forced shut by fuel exploding in the jet pipe behind.



some external means to a critical threshold velocity, something of the order of 300km/h (I86mph), before it will work, though there is the option to supply it with air under sufficient pressure and in sufficient quantity by means of a blower system. As the device travels forward, air is forced past the flap-valves and into the tube; the act of opening the flap-valves opens a second valve, which admits a quantity of petrol under pressure into the tube to form an explosive mixture (in exactly the same way that a petrol engine's fuel injection system does), and also activates a sparking plug. The primary result of the explosion is to blow shut the flap-valves, closing off both air flow and petrol flow, and this has the secondary effect of turning aimless explosion into directed thrust. As the pressure within the tube is reduced to below that of the air trying to rush into the engine from the front, the flap-valves are forced open again, and the whole process is repeated, and so on, many times per second; for example, the Argus 109-014 engine used in the operational Vis cycled 47 times per second.

CHEAP AND SIMPLE

In addition to its inability to self-start, the pulse-jet motor has other limiting factors: it works less effectively as the ambient air pressure drops, and functions poorly at much above 3000m (9800 feet); it operates at a fixed speed, though the dimensions of the combustion chamber can be varied to modify it; and the flap-valves are liable to burn out after a relatively short time. But it has several things in its favour, too: firstly, it works; secondly, it is simple to manufacture; and thirdly, it costs very little.

All in all, it was just the thing to power a short-range surface-to-surface missile, and this was one of the uses Schmidt suggested for it after failing to interest anyone in a vertical take-off aircraft powered by it. He submitted a design to the RLM in 1934. Initially it was poorly received, but after a number of rather more eminent scientists, including Wernher von Braun, took up Schmidt's case, both the RLM and the *Heereswaffenamt* (HWA - the German Army's weapons development and procurement office) took more notice. At last Schmidt got development funds, even if not in great amounts. By 1940, Schmidt's pulse-jets were giving over 500kg (1 lOOlb) of static thrust, but the RLM had started to look elsewhere for alternative developers. It looked, in fact, to the rather more prestigious Argus Motoren-Gesellschaft, where Dr Fritz Gosslau and his team began to develop a pulse-jet engine from first principles. They were not permitted to see Schmidt's engine until March 1940; they adopted his valve system in part, but mostly stuck with their own design. By the end of the year, they had produced a small engine of 150kg (3301b) static thrust, and on 30 April 1941 this engine made its first flight, beneath a Gotha Go 145 two-seater biplane trainer. During the summer, small cargo gliders made flights under pulse-jet power alone, which validated the concept, but it was a further year before the RLM took the next step, and on 19 June 1942,

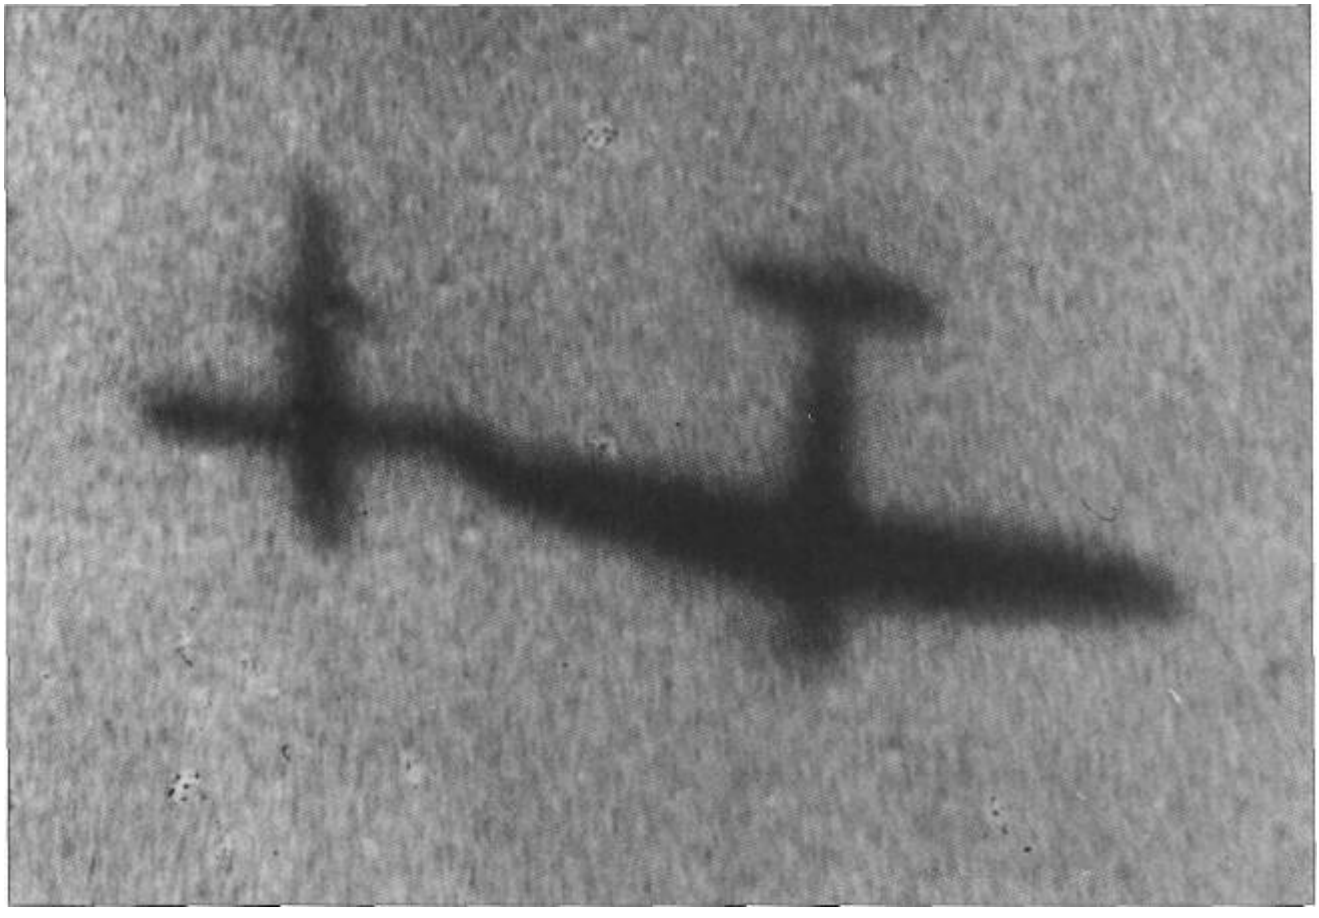
Above: The flying bombs were delivered to the launch sites dismantled, but it was a simple process to assemble them. Here the VTs wings are being introduced over the tubular main spar.

Above: V1s were launched on ramps by steam catapults. When they reached around 400km/h (250mph), their own powerplants took over and the guidance system took them in a gentle climb to their cruising altitude.

ordered Gerhard Fieseler to begin developing an airframe for a flying bomb. In the meantime Argus carried on developing the powerplant, Walter began work on a catapult launching system, and Siemens set out to produce a guidance system using an existing autopilot as a basis.

The airframe was actually the work of Robert Lusser who, we may recall, was involved in the original P. 1065 project at Messerschmitt, and Willy Fiedler. Development took 18 months, and it was early December of 1942 before the first (unpowered) example was launched from an Fw 200 'Condor' over the test range at Peenemiinde-West, to be followed by the first catapult launch on Christmas Eve. In one form or another, a total of perhaps 350 missiles were expended in the course of testing. At the start, testing did not proceed smoothly. The situation was complicated by the necessity to test all the components together, which made fault isolation difficult, but eventually the design of the air intake and the fuel-supply system were identified as the seats of the worst problems, and when they were re-thought, the bomb flew much more reliably. However, it flew considerably more slowly than had been envisioned, at around 600km/h (370mph), which made it vulnerable to interception by existing fighter aircraft. Consequently, there was a non-stop programme to improve the Vl's performance, both by upping the output of the Argus 109-014 motor (by injecting nitrous oxide into the combustion chamber, for example) and by replacing it with a more powerful unit such as the 109-044 or the Porsche 109-005 turbojet - both of which produced 500kg (1 lOOlb) of static thrust - or by an unspecified ramjet. By the war's end, experimental models were flying at almost 800km/h (500mph). By then, they were faced with much faster interceptors, such as the jet-powered Gloster 'Meteor' which scored its first combat victory on 4 August 1944 when it destroyed a VI by tipping it over with its wingtip to destabilise it. This was not as risky a manoeuvre as one might think, and was deemed preferable to shooting the flying bombs down at close range, with the attendant risk of damage to one's own aircraft. In fact, the Vis were a much easier target for guns on the ground than they were for aircraft, since they flew straight and level and at a fixed speed; more were destroyed by this means than by any other.

DESIGN MODIFICATIONS



Not entirely surprisingly, the guidance system and its installation proved to be problematic, too. The first difficulty actually showed up before the Fi 103 airframe was completed, and involved the positioning of the engine vis-ä-vis the fuselage. Tests carried out with engines mounted on Do 17 and Ju 88 aircraft showed that the pulse action produced considerable vibration, particularly if the exhaust stream passed over the fuselage, and so the design was modified to move the entire engine aft so that it overhung the tail by some considerable extent. Close attention had to be paid to the mountings, and eventually a system was adopted which combined a pivoted yoke at the front secured with a single pinned lug to the tail fin, both of the mountings in rubber bushes. However, there were still problems with vibration. The guidance system itself relied on a gyroscope for control in all three axes, linked to a master compass set to the desired heading before launch for azimuth control, and an aneroid barometer for altitude control. Corrections were transmitted to the servo-motors acting on the

rudder and elevators by means of compressed air. The distance flown was computed by means of an air-log driven by a small airscrew in the nosecone, and when a predetermined figure had been reached, a pair of detonators exploded, locking the elevator and rudder and deploying two spoilers, forcing the aircraft into a dive. This somewhat complicated procedure was necessary because the temperature in the jet pipe was high enough, even after just a few seconds' running, to sustain ignition alone, as there was no critical timing to worry about, and so the rather simpler method of cutting the current to the spark plug would have had no effect. It would perhaps have been possible to cut the fuel supply instead, though since the fuel system was pressurised this was not entirely predictable either, and in any event, it was actually more desirable for the vehicle to go into a powered dive. For some time the fuel did tend to cut out as the VI tipped over. This was not a feature, but a fault which was eventually corrected.

The bomb was equipped with three different types of fuze: an electrical impact fuze, powered by an onboard battery and with a resistor/condenser circuit which held enough charge to detonate the device if the battery connection was severed on impact; an

Below: Since V1s flew at a constant speed, at constant height and on a straight course, it was relatively simple for anti-aircraft gunners to establish a box barrage, particularly at night when the jet flare was obvious.

Above: The preferred way to destroy the bombs from the air was to tip them off course - not as risky a business as one might suppose. The aircraft pictured in this gun camera shot is, from its wingform, a Spitfire.

electro-mechanical all-ways fuze with a trembler switch; and a mechanical (clockwork) delayed fuze. The impact fuze had three actuators: one in the nose and one in the belly (both of which functioned by pressure); and an inertial switch in the fuze itself. The fuzing system was so good that of the first 2500 to hit the UK, only four failed to go off.

The launch system was less problematical than other elements, and employed a simple steam catapult, the steam being generated by the reaction of the same T-Stoff and Z-Stoff (basically hydrogen peroxide and calcium or potassium permanganate, as we might recall) used in rocket motors. The catapult track was a slotted tube 42m (138ft) long, inclined at an angle of six and a half degrees (later, a track half that length was employed), on a concrete and steel bed, within which a dumbell-shaped free piston ran. The piston incorporated a fin which protruded through the slot in the tube, and engaged with a simple trolley on which the missile sat. The slot was sealed by a tubular strip which trailed behind the piston to be forced into the slot by the pressure of the steam. The fuel to generate the steam was contained in tanks on a trolley, which also held the forged steel steam generation chamber, secured to the rear of the launch tube by a bayonet fitting. Alongside the rear of the ramp, there was a starter unit which contained the equipment necessary to get the pulse-jet operating.

LAUNCHING THE V1

The launch procedure was straightforward. The pulse jet was fired up and allowed to run for seven seconds, bringing it up to the correct operating temperature. The valve on a large bottle of compressed air was then opened by remote control, forcing 60 litres (13.2 gallons) of T-Stoff and 5 litres (1.09 gallons) of Z-Stoff into the steam generation vessel. Their reaction generated a large volume of super-heated steam, and as soon as the pressure in the chamber built up sufficiently, a restraining bolt sheared, whereupon the piston was free to travel up the tube, carrying launch trolley and missile with it. By the time it reached the end of the track - little more than half a second later,

having been accelerated at a rate of around 16 *g* - the whole assembly was travelling at around 400km/h (25()mph) and the pulse-jet had started to run independently. The piston was literally fired out of the tube and fell to earth some distance away (along with the launch trolley) to be recovered later, while the flying bomb began its climb to operational height at a rate of about 150m (492ft) per minute. The guidance system corrected its course as it went, and the aneroid capsule reset the elevators for level flight when the pre-determined altitude was reached.

The Fieseler Fi 103 A-1, the original and technically most common version of the flying bomb, was about 8m (26ft) long. Its wingspan was of around 5m (17ft) although there were two different wings produced in slightly different form and dimensions, and it had a maximum fuselage diameter of 0.84m (2.75ft); the warhead comprised 830kg (18321b) of Trialen (amatol), which was sometimes supplemented by incendiary bombs. Provision was made to replace the explosive with gas, though this never happened in practice. A full load of 75-80 octane fuel added 515kg (11331b) to the all-up launch weight total of 2180kg (48061b). It had an autonomous range of 240km (150 miles) at a maximum speed of 645km/h (400mph), and an operational ceiling of 3000m (9800ft). It was fabricated from sheet steel pressings, with an aluminium nosecone and sheet-steel wings around a single tubular steel spar. The emphasis was on keeping costs to a minimum, and little effort was put into reducing weight by employing more exotic materials. In 1945, the Fi 103 F-l was produced. Basically similar to the A-l, its warhead contained

Below: Very few V1 s were recovered intact after they had been brought down, but some failed to explode and gave up their secrets instead. Here, RAF personnel are seen examining one in a bean field, somewhere in Kent.

FIESELER Fi 103 (V1) STANDARD MODEL

Type: Cruise missile
Length: 8.32m (27.3ft)
Span: 5.30m (17.39ft)
Launch weight: 2180kg (4806lb)
Max speed (later models): 800km/h (497mph)
Range: 240km (150 miles)
Warhead: 830kg (1832lb) of amatol

Above: The Fieseler Fi 103, to give the V1 its official name, was unleashed in earnest against England in Operation Boxroom, which began in June 1944.

436kg (9621b) of amatol, and its fuel tanks were enlarged from 568 litres (125 gallons) to 756 litres (166 gallons), increasing range to 370km (230 miles).

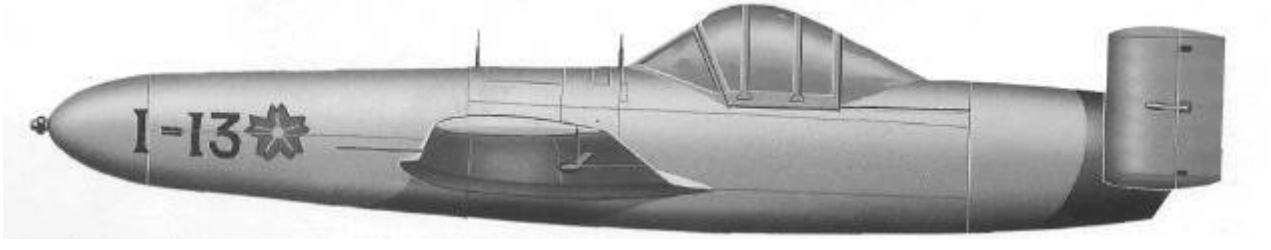
THE V1 CAMPAIGN BEGINS

The first operational Vis were launched in the early hours of 13 June 1944. Just 10 missiles were deployed: four crashed immediately; two fell into the sea; and four hit the Home Counties (one in Sussex, one near Sevenoaks in Kent, one in the south-eastern suburbs of London, and one in Bethnal Green, north of the Thames). Two days later, *Unternehmen Rumpelkammer* (Operation Boxroom) commenced in earnest, and between 2200 hours on 15 June and 12 noon the following day, 244 Vis were launched, most of them against London and some against Southampton which was the re-supply base for the invasion force, even then trying to fight its way out of the beachhead in Normandy. More than half of the flying bombs launched (144 in all) crossed the English coast, and 34 were shot down by anti-aircraft guns and fighter aircraft.

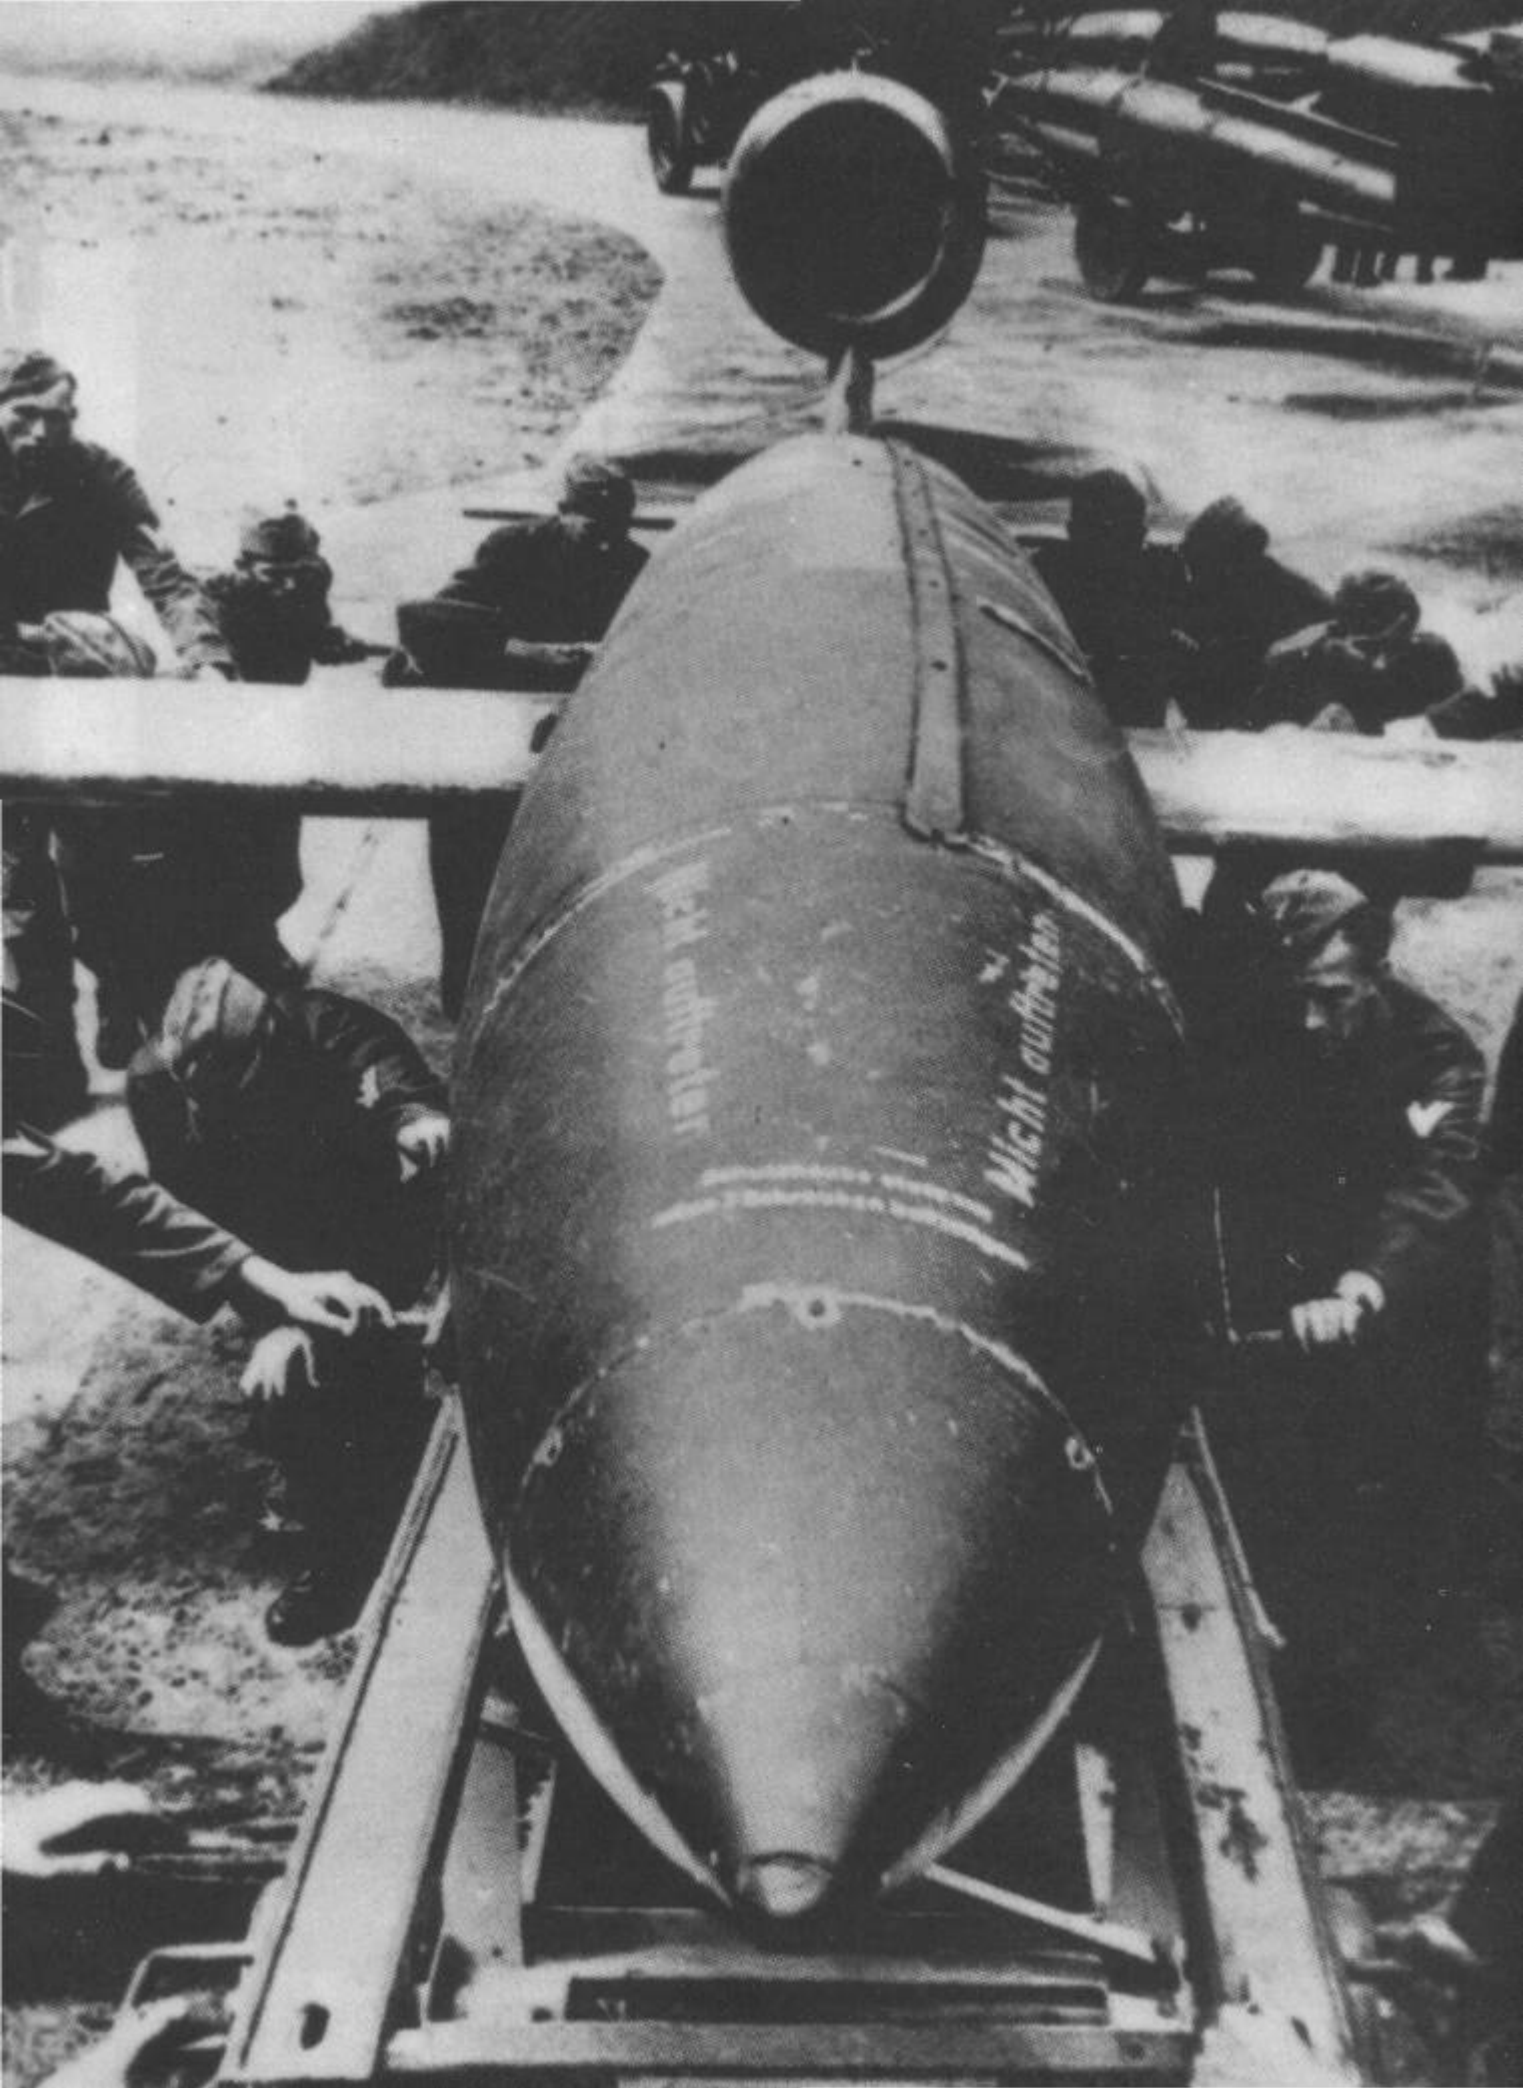
This campaign from launch sites in the Pas de Calais continued until the end of August, by which time Allied troops were closing in. The Luftwaffe's Flakregiment 155 (W), its name a cover like the FZG 76 designation, had been set up in August 1943 under the command of Colonel Max Wachtel, and it packed up and moved to Holland with the intention of concentrating activities on Antwerp. By that time, it had launched 9017 missiles, 6725 of which had reached England. As many as 2340 landed in the Greater London area, the vast majority of them exploding as planned. Other reports suggest that 8892 missiles were launched with the UK as their target during the entire war, and still others put the total at fractionally over 10,000. As early as 7 July, the ground launches had been supplemented by air launches from Heinkel He 111 bombers of HI/KG 3, based at Gilze Rijen in Holland, which carried one missile each on a pylon located just outboard of the starboard wing root, and launched it at an altitude of 450m (1500ft) over the North Sea. By the end of August, over 400 missiles had been deployed in this way, mostly against London, but some against Southampton and Bristol.

Air-launched operations against targets in the United Kingdom recommenced in mid-September in a campaign which lasted until mid-January. A total of around 1200 missiles were launched (some of them at targets as far north as Manchester, though only one reached that particular objective), but only around 20 per cent of them got through to populated areas and just 66 landed on London, still the prime target in the UK. During the same period, around 1600 missiles were air-launched against Antwerp and Brussels. In all, they cost the Luftwaffe 80 aircraft shot down.

On 3 March 1945, a new campaign against London started from sites in Holland, using F-l missiles with greater fuel capacity and a smaller warhead, but this was of only very limited success. The last flying bomb landed in London on 29 March. In all, a total of 2419 Vis had hit London and 2448 had struck Antwerp (though these were not the only targets, of course), representing roughly 25 per cent of those launched. It is estimated that VI rockets were responsible for the deaths of perhaps 12,000 people. Official figures put the death toll in the UK at 6184, with 17,981 injured. Altogether, around 34,000 Vis were



produced, by Fieseler, Volkswagen (initially with a marked lack of success), and 'Mittelwerke', the underground factory at Nordhausen in the Harz mountains staffed almost exclusively by slave labour. The V1 was very cost-effective, even if it was at best only 20 per cent effective. Estimates of the unit cost vary, but around 5000 Reichsmarks seems reasonable at a time when the standard German infantry rifle, the Mauser 98K, was costing RM56, and a PzKpfw IV tank over RM 100,000.



Above: The Reichenberg IV, seen here, was the operational version of the manned flying bomb, with a warhead but without the landing skid on its belly or flaps on the trailing surface of the wings. None was ever flown in combat.

Below: The Japanese Navy also worked on a manned flying bomb, the Yokosuka MXY7 'Ohka'. Simpler than the Reichenberg, it had rocket boosters to accelerate its gliding attack and only rudimentary flight controls.

YOKOSUKA MXY7 'OHKA'

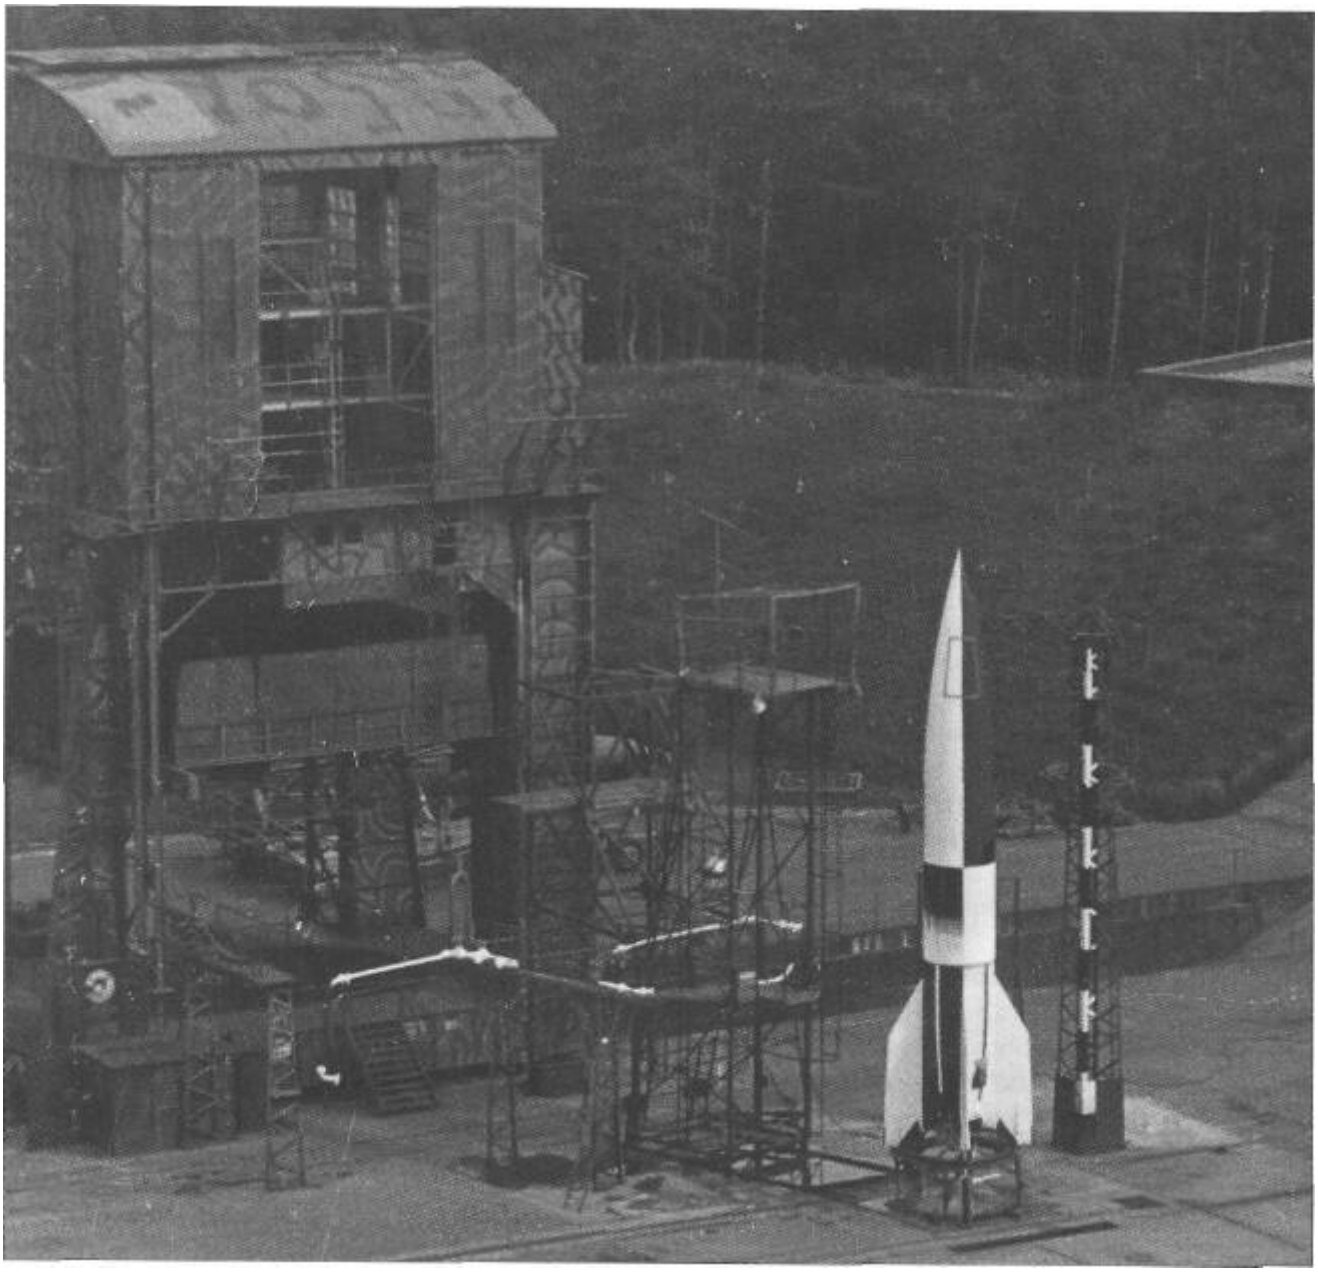
Type: Single-seat suicide missile
Length: 6.066m (19.9ft)
Span: 5.12m (16.8ft)
Max take-off weight: 2140kg (4718lb)
Max speed: 649km/h (403mph) at 3500m (11,482ft)
Range: 37km (23 miles)
Warhead: 1200kg (2646lb) of explosives

Nicht aufklappen

Left: A complete VI weighed some 2.032 tonnes (2 tons), and it was customary to manhandle it into position at the foot of the ramp on its launch cradle.

THE SELBSTOPFERMÄNNER BOMBER

Desperate times breed desperate men, and both remaining arms of the Axis began to consider formalised suicide tactics, perhaps from as early as late 1943. The most famous of these was the Japanese Kamikaze (Divine Wind) campaign against ships of the Royal and US Navies from the time of the Battle of Leyte Gulf (23-26 October 1944), but Germany, too, made preparations for the use of such tactics, the most significant of those involving a manned version of the Fi 103 flying bomb. This was actually the first vehicle considered, but it was rejected in favour of a glider version of the Me 328, while a unit equipped with Fw 190s, known as 'Kommando Lange[1], or the 'Staffel Leonidas', was formed to begin training for missions which involved the pilot placing his aircraft - carrying the maximum possible bombload - in a steep dive aimed at the target before baling out and taking to his parachute. Eventually, the Me 328 project lost momentum, and it became clear that the chances of penetrating anti-aircraft defences in a Fw 190 carrying a sufficient bombload to be effective were extremely slim.



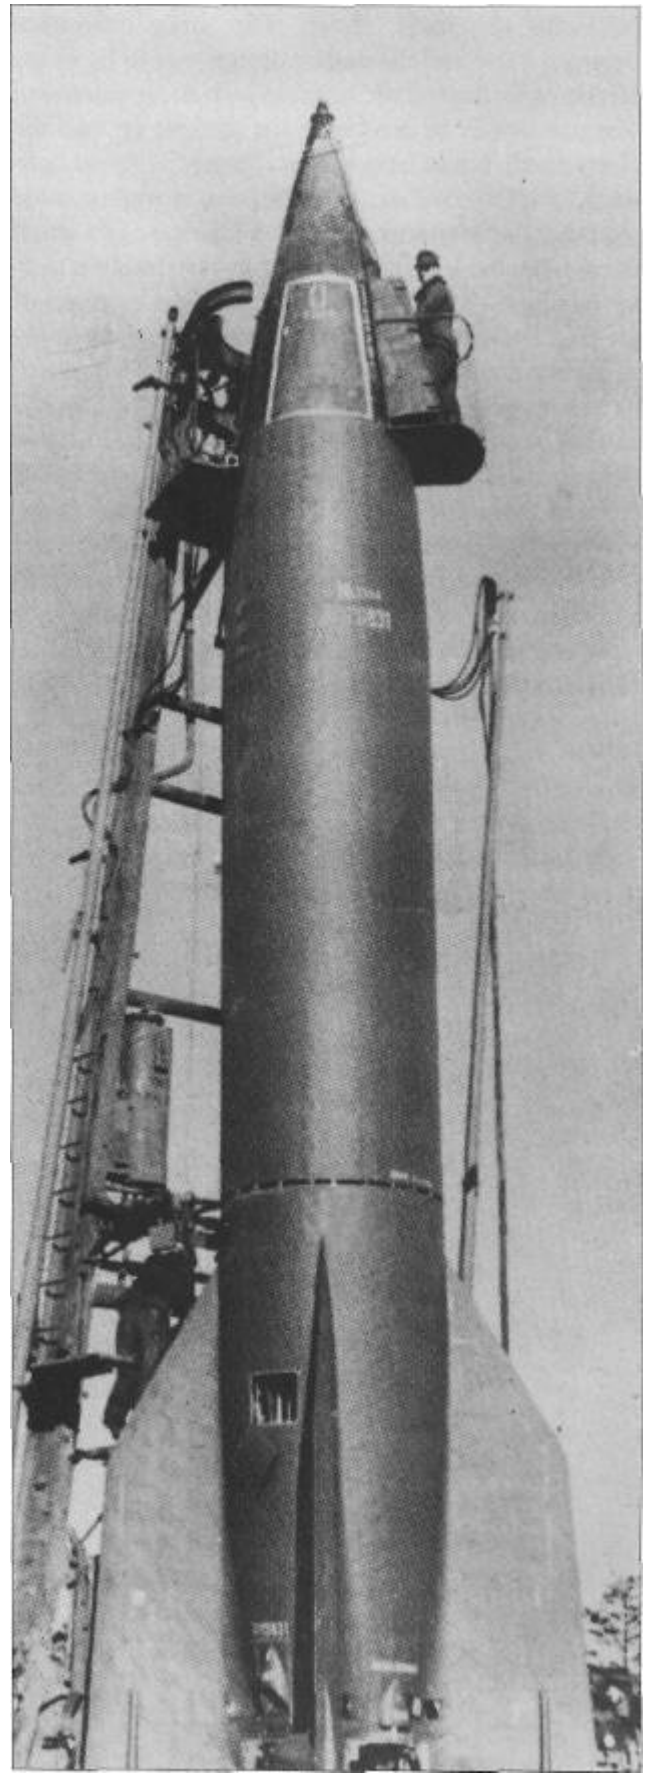
Attention returned to the use of the Fi 103. Designs for four different versions were worked up by DPS, and Henschel converted four standard VI missiles. The operational codename for the project was 'Reichenberg', and the four versions of the aircraft received 'R' prefixes, I through to IV. The Fi 103 R-I was a single-seater with ballast in place of its warhead; it had skids and landing flaps, but no motor: it was constructed for the test programme. The R-II was similar, but with a second cockpit in the nose section. The R-III was designed for advanced training, and was essentially the R-I equipped with an engine. The R-IV was the operational model, with no landing aids but with ailerons, and with the warhead reinstated. There are suggestions that the warhead might have been replaced with a cannon and the aircraft used as an interceptor, too. About 175 are thought to have been built in all.

The test pilots for the development programme were Heinz Kensche and the ubiquitous Hanna Reitsch, and they reported favourably on the aircraft's performance in flight (though there were hair-raising moments, apparently) but were not so enthusiastic about landing it. One can imagine that landing was hardly a consideration as these aircraft were never meant to be landed after use, except on training flights. The intention was for the pilot to aim the aircraft at its target and then bale out, but frankly, the arrangements made for him (or her) to exit the aircraft were somewhat cynical. The cockpit was located well aft - aft of the trailing edge of the wings - and almost underneath the motor's air intake, against which it jammed before it had been opened through the 45 degrees necessary to jettison it. Even if the pilot succeeded in freeing it, he would have had little chance of levering himself out of the cockpit in a steep dive at speeds in excess of 1000km/h (62()mph) without being seriously injured, if not killed. Although thousands volunteered for the *Selbstopfermänner* bomber programme and 70 were accepted for training, they were never asked to go into action, so in the final analysis, it is not important. Japanese pilots who flew the 'Ohka' flying bombs in the latter stages of the Kamikaze campaign were treated more honestly: they were sealed into their aircraft and knew they had no chance of getting out. The efficacy of the Japanese Kamikaze campaign gives some indication of the sort of results they were expected to achieve. Between 21 February and 15 August 1945,17 ships were sunk and 198 damaged for the loss of 930 aircraft, both flying bombs and escorts.

THE'AGGREGAT'ROCKETS

In the aftermath of the defeat of 1918, Germany was severely limited in terms of the weapons she could possess. As we noted earlier, there was a large-scale campaign to circumvent the restrictions imposed by the Treaty of Versailles by establishing development programmes abroad, but there were other avenues open, too; for instance, as early as 1929, the *Heereswaffenamt* began to look into rocketry as an alternative to long-range artillery, and set up a trials and proving ground about 32km (20 miles) south of Berlin at Kummersdorf. Captain Walter Dornberger, a professional soldier who had been sent by the Army to the School of Technology at Charlottenberg, and had earned an MA in ballistics there, was put in charge of the project in 1930 under the HWA's head, Karl Becker, himself very enthusiastic.

In 1927, a group of keen amateurs, centred on Hermann Oberth, author of *Die Rakete zu den Planetenräumen (The Rocket into Interplanetary Space),* published in 1923, formed the Society for Space Travel, the *Verein für Raumschiffahrt.* They began to experiment with rocket motors, and were funded initially by



Above: The launch pad at the Peenemünde research station, deep in the pine forests of the island of Usedom on the remote Baltic coast. All the test flights of the A4 were initiated from this site.

Fritz von Opel (who, we may recall, had commissioned a rocket-powered glider from Alexander Lippisch, and had also built a rocket-assisted car, the RAK 2), and funded latterly by a 10,000-franc prize Oberth won in 1929 for his book *Wege zur Raumschiffahrt (Ways to Spaceflight).* In 1930, a promising student named Wernher von Braun joined the Society and the following year, they successfully flew a small rocket fuelled by liquid oxygen and petrol. By then, funds were running short, but fortuitously, the Society was approached by Dornberger, who arranged for them to receive a series of small grants. In 1932, von Braun, just graduated from the Berlin Technical Institute with a BSc in mechanical engineering, went to work at Kummersdorf and by December 1934, his group had launched two liquid-oxygen- and alcohol-fuelled rockets, designated A2, which had reached altitudes of over 2500m (8200ft).

In 1935, work started on a new rocket, the A3, which weighed 750kg (16551b) and stood 7.6m (25ft) tall. It, too, was fuelled by A-Stoff (liquid oxygen, at -183 degrees C) and M-Stoff (methyl alcohol, or methanol), but this time the motor produced 1500kg

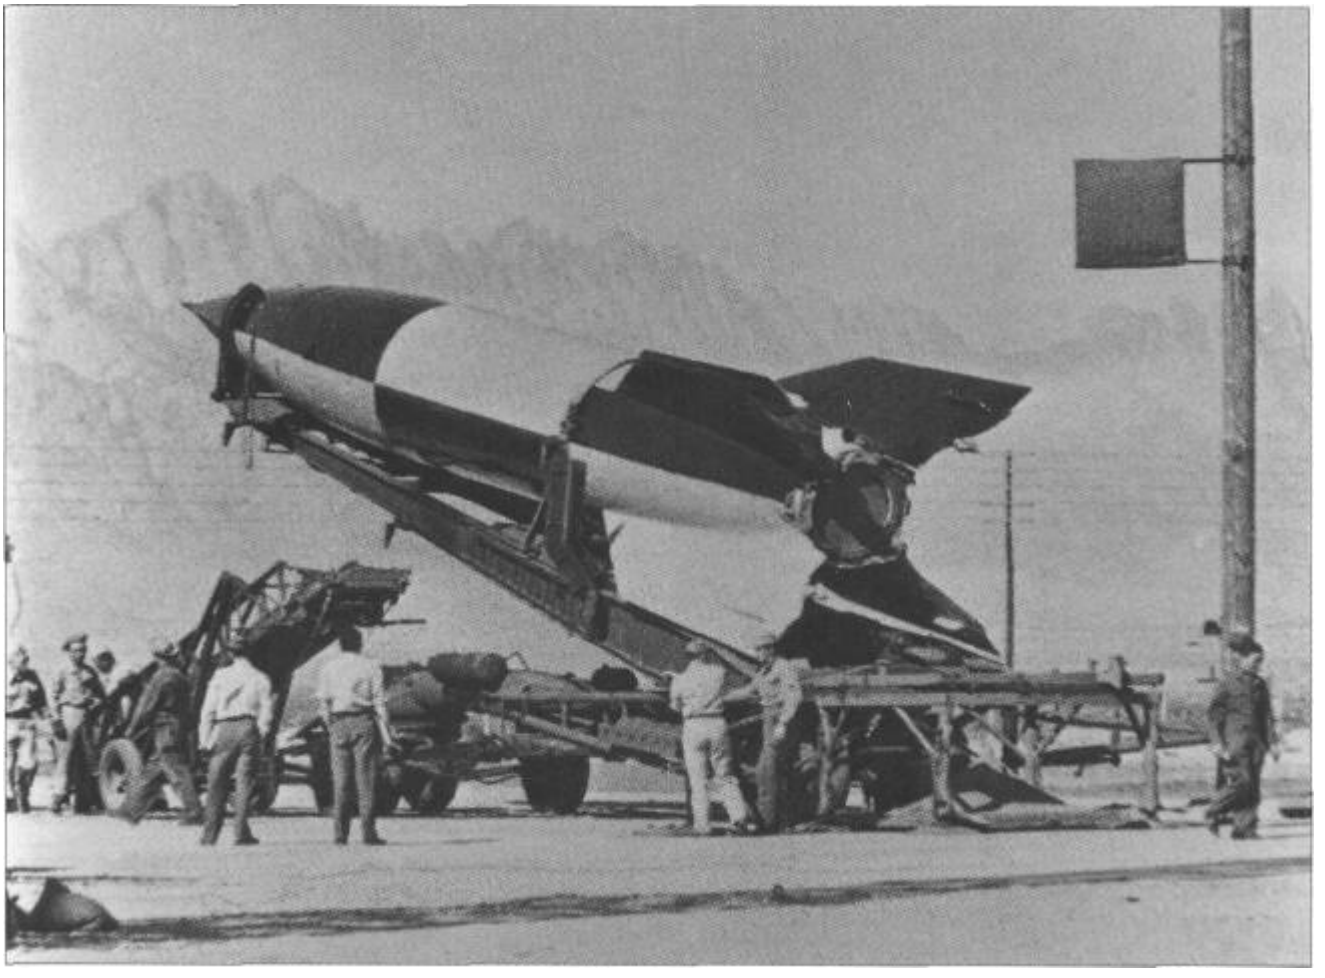
Right: A technician is photographed making last-minute adjustments to the guidance system prior to launching an A4 rocket, which has been brought to the vertical position by the mobile erector.

(33001b) of thrust for 45 seconds instead of the 300kg (6601b) for 16 seconds of the A2. More important, perhaps, was the new method of stabilisation which von Braun's team devised. Whereas the A2 was stabilised by its centre section being spun by an electric motor to create a gyroscopic effect, the A3 would have small molybdenum 'rudders' (more accurately, vanes) acting to deflect a portion of the exhaust stream under the control of gyroscopes. The A3 also had four rudimentary tail fins, though these hardly extended outside the diameter of the body. Its payload consisted of an instrumentation package, and it was to return to earth on a parachute. The first A3 launch took place on 6 December 1937 from the island of Greifswalder Oie, off the Baltic coast. The new stabilisers worked, but other elements of the design, in particular the overall aerodynamics, were faulty, and the rocket was never entirely a success, although three examples were launched.

THEMOVETOPEENEMUNDE

By then, the research group was fast outgrowing the facilities at Kummersdorf. The A2s were actually launched from the island of Borkum, off the mouth of the River Ems in the North Sea. In early 1936, the HWA and the RLM joined forces to purchase a large area of suitable land, an isolated peninsula around the village of Peenemünde on the island of Usedom, off the Baltic coast close to the present-day border with Poland. They also bought the adjacent Greifswalder Oie, and it was to this location that both moved their rocket development programmes. The Army were located to the east of the site, in an area known as *Heeresversuchsanstalt-Peenemünde* (HVP), and referred to as *Electromechanische Werke* (EMW) as a cover, where Dornberger was appointed Head of Weapon Test Section 11, with von Braun as his Technical Director. It was here that the first successful ballistic missiles the world had ever seen were developed and tested, and the name Peenemünde soon took on a new significance.

After the failure of the A3 to live up to expectations, development work on the A4, which was always intended to be a military rocket, was halted. Instead, von Braun turned to the design of another research rocket, the A5, somewhat larger than the A3



but with the same motor. The main difference between these and the earlier design was to be in the profile of its flight path, because now the requirement was not simply to send a rocket straight up into the atmosphere, but to launch it at a terrestrial target hundreds of kilometres away, and for that, a sophisticated guidance package was required. In the case of a small device like the V1, basic direction was simply a matter of aligning the launch ramp with the azimuth of the target, and then relying on a gyrocompass to apply small corrections. But steering the ballistic missile to its target would be quite another matter, since it would have to be launched vertically, and then tipped over in the precise direction of the target to an angle of 41 degrees from the horizontal and maintained there. Range was determined by the length of the burn, and that meant that propellant cut-off had to be precise and instantaneous. Cut-off was actuated initially by a radio signal from the ground, and was the only external factor applied after the launch sequence had been initiated (and this, too, being later automated). Without going too far into the intricacies of the matter, to achieve a proper degree of directional stability in a ballistic missile it is necessary to be able to control its movement in three axes: pitch (to achieve and maintain the proper angle of climb); yaw (side-to-side movement, to correct the heading); and spin, which is a natural tendency of a cylindrical body in motion, but which makes controlling pitch and yaw by means of rudders almost impossible, and which must be damped out. To make matters worse, the characteristics of the missile - in particular the all-important centre of gravity - change as its fuel is consumed, and its flight characteristics change no less drastically as it climbs into and through the upper atmosphere and then descends again on its parabolic course.

Below: The RAF launched a major raid on Peenmünde on the night of 17/18 August 1943, and caused considerable damage, particularly to accommodation blocks. Both slave labourers and research staff died in the raid.

EPOCH-MAKING RESEARCH

All in all, the problems of guidance were the most complex Wernher von Braun's team had to face, and they solved them definitively and, we may add, with nothing more sophisticated than slide-rules and mechanical calculators; it is perhaps significant that some of the first simple computers were produced to solve ballistic problems. The team used three-axis gyroscopes controlling small rudders built into the tips of the fins, supplemented by deflector vanes,

Above: Many of the A4s captured intact found their way to the United States (as did most of the development team). This A4 is being readied for launch, probably at the White Sands Proving Ground, New Mexico.

made now of graphite rather than molybdenum, in the exhaust stream during the first few seconds of flight, when the airflow over the conventional control surfaces was insufficient. The team's work on the remote north coast of Germany under increasingly difficult conditions between 1938 and 1945 was actually to change civilisation itself - if not in the sense that at least some of them intended - by enabling man to leave earth for the first time.

During 1938, work proceeded on the new design, and by the year's end, four unguided launches had been made to a distance of 17km (10.6 miles), and an altitude of 11,000m (36,000ft). Work on the guidance system continued. By October 1939, a month or so into World War II, the guidance and control package - in fact, every essential component of the A4 except its warhead and motor - had been assembled in the rocket, and test firing commenced. The results were successful, and in early 1940 Dornberger thankfully ordered work on the A4 to begin once again, with a production target date of mid-1943. He bargained without Adolf Hitler.

By July 1940, it seemed that Hitler's war would be over by the year's end, with virtually all of Europe under his control, the Soviet Union pacified by treaty, and Britain isolated. It was then that the Führer gave the fateful order to cancel any research project which could not be guaranteed to show results within 12 months. One of the first casualties was Dornberger's war rocket. Or so, at any rate, went the theory. In fact, Dornberger managed to evade the directive by continuing to work on individual components, including the 25,000kg- (55,1251b-) thrust engine, and was also able to continue the A5 programme, which was still supplying much-needed data on flight characteristics.

In fact, test firings of the new motor, the brainchild of Dr Walter Thiel, had already begun. These tests had revealed that there would be additional problems in its operation, relating purely to scale, particularly in

cooling it and supplying it with sufficient fuel. The calculations had shown that to obtain 'the required thrust, it would be necessary to deliver almost 125kg (2751b) of fuel to the combustion chamber every second. The earlier rockets had required very much less, and it had been sufficient to pressurise the propellant tanks with nitrogen. But now it was necessary to devise a means of actually pumping the fuel and the liquid oxygen from tank to burner. The method chosen was a steam turbine, and the means of generating the steam was the same as that used in the Vl's launch catapult: the near-explosive decomposition of T-Stoff into super-heated steam when it came into contact with the catalyst Z-Stoff. The turbine thus powered produced around 675hp and ran at 500()rpm.

TO THE MARGINS OF SPACE

Thanks to a long catalogue of setbacks (and, we may imagine, the need to keep the project at least partially hidden from those who would have preferred more resources to have gone into their own laboratories), the hand-built prototype A4 was not ready for static testing until 18 March 1942, and even then, it exploded. Von Braun's team built another one, which exploded too, but eventually they managed to make enough progress to dare a test flight. Scheduled for 13 June, it was a failure. Von Braun returned if not to the drawing board, at least to the workshop, and readied another prototype. After a second failed test launch, on 16 August, happily for von Braun and Dornberger, the third attempt on 3 October proved more successful. The missile flew over 200km (125 miles) to an altitude of 85km (53 miles) and thus into the ionosphere at the margins of space; it returned to earth within 4km (2.5 miles) of its intended target. Now all that remained was to sell the concept as a weapon of war; by late 1942 that was not much of a problem.

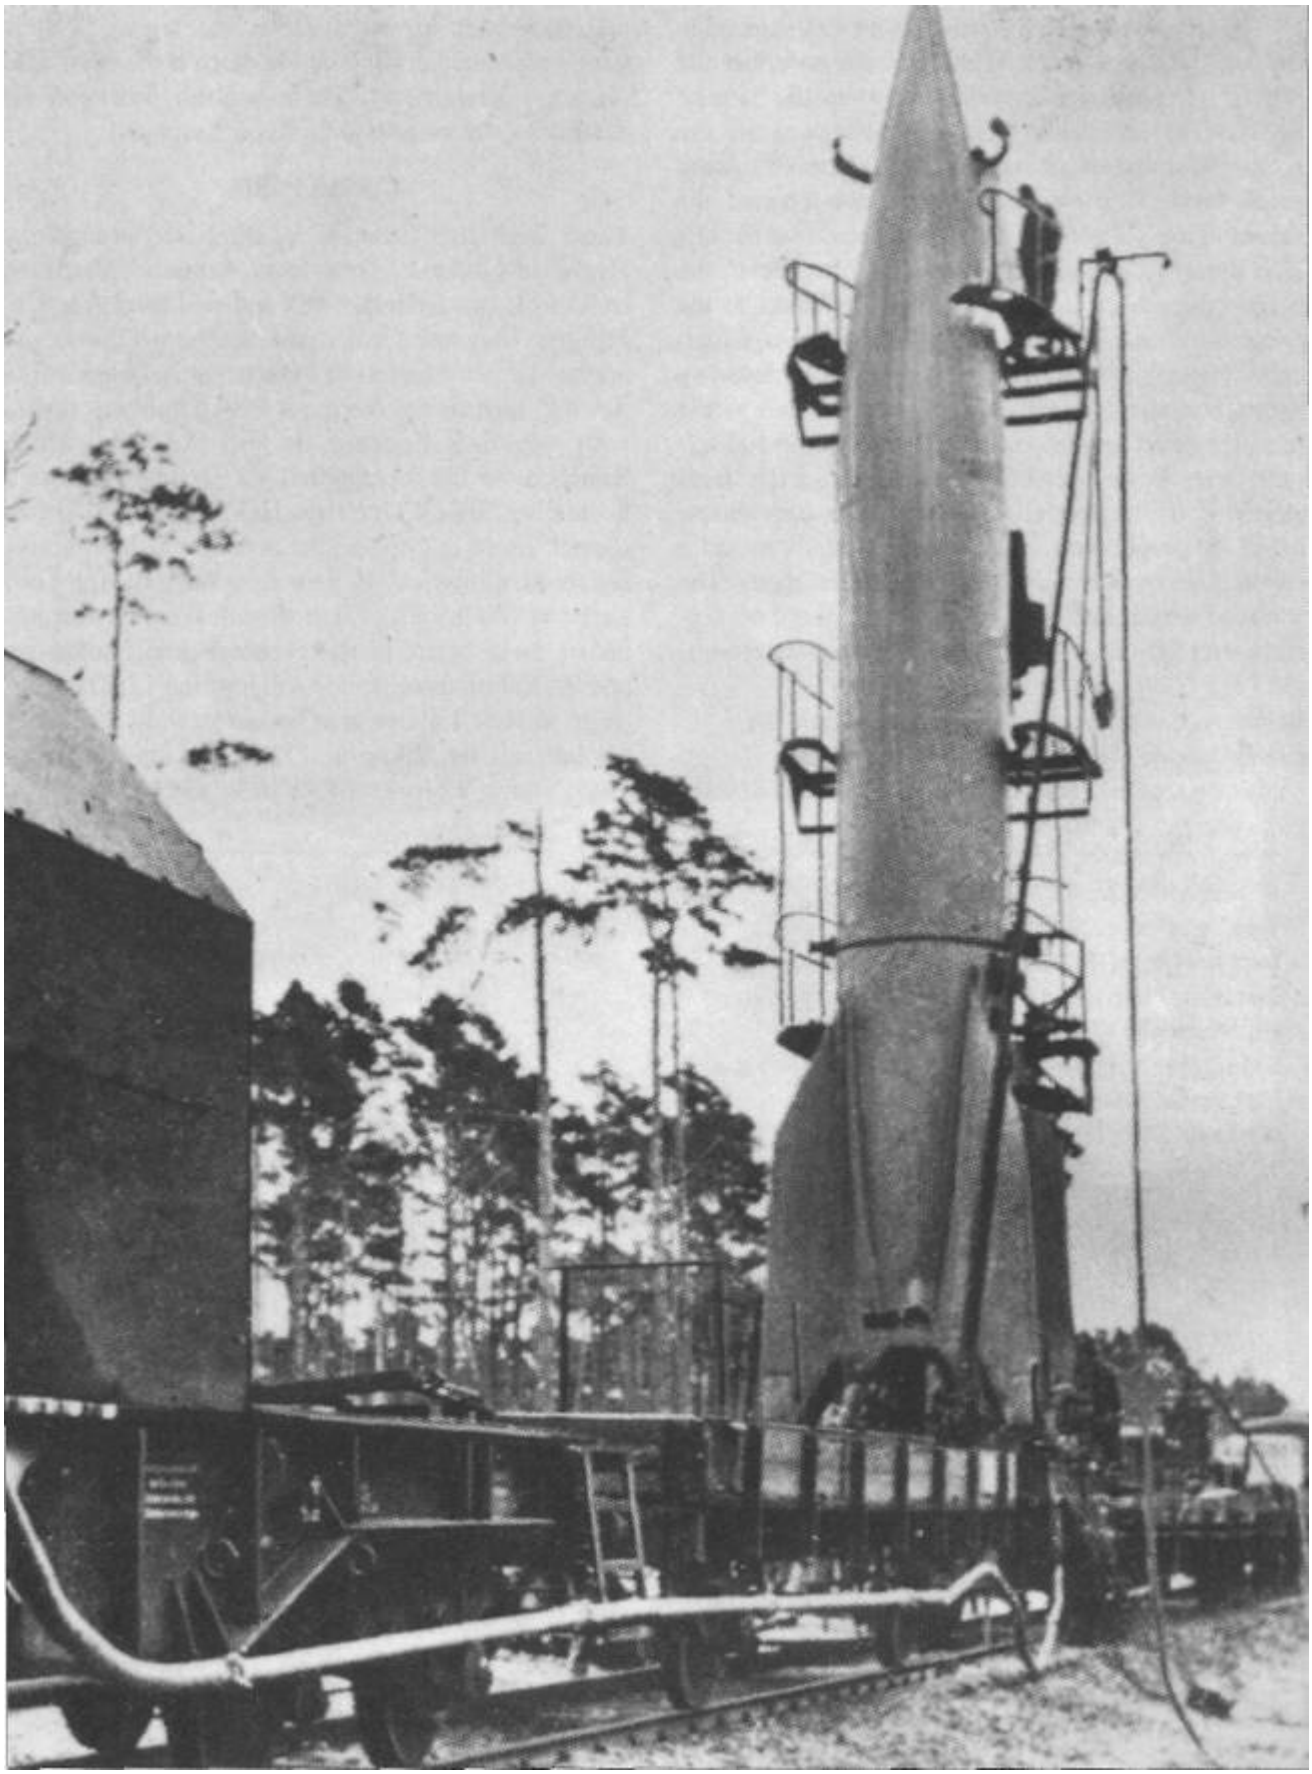
Hitler endorsed the V2 programme, as it soon became known, on 22 December, It was held up by shortages of strategic materials and by the RAF, which sent a mixed force of 596 aircraft to drop 1828 tonnes (1800 tons) of bombs on Peenemünde on the night of 17 August, losing 40 aircraft and killing around 800 people on the ground - most of them conscripted Polish labourers, but including Dr Thiel - and setting back the programme by perhaps two months. It had seemed for a while that the Army-sponsored A4 would lose out to the Air Force's Fi 103, but a demonstration of both before high-ranking government officials in May 1943 came at a bad time for the latter, and the A4 programme survived. As the war situation worsened that year, Hitler became more and more interested in the A4, eventually giving it the highest priority, allocating production facilities at one of Henschel's factories and at the Zeppelin works at Friedrichshafen. Both sites were bombed before production could start up, in fact, and A4s were instead assembled at the 'Mittelwerke' underground factory at Nordhausen from components manufactured all over occupied Europe. First deliveries were made in July 1944, and from September, the month when the V2 campaign started, a steady output of over 600 a month was maintained. Meanwhile, a training and test unit was established and launch sites were selected.

There were two opposing views as to how the V2s should be deployed. The *Oberkommando des Heeres* (OK.H - Army High Command) wanted huge, well-protected fixed sites, and selected three locations in Northern France from which rockets could be launched against England. The first of these, at Watten, near St Omer, was destroyed by the USAAF on 27 August 1943 while construction was still in an early phase; the second, at Siracourt, and the third, in a quarry at Wizernes, were truly massive affairs, over one million tonnes (one million tons) of reinforced concrete being cast into a protective dome, beneath which storage and launch chambers, and accommodation, were hollowed out. They were both destroyed by the RAF in July 1944 as part of Operation Crossbow (the broader campaign to destroy the VI launch sites) using 'Tallboy' penetration bombs, and finished off with remotely controlled B-17 Flying Fortresses, packed with explosive, the following month. With that, the thoughts of the high command turned to the sort of mobile launchers that Dornberger had been advocating all along.

30-VEHICLE BATTERY

Given the complexity of the missile itself, the launch procedure was quite straightforward. One of the trucks in the battery's 30-vehicle convoy carried a circular launch platform fabricated from steel, which incorporated a blast deflector. This was set up on the ground at the rear of the missile transporter and levelled by means of screw jacks in its four legs. TheFR-Anhanger-S missile transporter, commonly known as the 'Meillerwagen' after its manufacturer, was

Left: Some captured A4 rockets were launched from sites in Germany into the German test target zones. Here, British personnel prepare to launch a V2 using the original equipment, including the 'Meillerwagen' erector/launcher.

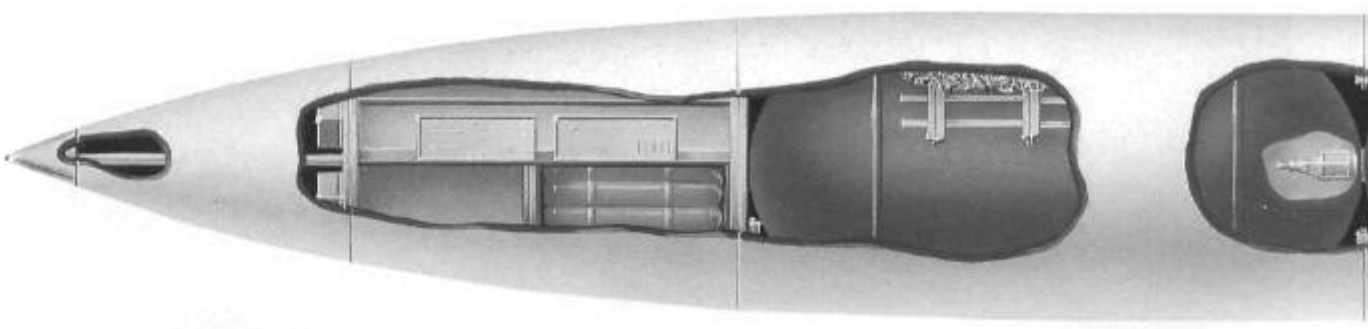


secured to it. While the power and test cables were being run out from the generator and control trucks, two of the three straps retaining the missile on its trailer bed were removed, leaving the topmost in place, and the nose fuze was then inserted. An auxiliary motor provided power for the hydraulic rams which then raised the missile to the vertical position - a process which took about 12 minutes - and when it was hanging vertically over the launch platform, the latter was jacked up to take the missile's weight and the top retaining strap was removed.

The various cables were then connected up, the transporter withdrew a short distance so that hinged platforms on its gantry could be deployed as work stations, and the testing procedure began. Once this had been successfully completed, the fuelling crews went to work, filling the main tanks with liquid oxygen and methanol and the smaller tanks with hydrogen peroxide and the permanganate catalyst. Then the launch platform was rotated on its base to align the missile with the target (the process of tipping it in flight was carried out by spinning a drum around its horizontal axis, thus causing the missile to rotate slowly in the opposite direction; the axis of the drum had, therefore, to be precisely at right-angles to the azimuth of the target). Lastly, the igniter - a small firework, set off electrically - was wedged into the tail pipe, and the set-up crews withdrew.

Right: In addition to the 'Meillerwagen' and its fleet of associated vehicles, A4 launch teams also employed special trains. They were somewhat less flexible logistically but smoother in operation.

Below: The A4 rocket - even without its 975kg (2150lb) warhead filled with amatol mix- could make a very large hole in the ground indeed... This crater was the result of a test firing at White Sands.

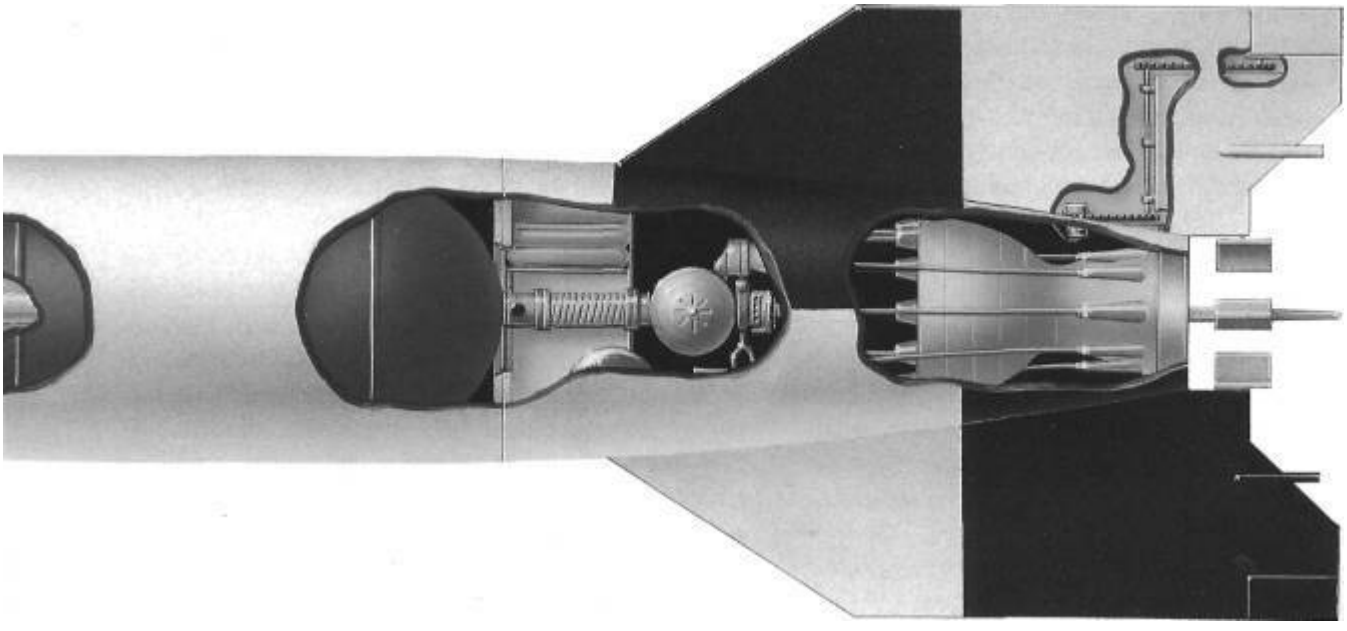


The armoured launch control booth was situated in the back of a half-track vehicle, based on either the SdKfV, 11 Leichter Zugkraftwagen or the similar SdKfz 251 Mittlerer Schützenpanzerwagen, the armoured maid-of-all-work of the German Army since 1944. Closing the firing switch opened the valves in the T-Stoff and Z-Stoff tanks and set the turbine pump in motion. Once it was up to speed, the main valves were opened, feeding propellant to the combustion chamber, and the igniter was fired. Directional control in the first few seconds was achieved by the carbon vanes in the exhaust gas flow, but as the rocket's speed increased, the external fin-tip rudders took over. As the missile rose, the spin of the drum caused it to tip over slowly, and at the appropriate point, the propellant supply was cut, initially by radio signal, later by command from an accelerometer. The warhead was armed only during flight, about 60 seconds after lift-off at the moment of propellant cut-off, and there was an interlock in the arming system which prevented arming taking place if the right conditions were not met. There was no provision for destroying the missile in flight on command.

Below: As this cutaway diagram shows, most of the internal volume of the A4 was taken up with tanks containing the liquid oxygen and methanol it used as fuel.

TARGET PARIS

There were five batteries in all, based around the Hague in Holland - one from Artillerie Abteilung (AA) 444, two from AA 485 and two from AA 836. The first and last formed the Southern Group, and operated against targets in France and Belgium, while AA 485 formed the Northern Group and was tasked with targeting England. Tt was AA 444 which launched the first operational V2, against Paris on 5 September 1944. Three days later, AA 485 fired two rockets aimed at London, the first of which hit Staveley Road, Chiswick, in west London - having been aimed at Southwark, 13km (8 miles) away - at just before 1845 hours in the evening, demolishing six houses, killing three people and injuring 17. The campaign against London was to last exactly 200 days, the last missile falling at 1920 hours on 27 March 1945, hitting a block of flats in Whitechapel, killing



PEENEMUNDEA4 (V2)
Type: Long-range ballistic missile
Length: 14.05m (46.09ft)
Diameter: 1.68m (5.51ft)
Lift-off weight: 12,870kg (28,373lb)
Speed: 5580km/h (3465mph)
Max range: 330km (205 miles)
Warhead: 975kg (2150lb) of amatol mix

134. Other reports suggest that the last A4 launched against London actually fell in Orpington, Kent, that day. In those 200 days, out of 1120 launched, 1054 rockets landed in England, 517 of them in the Greater London area, and, according to official figures, killed 2754 people and injured 6532. The larger Southern Group fired rather more missiles in all (about 1675), most of them targeted against Antwerp (1341). It also directed its fire against Brussels, Liege, Luxembourg, Paris and the Rhine crossing at Remagen. There was, of course, no defence against the V2. Only the Allied advance across northern Europe, which drove the Mobile Artillery Battalions out of range of worthwhile targets, put a stop to the campaign. Gruppe Nord reportedly still had 60 unexpended missiles when it fell back into Germany on 29 March.

It is worth noting that a project aimed at firing an A4 from a submerged U-boat (actually, from a self-contained chamber it towed behind it, which was caused to float vertically by means of flooding its tail section) had reached a fairly advanced stage by 1945, with several containers having been completed and tested at the Vulkan shipyard in Stettin. Known as Project Test-Stand XII, and conceived apparently by Volkswagen in late 1944, this was aimed at the bombardment of New York. However, it is suggested that a more-or-less successful test firing in the Baltic made it clear that a fully fuelled missile (there was no way it could be fuelled at sea) could not be expected to stand up to the rigours of a trans-Atlantic voyage, even submerged. The project was shelved.

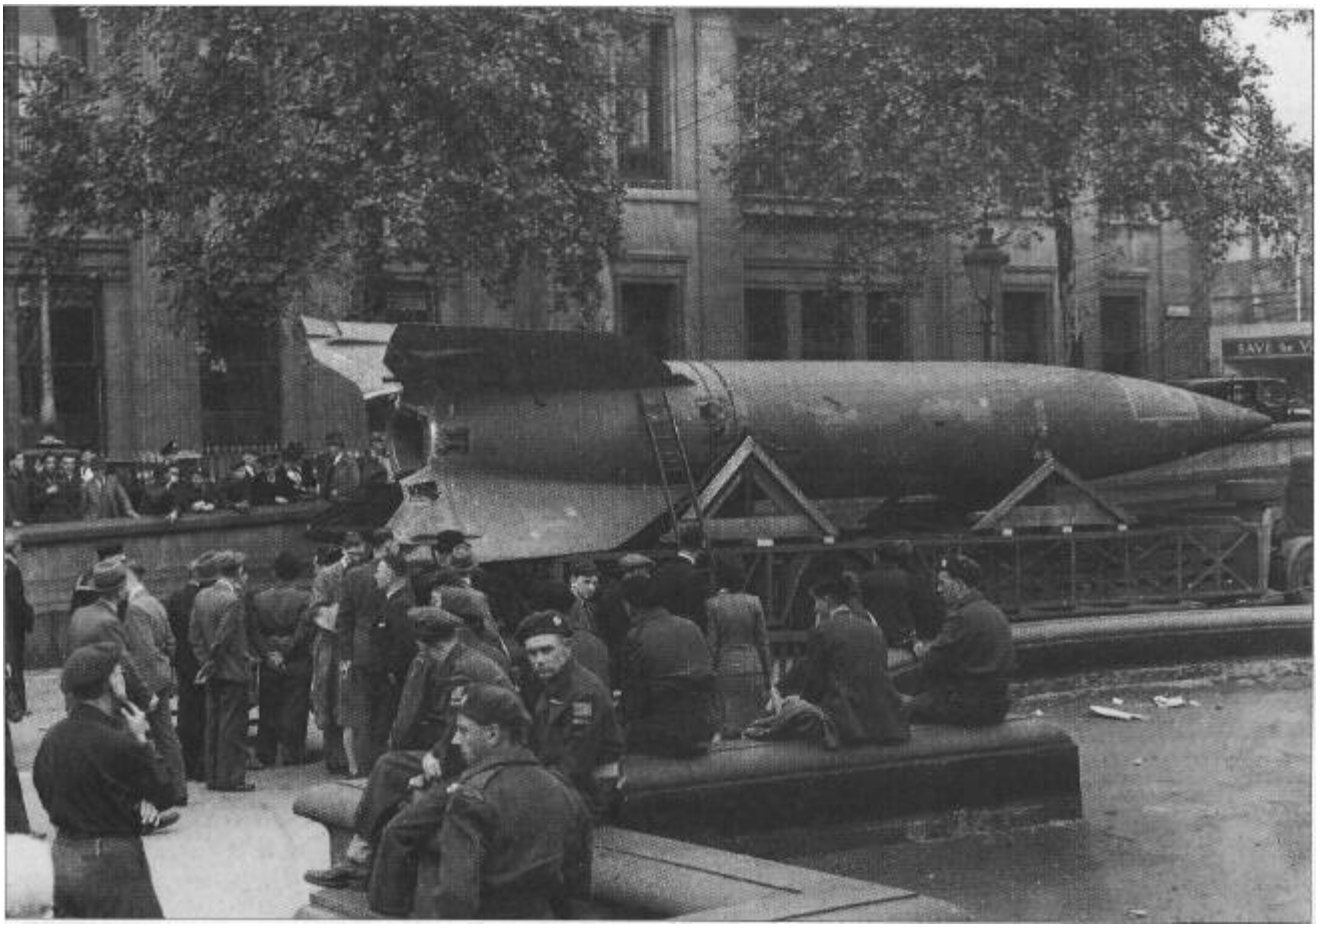
The A4 missile in its final form was to be made entirely of steel. At just over 14m (46ft) long, with a maximum body diameter of 1.68m (5.5ft) and a span over its fins of 3.5m (11.5ft), it weighed 12,870kg (28,3731b), of which 975kg (21501b) of amatol comprised its warhead, and 4900kg (10,7801b) of liquid oxygen and 3770kg (83001b) of methanol comprised the bulk of its propellant. It had a maximum range of 330km (205 miles), which it covered in 3 minutes 40 seconds (of which it was under power for 70 seconds), reaching a maximum velocity of 5580km/h (3465mph) and height of 96,000m (315,000ft). Its velocity at impact was 2900km/h (1800 mph). There are rather divergent figures for total A4 production, estimates ranging from 6000 to as many as 10,000.

Above: An A4 rocket, shrouded in tarpaulin, on the railway flatcar used to transport it to the vicinity of the launch site. The Allied advance across northern Europe drove the V2 battalions out of effective range of worthwhile targets.

THE LATER GUIDED BALLISTIC MISSILE PROJECTS

As soon as the A4 was viable, the project was taken out of von Braun's hands. He and his team, it is suggested, were never entirely satisfied with it, and would happily have gone on refining their design, but Heinrich Himmler, who had previously seized control of all the secret weapons programmes, would not accept that. Von Braun turned to working on ways of increasing its range. The simplest means, he concluded, was to fit it with wings, so that it would glide in the final phase of its flight, prolonging its descent and increasing its range to 435km (270 miles), but he counted without the effects of re-entering the dense air at lower atmospheric levels. The one A4b missile which was launched successfully (the first one crashed soon after take-off) failed to re-enter cleanly and was destroyed.

The A6, which never made it past the discussion stage, was to have been an A4 fueled by SV-StoiT, made up of 94 per cent nitric acid and 6 per cent nitrous oxide, and Visol (the generic name given to a group of isobutyl-vinyl esters); it was to have 20 per cent more thrust. The A7 was a winged version of the A5, air-launched as a concept vehicle for the A9. The A8 was virtually identical to the A6 but fuelled with SV-Stoff and diesel oil, although it is also suggested that it was to have been fuelled with LOX and methanol contained in pressurized tanks, rather than employing the turbine pump to deliver them to the combustion chamber. The A9 was the A4b with modified wing planform: essentially, the horizontal fins were to have been continued forward, right to the rocket's nose, in a simple ogive, to allow it to survive re-entry; it had the motor from the A6, with a projected range of 600km (370 miles).



The final ballistic missile project, the A10, was much more ambitious in scale and had it ever materialised, would have been the first ever ICBM. The projected inter-continental ballistic missile was to have been a two-stage rocket, the first stage being based on six A4 motors linked into a common venturi, and designed to propel its second stage - either an A4 or an A9 - to an altitude of 24km (14.9 miles) before its own motor was fired, giving it a range of around 4800km (2800 miles) with a 1000kg (22001b) amatol warhead and a flight time of around 45 minutes. It is suggested that this project was first discussed as early as 1940, long before the United States entered the war, but there is no evidence that it got beyond the

discussion stage. There was also talk of modifying the second-stage A9 missile to carry a pilot, who would have been ejected once he had locked the missile on a course for its target (presumably he would have been recovered by a submarine), but that idea can be dismissed as a flight of fancy.

THE 'RHEINBOTE' ROCKET

The FZG 76 and the A4 were the only guided surface-to-surface missiles employed by either side during World War IT, but the A4 was by no means the only war rocket. Most of the combatant nations employed much simpler devices - unguided and with solid-fuel 'motors' - as adjuncts to their artillery or as assault weapons, but once again, only Germany went one stage further, and produced a long-range unguided ballistic missile, the Rh.Z.61/9 'Rheinbote' ('Rhine Messenger'), developed by a company better known for its artillery pieces and its share in the development of the superlative MG 42 general-purpose machine gun, Rheinmetall-Borsig. Where the A4 was complex and expensive, 'Rheinbote' was simple. It was a fin-stabilised four-stage solid-fuel rocket, each of the first three stages igniting the next as it burned out and fell away, with no guidance system, but relying on simple alignment of the launch rail with the target. The launch rail could be mounted on either a high-angle 8.8cm anti-aircraft gun mount or on a modified 'Meillerwagen', and the complete missile was almost 11.5m (37.5ft) long with a maximum body diameter (in the first stage) of 535mm (21.1in) and a maximum fin span of 1.49m (58.5in). It weighed a total of 1715kg (37751b), almost a third of which was propellant. It had a maximum range of 220km (140 miles) when fired at an elevation of 65 degrees, the final stage, with its 40kg (881b) warhead, attaining a speed of Mach 5.5 (almost 6000km/h; 3730mph) and climbing to a maximum altitude of 78km (48.5 miles). Over 200 of these missiles were fired at Antwerp in November 1944.

Below: An A4 rocket is paraded through London's Trafalgar Square in late September 1945. The rocket was reportedly captured in France, and was later set up as if for launch next to Nelson's Column. Greater London was on the receiving end of more than 500 V2s in 1944-45.

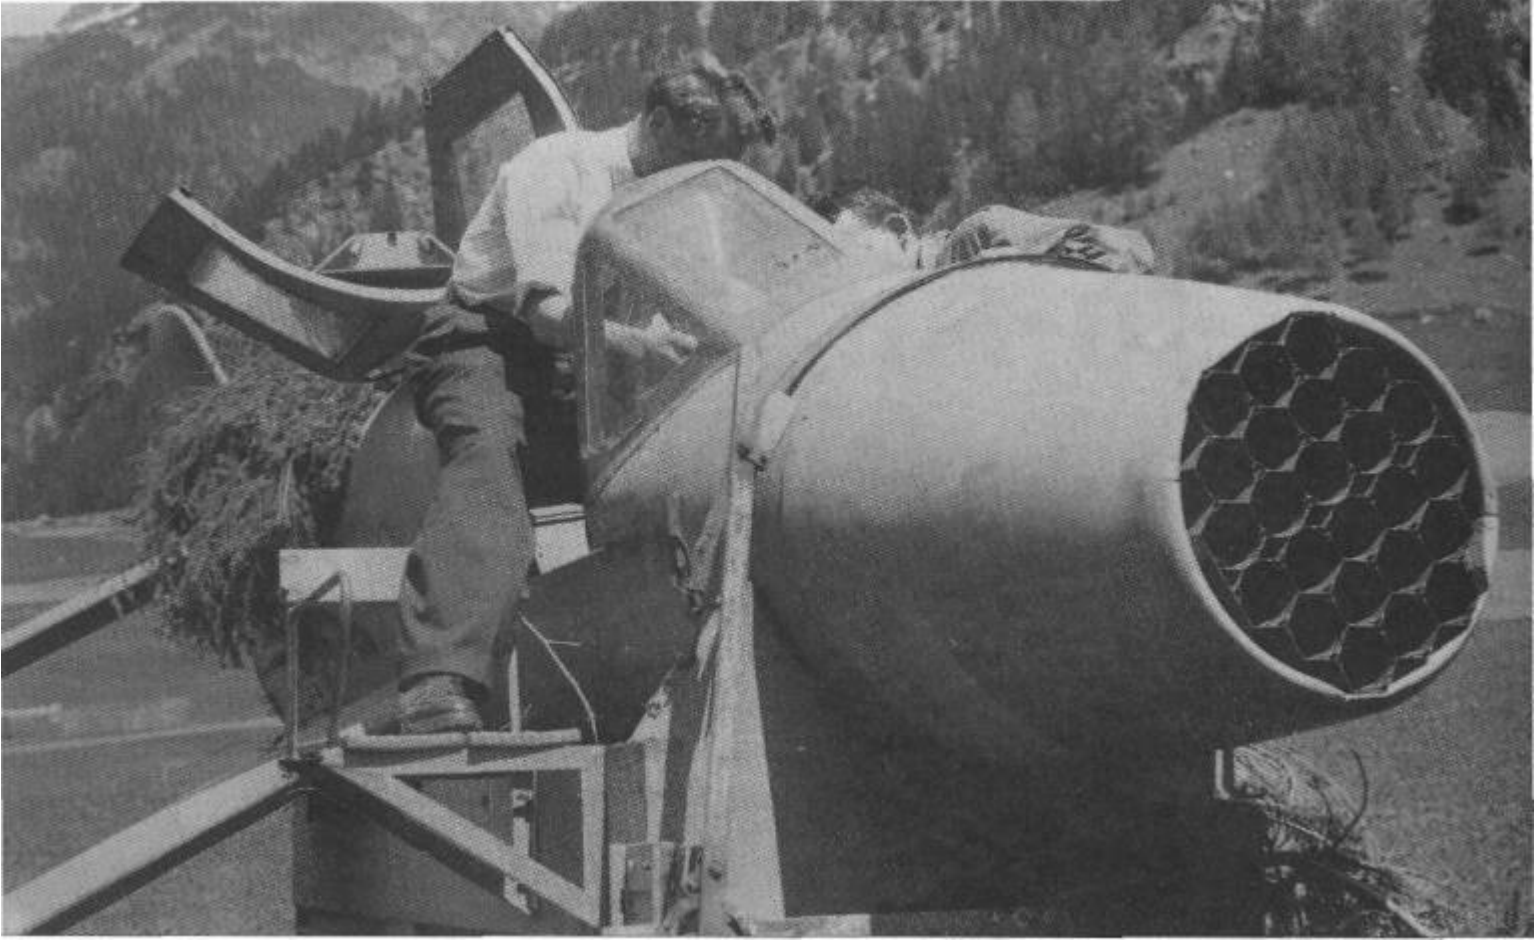
CHAPTER SIX

Air-to-Air Weapons



While the adoption of the machine gun made air-to-air combat feasible, by the mid-years of World War II, it had come close to causing a stand-off: machine gun- (and even cannon-) armed aircraft dared not approach each other: it was too dangerous. The alternative, it was clear to German researchers, was to develop small rocket-propelled flying bombs which could be directed to their targets via either wire-borne or radio signals from a chase plane which stayed outside the lethal area.

During his post-war interrogation, Generalleutnant Adolf Galland described the many and various weapons the Luftwaffe had used - or had contemplated using - against the tightly packed formations of Allied daylight bombers with their heavy defensive firepower. He described how attacking the formations from the rear immediately resulted in heavy casualties, and how the German interceptors then switched over to attacking them head-on, hoping to break up the formation and then go after consequently vulnerable individual aircraft. This worked up to a point, but only until the bombers began taking concerted evasive action, and from then - some time in the winter of 1942-43 - the Luftwaffe began looking at alternatives to the simple cannon and machine gun to arm their aircraft, to allow them to attack either from unexpected directions or from outside the effective range of the Fortress's and Liberator's .5 inch Brownings. Because the bombers flew so close together, much consideration was given to bombing them, and a variety of methods were tested, including dive-bombing individual aircraft; towing command-detonated 10kg (221b) fragmentation bombs on long cables (tested in combat, with two unconfirmed successes, despite the physical difficulty of actually delivering the weapon, which trailed out behind the towing aircraft); and dropping blast and fragmentation bombs on parachutes ahead of the formation to form an aerial minefield (this latter method was promising, but development of a satisfactory weapon came too late). Other methods included using forward-firing heavy cannon - essentially, light anti-aircraft and anti-tank guns - to shoot at them from a great distance, but this was to prove only marginally effective; and using

Above: Henschel developed the Hs 293 for use against shipping, but an air-to-air variant was also produced.

Left: Germany desperately needed an antidote to massed formations of Allied bombers like these B-17s.

Above: The simplest of all air-to-air missiles was the unguided rocket, fired in a salvo. This Ba 349 was armed with 24 R4M rockets with 250g (8.8oz) warheads.

obliquely firing cannon to attack them from below. This approach was to prove devastatingly effective against RAF night bombers, but less so against the USAAF, whose aircraft had belly and waist gunners.

One of the reasons that heavy forward-firing guns were ineffective was the amount of recoil they produced: it slowed the aircraft perceptibly if more than a few rounds were fired. The effect should not be underestimated. One trainee in an Me 262, who found himself committed to landing on too short a strip, let go with the four 30mm MK 108 in the aircraft's nose and brought his aircraft up short of the end of the runway, thanks to the additional braking effect. Another reason was the extra drag these usually externally mounted guns created, reducing the aircraft's performance considerably. For the Germans, the employment of relatively heavy calibre guns in aircraft seems to have had a lasting fascination. Other nations' air forces tried it too; the ultimate in that line, according to one source, seems to have been the fitting of a 32pdr (94mm) anti-tank gun into a Mosquito. For the Germans, the programme to adapt light anti-aircraft guns and anti-tank guns - notably in 3.7cm and 5cm calibres, though 7.5cm was tested, too - continued to the war's end. Some of the last German aircraft left in combat were a pair of Me 262A-la/U4s with the 5cm Mauser MK 214 mounted in the nose. One of these aircraft, nicknamed 'Wilma Jeanne' was captured intact by US forces, but was destroyed after it suffered engine failure during a flight to Cherbourg, where it was to have been loaded aboard a ship for the USA.

There was an alternative: the so-called 'recoilless rifle', invented during World War I by an American naval officer named Davis. A variety of recoilless rifles were mounted on aircraft and tested, but though the type worked well enough in principle - and one, it is reported, was used successfully in combat - this was a single-shot weapon, with all the problems thereof. In fact we may bear in mind that the only reason air-to-air combat had ever been even possible was thanks to the machine gun, with its unique ability to keep on throwing bullets into a target area until something ran into one or more of them. The weapons in question were of two basic types. The simpler type worked on the counter-shot principle and was almost two guns in one. The 'ordinary' barrel contained the projectile; a subsidiary barrel behind the breech, precisely aligned with the regular barrel, contained a counter-shot of the same weight, usually composed of wax or grease and lead shot in a paper cartridge. In between them lay the chamber containing the propellant cartridge. When the gun was fired, both projectile and counter-shot left their respective barrels with the same energy, and their recoils thus cancelled each other out. In the more refined (and more complex) version of the weapon, the cartridge case became the

counter-shot, its lesser mass being compensated for by allowing a proportion of the propellant gases to be exhausted through a series of jets in the chamber wall, the components once again cancelling each other out. Both methods worked, though the latter caused some bad moments for pilots who flew aircraft so equipped.

THE ZOSSEN DEVICE

The Luftwaffe tried to surmount the problem of the weapon being able to fire only a single round by mounting it in groups of as many as 49, to be set off in ripple salvoes. Recoilless guns were mounted to fire both forwards and upwards; pilots of single-seater aircraft found aiming the latter to be somewhat problematic, and so a trigger unit which incorporated a light source and a photoelectric cell, the so-called 'Zossen' device, was developed. Tt was tested successfully in 1944, but very few were ever fitted to aircraft. An even more complicated automatic trigger was developed for a downward-firing recoilless rifle for use against tanks, detecting the tank's magnetic field and using that to trigger the gun when the aircraft was directly overhead.

Perhaps the most ambitious plan ever involving gun armament for aircraft was put forward early in 1939. The Gerät 104 was a 35cm-calibre recoilless gun which fired a 635kg (14001b) armour-piercing shell (the cartridge case weighed the same, and thus acted as the counter-shot itself). It was intended for use against ships of the Royal Navy lying at anchor in Scapa Flow (a place of special importance to the Germans, of course, not just because it dominated the northern approaches, but also as the site of the scuttling of the High Seas Fleet in 1919), but in the event, the plan came to nothing. However, later an even bigger weapon, the 54cm 'Munchausen' cannon, was proposed, and it seems that a prototype was constructed and mounted beneath a Junkers Ju 87 Stuka dive-bomber. Not entirely unsurprisingly, the effect of firing such a weapon, recoilless or not, upon a relatively light aircraft was unpredictable to say the least and the project was cancelled.

Another, and simpler, solution to the recoil problem was to substitute rockets - which have no recoil - for guns, and almost from the outset, this proved to be successful. Initially, the weapon used was a cut-down version of the Army's 21cm Nebelwerfer 42 rocket launcher, mounted in various ways, which was eventually superseded by the 5.5cm R4M rocket. The 21cm rockets were first fitted in pairs to Fw 190s; they could be jettisoned after use, and most pilots adopted this procedure, for they robbed the aircraft of about 50km/h (30mph). They were used against bomber formations, and also as air-to-ground weapons. Twin-engine fighters such as the Bf 110 and Me 410 were fitted with larger batteries. They were not only employed as forward-firing weapons; a few Ju 88s and He 177s were modified to carry up to 24 launchers within the fuselage, angled to fire upwards, while some Fw 190s carried a single rearwards-firing tube. The rocket itself, the 21cm Wurfgranate (Spreng), was a powerful weapon, with a 10.2kg (22.41b) warhead and an intial velocity of 320m/s (1050fps). As an artillery bombardment rocket it had a range of about 8000m (8750 yards); in the air it was reckoned to be effective out to 800-1200m (875-1300 yards).

THE R4M

The R4M was more effective: with its much smaller profile it produced less drag, and more could be carried. The usual load for an Me 262 was 24, in a rack under each wing outboard of the engines, but that could be doubled when necessary by adding another pair of racks. The racks were mounted at an upwards inclination of 8 degrees, and the missiles were fired serially, at a fraction of a second's interval (a 'ripple salvo'), at a range of around 600m (660yds). The R4M was simplicity itself: a stick of diglycol solid fuel which, being nitrocellulose based, burned at a predictable rate based on the surface area exposed to the atmosphere, with a contact-fuzed warhead and spring-loaded stabilising fins, which deployed as soon as it left the launch tube (originally of metal, but later of carboard). Measuring 82cm (32.2in) long and 5.5cm (2.16in) in diameter, it was adapted for a variety of purposes but was mainly employed against aircraft and tanks. It was virtually identical to the British 3in (7.62cm) rocket which preceded it into service by some years. 'Föhn', its putative successor, was a somewhat larger but essentially similar device, originally designed as an anti-aircraft weapon. With a diameter of 7.3cm (2.8in), it had a conventional warhead containing 250g (8.8oz) of TNT/RDX (the R4M's anti-aircraft warhead, the PB-3, was a shaped-charge, with 400g (14oz) of Hexogen). Few, if any, were used operationally.

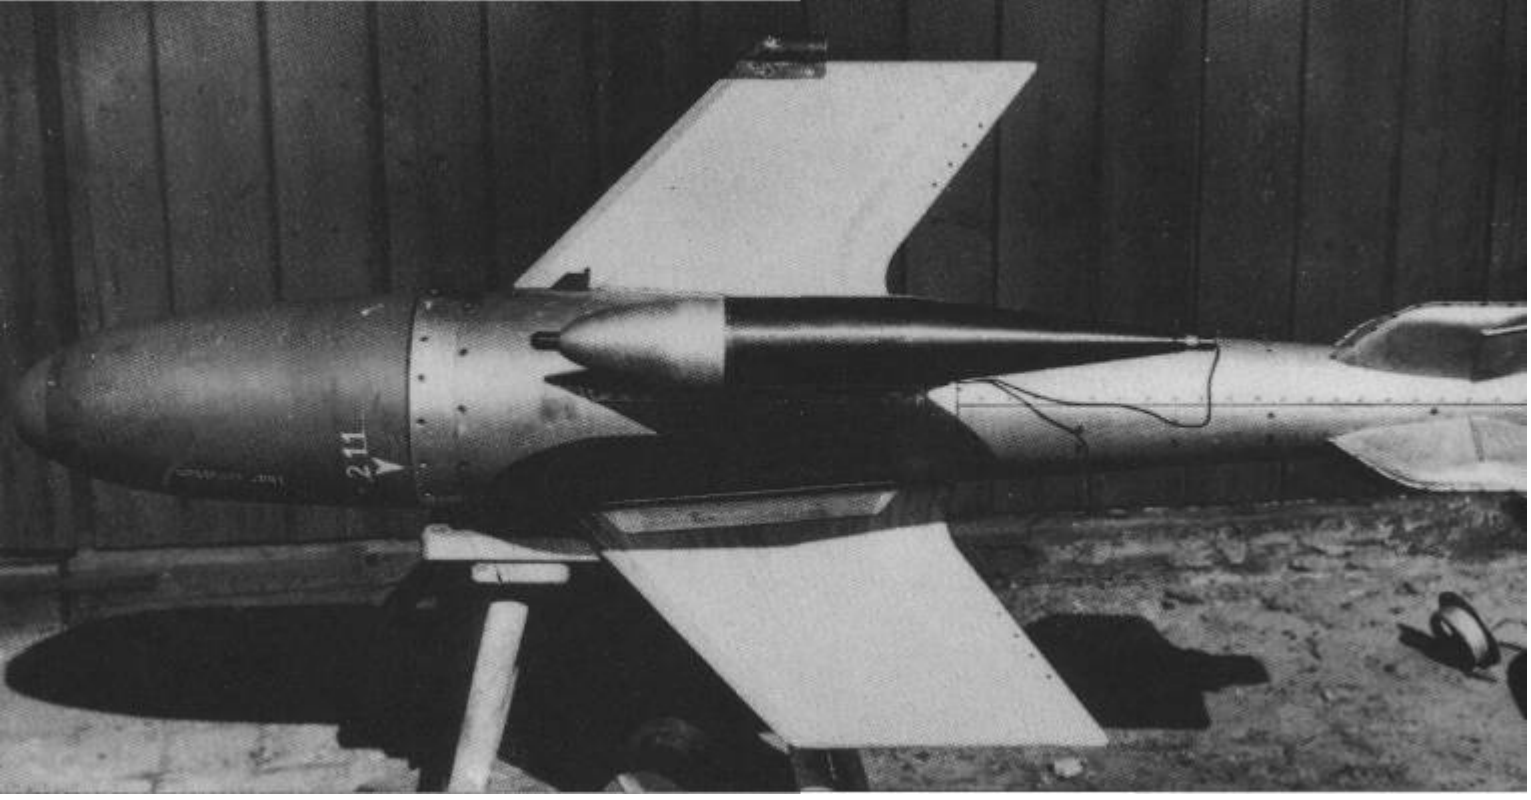
One of the advantages of the R4M was that since the rocket had the same short-range ballistics as the 30mm cannon shell, the existing cockpit gunsight could be employed, but unfortunately, that was saying very little, for it was not an easy task to take accurate

aim on a target which was taking evasive action from a fast-flying aircraft whose flight characteristics caused it to snake at high speed. The answer, of course, was to provide a guidance system to control the missile in flight.

AIR-TO-AIR MISSILES

From as early as 1939, the Henschel company - a newcomer to aviation, but with a very solid background in heavy engineering - had maintained a team whose task was to study the remote control of unmanned aircraft. In January 1940, Herbert Wagner arrived to head the team, with a brief from the RLM to concentrate on air-to-surf ace missiles (ASMs). He was successful, as we shall discover, and in 1943 the company proposed a version of the Hs 293 ASM he developed as an air-to-air missile (AAM). Like most of the ASMs, the Hs 293H was a blast weapon, to be guided into a bomber formation and exploded there, instead of being aimed at an individual aircraft, and had a 295kg (6501b) warhead. One version of it was to have had a television camera in its nose, the picture it transmitted to the controller allowing him a clear view at ranges of up to about 4km (2.5 miles), but the apparatus proved very unreliable, and the idea, also tried out on the ASM itself, was shelved. Control was line-of-sight from the launch aircraft, the operator using a joystick to initiate radio signals which in turn actuated control surfaces on the missile itself.

This system was to be used in all the German guided missiles, and will be explained more fully below, in the context of the surface-to-air missiles for which it was originally developed. The missile had both command and proximity fuzes as well as a barometric fuze to ensure that it would self-destruct before it hit the ground. It was powered by a specially designed Schmidding rocket which used M-Stoff (methanol) and A-Stoff (oxygen), the latter being, unusually, in gaseous form, to produce 610kg (13401b) of static thrust for 11 seconds. The Hs 293 was too big and clumsy for the anti-aircraft role, and it comes as no surprise to discover that after some initial enthusiasm, the RLM went cold on the idea. By then, however, Henschel had begun work on the 'Schmetterling' surface-to-air missile (SAM; see Chapter Eight), and had proposed a version for use in the AAM role.



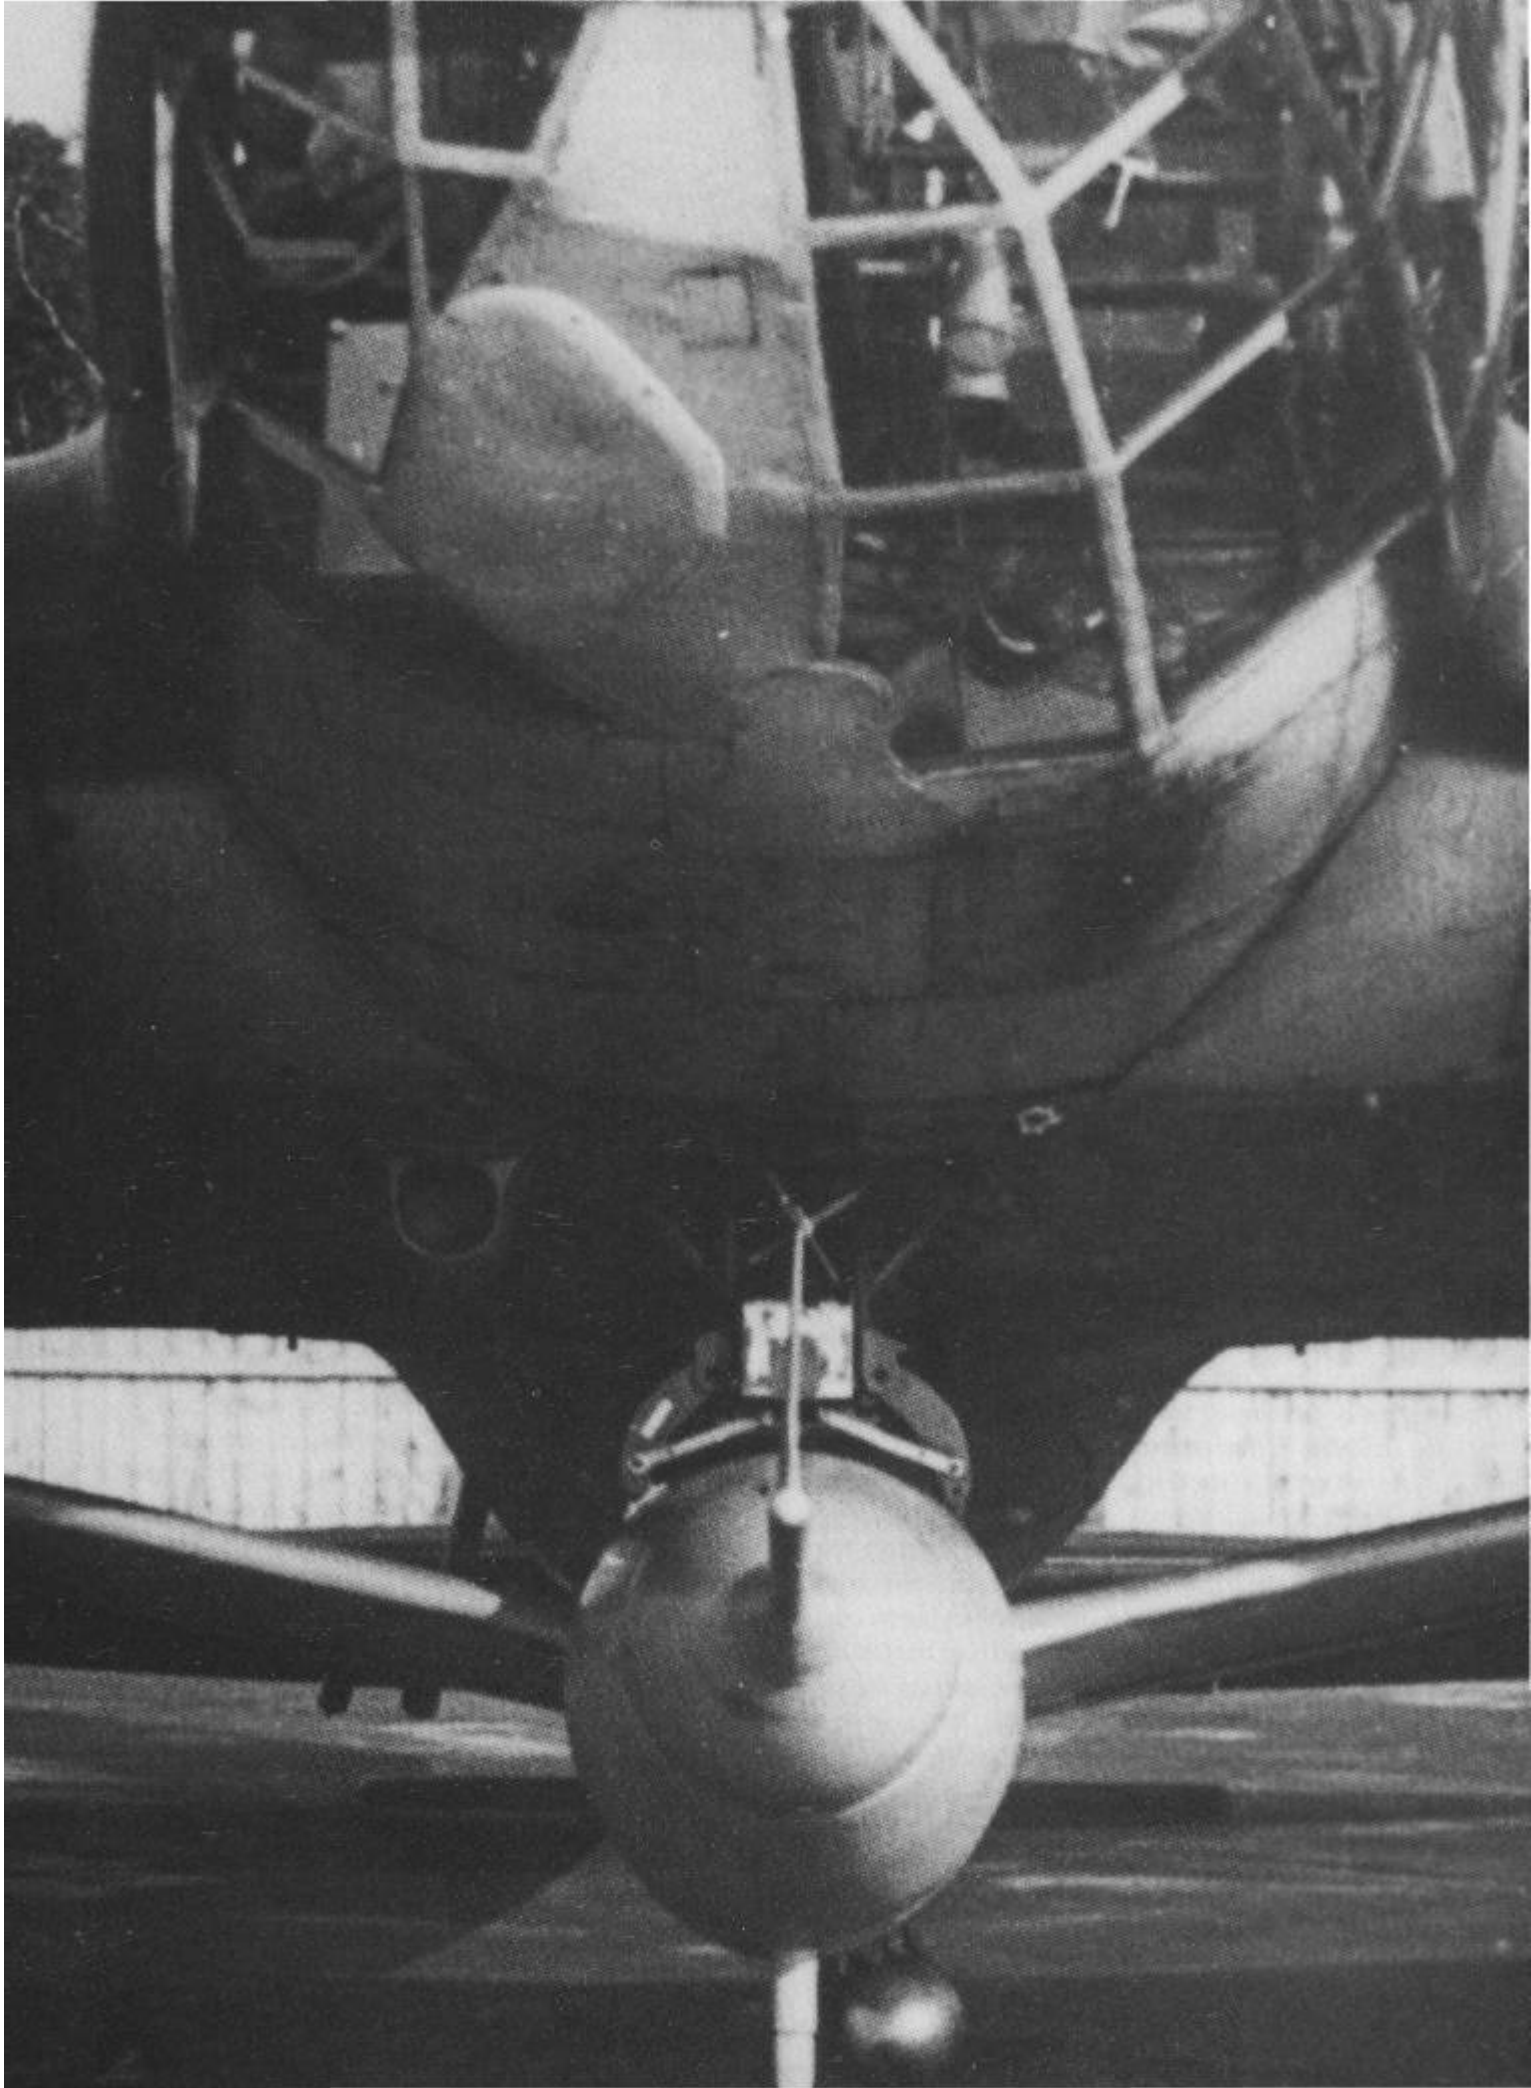
THE HENSCHEL Hs117H

The Hs 117H, as the variant was known, was very little different from the basic 'Schmetterling', save that it required no external booster rockets, but it had a significantly larger warhead, containing 100kg (2201b) of explosive. It employed the same guidance system as the Hs 293H. The intended range of the Hs 117H was 6-10km (3.7-6.2 miles), at up to 5000m (16,500ft) above the 'parent' aircraft, which was a considerable improvement over the earlier missile. It was still in development at the war's end, having survived the axe which descended on so many development projects in January 1945, it is suggested, simply because it had so much in common with the ASM from which it was descended.

Henschel also developed a missile specifically intended for use in the air-to-air role, the Hs 298, considerably smaller than either of the others and with reduced range. Like them, it had swept-back wings and a tailplane with short fins at its extremities, and control was by means of solenoid-operated 'Wagner bars' responding to radio signals. The motor was a solid-fuel two-stage Schmidding 109-543 which gave 150kg (3301b) of thrust for five-and-a-half seconds followed by 50kg (HOlb) of thrust for 20 seconds. The first experimental Hs 298 was fired in May 1944, and altogether some 300 were produced and expended in trials. With a warhead containing either 25kg (551b) or 48kg (1061b) of explosive, detonated on command or by a proximity fuze, it had a range of up to 2500m (2735 yards), travelled at either 940km/h (585mph) or 680km/h (425mph), and was designed to be deployed aboard piston-engined aircraft such as Do 217s, Fw 190s and Ju 88s. Development ceased in favour of the Ruhrstahl X-4 in January 1945.

THE RUHRSTAHL X-4

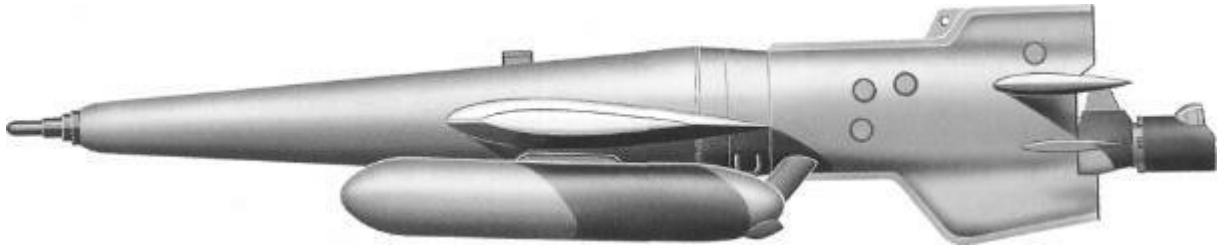
Ruhrstahl AG was, as its name suggests, a steelmaker. In 1940 it was ordered to collaborate with Dr Max Kramer of the DVL to develop a series of bombs and missiles using the spoiler control method the latter had demonstrated two years earlier. This collaboration was to result in three very interesting missiles: the so-called 'Fritz-X' guided glider bomb; the X-7 'Rottkappchen' ('Red Riding Hood') anti-tank missile; and the X-4 air-to-air missile. Development of the X-4 began in 1943 in parallel with Henschel's Hs 298. These two missiles had very similar specifications, though it appears that the X-4 was designed from the start to operate with jet aircraft, and thus flew at higher speeds. The primary difference between the X-4 and other missiles was that it was equipped not with wings and a tailplane, but with two sets of four fins, one set swept back at an acute angle, with parallel chord width roughly halfway back from



Above: The Ruhrstahl X-4 was the most sophisticated of all the air-to-air missiles produced during World War II. It had an ingenious wire-based guidance system.

the nose; the other, offset by 45 degrees and carrying the moveable spoilers, at the tail. Secondarily, it was designed from the outset to be guided by wire, rather than radio signals - as it was planned to switch over to control by wire for all missiles since radio signals were simply too easy to jam - the necessary differentiation being obtained by switching the polarity of the signal to activate the pitch controls, and by varying its strength to activate the yaw controls. This system used the Düsseldorf/Detmold (FuG 510/238) transmitter-receiver pair, which were analogous to the Kehl/Strassburg radio transmitter and receiver. It was originally developed for use with the glide bomb, as we shall see in due course.

As we noted when discussing the surface-to-surface missiles, a cylindrical body in flight has a tendency to roll. The small fin-tip vanes necessary to correct the tendency in the X-4 would have interfered with Kramer's control spoilers, so instead of trying to correct it, the X-4's designers encouraged and controlled it to a rate of about one revolution per second by fitting offset trim tabs to the main fins. This, it was believed, had the subsidiary effect of nullifying manufacturing inaccuracies causing imbalance (which would have thrown the missile off its line) just as the rifling in a gun's barrel does. Because of the spin, though, it was necessary to fit a gyroscopic unit which switched the control signals between the spoilers on the rear fins so that those which controlled pitch while they were within 45 degrees of the horizontal changed over to controlling yaw as they came within 45 degrees of the vertical, and vice-versa. The 5.5km- (3.5 mile-) long wires carrying the positive and return components of the electrical signal were paid out from bobbins in streamlined pods on the tips of two of the main fins. It mattered not at all that the control wires became twisted as the missile spun, for it made a maximum of perhaps 24 revolutions in the entire course of its flight. It was planned to use the liquid-fuelled BMW 109-548 rocket to power the missile, and in order to counteract any tendency the spin (and any violent manoeuvres in flight) had to disrupt fuel flow, the tanks which contained the R-Stoff and SV-Stoff were spirally wound concentrically within the double-tapering cylindrical form of the missile's body. They contained free-moving pistons - leather in the R-Stoff tank, aluminium in the acidic oxidizer - driven by compressed air. The motor, producing 140kg (310Ib) of thrust reducing to 30kg (661b) by the end of its 17-second burn time, was only ever used in some of the test launches, Schmidding 109-603 diglycol solid-fuel motors being substituted.



The first test firing of the missile from an aircraft (an Fw 190) took place on 11 August 1944, and by that time a total of 224 prototypes had been produced. In all, about 1000 airframes were then produced for operational use between August and December 1944, but there were delays in engine production. Then, just as the problems were ironed out, the BMW plant which was manufacturing the 109-548 was badly damaged in an air raid, and the motors which had been belatedly produced were destroyed. This was the final nail in the X-4's coffin and the missile never saw operational service as a result.

CHAPTER SEVEN

Air-to-Surface Missiles

Hitting a target on the ground with a bomb dropped from an aircraft was never easy; as soon as effective anti-aircraft artillery and fighter aircraft were added to the equation, it became very costly, too, particularly in human lives. By the end of the twentieth century, stand-off bombing using remote guidance was to become commonplace, but at the time of World War II this was pure fantasy - until German scientists took up the task.

During the Spanish Civil War of 1936-1939, the Luftwaffe discovered that the only really effective way to deliver bombs on to a point target was in a near-vertical dive. This procedure they repeated in 1939 in Poland and in 1940 in the Low Countries and France. Over Britain, later in the year, the Luftwaffe came across the basic flaw in this principle: dive bombers were uncomfortably vulnerable to effective fighter aircraft and concentrated anti-aircraft artillery. As an alternative, there was always area bombing from high altitude, but it was very wasteful and of little use against isolated high-value targets. Warships at sea were particularly difficult to hit, and the Luftwaffe frequently found itself mounting costly raids on important maritime targets which achieved little or nothing. Quite early on, thoughts turned to the development of a bomb which could be guided in flight.

Above: The Henschel Hs 294 guided aerial torpedo's tail and wings were designed to break off on hitting the water.

Left: An early air-to-surface missile was the Blohm & Voss Bv 143, mounted here on a Heinkel He 111H.

THE RUHRSTAHL X-1

Ruhrstahl's X-4 air-to-air missile showed promise, but it never lived up to it. Much more useful was the guided bomb they produced as the X-1. It had a

plethora of names: the RLM called it the PC 1400X; the Luftwaffe called it the 'Fritz-X'; and it has also been referred to as the FX 1400 and simply as the FX. However, its success was shortlived, despite having been designed with cheapness and simplicity in mind.

It had as its starting point the Luftwaffe's standard 1400kg (30801b) bomb, either the cast-steel thick-cased SD (Sprengbombe Dickwandig) 1400 known as 'Fritz', or the forged-steel armour-piercing variant, the PC (Panzersprengbombe Cylindrisch) 1400. The original bomb, manufactured by Rheinmetall-Borsig, of perfectly conventional shape, was a plain cylinder with a rounded nose coming to a blunt point and a conical tail with four sheet-metal fins partially shrouded by a strengthening ring at the extremity. Ruhrstahl modified the overall form somewhat for its guided bomb, leaving the last part of the cylinder intact but introducing an oversize ogival form to the first two-thirds of its length.

In order to maximise its aerodynamic performance, they gave it four relatively large fins, located forward of the mid-point of the bomb's length, with square leading edges and a pronounced sweep to the trailing edges. These main fins were mounted asymmetrically, as if they formed the diagonals of a rectangle with sides in the ratio one-and-a-half to one. The 12-sided framework which replaced the simple fin-and-shroud empennage maintained that same basic rectangular form, but with the corners cut off. Within it were four smaller fins, set vertically and horizontally and containing the spoilers themselves, simple tabs which were actuated by electro-magnets and which caused disturbance within the airflow over the appropriate surface of the fin when they were deployed. Deployment in turn caused the whole bomb to alter course or angle of descent by swinging it around the axis formed by the straight leading edge of the main fins.

RADIO GUIDED

Guidance was by means of a radio link using the Kehl/Strassburg system (but later, the wire-link control system was adapted for use with the X-l too), while flares, or battery-powered lamps on the tail for use at night, helped the operator to keep track of the missile in flight. It was a simple, fairly ingenious system, and it worked well enough, so long as the bomb was dropped from sufficient height. Released at the minimum altitude of 4000m (13,125ft) it had a range of up to 4.5km (2.8 miles); dropped from the maximum height any of its carrying aircraft could attain of 8000m (26,250ft), the range was up to 9km (5.6 miles). It was capable of piercing 130mm (5.125 in) of armour plate when dropped from 6000m (19,700ft). Though it is often referred to as a glider bomb, that is not actually the case. Its forward speed was that imparted by the launching aircraft, and it certainly did not 'fly' in any accepted sense. Its only major vector was downwards, and all the spoilers could do was modify its path to a small degree. That was often enough to make the difference between success and failure, as we shall see later when we look at operational deployment of the ASMs. A total of 1386 X-ls were produced between April 1943 and December 1944, when manufacturing ceased, and this was far short of the planned figure of 750 per month. Less than half of them - a total of 602 - were expended, in testing, training and operations.

THE RUHRSTAHL X-1 IN ACTION

From 29 August 1943, III Gruppe/Kampfgeschwader 100 (HI/KG 100), equipped with Dornier 217K-2s and operating out of Istres near Marseilles, was the first unit to employ Ruhrstahl X-ls to attack Allied shipping in the Mediterranean. Initially they were unsuccessful, but within a fortnight they had scored heavily and it soon became clear that the X-1 was a very potent weapon indeed.

On 4 September, Italy abandoned the Axis and reached a separate peace with the Allies, but there were still no clear indications of which way the powerful but until now seriously misused Italian Navy would jump. On 9 September the Allies landed at Salerno, and at 12 noon that day, reconnaissance reported that the Italian Fleet was at sea, headed south for Malta. Within two hours, 12 Do 217s of III Gruppe, led by Major Bernhard Jope, each armed with a single X-1, were in the air. They headed east at low altitude, then, climbing as they neared the coast of Sardinia, made out the shapes of three battleships with an escort of six cruisers and eight destroyers, Jope led his formation to 6500m (7108 yards) and turned towards the ships, which were now zig-zagging wildly and firing every one of their anti-aircraft guns. The first missile, launched by Oberleutnant Heinrich Schmelz (who was to be awarded the Knight's Cross, and later go on to command the group), struck the 40,000-tonne (39,368-ton) battleship *Roma* amidships at a terminal velocity of about 330 metres (1080 feet) per second, punching straight through her bottom to explode beneath the ship. A second hit her just forward of the bridge, where her

armoured deck slowed it down fractionally, so that it exploded in the forward magazine beneath. She broke in two and sank within 40 minutes, carrying 1255 men down with her, including the commanding admiral, Bergamini. Her sister-ship the *Italia* was also hit by a missile which passed through the deck and side just forward of 'A' turret (ie, the most forward turret) before exploding in the sea. She took in 800 tonnes (787 tons) of water, but managed to make Malta, though she played no further part in the war.

More successes followed. On 11 September, the 10,000 tonne (9842-ton) American cruiser USS *Savannah* was disabled, as, two days later, was HMS *Uganda* (8500 tonnes; 8365 tons). Better still was the attack Jope himself carried out on the 33,000-tonne (32,478-ton) British battleship HMS *Warspite,* which was giving fire support off the Salerno beaches. The missile hit the *Warspite* amidships, and penetrated six decks before exploding against the bottom of the ship, blowing a large hole in her. She took in a total of 5000 tonnes (4921 tons) of water, lost steam (and thus all power, both to the ship herself and to all her systems), and had to be taken in tow. She reached Malta but was out of action for the next 12 months. The British cruiser HMS *Spartan* and the destroyer HMS *Janus* were also sunk by X-ls, and the American cruiser USS *Philadelphia* was badly damaged.

Above: The Ruhrstahl X-1, also known as the Tritz-X', was one of the least sophisticated air-to-surface weapons, but one of the most successful. On 9 September 1943, two of these guided bombs sank the Italian battleship *Roma.*

THEHENSCHELHs293

The Ruhrstahl X-1 development programme began at around the same time that Wagner's team at Henschel began work on the Hs 293. Surprisingly, development took longer, but it proved to be much simpler to train aircrew to 'fly' the bomb than the missile, and the two were eventually deployed together. Initially, the RLM had tried to persuade Henschel to produce a missile which levelled out just above the water some distance before reaching the target, and another which would actually submerge and act like a conventional torpedo, but the company refused on the grounds that such a course would be too ambitious, since there was no experience on which to draw. Instead, it put forward the concept of a straightforward guided glider bomb,

FOCKE-WULF Fw 200C-6

Type: Long-range maritime reconnaissance bomber
Length: 23.85m (76.96ft)
Span: 32.84m (107.79ft)

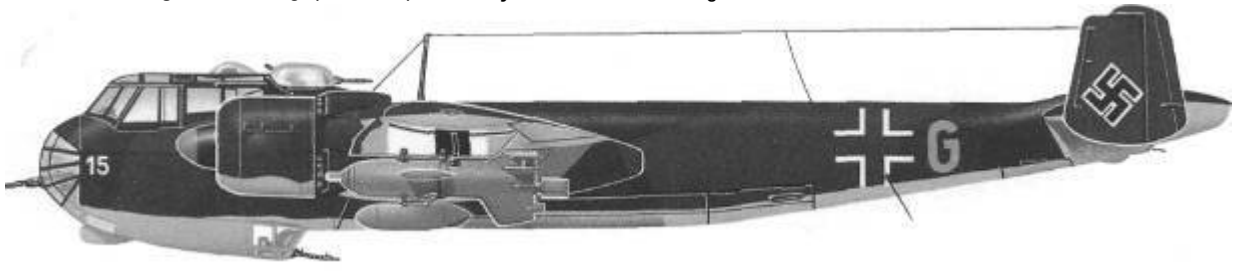
Max take-off weight: 22,700kg (50,044lb)
Max speed: 360km/h (224mph) at 4700m (15,420ft)
Range: 3560km (2211 miles)
Payload: 2 x Hs 293A guided missiles

Above: One of the German aircraft equipped to employ the Hs 293 rocket-propelled guided bomb was the long-range Focke-Wulf Fw 200 'Condor'. Two missiles could be carried, under the outboard engine nacelles.

unpowered but with aerodynamic properties, and the RLM agreed. The first experimental version, with no warhead, was tested in the spring of 1940, and by the end of the year a variant with a rocket motor, which allowed launch at 400m (1315ft) instead of the 1000m (3280ft) previously required, had been flown successfully, and plans for a production version of the latter were going ahead.

10 SECONDS OF THRUST

The Hs 293A-1 was built up from the nose and body sections of an SC (Sprengbombe Cylindrisch) 500 thin-walled bomb, with an elongated rear section tapering in the vertical plane, which extended above and below the body unequally to form small dorsal and larger ventral fins, carrying the guidance system. Short symmetrical wings with conventional ailerons were mounted where the bomb and tail section joined, and a tailplane with an equally conventional elevator was mounted just above their plane, where it would operate in clear air. The ailerons were actuated by electromagnets; the elevator by an electric motor and worm screw. The rocket motor - a liquid-propellant Walter 109-507B, using T-Stoff and Z-Stoff held in pressurised tanks - was underslung beneath the fuselage in a pod; it gave only 600kg (13001b) of thrust for 10 seconds, but that was enough to propel the missile well ahead of the aircraft to a point where the bomb aimer could see it. This had been a recurring problem with the X-l, and one which could only be solved by the pilot of the launch aircraft throttling back and lowering his flaps until the aircraft almost stalled, which made him very vulnerable indeed.



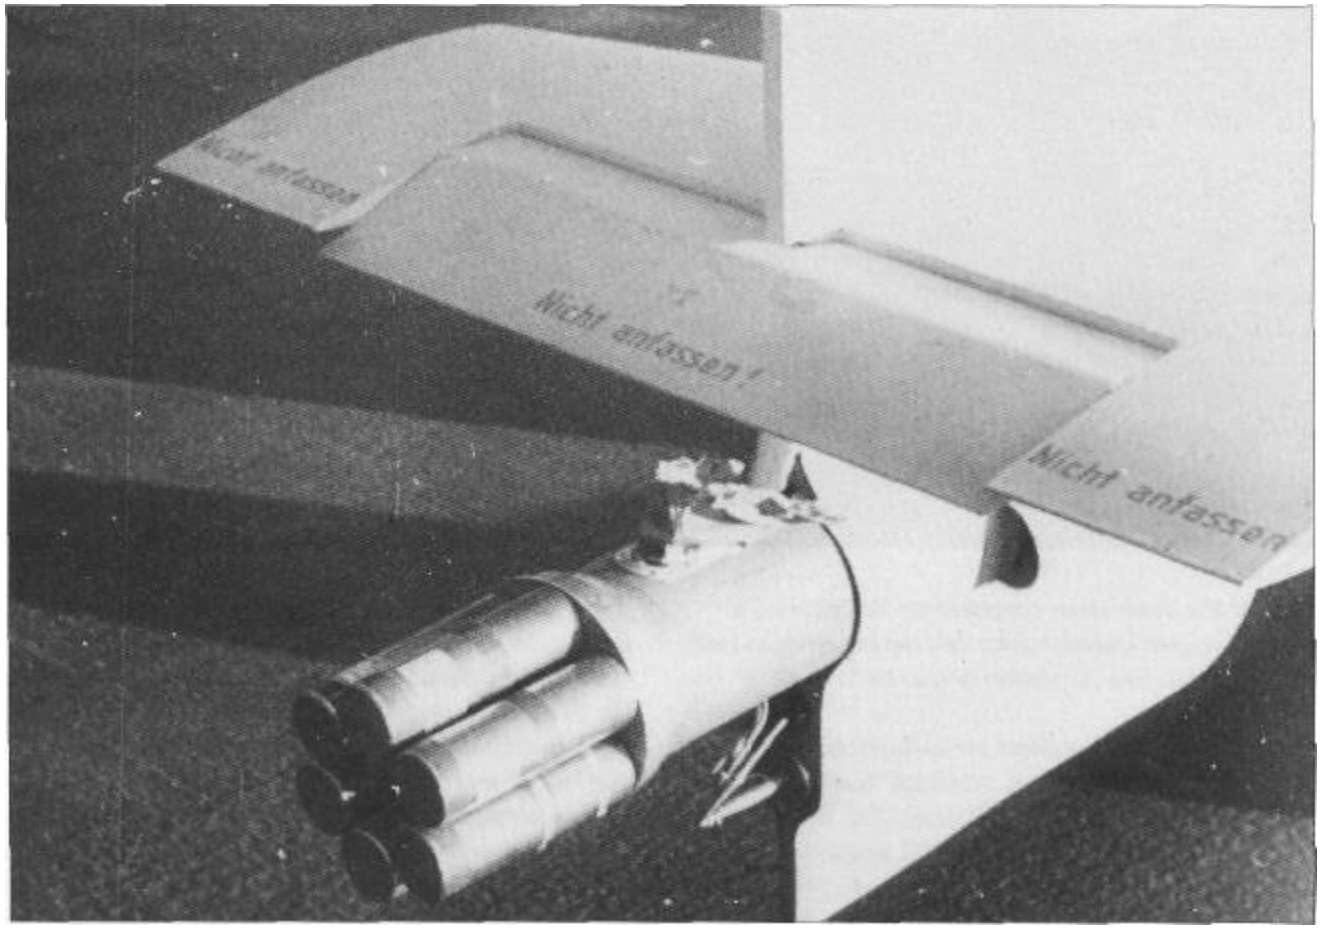
The flight profile of the Hs 293 was quite different from that of the X-l. It was normally released at between 400m (1315ft) and 2000m (6560ft), and between 3.5km (2.2 miles) and 18km (11 miles) short of the target. The terminal velocity varied between 435km/h (270mph) and 900km/h (560mph) depending on the altitude from which it had been released. Control, as always, was by joystick and radio link, on the Kehl/Strassburg system, but wire linkage was soon proposed and implemented, this time using a duplex bobbin system, with the wire being paid out from aircraft and missile simultaneously, giving a maximum range of 30km (18.7 miles). As with the X-1, flares in the tail - which were exchanged for small battery-powered lamps for night operations - allowed the bomb-aimer to keep track of the missile in flight.

A version of the basic weapon, with an extended nose to contain a television camera, was developed as the Hs 293D. The television equipment was developed by Fernseh GmbH in collaboration with the *Reichspost-Forschungsanstalt.* It was a vertical raster-scan 224-line system operating at 50Hz. Under ideal (laboratory) conditions, with its inventors to operate it, the system worked adequately enough, but under operational conditions it was much less successful and was finally abandoned. Such technology was not yet fully understood, and it was to be many years before it was perfected in weapons such as the American AGM-65 'Maverick' and the Anglo-French 'Martel'of the 1980s.

Other Hs 293 variants included the Hs 293H, which was discussed above in the context of air-to-air missiles, and the delta-winged, tailless (and stillborn) Hs 293F. It is unclear how many Hs 293s of all types

DORNIER Do 217E-5

Type: Four-seat anti-shipping bomber
Length: 18.20m (60.00ft)
Span: 19.00m (62.33ft)
Max take-off weight: 16,465kg (36,299lb)
Max speed: 515km/h (320mph) at 5200m (17,060ft)
Range: 2300km (1429 miles)
Payload: 2 x Hs 293A guided missiles



were manufactured, but educated guesses put the number at perhaps 1500, many of which were expended in the long testing and training programme.

THE HS 293 IN ACTION

II Gruppe of Kampfgeschwader 100, flying Hs 293A-equipped Do 217E-5s out of Cognac under Hauptmann Heinz Molinus, was the first unit to go into

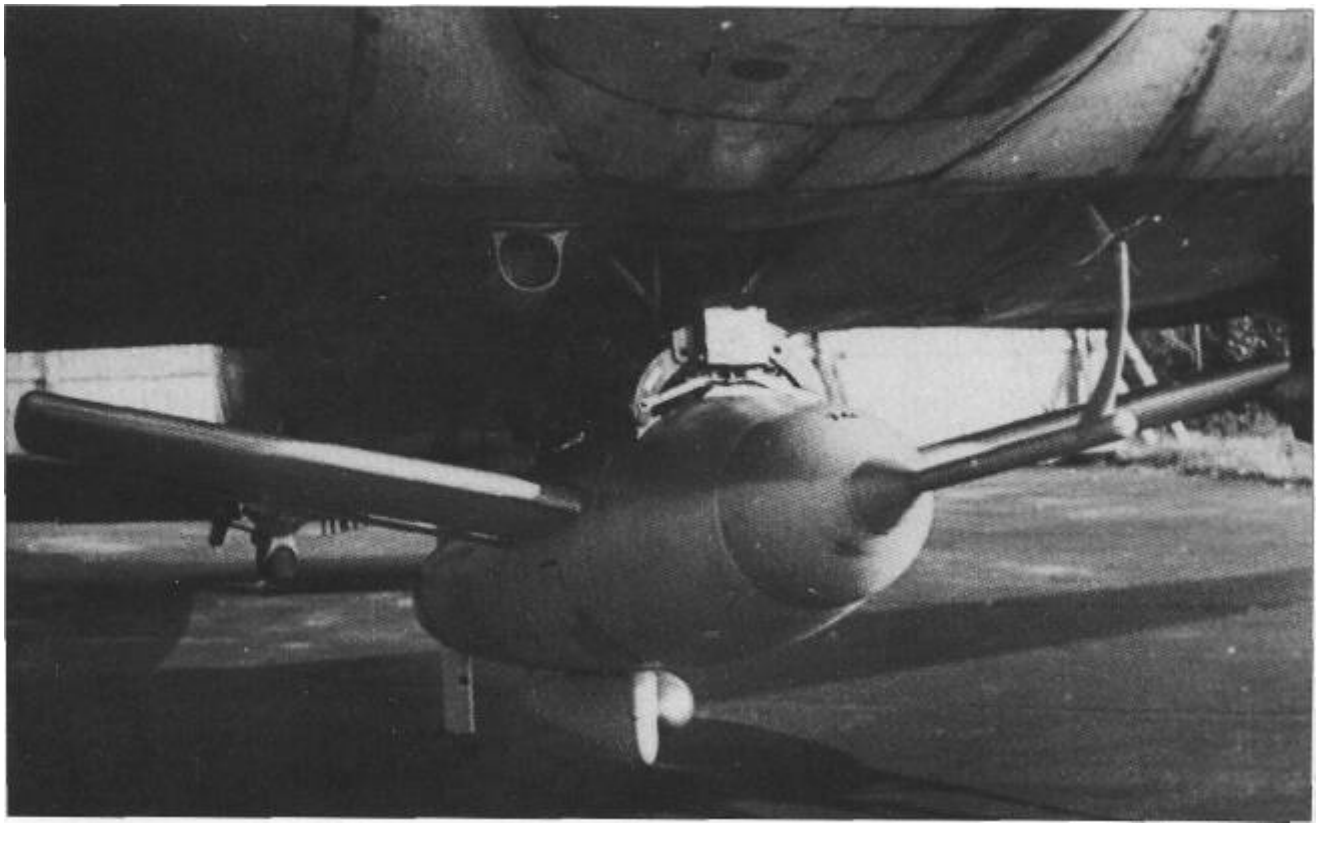
Above: Somewhat more successful than the Fw 200 was the Dornier Do 217E-5, which also carried two Hs 293As under its wings. It was one of these aircraft, of I I/KG 100, which scored the first success with the new weapon,

Below: The bomb-aimer needed to keep the Hs 293 in sight all the way to the target, and for this purpose a multi-tube flare unit was attached to the bomb's tail.

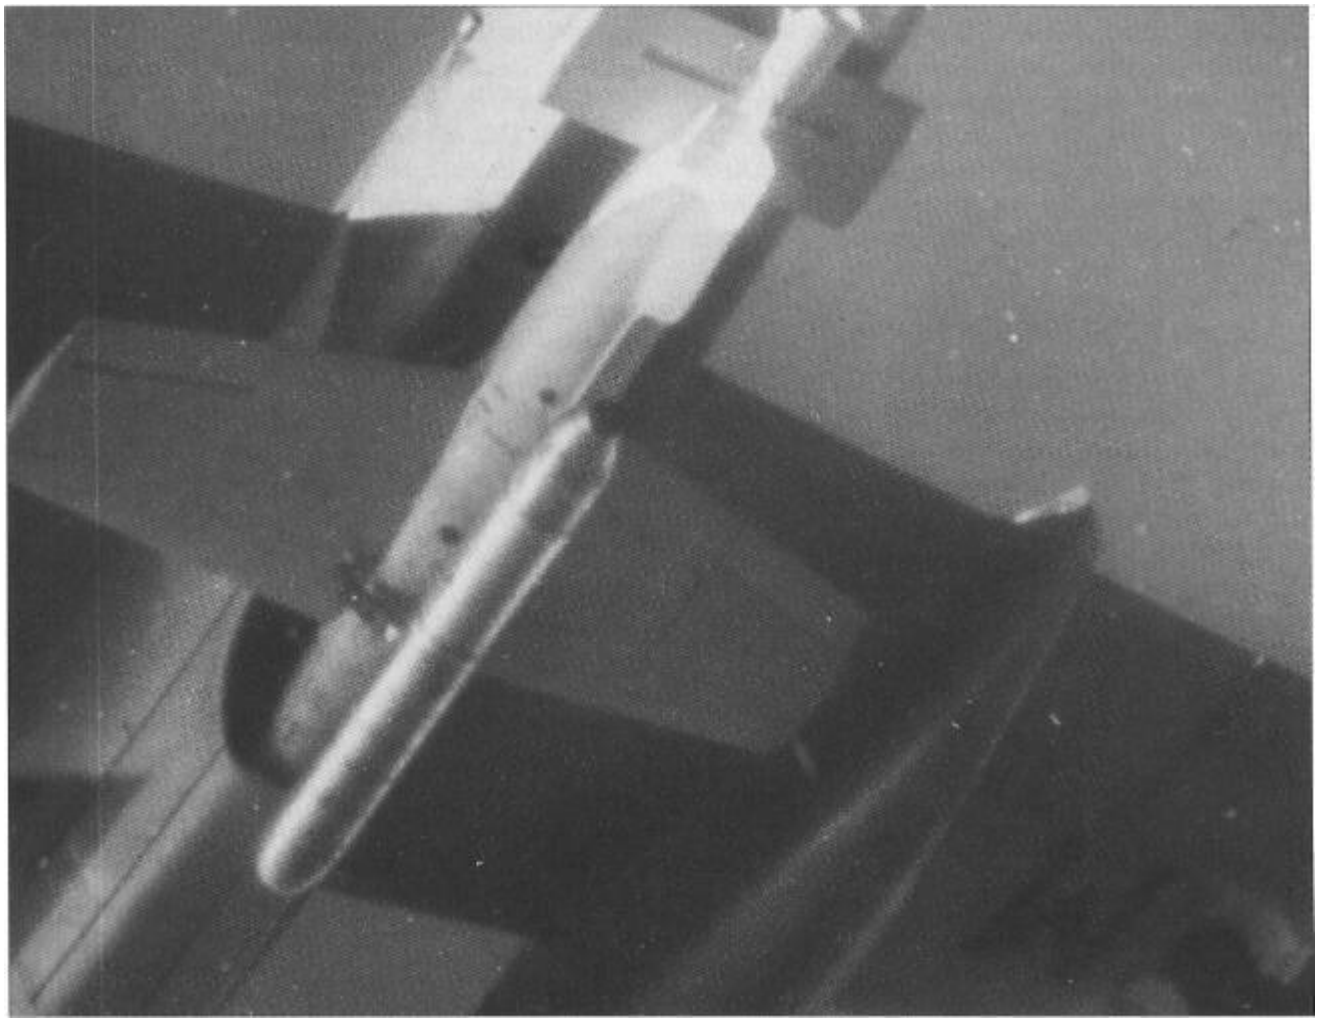
Above: The bomb-aimer controlled the Hs 293 using a two-axis joystick which transmitted signals either by radio or over wires. This installation is in an He 111H-12.

action armed with guided air-to-surface missiles, on 25 August 1943, against warships hunting German submarines in the Bay of Biscay. The first-ever kill with a guided missile came on 27 August, when one scored a direct hit on the 1270-tonne (1250-ton) sloop (ie, corvette) HMS *Egret*, detonating the ammunition in her after magazine and blowing her to pieces with the loss of 222 lives. In fact, II/KG100 later moved to Tstres, near Marseilles, and II/KG40, equipped with He 177A-5s, replaced it on the Atlantic coast. Besides the *Egret*, Hs 293s accounted for five destroyers and a number of merchant ships before the Allies found a way to combat them using a set of defensive tactics which included jamming the radio control signals and targeting the launch aircraft during the vulnerable control phase, when they had to fly straight and level

at reduced speed. These defensive tactics made the missions very costly. On 23 November, II/KG40 lost half its entire strength while attacking a well-protected convoy off the Algerian coast. Hs 293s were last used in action, with some success, against Red Army forces crossing the River Oder in April 1945, when they went into action with 'Mistel' (qv) piggyback hybrid aircraft.



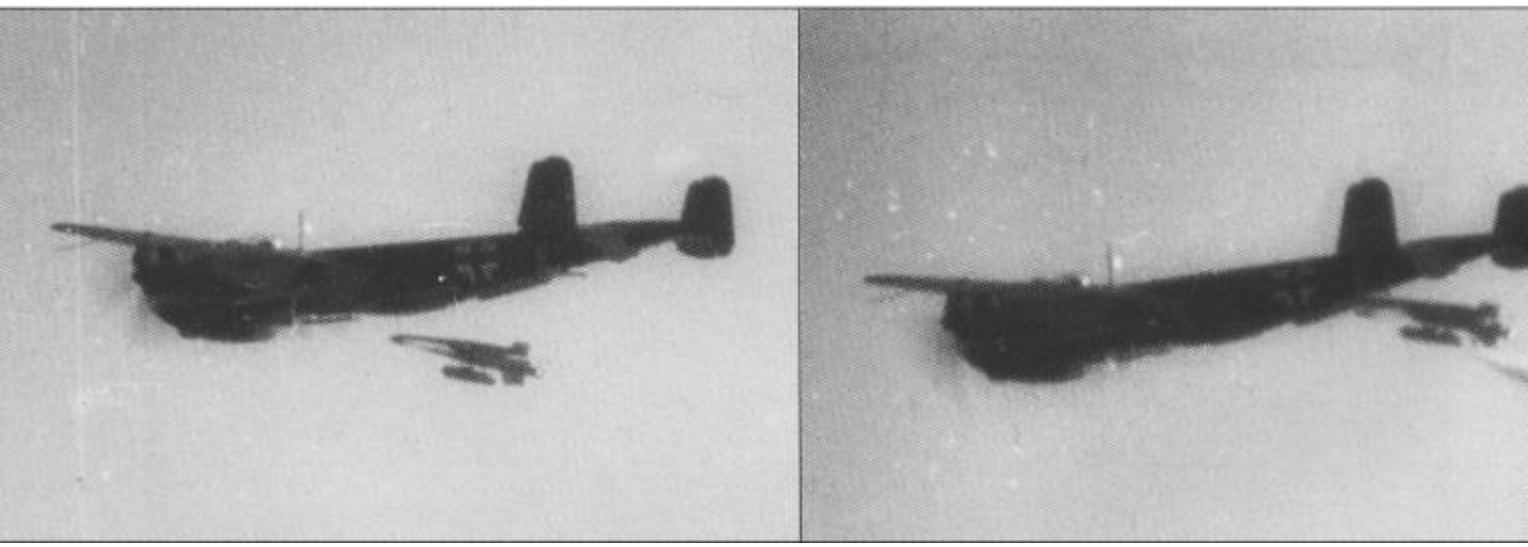
THE BLOHM & VOSS ASMS



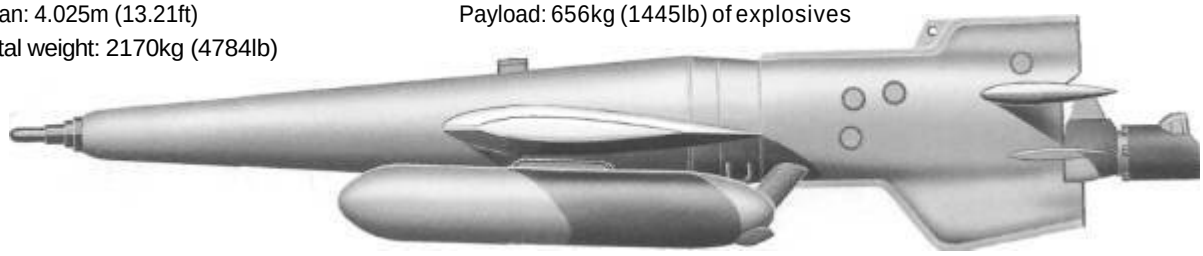
Blohm & Voss reacted to the RLM's requirement for a sea-skimming missile with a proposal for a guided glider bomb. This incorporated a rocket motor which was only ignited by tripping a 2m- (6.5ft-) long lever hanging from its underside when the bomb came to the end of its descent. It was an ingenious solution, but proved to be unworkable. The length of time available to initiate the rocket motor was just insufficient, and the prototypes simply ploughed into the sea. Rather better conceived was the Bv 246 'Hagelkorn' ('Hailstone'), which was a pure glider and was intended specifically to attack radio stations transmitting navigational signals to RAF bombers by homing in on their very signals. The Bv 246 was a simple aerodynamic shape with a cruciform empennage incorporating a vertical control surface, and high aspect-ratio wings designed to give it a shallow glide angle (1:25, or barely 4 degrees) and thus a long range after launch. Released at 10,500m (34,450ft), it had a range of 210km (130 miles). The original proposal was made in 1942, but there was little official interest despite the fact that the RAF had already begun to use radio as a navigational aid. It was December 1943 before 'Hagelkorn' was ordered into production and it was cancelled two months later in the February 1944 austerity drive, by which time hundreds had been built. These missiles were gradually expended in a protracted low-priority test programme which lasted until January 1945. With an all-up weight of 730kg (1600lb), of which 435kg (960lb) was warhead, it was light enough to be deployed by an Fw 190.

FLYING TORPEDOES

The RLM did not give up its search for an air-to-subsurface weapon, and Henschel responded eventually with a variety of designs for what we may regard as guided air-launched torpedoes. The simplest of these



Below: The Blohm & Voss Bv 143 was a rocket-assisted glider bomb, the powerplant of which was ignited only when the projectile had come within 2m (6.5ft) of the surface of the sea.

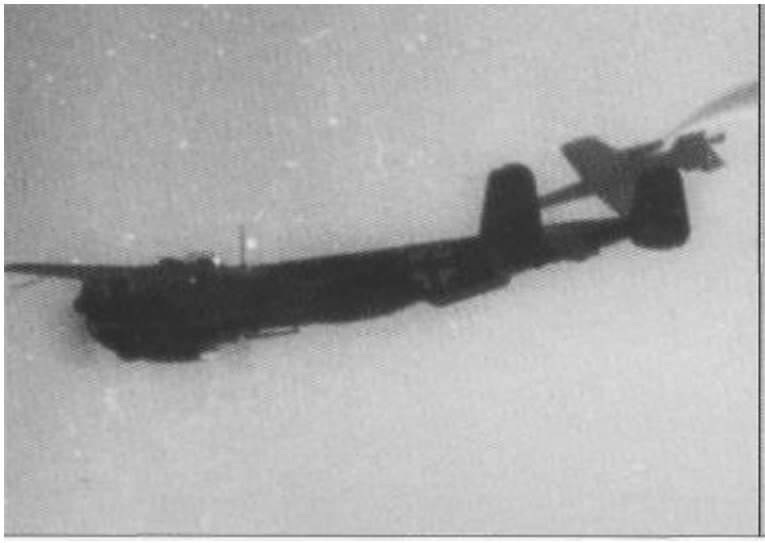


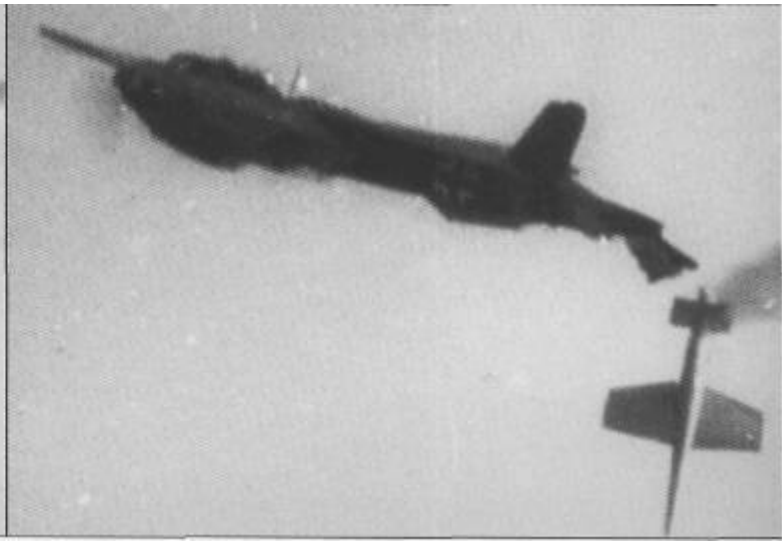
Above: The Dornier Do 217 was the aircraft of choice for the deployment of the Henschel Hs 294 anti-ship missile. Perhaps 1450 of these sophisticated guided missiles were ordered but few were completed.

Below: This sequence shows a launch of an Hs 294 which went disastrously wrong. Having disengaged from the parent Do 217 aircraft, the missile then collided with the bomber, slicing off a tail fin.

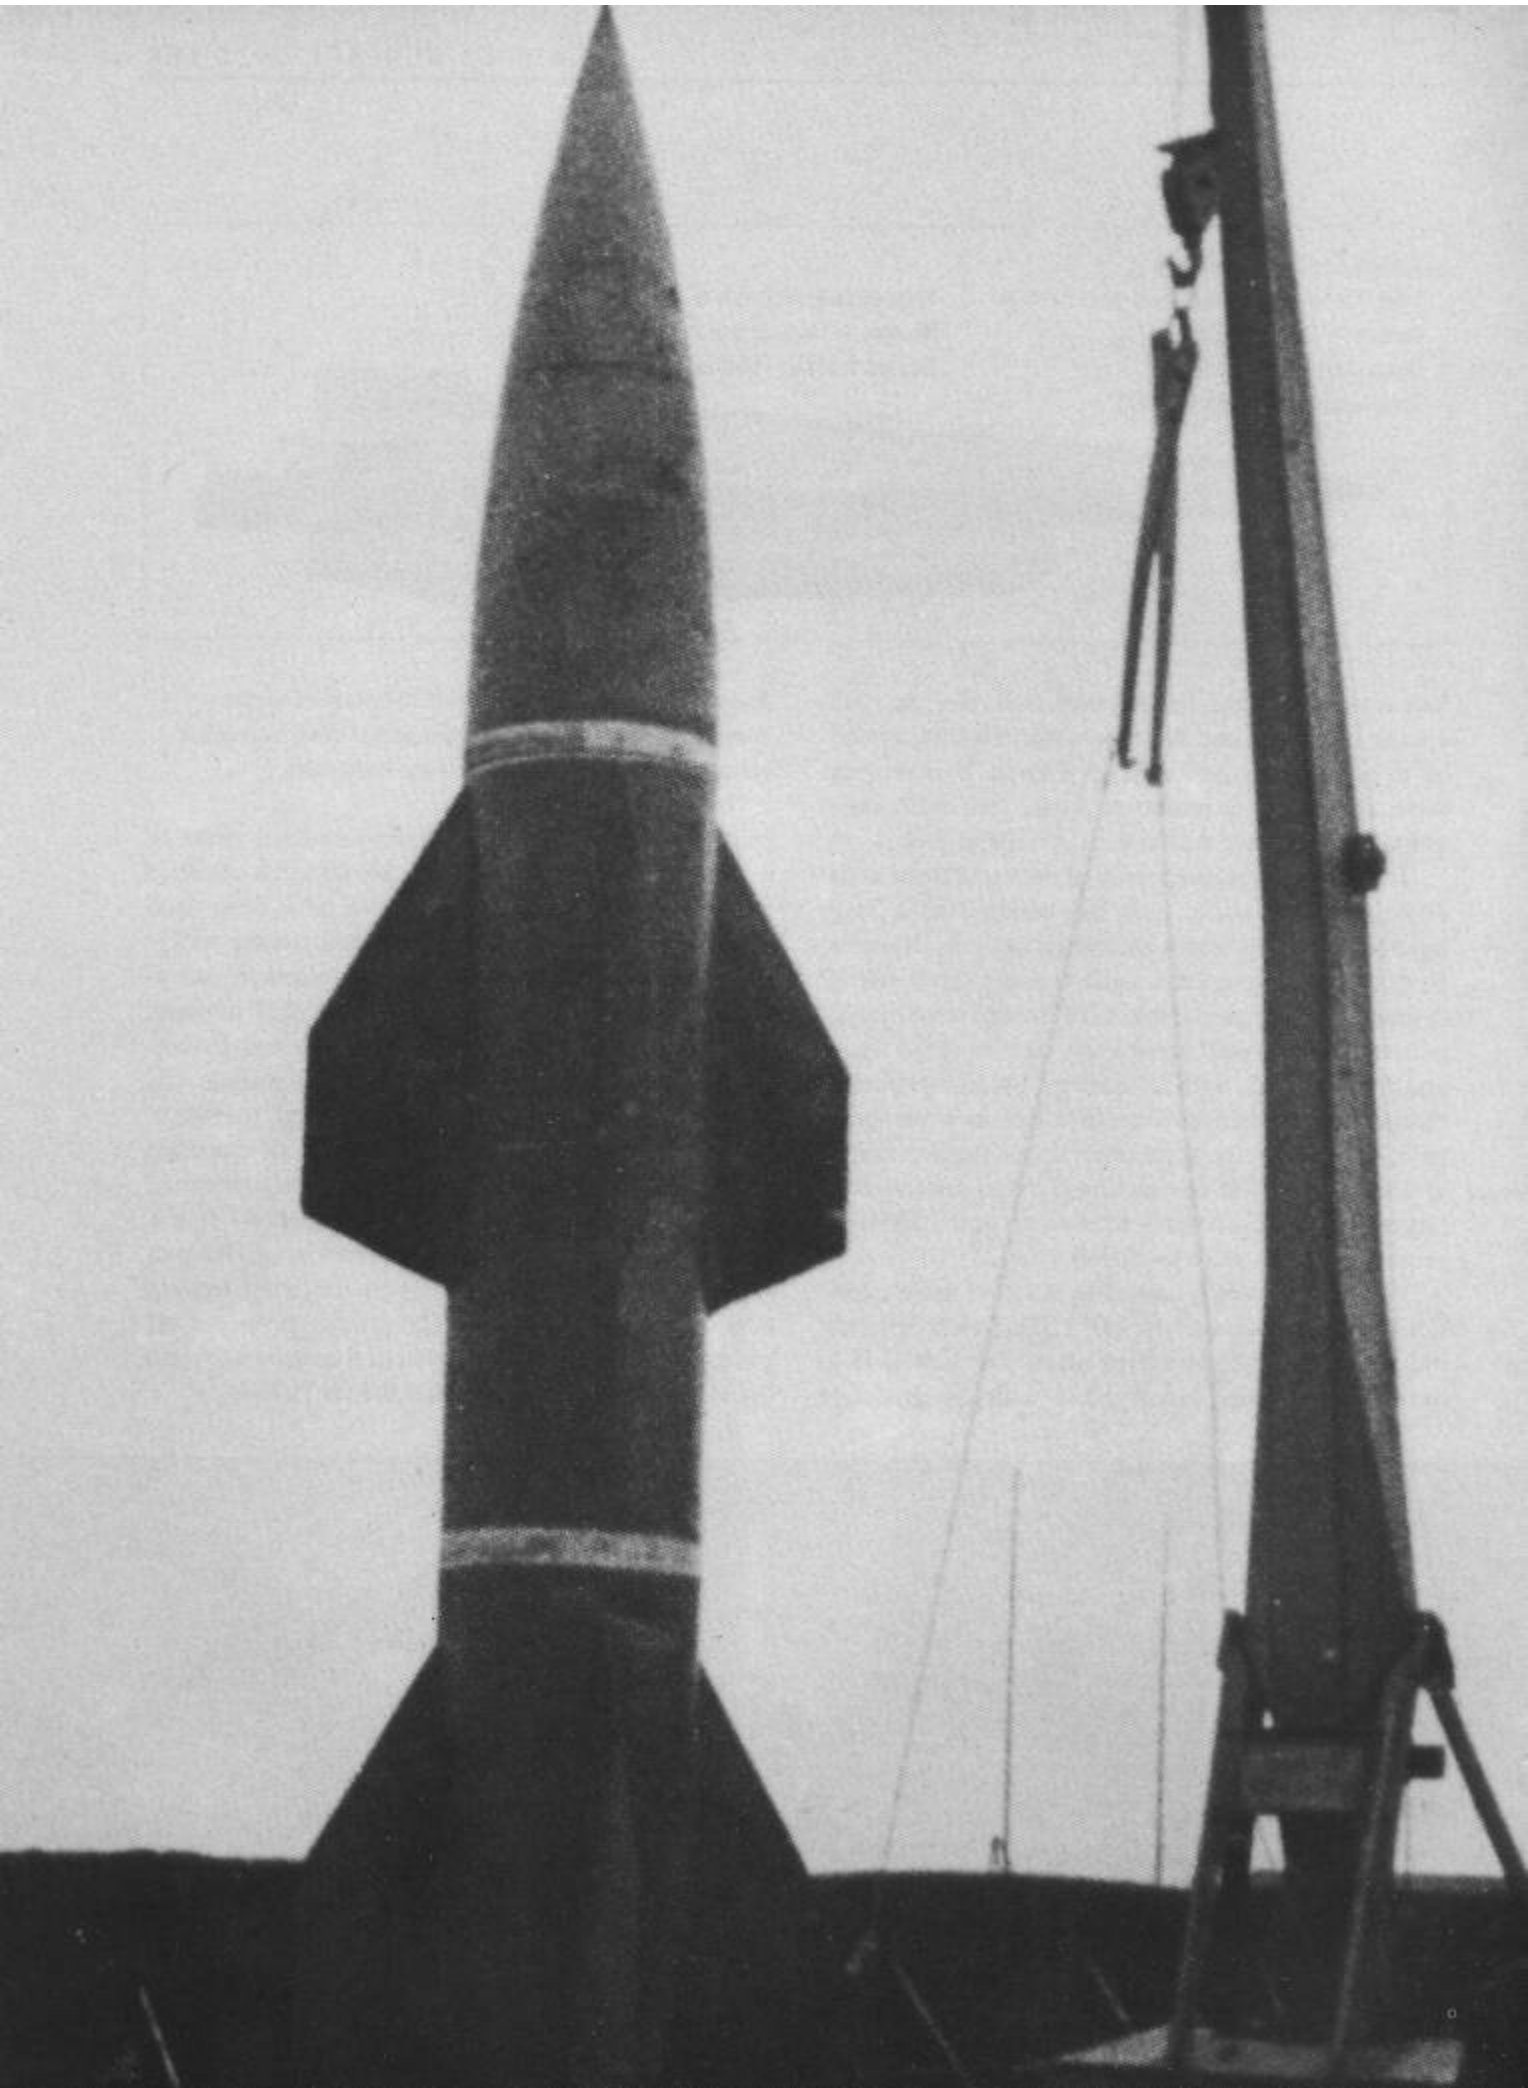
HENSCHEL Hs 294

Type: Rocket-propelled anti-ship missile
Length: 6.12m (20.08ft)
Span: 4.025m (13.21ft)
Total weight: 2170kg (4784lb)
Max speed: 860km/h (534mph)
Range: 4-14km (2.5-8.7 miles)
Payload: 656kg (1445lb) of explosives





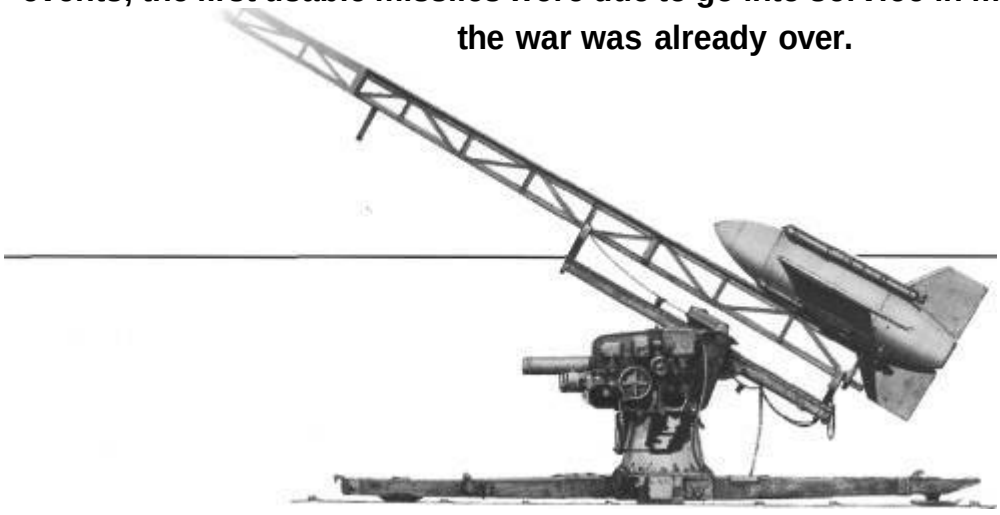
was a version of the Hs 293, and from that, in 1943, sprang the larger and more powerful Hs 294, intended to be used to attack armoured ships. Two versions were produced in prototype form, one with radio guidance, the other with a wire command link.



The Hs 294 was essentially of the same form as the air-to-surface missile, with the addition of a long, tapered nose cone and a second rocket unit. It was to be flown into the sea at a shallow angle (optimum 22 degrees); the wings and the rear fuselage were mounted so that they would break away on hitting the water, and the warhead, with its 656kg (14451b) explosive charge, would then be free to travel in a parabolic path, induced by the form of its upper surface, for up to 45m (150ft), self-destructing if it had not found its target. It is believed that a total of around 1450 were ordered, but few were produced.

The Hs 294 was followed by a rather more ambitious project known as the GT 1200, which certainly did not get past the prototype stage. GT 1200 was to have been an unpowered glider, with the guidance package of the Hs 293, but without a rocket motor to assist its launch. Instead, the rocket motor, a standard Schmidding solid-fuel unit, was to have been used only during the last phase of its deployment, underwater, when, shorn of its wings and 'fuselage' extension, it became an otherwise conventional torpedo, steered by small rudders on its cruciform rear-mounted fins. There is no indication of how the missile was to have been guided during its run through the water. Hensehel's last foray into the field of air-launched submarine weapons was to have been a supersonic missile known as the 'Zitterrochen' (Torpedo Fish'), its triangular planform wings incorporating 'Wagner bars' - simply spoilers moved to the wing trailing edge - instead of ailerons. The project never got off the ground, but the control system found its way into the Hs 117 'Schmetterling' and the Hs 298.

Above: The Hs 294 was intended to enter the water cleanly some way from its target and strike it below the waterline, where it was at its most vulnerable.



CHAPTER EIGHT

Surface-to-Air Missiles

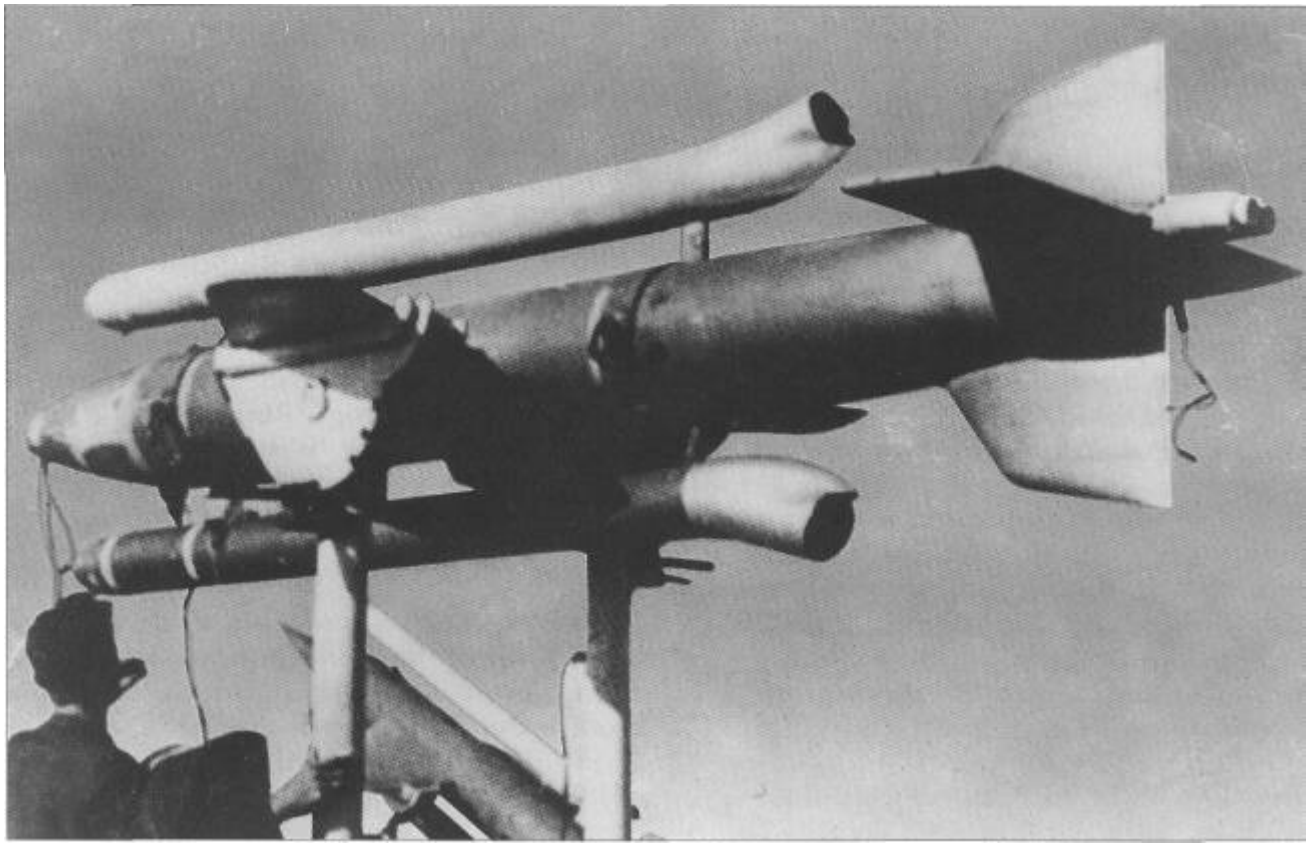
In parallel with the programmes to develop air-to-air and air-to-surface missiles, German scientists and engineers also strove to produce guided surface-to-air missiles (SAMs). Work first began in 1941, but yet again, progress was overtaken by events; the first usable missiles were due to go into service in mid-1945, but by then the war was already over.

Finding ways to defeat the Allied bomber formations which pounded the Reich preoccupied the Luftwaffe and the RLM alike. As a result, a number of teams were at work developing new weapons. Most important amongst these were the more-or-less successful jet and rocket-powered aircraft we have already discussed. However, much energy and resources went into developing surface-to-air missiles (SAMs) too, amongst the most significant of which were the Henschel Hs 117 'Schmetterling' ('Butterfly'), the Messerschmitt 'Enzian' ('Gentian'), the Rheinmetall-Borsig 'Rheintochter' ('Rhine Maiden'), and the BMW 'Wasserfall' ('Waterfall') - all of which had a guidance system - and the BMW Taifun' (Typhoon'), which was unguided.

Above: The Messerschmitt 'Enzian' was made largely of plywood and flew at subsonic speeds.

Left: Like the 'Enzian', the 'Wasserfall' relied on blast effects; its warhead was detonated by an artillery fuze.

THE HENSCHEL Hs 117 'SCHMETTERLING'

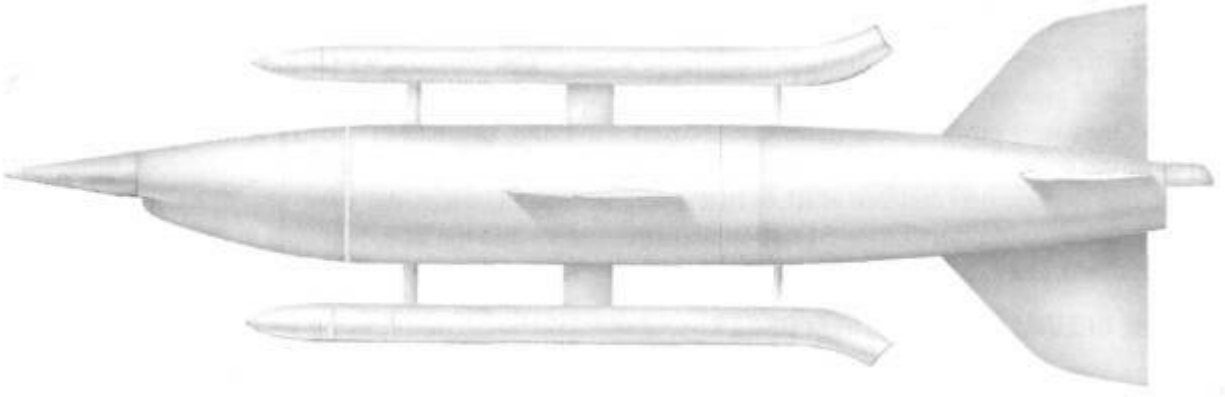


The earliest of the projects was for a subsonic short-to-medium-range missile which was radio controlled by an operator on the ground. Henschel first began work on the project in 1941, alongside a number of unguided flak rockets, and two years later was ordered to develop it as the Hs 117. With stubby swept-back wings and a cruciform tail, the Hs 117

'Schmetterling' was controlled like an aircraft, with solenoid-operated 'Wagner bars' rather than conventional ailerons on the trailing edges of the wings and tailplane. It appeared somewhat unbalanced, having a bifurcated nose, with the starboard cone elongated to form a warhead extension and the port cone finishing in a small airscrew driving a generator. Launch power was supplied by a pair of external solid-fuel motors, one above and one below the fuselage, which gave 1750kg (38501b) of boost for four seconds, accelerating the missile to 1100km/h (680mph) before falling away and igniting the sustaincr motor. The motor was to have been either a BMW 109-558 or a Walter 109-729, both of which used liquid fuel - R-Stoff or Tonka', a composite self-igniting fuel, with SV-Stoff (concentrated nitric acid) as an oxidizer in the former; SV-Stoff and Br-Stoff (low-octane petrol), with an alcohol igniter, in the latter.

LAUNCHING THE 'SCHMETTERLING'

At 4.3m (14ft) long and weighing a total of 420kg (9251b) including the solid-fuel motors, the 'Schmetterling' was launched from a modified anti-aircraft gun mounting, azimuth and elevation being approximately pre-set manually by the launch crew. Once in flight, a flare in the tail was ignited, and the controller observed its progress through a telescope, correcting by radio using the Kehl/Strassburg system codenamed Tarsival' (FuG203/230), which was also widely used for other operator-guided missiles, employing four separate radio frequencies, two for the horizontal axis and two for the vertical. Control was by a simple joystick. A fifth radio frequency was used to detonate the 25kg (551b) warhead, which relied on blast rather than fragmentation, on command, though proximitiy and time delay fuzes were also developed. The effective range was 16km (10 miles) and the ceiling was 1 1,000m (36,000ft). In blind conditions it was hoped to employ the Mannheim-Reise/'Rheingold' radar system, which worked something like the Würzburg fighter control system, one set tracking the target, the other the missile; the operator would use the joystick as before, but would now be observing dots on a cathode ray tube, and trying to keep them superimposed. Later, it was hoped, corrections would be applied automatically.



Below: The Henschel Hs 117 'Schmetterling' was the first attempt by Germany to develop a surface-to-air missile; it was for use against low- and medium-altitude intruders.

MENSCH EL Hs 117

Type: Rocket-propelled surface-to-air missile
Length: 4.29m (14ft)
Diameter: 350mm (13.77in)

Launch weight: 445kg (981 lb)
Max range: 32km (20 miles}
Warhead: 25kg (55lb) of high explosive

Above: The Henschel Hs 117 'Schmetterling' surface-to-air missile. The Hs 117 was also produced in an air-to-air version which lacked the SAM's external boosters.

Testing of the 'Schmetterling' began in May 1944, and by September, 22 launches had been made, some of them of a variant intended as an air-to-air missile, the Hs 117H (qv). The success rate was good enough that the missile was ordered into production in December, with first deliveries - 150 units per month - to take place in March 1945, rising to 3000 per month by November. This was hopelessly optimistic, of course, at a time when industrial output in Germany was failing fast, and no missile was ever produced for operational use.

THE MESSERSCHMITT 'ENZIAN'

Messerschmitt's proposal resembled an unmanned version of the Me 163 'Komet', with the same stubby body and wings and the twin ventral/dorsal tail fins. It was considerably heavier than the 'Schmetterling' at 1800kg (39701b), had a 300kg (6601b) warhead, and was designed to operate at up to 12,000m (41,000ft) or out to a range of 24.5km (15.25 miles) at lower levels. One most important feature of the 'Enzian' was the fact that its airframe was to be constructed of moulded plywood, a material Germany had in abundance, and this was almost - but not quite - enough to give it sufficient official approval points to actually see it into production, especially since it used technology which was well understood.

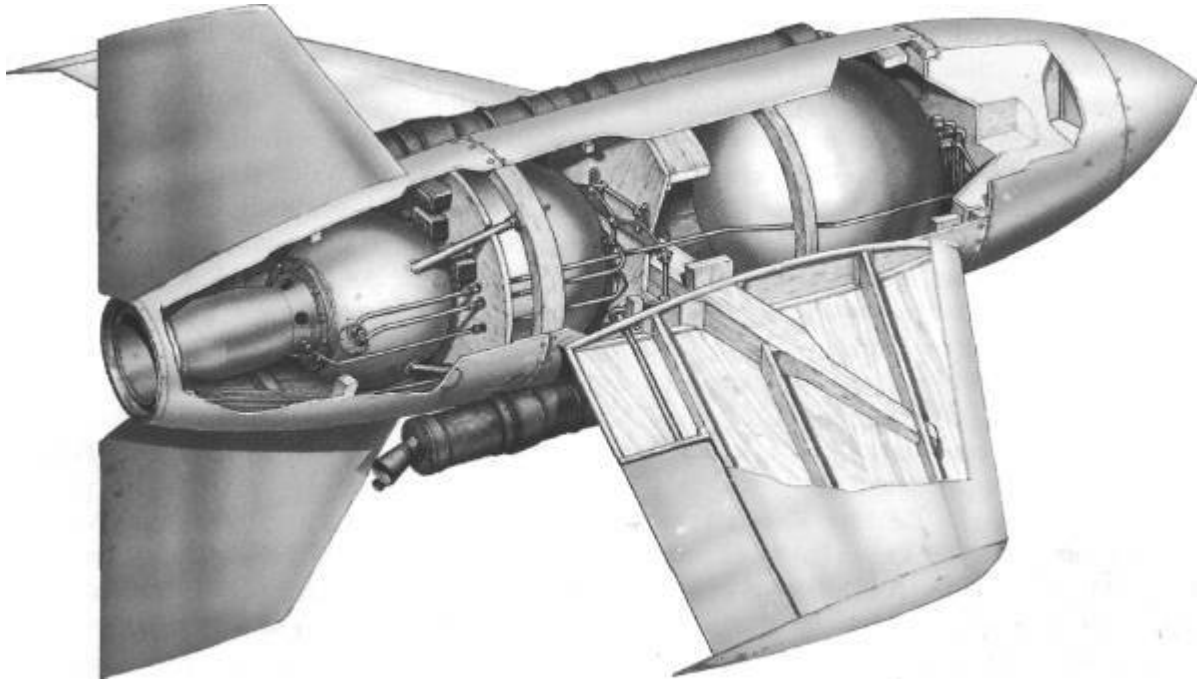
The 'Enzian', originally the Flak Rakete l, was designed from June 1943 by a team led by Hermann Wurster at Messerschmitt's R&D headquarters at Oberammergau, with prototypes to be produced at Augsburg and serial airframe manufacture to be carried out at Holzbau Kissing AG, in nearby Sonthofen.

Like the 'Komet', it had a circular-section fuselage, 0.9m (3ft) in maximum diameter; it also had ventral and dorsal fins and mid-mounted swept-back wings with full-width elevons, which operated in unison or independently and thus obviated the need for a rudder. Launch power was provided by four Schmidding 109-533 diglycol-fuelled rockets, the same as that employed for the 'Schmetterling', which gave a combined thrust of 7000kg (15,40015) for four seconds and were then jettisoned. The launch platform consisted of 6.8m (22.25ft) rails on a modified 8.8cm anti-aircraft gun mounting, which could of course be trained in azimuth and elevation. The sustainer rocket was to have been a Walter R1-210B, using SV-Stoff and Br-Stoff as its fuel, delivered to the combustion chamber by a pair of steam-driven turbo-pumps as employed in the A4. About 15 of these motors are thought to have been produced, and they were used to test the prototype missiles, but for the production version a simplified motor was designed by Drs Konrad and Beck of the *Deutsches Versuchsanstalt für Kraftfahrzeug- und Fahrzeugmotoren* (DVK - the German Aviation Propulsion Experimental Establishment), which used S-Stoff and Visol delivered by compressed air, and in its final form gave the slightly higher performance figures of 2500kg (55101b) of thrust falling to 1500kg (33001b) by the end of its 56-second burn time. The reducing thrust ensured that the missile did not exceed its maximum

Mach number and become unstable. Guidance was exactly the same as for the 'Schmetterling' and the same sort of proximity fuze was to have been used.

Perhaps 60 'Enzian' missiles were constructed, of which 38 were tested, beginning in April 1944. The first examples fared badly because the designers had not grasped the importance of aligning the missile's axial centre of gravity and thrust lines, but that was cured, and later tests proved successful. The 'Enzian' fell foul of the general deterioration in manufacturing capacity, and as there was concern at RLM that it was detracting from the production of Me 163s and Me 262s, in January 1945 the project was axed.

THE RHEINMETALL-BORSIG MISSILES



Although successful with its unguided 'Rheinbote' bombardment missiles, Rheinmetall-Borsig achieved less with its surface-to-air missiles. The company's first foray into the field was a winged missile called the 'Hecht' ('Pike'), which seems to have been no more than a design and concept-proving exercise; several are known to have been air-dropped, both in powered and unpowered forms. Work on it stopped in 1941, when the 'Feuerlilie' project was initiated; it seems that this, too, was to have been purely a research programme, but the RLM insisted that it be adaptable to use as an anti-aircraft rocket, should that prove necessary. Even though there is no evidence that that step was taken, and the missile was unguided, we may include it here in passing.

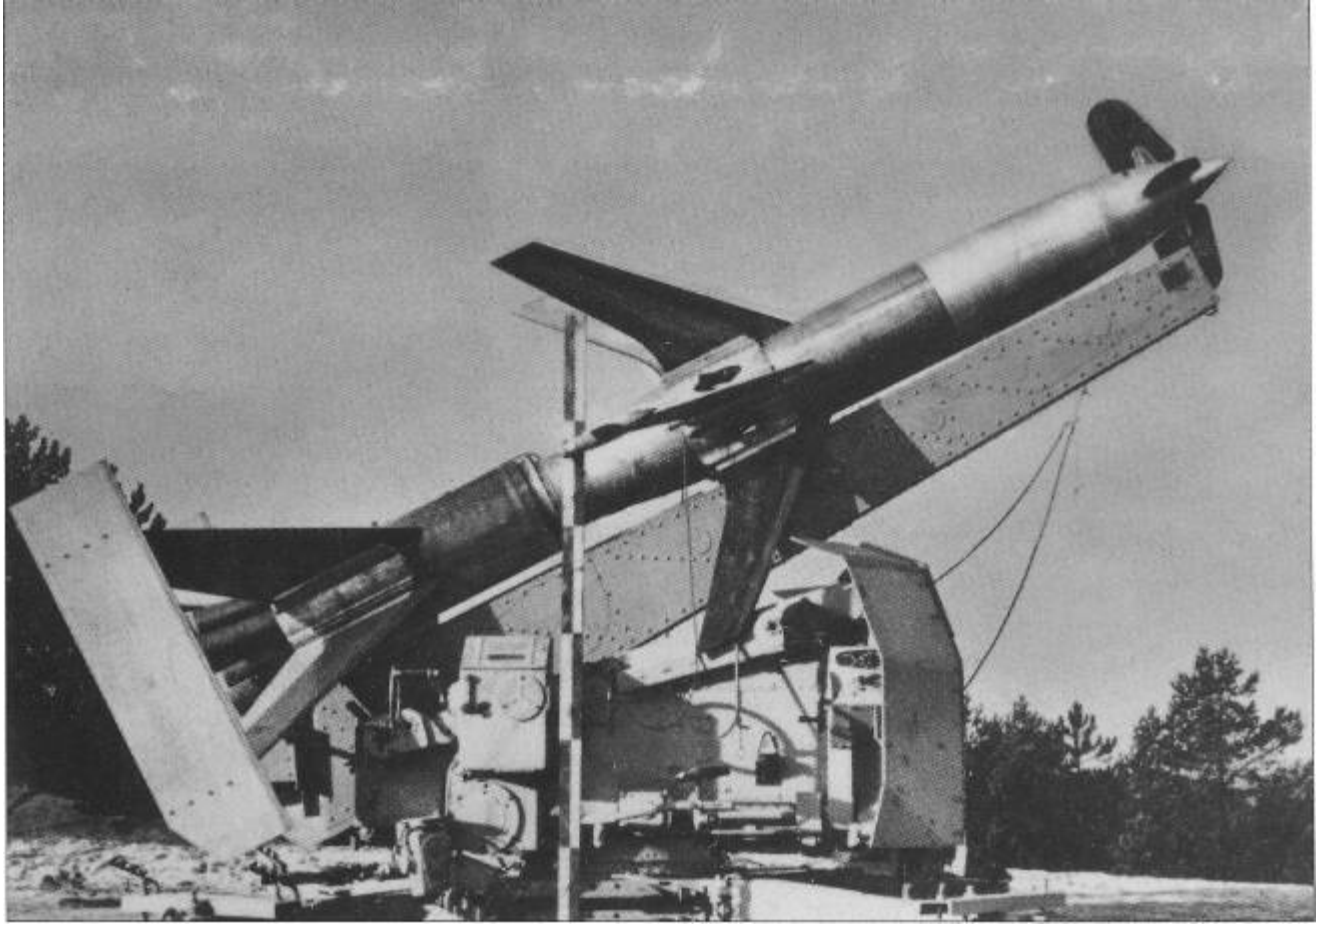
The 'Firelily' was to have a streamlined cylindrical fuselage with rear-mounted swept-back wings terminating in small symmetrical fins. It was to have been produced in a number of versions of different fuselage diameter, the most important of which were the F25 and the F55, and was to have been propelled by solid-fuel rockets which the company already had in production as take-off assistance units (RATO) for gliders and heavily-loaded transport aircraft, though there was also a plan to produce a supersonic version of the 55cm missile, with simple fins in place of the wing assembly, to be powered by a Konrad-designed liquid-fuel rocket. The 'Firelily' project continued

Below: In looks, 'Enzian' resembled the Messerschmitt Me 163 'Komet' rocket plane. Like all liquid-fuelled rockets, most of the internal space of the 'Enzian'was taken up with fuel tanks.

MESSERSCHMITT 'ENZIAN'

Type: Rocket-propelled surface-to-air missile
Length: 2.4m (7.875ft)
Diameter: 0.88m (2.9ft)
Launch weight: 1800kg (3970lb)
Max range: 24.5km (15.25 miles)
Warhead: 300kg (660lb) of explosives

Above: Rheinmetall was better known for its artillery pieces, but its 'Rheintochter' SAM was an ambitious design intended to fly at up to 1300km/h (SOOmph).



until early 1945, but it seems clear that no attempt was ever made to utilise the missiles as weapons. Several F25s were manufactured and were tested at Peenemunde-West and at the company's own proving grounds at Leba, but certainly no operational variant was ever produced. Perhaps six F55s were produced; one was tested successfully at Leba, and two were sent to Peenemünde, where the one went out of control when launched.

The 'Rhine Maiden' was an entirely different matter. It was conceived from the outset as an anti-aircraft missile. It was an ambitious design incorporating two stages: the cylindrical first stage housed nothing but solid-fuel booster rockets, and had four fixed, swept-back fins with bracing struts between them, which acted simply as stabilisers, being jettisoned on burn-out; the second stage, also cylindrical, tapered to a point at the nose and slightly at the tail, and had six fixed fins mounted about two-thirds the way back from' the nose, and four small rounded steering surfaces - canards, in effect - at the nose itself, which were actuated by servos to guide the rocket in flight. Unusually, the warhead was situated in the rear of the rocket, behind the fins and motor unit, the six venturi of which were positioned between the fins, angled out, which also worked to help stabilise the missile in flight. 'Rheintochter F was intended to reach speeds of almost 1300km/h (SOOmph), and carry a 100-150kg (220-3301b) warload to 40km (25 miles) and 6000m (19,700ft). The missile had a lengthy development period. The contract was signed in November 1942, but by late 1944 only a relatively small number - perhaps 50 - had been launched, less than half of which carried guidance equipment that was essentially similar to that incorporated in 'Schmetterling' and 'Enzian' and in the more successful guided glide bombs. At the year's end, the project was abandoned, the missile never having come close to reaching its design altitude.

It seems that the development team had known all along that the RATO units would never produce the required performance, and had planned to power the production version of the missile, known as 'Rheintochter III', with a version of the same Konrad-designed liquid-fuel rocket which was to go into the supersonic 'Feuerlilie', though a version with a much-enlarged solid-fuel rocket was also proposed. This was, in fact, the only version of the 'Rheintochter IIP ever tested.

THE EMW'WASSERFALL

Although Wernher von Braun worked for the German Army, and anti-aircraft defences were the responsibility of the Luftwaffe, EMW was ordered to produce an anti-aircraft guided missile. Most of the necessary work had already been done in developing the A4,

Above: The 'Rheintochter' 1 on its launch ramp. Guidance was provided by the small vanes at the nose, which were controlled from the ground via radio signals.

and the chief difference between 'Wasserfall' - as the surface-to-air missile was known - and the A4 was to be in its propulsion plant. From the outset it was clear that the operational requirements for the two rockets were quite different. Whereas A4 could be fuelled as and when required, in a more or less leisurely fashion, and fired when it was ready, the SAM would be required to be held at instant readiness, perhaps for months, and this was simply not practical if a cryogenic propellant like liquid oxygen was employed. Instead, it would be fuelled by Salbei (90 per cent nitric acid, 10 per cent sulphuric acid to inhibit corrosion) and a type of Visol, the fuel - which ignited spontaneously on being combined - being delivered to the combustion chamber by pressurising the propellant tanks with inert nitrogen, rather than by using cumbersome high-pressure steam turbines. Because the two components of the fuel reacted so violently, pre-launch and launch-time safety procedures very important, and there was an elaborate system of interlocks involving metal membranes which would rupture only in predetermined circumstances.

'WasserfaU' was about half the length of the A4, at 7.84m (25.7ft), and weighed 3500kg (77201b) all-up, as opposed to 12,900kg (28,4401b), but it was still by far the biggest of all the German surface-to-air weapons, even though its warhead was smaller, at 235kg (5201b), than that of the 'Enzian'. It was very similar in shape to the bigger missile, but unlike the A4 it had four stabilising fins located about one third the way back from the nose.

35 TEST LAUNCHES

'Wasserfair was designed to operate at greater range and altitude than the other SAMs. Its 8000kg-(17,6301b-) thrust engine burned for 40 seconds and gave it a range of up to 50km (30 miles) and an altitude of 20,000m (65,000ft), even though the latter was far higher than any aircraft attained. Its guidance system was manual and ground-based, with course corrections transmitted to the rocket by radio signals, but since it was launched vertically, it also carried the A4's basic inertial guidance system, to point it in the approximate direction of the target. It is difficult to imagine visual tracking and control being at all effective at anything like extreme range and altitude, and given its high launch speed, guiding it manually at all, whether through a sighting telescope or by superimposing dots on an oscilloscope, generated by tracking radars, must have presented problems. The first successful launch occurred at Peenemiinde on 29 February 1944, and it is believed that about 35 test launches were made in total. Series production was to have been at the biggest underground factory of them all, Bleichrode, but in the event even the factory itself had not been built when the war ended in May 1945.

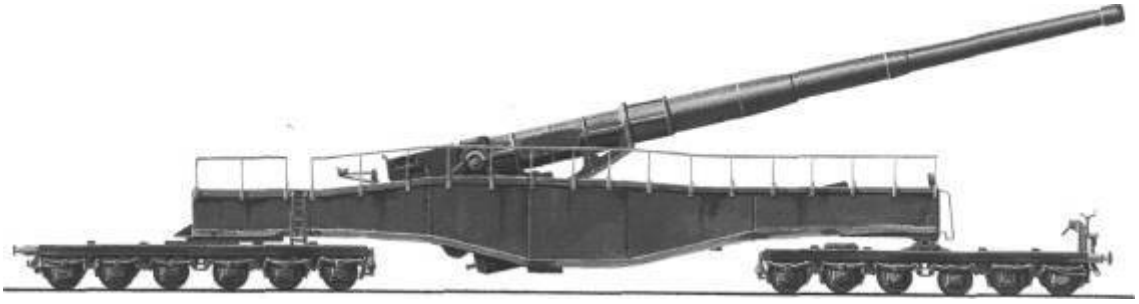
THE UNGUIDED 'TAIFUN'

By mid-1944, there were many in Germany who advocated cancelling the offensive weapons development programme completely in order to concentrate on developing more effective defensive measures, but of course Adolf Hitler was not one of them, and what he said still went. The 'Aggregat' programme certainly got priority at Peenemünde, and since the same team was working on 'Wasserfall', that inevitably meant that the latter lost out because resources were not available. The A4 got into production, while 'Wasserfall' did not. Tn fact, there was not even a clear consensus in favour of 'Wasserfall', or even general acceptance of its desirability. Some at BMW even advocated scrapping 'Wasserfall' (on the grounds that it would never work successfully without an automatic guidance system) and concentrating on a simpler, unguided flak rocket.

A design for just such a missile was put forward by the Range Officer at Peenemünde, an engineer named Scheufein, and was - perhaps somewhat surprisingly, considering all the other demands being put on that establishment - ordered into development in September 1944 as the Taifun' ('Typhoon'). The first examples used solid-fuel motors, but it soon became apparent that they would not reach the desired height (the 'Rheintochter' development team was having the same problem, we may recall), and liquid propellants Salbei and Visol were used instead. They were stored in concentric cylindrical tanks, which made up the body of the missile, and forced into the combustion chamber by nitrogen under pressure, a cunningly designed valve ensuring that initially there was a fuel-rich mixture in the chamber which allowed pressure there to build up slowly and evenly (relatively speaking since the delay between triggering and firing was one tenth of a second). This was to prove most effective, and was to make 'Taifun' surprisingly accurate even at high altitude, which meant that the warhead could be fitted with a contact or graze fuze, and needed to be no bigger than a conventional anti-aircraft artillery shell of 0.5kg (1.lib).

Overall, the missile was 1.93m (6.3ft) long and 100mm (4in) in diameter. Tt weighed 21kg (461b) before launch, and reached a height of 15,000m (49,210ft) before falling back to earth, with a maximum velocity of 3600km/h (2235mph). It went into limited production at Peenemünde in January 1945, and an estimated 600 were completed, along with a small number of launchers (which were based, once again, on the mounting of the 8.8cm FlaK 37). Unit cost would have been very low and, at RM25, less than a third of the price of a rifle. There is no clear indication whether it was ever used operationally, and no evidence to suggest that it ever brought down an aircraft, though that is certainly possible, since to the target's crew, it would have appeared that the aircraft had been hit by conventional anti-aircraft fire.

Below: The 'Wasserfall' was essentially a scaled-down A4 (V2) rocket; it weighed 3.5 tonnes (3.4 tons) and reached an altitude of 20km (12.5 miles}.



CHAPTER NINE

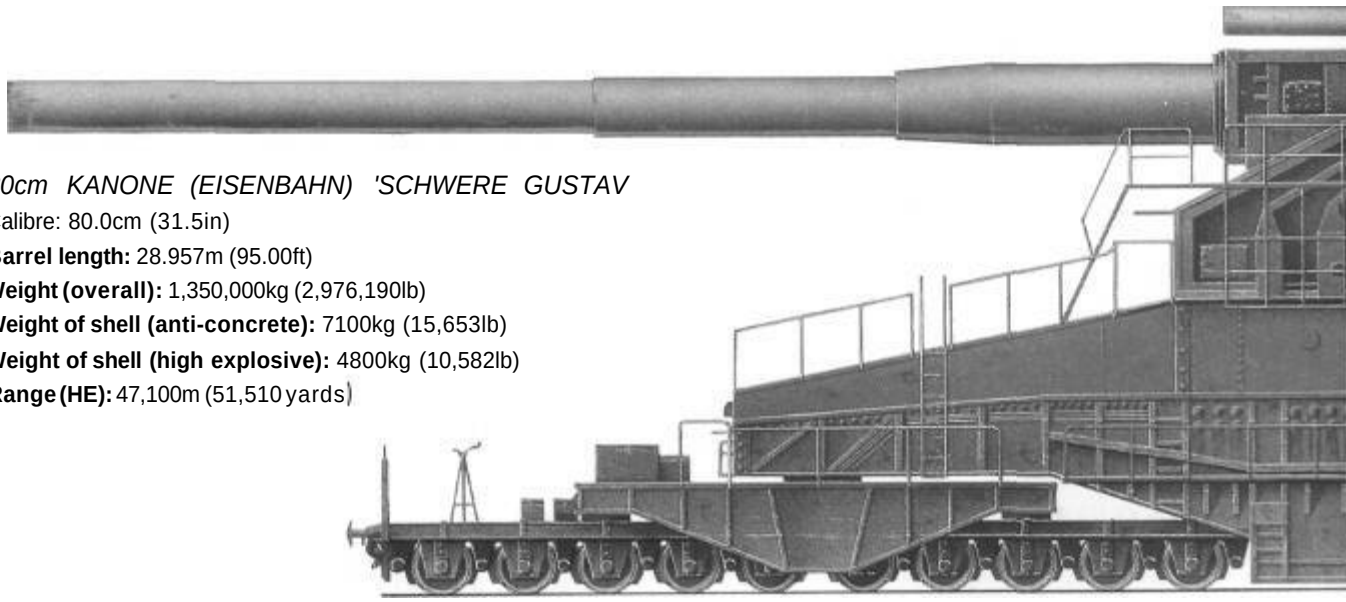
Artillery

By the end of the nineteenth century, artillery pieces had already reached a very high standard of sophistication, being able to hit small targets at ranges of 25km (15.5 miles) and more. There was really very little left for gunmakers to do save to make them bigger and yet bigger still, and that is just what the likes of Krupp, long recognised as masters in the field, did.

Germany had some success with ultra-long-range artillery during World War I, notably with the so-called 'Paris Gun'. The Imperial German Navy, which constructed and manned them, called them the 'Kaiser Wilhelm Geschütz', and they were used sporadically from March to July 1918 during the massive and so nearly effective German counter-attack in Picardy to bombard the French capital from the region north of Soissons over 100km (60 miles) away. They were 38cm (15in) naval guns, as mounted aboard the battleships of the day, sleeved down to 21cm (8.25in) with liners whose rifling consisted of deep grooves within which lugs on the shell located, a method first adopted in the early days of the development of the rifled gun in the 1840s. This same method was to be employed in the very long-range artillery pieces developed in Germany for use in World War II - the K5 battlefield weapons and the 'strategic' K12, built to fire on England from the French coast - though the shells of these guns were rather more sophisticated. Heavily over-charged, they projected their shell into the stratosphere where, meeting little air resistance, it could extend its trajectory considerably. The use of a far heavier charge than the gun had ever been designed to employ soon caused the barrel to wear out - it seems that 25cm (lOin) of rifling was destroyed with every round fired, and that a barrel's life was just 50 rounds in consequence - and it then had to be rebored or relined. The Paris Guns, with three mountings and seven barrels,

Above: The K5 (E), a 28cm gun mounted on a railway car, was perhaps the most successful of the 'superguns'.

Left: This 38cm gun, its barrel 45 calibres long, was derived from a weapon designed for battleships.



which were employed serially, fired just 303 rounds towards Paris, slightly more than half of which (183) actually landed within its boundaries, killing 256 and wounding 620. These results made the entire project highly cost-ineffective, except in propaganda terms.

Though these first-generation ultra-long-range guns were to enjoy only limited success, they did, albeit imperfectly, solve the problem of how to bombard high-value area targets with relative impunity from outside the range of counter-battery fire. In more modern times they would be sickeningly vulnerable to air attack, since they presented big targets, were hard to conceal, and impossible to move at very short notice, but in 1918, despite a huge campaign to locate them, they were never found. By the time the Allies overran the Forest of Crepy, where they were located, there was no sign of them left save their concrete emplacements. Another problem - and many said a more pressing one - remained: how to subdue organised defensive positions like the modern fortresses of the Maginot Line, which ran down the French-German border, in the shortest possible time. For this, a task which was to be undertaken at shorter range, an approach which can almost be characterised as 'brute force and ignorance' was all that was necessary, and the guns in question were no more than straightforward developments of the siege guns which were some of the first weapons deployed in 1914.

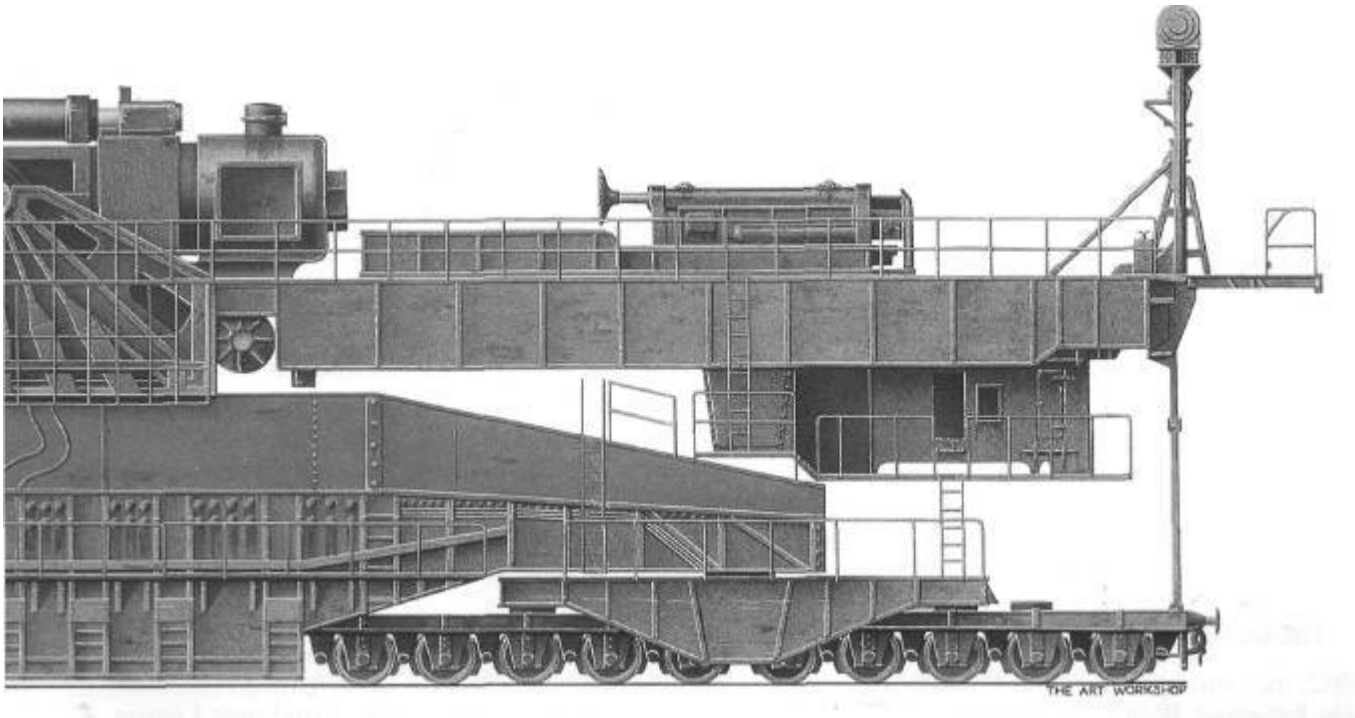
Below: Krupp made two massive 80cm guns, 'Gustav' and 'Dora'; they fired a 7.1 -tonne (7-ton) anti-concrete shell 32km (20 miles} but required a crew of 2000.

'BIG BERTHA'

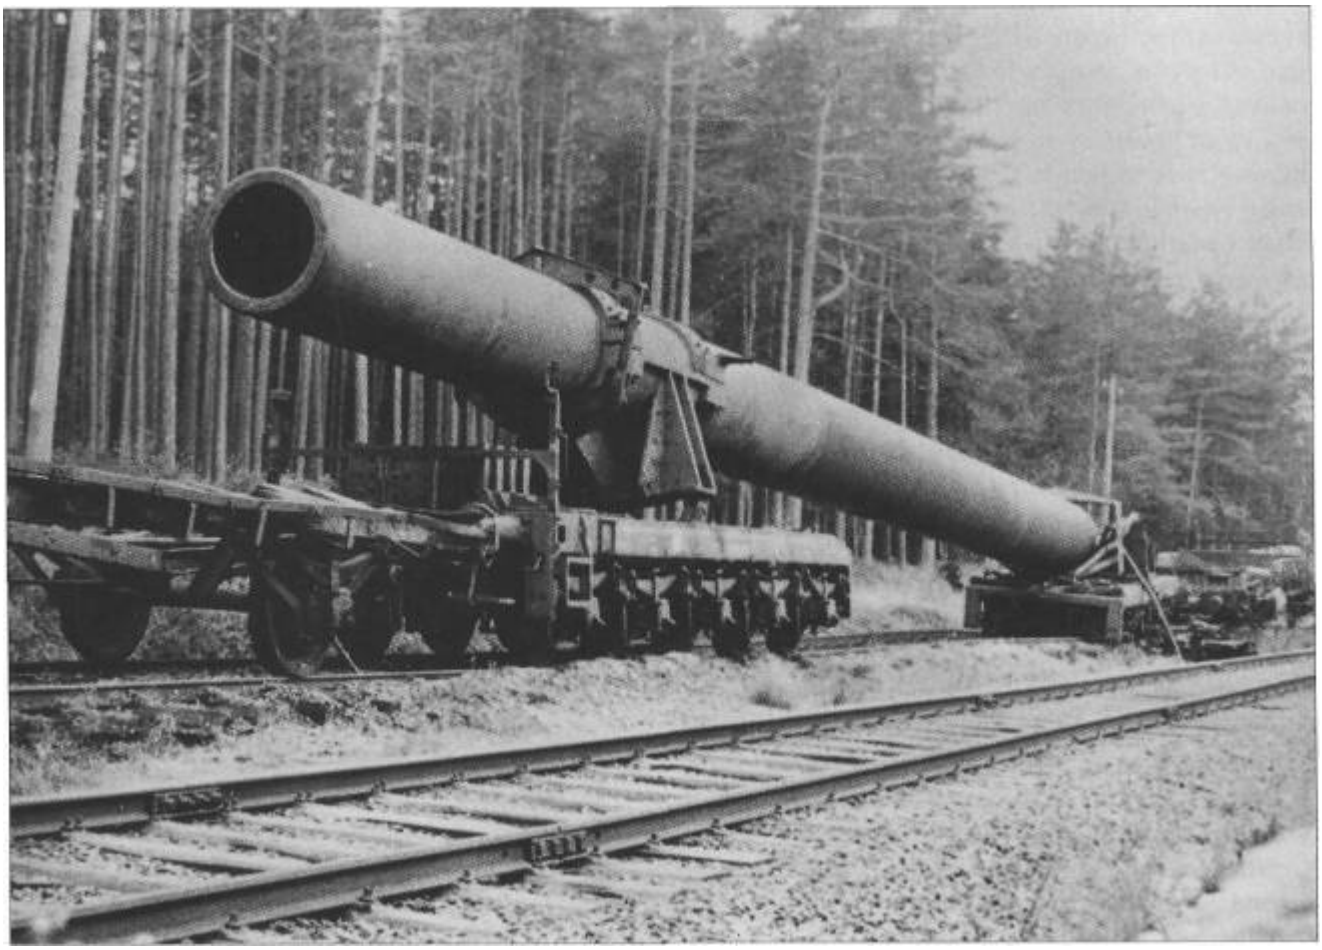
In August of that year, the German Army advanced through Belgium in order to execute the Schlicffen Plan, sweeping through northern France to take Paris from the northwest and thus avoid the hardened defensive positions which dominated the approach routes from Germany. For the most part, and exactly as expected, they met little resistance, except from the forts surrounding the vital city of Liege, and to subdue these, they called up the big guns, the 42cm (16.5in) siege howitzers. The operation took longer than envisaged, but in the end 'Big Bertha' and her sisters, as the British came to call the guns, prevailed. They were not always to be so successful, however; they were later taken to Verdun and used against the fortress complex there to much less effect. These guns were enormous, by any definition - after all, they fired a shell which stood almost as high as a man, and weighed in excess of a ton - and moving them was no

80cm KANONE (EISENBAHN) 'SCHWERE GUSTAV

Calibre: 80.0cm (31.5in)
Barrel length: 28.957m (95.00ft)
Weight (overall): 1,350,000kg (2,976,190lb)
Weight of shell (anti-concrete): 7100kg (15,653lb)
Weight of shell (high explosive): 4800kg (10,582lb)
Range (HE): 47,100m (51,510 yards)



simple matter. In around 20 hours, they broke down into 172 pieces, and could then be transported on 12 railway wagons. Not surprisingly (especially since it was often necessary to construct railway lines first) moving such monsters in and out of position was a major operation, but there was no alternative, and the sheer size of the guns was one of the most important motives for the German Army's interest in much more mobile rocketry. It had been a limiting factor in World War I, and was to remain one in World War II.



Bertha was the daughter of Friedrich Alfred Krupp, son of the founder of the company, and the wife of Gustav von Bohlen und Halbach. 'Big Bertha' had been manufactured by Krupp, and it was to the Essen-based company that the *Heereswaffenamt* (HWA - the German Army's weapons development and procurement office) turned in the mid-1930s when it realised that while the 'new' strategy of war, the Blitzkrieg, once more placed the emphasis on movement, there would still inevitably be fortresses to subdue. In response to the HWA's request, Krupp's engineers produced outline proposals for three guns, of 70, 80 and 100cm calibre. The most realistic of those was the 80cm gun, which would fire a projectile weighing up to 7.11 tonnes (7 tons) to a range of around 32km (20 miles). It would weigh around 1370 tonnes (1350 tons) and require a crew approaching 2000 strong. It would be mobile, but only in the loosest possible sense, for it would take around three weeks to dismantle it and the same to put it together again, and would need twin railway tracks for the whole of its journey, with an additional pair of tracks for the cranes required for assembly and disassembly.

'GUSTAV AND'DORA'

Nothing more on the subject was heard from the HWA, and Krupp's technicians went back to the more realistic task of developing the K5 and K12. There the matter may have rested, but in 1936, Hitler visited the establishment and began asking about the possibility of developing guns to defeat the Maginot Line. Gustav Krupp told him of the 80cm gun project, and as soon as the visit was concluded, well knowing Hitler's weakness for the gargantuan, Krupp had his staff draw up detailed plans. These were submitted to the HWA early in 1937, and the response was an order to construct three guns, work to start immediately and to be completed by 1940.

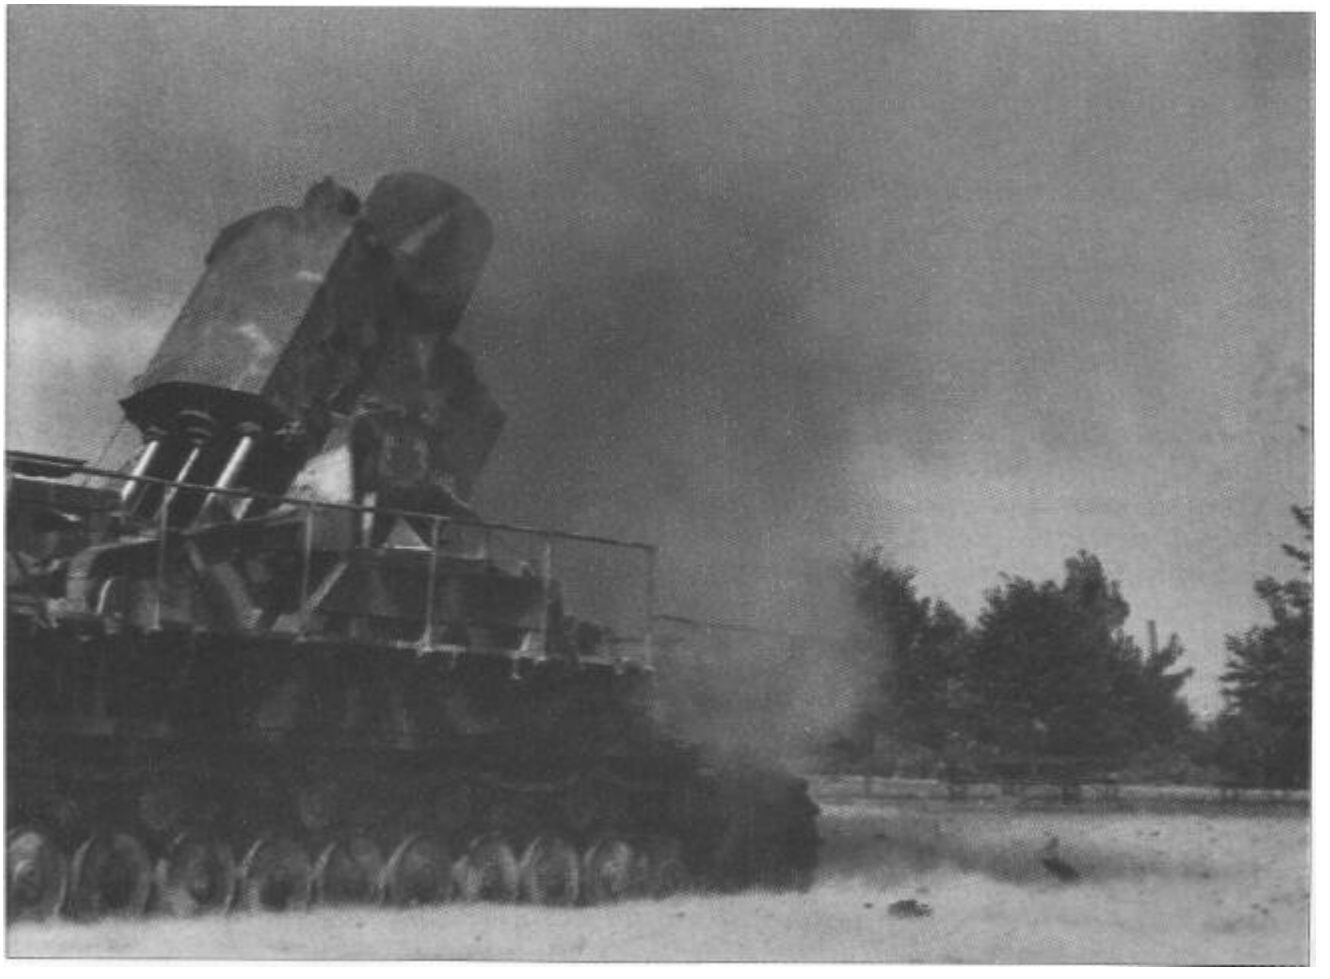
In the event, the barrels proved very difficult to manufacture, and Krupp missed the deadline by a considerable margin. By the time they were ready to proceed, the German Army had simply bypassed the

Above: The barrels of very large-calibre guns were transported dismounted. This barrel was captured by Allied forces at the war's end.

Maginot Line. With no suitable target immediately to hand, work slowed down, and it was the end of the year before the first barrel was completed, and 1941 before it was proofed. Only then was it worth setting to work on building the very complicated carriage, and that took the rest of the year. It was 1942 before the first complete gun was transported to the firing ranges at Rügenwald on the Baltic coast, assembled and tested, in the presence of Hitler himself. All went well and 'Gustav', as the gun had been christened, in honour of the company's Chairman, was presented to the nation with the company's compliments, to be followed almost immediately by 'Dora', named after the wife of the chief designer, Erich Muller.

THE BOMBARDMENT OF SEBASTOPOL

By 1942, the course of World War II had taken a drastic turn following Hitler's declaration of war on the Soviet Union. There may have been no worthwhile targets for 'Gustav' in Western Europe, but there were now plenty to the east. The gun was broken down into its components, they were loaded aboard their specially constructed railway flatcars, with the carriage base trundling along independently, occupying twin tracks, and the whole ensemble got underway for the Crimea. 'Gustav' was set up some 16km (10 miles) to the northeast of Sebastopol, which was still holding out, where it fired 48 rounds in all (including one which, most spectacularly, blew up an underground magazine) and played a significant part in the fall of the city, whereupon it was shipped back to Essen in order for the barrel to be relined. 'Dora' took its place, but it is doubtful whether it actually saw action, since the Red Army soon counter-attacked and surrounded the Germans, and by that time it had been safely evacuated. There are no substantiated reports of either gun having been used in anger again, though there are reports of 'Gustav' having seen action at Leningrad and 'Dora' having been sent to Warsaw to take part in the bombardment after the uprising in 1944. At the war's end, parts of 'Dora' were found near Leipzig, parts of 'Gustav' in Bavaria, and components of the



third gun, which was never completed, in Essen. The project proved to be a very expensive exercise in futility: seven million Reichsmarks per gun, without the cost of the special trains needed to transport them and the manpower required both to manufacture and to operate them. There were various schemes put forward for improved versions on the original carriages. These included one in 52cm calibre to fire a 1.42-tonne (1.4-ton) shell to a range of about 113km (70 miles); one to fire a 38cm sabotted sub-calibre shell to over 145km (90 miles) and even to fire rocket-assisted projectiles to something like 193km (120 miles); and a smooth-bore version to fire a version of the fin-stabilised, dart-like projectile called the Teenemunde arrow shell' *(Peenemünde Pfeilgeschoss* developed for the K5 gun (see below). None came to anything.

THE GERAT 041

The 'Gustav Gerät' guns were not the only fortress-smashers constructed for the German Army. Rather more satisfactory, and more practical, were the self-propelled 60cm howitzers developed by Rheinmetall as the Gerät 041, known unofficially as 'Karl', after General Karl Becker, whose brainchild they were. These were short-barrelled weapons, more like mortars than howitzers, with a maximum range of 4.5km (2.8 miles); they fired a 2.23-tonne (2.2-ton) shell specially designed to destroy reinforced-concrete structures such as blockhouses by burrowing into them for 2.5m (8.2ft) before exploding their 240kg (5291b) charge.

The complete ensemble weighed 124 tonnes (122 tons), and if the howitzers themselves were massive, the carriages upon which they rode were hardly less so at 11.3m (37ft) long, with full-length tracks with eight, and later 11, small roadwheels, each one independently sprung on a torsion bar. The vehicle could be jacked down to allow its hull to rest on the ground, thus avoiding the effects of recoil on the suspension. The recoil system itself was duplex: the gun recoiled

Below: Rheinmetall constructed six 60cm self-propelled mortars for the Wehrmacht. These 'fortress smashers' - this is 'Thor' - were used all along the Eastern Front.

within a cradle, which in turn recoiled along the chassis, controlled by hydro-pneumatic compensators. The vehicles were powered by 44.5-litre motors, although they were only expected to travel for short distances under their own power. For longer journeys they were loaded aboard specially built transporters or on railway cars. Six were manufactured, together with tracked, armoured ammunition carrier/loaders, and were issued to 628 Heavy Artillery Battalion (Motorised), which promptly named them 'Adam', 'Eve', 'Odin', 'Thor', 'Loki' and 'Ziu'. They first went into action at the Siege of Brest-Litovsk in June 1941, and were also present at Lvov and Sebastopol as well as elsewhere. In 1942, the Army asked for proposals to increase their range, and Rheinmetall's answer was to produce new barrels in 54cm calibre which fired 1250kg (27551b) shells to a maximum range of about 10km (6.2 miles). From then on, the barrels seem to have been swapped to suit whatever ordnance there was available. Two were seized by American forces in Bavaria in 1945.

Above: The 60cm mortars fired a shell weighing 2.23 tonnes (2.2 tons), which was specially designed to drive deep into a fortification before exploding.

THE K5 GUNS

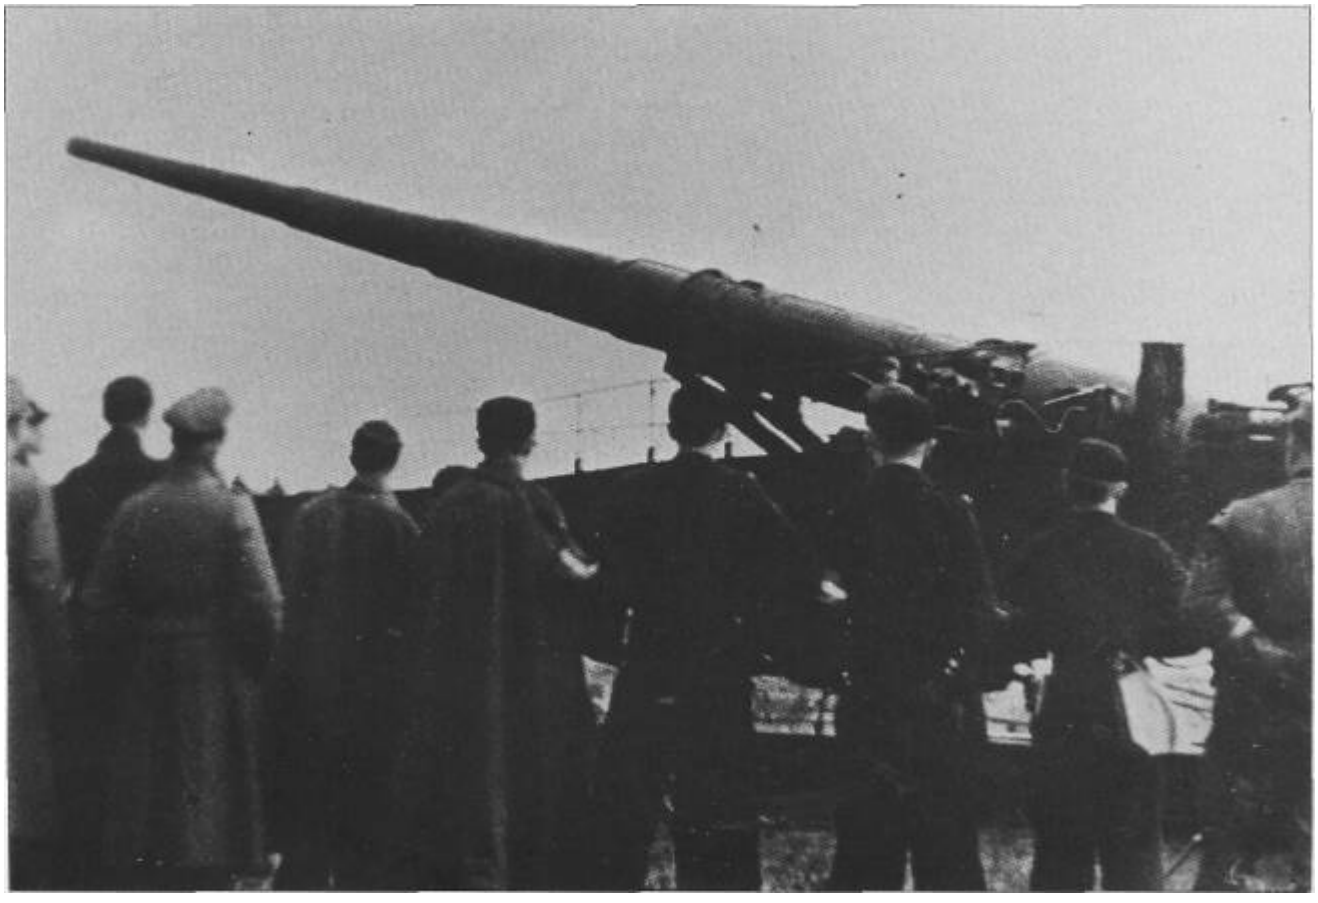
Also considerably more practical than 'Gustav' and 'Dora' were the K5 guns in 28cm calibre, which fired 255kg (5651b) shells out to a range of close to 64km (40 miles). A total of 28 of these were constructed between 1936 and 1945, and all were used most effectively in combat, the most famous probably being 'Anzio Annie', which was used to bombard the Anzio beachhead, and is now on display at the US Army's artillery proving grounds at Aberdeen, Maryland. Like the Paris Guns, the K5 employed deeply incised rifling - the 12 grooves were 7mm (0.25in) deep - and each shell had very precisely machined curved slots into which were inserted soft iron rails to form splines, matching the pattern in the barrel exactly, instead of the simple lugs or studs of the original. These guns too were mounted on railway cars, though

unlike the 'Gustav Gerät', they were transportable largely intact, and could thus be put into and out of action much more quickly and easily. They were fully practical weapons, and the smaller 24cm K3, built by Rheinmetall, was perhaps better still, especially in its improved form, the Krupp-developed K4.

However, that did not prevent the development of projects to improve on these weapons. One of those was to produce a rocket-assisted projectile (RAP), which grew out of an attempt to develop a 15cm RAP for an existing gun. This proved to be much more practicable in the extra volume available. The shell was in two parts, the head containing the solid propellant, with a blast tube leading down to the base, surrounded by a conventional high-explosive filling. The propellant was ignited by a time fuze which detonated 19 seconds into the projectile's flight when it was approaching the apogee of its trajectory and boosted its velocity. The maximum range achieved on test was 86.5km (53.7 miles), and it was calculated that half the shells would land in an elongated target area around 3500m (11,482ft) long and 200m (656ft) wide, which was entirely acceptable given the nature of the likely targets.

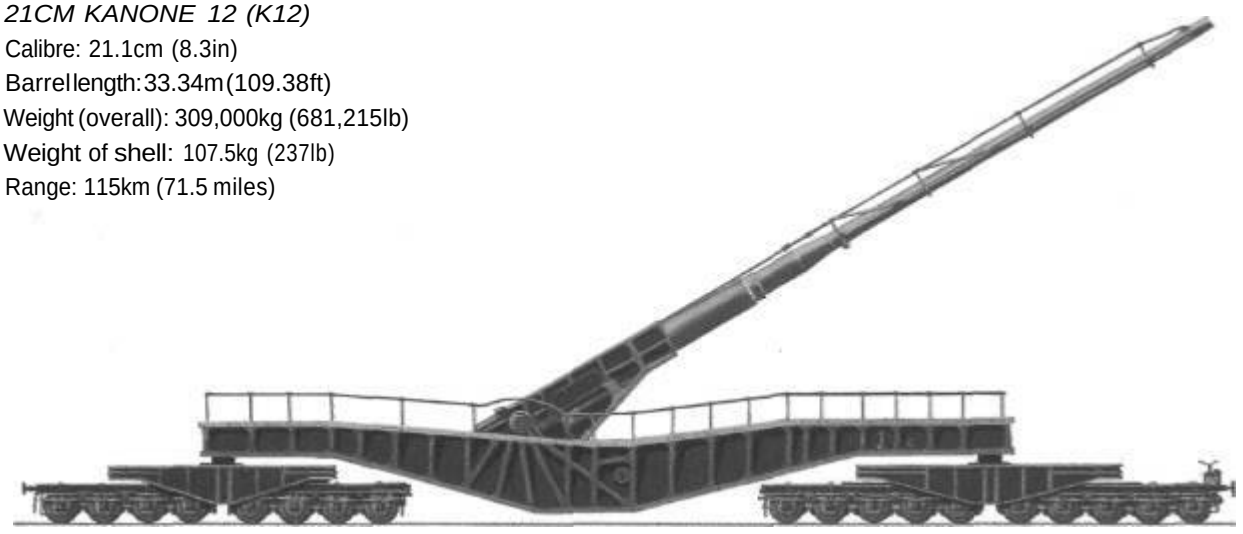
The RAP, an accepted part of the artilleryman's arsenal only by the 1980s, was not the only new projectile developed for the K5 gun. Scientists at Pennemünde also became involved in the attempts to increase the K5's range, and came up with the *Pfeilgeschoss,* in this case a projectile 120mm (4.7in) in diameter, 1.8m (6ft) long, with four fins and a form of rudimentary sabot, which was little more than a three-part flange, 31cm (7.9in) in diameter, which was to be fired from a version of the gun with a smooth-bore barrel bored out to that same calibre. The sabot flange was discarded as soon as the projectile was in free flight. With a suitable propellant charge to take its trajectory well into the stratosphere, this projectile, which had a 25kg (551b) explosive payload, reached a maximum range of almost 155km (95 miles). Development began as early as 1940, but with a low-grade priority it did not culminate until 1944. *Pfeilgeschossen* were issued, and seem to have been used in combat, albeit in small numbers, in

Below: Rheinmetall also built railway guns in 24cm calibre; this one is seen in northern France, firing at targets in Kent, across the English Channel.



1945. The projectile was the forerunner of the FSDS (fin-stabilised, discarding sabot) round, now in common use. The credit for the original idea is usually accorded to a French gun designer, Edgar Brandt, better known for the infantry mortars he developed; in the 1930s he produced a very effective 105mm/75mm projectile, which had very superior performance when fired from a 105mm gun with a standard charge.

THE'CROSS-CHANNEL GUN



Meanwhile, Krupp's engineers were also working on a 'brute force' solution to firing a projectile out to 8()km (50 miles) or more by a simple process of refining the original design of the Paris Gun. The result was the K12, in 21cm calibre, which used the same rifling and shell-seating method as the K5, with the addition of a composite copper/asbestos/graphite band to improve its sealing within the tube and maximise the effect of the propeliant charge. It was hoped that the use of soft iron splines rather than simple lugs would both cause them, and not the hardened molybnedum-steel of the barrel, to wear, and also spread the load of rotational acceleration, thus prolonging barrel life even in the presence of an abnormally large propeliant charge. The first barrel was proofed in 1937 and the first complete gun, the K12(V), was tested in 1938 and declared serviceable in 1939. It fired a 107.5kg (2371b) shell out to a maximum range of 115km (71.5 miles) and the Army declared itself satisfied, for it was a greater distance than the Navy had achieved with the Paris Gun. Beating that record seems to have been a major incentive. However, it was less than perfect in operation. It had to be jacked up by Im (3.3ft) into its firing position, so as to allow extra space for recoil, and then returned to the lower position for loading. Krupp was asked to devise an alternative mounting sub-frame and so produced a modified gun with strengthened hydraulic buffers as the K12 (N) in the summer of 1940. No more were ever constructed.

Mounting the gun presented problems of its own. To begin with, its barrel was 157 calibres long, well over three times the length of comparable naval guns, more than 33m (108ft) from breech to muzzle. This

Below: Two K5s were in action against Allied forces contained on the beachhead at Anzio for four months in 1944. One was captured and shipped back to the USA.

21CM KANONE 12 (K12)
Calibre: 21.1cm (8.3in)
Barrel length: 33.34m (109.38ft)
Weight (overall): 309,000kg (681,215lb)
Weight of shell: 107.5kg (237lb)
Range: 115km (71.5 miles)

Above: The 21cm K12 railway gun had the longest range of alf the 'superguns'- around 115km (71.5 miles), depending on weather conditions.

meant that it distorted under its own weight and had to be very carefully braced. It also needed its trunnions to be very accurately located at the centre of balance, otherwise elevation would have been very difficult. The mount was in the form of an over-size railway car (more accurately, two railways cars); the main structure, with the trunnipn supports and elevating machinery, was mounted on two sub-frames each of which, in turn, was mounted on a pair of bogies, two eight-wheeled units to the fore and two ten-wheeled units behind. For operational purposes it ran on a track section laid in an arc, and it was trained by running it backwards and forwards. The whole ensemble weighed 304.8 tonnes (300 tons) and was over 41m (135ft) long. It appears that the two guns were operational, with Eisenbahn Batterie 701, only for brief periods in late 1940 until early 1941, and they were directed at targets in Kent, particularly around Dover, from emplacements in the Pas de Calais. The greatest range attained seems to have been of the order of 90km (56 miles). One example was captured by Allied forces in Holland in 1945.

THE HIGH-PRESSURE PUMP

The K12 guns were not the only weapon developed with an eye to bombarding southern England with artillery fire, but the other project, the so-called 'High-pressure Pump', was much less conventional, and relied on a principle first demonstrated, albeit imperfectly, in the United States of America around 1885. It was the work of Lyman and Haskell, who reasoned that subsidiary propellant charges, spaced at intervals up the barrel of a gun in side-chambers and ignited a micro-instant after a shell had travelled past on its way up the barrel, would provide a subsidiary propellant force and thus increase the muzzle velocity of the projectile. The result, when they built it on the instructions of the US Army's Chief of Ordnance, didn't much resemble an artillery piece as we know it. Firstly, the barrel had to be so long that it could not be supported save on the ground and had to be laid on an inclined ramp; and secondly, it had pairs of chambers, angled back at 45 degrees, let into it for much of its length. In the event, it didn't work: obturation was faulty, the flash from the original propellant charge bypassed the shell and ignited the subsidiary charges ahead of it, defeating the whole object of the exercise. Lyman and Haskell gave up, and the idea was consigned to the history books. It was apparently raised again in Britian, during World War I, but was turned down once more.

In 1943, a German engineer named Cönders, who worked for Röchling Eisen- und Stahlwerke (which was not just a producer of iron and steel, but had also been active in the field of munitions) proposed an identical weapon. Thanks to the success of one of Cönders' other projects, the so-called 'Röchling Shell' (a bunker-buster par excellence), those who had the all-important ear of the Führer, particularly Albert Speer, the Minister of Munitions, took note. Even though he would only proceed on the understanding that no one, not even the HWA, 'interfered' with his

work, Cönders was told to produce a prototype of the *Hochdruckpumpe* ('High-pressure Pump'). He made one in 20mm calibre and obtained satisfactory results, and at that point, Hitler, who had been following progress with interest, decided to take a hand. Cönders would, he decided, build not just one or two guns, but a battery of 50, which would be located in a suitable position behind Calais, aligned towards London some 160km (100 miles) away. A suitable site for what was already being referred to as V3 was found at Marquise-Mimoyecques behind Cap Gris Nez, very close to the southern end of the modern-day Channel Tunnel. This cannot have been altogether easy, when we consider that the VI and V2 launch sites were already under construction in that same area. There must have been, to say the least, a lively discussion as to which weapon got which piece of real estate. Despite this, work began on two excavations, each of which was to hold an array of 25 guns in 15cm calibre, which would fire long, dart-like projectiles fitted with stabilising fins, which Cönders was even then perfecting. Or, more accurately, which Cönders was not perfecting.

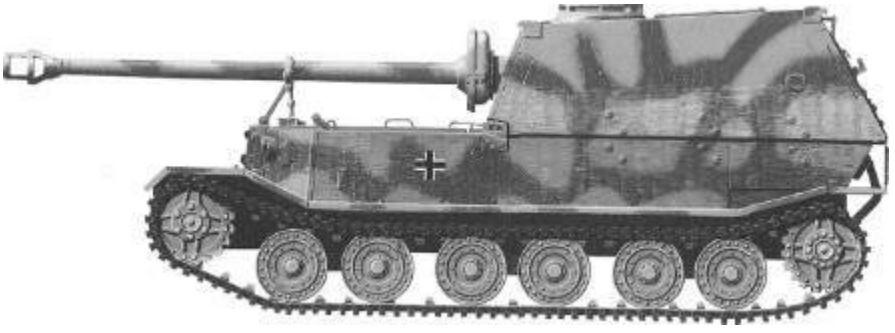
THE HWA TAKES CONTROL

Cönders had built a full-calibre gun at the Hillersleben proving ground, near Magdeburg, and by late 1943 had run into severe problems, both in putting the principle into practice and in producing a workable design for the shell. And even when everything went according to plan - which was seldom - the results were not promising, for muzzle velocity, at just over 1000m (3280ft) per second, was nowhere near high enough. Nonetheless, plans to build a single full-size gun with a barrel 150m (492ft) long at Misdroy near Peenemiinde went ahead, while preparation of the site in the Pas de Calais (now reduced to just one following a series of successful bombing raids by the RAF and the USAAF, which had by this time started to pay very close attention to any large engineering work in the area) had reached an advanced stage, and a special artillery battalion was being formed. Still working in isolation, there was little Cönders could do but press on and hope for the best. By mid-March, with no good news coming out of Misdroy, the HWA had had quite enough of this unconventional working arrangement. Senior staff travelled to Misdroy for a demonstration and were less than pleased with what they saw. Generals von Leeb and Schneider of the HWA took control. Matters took a distinct turn for the better as a result. Cönders became but one of the engineers working on the three main problems: projectile design, obturation, and ignition of the subsidiary charges. In all, six different specialist firms including Skoda and Krupp produced satisfactory designs for shells. Obturation problems were solved by placing a sealing piston between the projectile and the initial charge, and that in itself solved the problems of precisely controlling the serial detonation of the subsidiary charges, for now the flash from the original charge couldn't get ahead of the projectile and there was no need to attempt to develop an electrical firing sequence.

By late May, the Misdroy gun was producing more satisfactory results, and ranges of up to about 80km (50 miles) were being reached, when it burst on firing, destroying two sections. New parts were ordered, and a further trial set for early July, but meanwhile the RAF was still at work. After the western site at Marquise had been abandoned, the Todt Organisation, responsible for construction, took great pains to hide the accesses to the eastern site, and for some time it succeeded. However, by late June, the photographic interpreters had decided that there was enough evidence to suggest that something was going on in the area to justify sending Bomber Command's elite 617 Squadron to pay it a visit with I2,0001b (5443kg) 'Tallboy' deep-penetration 'earthquake' bombs. The effect of the raid on 6 July was devastating: one bomb hit the target square-on, and four more scored very near misses which were actually reckoned to be even more effective. The site was put out of commission and no further work was undertaken before it was overrun by Allied troops.

Meanwhile, on 4 July the trials gun had been fired again. This time it got off eight rounds - one of which reached a range of 93km (58 miles) - before it burst, and that effectively put an end to the project to bombard London. There is evidence that further development took place. When Allied troops captured Hillersleben, they found two guns in damaged condition, one with 10 pairs of subsidiary chambers (set at right-angles to the axis of the bore), and the other with five pairs set at a 45-degree angle. Both were 75m (246ft) long. There are unsubstantiated reports that two short-barrelled versions were built and used in combat against US forces during the Battle of the Bulge in December 1944, but experts discount them.

Right: The so-called 'High Pressure Pump' - an innovative approach to the solution of applying greater propulsive force to a projectile. It was never effective.



CHAPTER TEN

Tanks and Anti-Tank Weapons

While the British pioneered the use of armoured fighting vehicles in 1916, by 1939 the baton had passed to Germany, where men such as Guderian showed that they could win a war of movement, as British theorists had always promised. Then Hitler took a personal hand in the German tank programme, and his insistence that size mattered above all things was to send the entire effort off on a wild goose chase from which it never fully recovered, even though saner counsel did eventually prevail.

Properly speaking, the tank ceased to be a secret weapon on the morning of 15 September 1916, when the British Tank Mark 1, or 'Mother', went into action on the Somme battlefield. Its appearance came as a complete surprise to the German infantry, secrecy having been maintained throughout. Even the name 'tank' was deliberately misleading, though it stuck. More of a secret than the existence of tanks in the German Army was the way in which they would be employed. In any event, their use came as a complete surprise to the Poles in 1939 and to the French the following year. However, that was not to say that new models would be developed in full view.

Above: The Panzerjäger Tiger was based on the vehicle Ferdinand Porsche put forward for the Tiger project.

Left: The 'Panzerschreck' fired a rocket-propelled grenade with a hollow-charge warhead.

THE TIGER TANK

When the 58-tonne (57-ton) Sonderkraftfahrzeug (SdKfz) 181 Panzerkampfwagen VI Tiger first went into action on the Leningrad front, 26 years ancf 1 day

PzKpfw VI TIGER Ausf E
Length (overall): 8.24m (27.00ft)
Width: 3.73m (12.25ft)

Max road speed: 38km/h (24mph)
Max road range: 100km (60 miles)
Crew: 5
Armament: 8.8cm KwK 36 gun;
2 x 7.92mm MG 34 machine guns

Above: The Tiger was the first of the German 'supertanks', and was effective if properly handled. Its underpowered engine was the cause of many breakdowns, though.

after the armoured fighting vehicle made its original debut, it was something the like of which had never been seen. With frontal armour 100mm (3.93in) thick, it was unstoppable at anything but suicidally short range, and its 8.8cm/L56 gun could, quite literally, shoot straight through any vehicle it might happen to meet, the Soviet T-34 which it was specially built to combat being no exception.

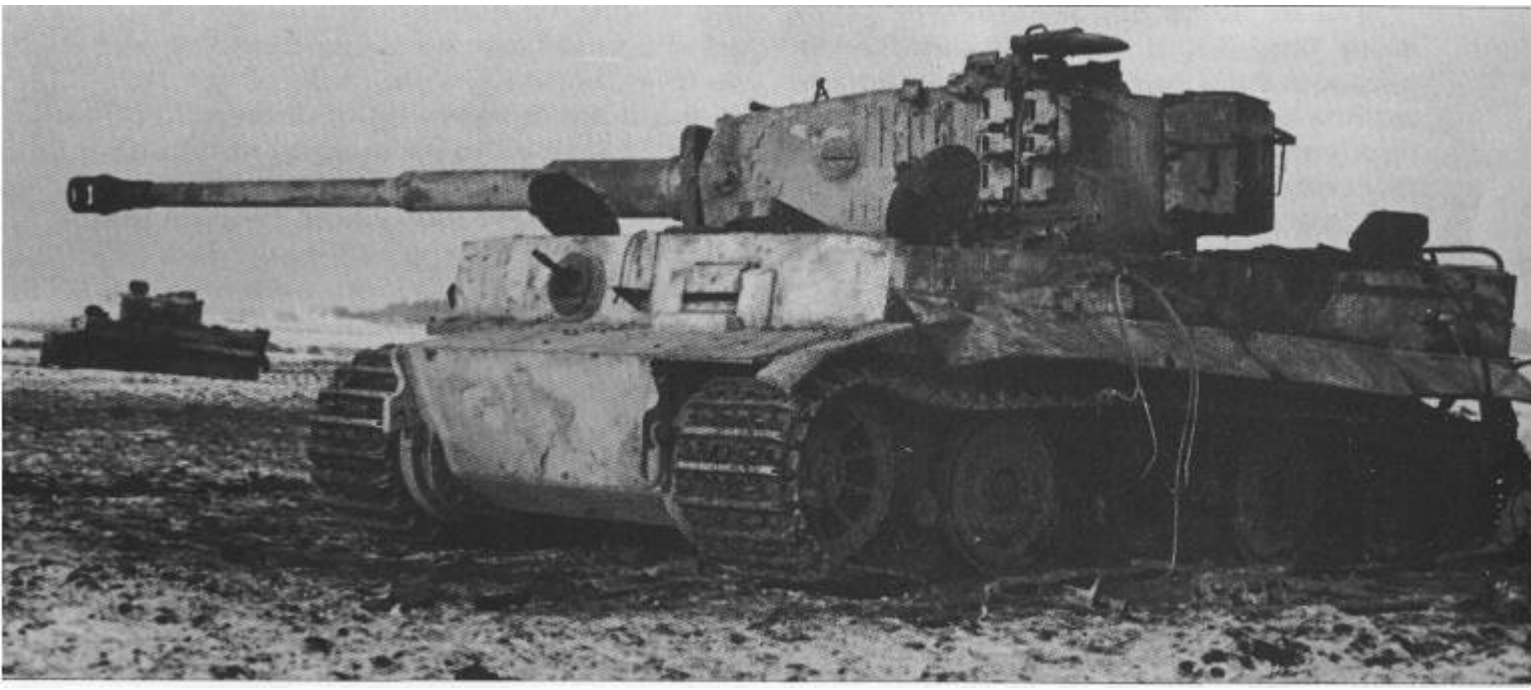
In fact, the Tiger's first outing was indecisive, and its second, a week later, much less than successful when one of them bogged down in no-man's-land and had to be blown up to prevent it from falling into enemy hands. It was January of the following year before Tigers went into battle again, and it soon became clear that they were not the omnipotent force they had been thought to be, even though at best, and in the best hands, they were very effective indeed. In the long run, the Tiger would prove to be deeply flawed: its fuel consumption was shocking, and its powerplant and transmission insufficiently robust. By 1944, the Allies had weapons capable of dealing with it, but it seems to have had a place second to none in Adolf Hitler's affections. Certainly it fulfilled all his 'biggest ... strongest... best' requirements, at least in the short term. It was eventually to be superseded by the 71.1-tonne (70-ton) SdKfz 182 Tiger II, which was more of everything, and which, despite being even less effective in all but very narrowly defined circumstances, still did not prove to the Führer that the law of diminishing returns was at work.

THE GIANT MOUSE

Hitler is usually held responsible for the decision to build the monster tanks, and he certainly gave them his very active personal approval, but he had a willing assistant in the person of one Dr Ing. Ferdinand Porsche, who, conveniently, was both the country's leading tank designer (at least, in his own eyes) and head of the Tank Commission. As early as 1942, even before the Tigers had gone into action, Porsche brought forward a plan for a tank he called, presumably with studied irony, the 'Maus' ('Mouse'). This was to be a 152.4-tonne (150-ton) vehicle, with frontal armour a massive 350mm (13.75in) thick, and mounting either a 12.8cm or a 15cm gun with a 7.5cm gun mounted co-axially (as well as a 2cm cannon and two 7.92mm machine guns). Like Porsche's proposed design for the Tiger (which became the Panzerjäger Tiger), the 'Maus' was to have petrol/electric drive, its 1200bhp engine driving a generator, which in turn drove electric motors in the hubs of the driving wheels. This was an elegant enough solution to the many problems of power transmission, but one which would ultimately prove to be flawed, at least on this smaller scale. Submarines and even battleships used it successfully, but in tanks, the motors were not powerful enough and drivers often burned them out trying to extricate their vehicles from difficult situations.

Orders were placed for six prototypes, the first of which was mobile under its own power in December 1943. It proved surprisingly successful, attaining a speed of 20km/h (12.5mph) with an under-spec lOOOhp engine; particularly successful was its suspension system, which was a modified version of Porsche's Tiger's, with longitudinal torsion bars and four interleaved roadwheels per stub-axle. At a total

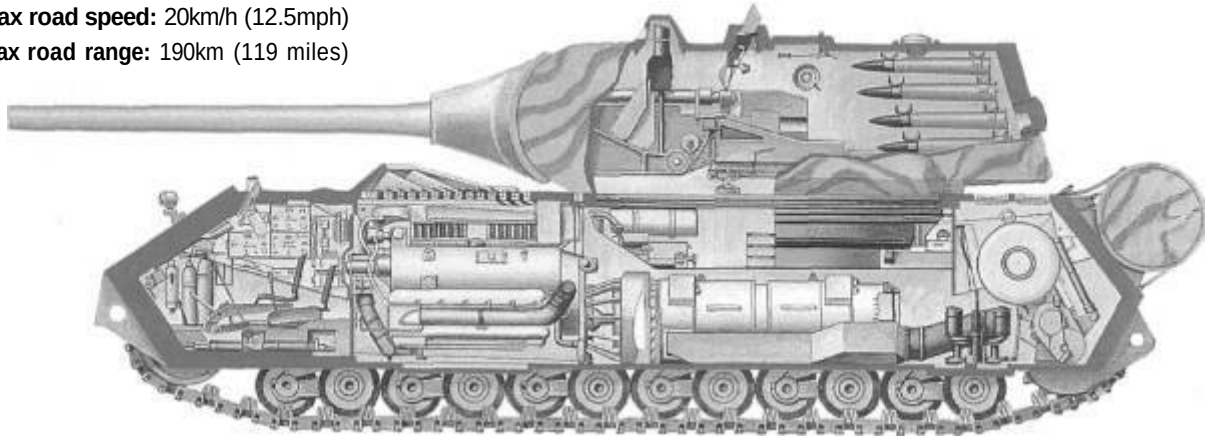
PzKpfw VI TIGER H Ausf B
Length (overall): 10.26m (33.66ft)
Width: 3.75m (12.29ft)



Weight: 71,100kg (156,747lb)
Max road speed: 38km/h (24mph)
Max road range: 110km (68 miles)
Crew:5
Armament: 8.8cm KwK 43 gun; 2 x 7.92mm MG 34 machine guns

weight of almost 193 tonnes (190 tons) including its six-man crew, fuel and ordnance, there was hardly a road bridge in the country which would have taken its weight, and thus it was designed from the outset to be able to submerge to a depth of 8m (26.25ft), air for occupants and powerplant being supplied via a schnorkel tube which extended from the turret roof. The 'Maus' project didn't get much further than the initial stage; in all, nine prototypes had been wholly or partially completed by the war's end, though that small result does not reflect the amount of energy, money and scarce resources which had been lavished on it. And worse was to come, because the HWA - having protested that it did not want such a vehicle and could formulate no sensible tactical plan for its use, and having been overruled by the Führer - then decided to commission something very similar itself!

Above: The King Tiger was heavier than the Tiger and had a more powerful 8.8cm gun. It was, however, also prone to breakdowns, having the same powerplant as the Tiger.



It comes as no surpise to find that it was to Henschel, the producer of both versions of the Tiger (and of the much more successful PzKpfw V Panther), that

Below: A pair of knocked-out Tigers in the Soviet Union in 1944. By that time the Allies had got the measure of these 58-tonne (57-ton) monsters.

PANZER 'MAUS'
Length (overall): 10.08m (33.08ft)
Width: 3.67m (12.00ft)
Weight: 193,000kg (425,488lb)
Max road speed: 20km/h (12.5mph)
Max road range: 190km (119 miles)

Crew: 6
Armament: 15cm KwK 44 gun, 7.5cm KwK 44 gun; 2 x 7.92mm MG 34 machine guns

Above: Even the King Tiger would have been dwarfed beside the 'Maus'. Its secondary armament was to have been the 7.5cm gun, the Panther tank's main armament.

the HWA turned, and even less of one to learn that the E100, as the project was known, displayed more than a passing resemblance to them, though it was certainly on a grander scale. Its all-up weight was estimated at 142.2 tonnes (140 tons) which would probably have meant it going into battle at least 10.16 tonnes (10 tons) heavier, and it, too, was to have had the KwK 44 15cm gun and a co-axially mounted 7.5cm. In all, it appears to have been a more realistic (though the phrase is used loosely) proposition than the Maus. One prototype was under construction at the war's end, but had never run.

In all, the German tank development programme during World War II was deeply flawed by the assumption that a single vehicle, heavily armoured and with a powerful gun, would be able to out-fight (or at least out-range) any number of enemy tanks. By the time the Allies landed in Normandy in 1944, this was certainly not true. American Sherman tanks, which appeared on the battlefield around the same time as the Tiger, had by then acquired very much more powerful guns - the 76mm in American-manned tanks, the 17pdr in British service - and had a fighting chance which their numerical superiority turned into a certainty. The same was true in the east with the up-gunned T-34. It would have been very much more sensible to have abandoned the Tiger (or better still, never to have begun it) and to have concentrated instead on the PzKpfw V Panther, which many experts rate as the best tank of the entire war. Certainly, Panthers were quicker (and much cheaper) to produce, and were formidable opponents, with a KwK 42 7.5cm cannon, 70 calibres long, developed by Rheinmetall-Borsig, which was capable of perforating any Allied tank at virtually all ranges.

ANTI-TANK WEAPONS

If the German tank development programme was fatally flawed, the same could not be said of the anti-tank (AT) weapons development programme. At the start of World War II, anti-tank weapons were simply not up to the task, save in a few particulars. One was the heavy German 8.8cm gun, which had started life as an anti-aircraft weapon but which showed itself during the Spanish Civil War as a very successful AT weapon, once appropriate armour-piercing projectiles had been developed. It soon acquired a practical and practicable mobile mounting, and was issued as the Panzerabwehrkanone (PaK) 36; it was also adopted as the KwK 36 for the Tiger tank. It was very capable, but entirely conventional; other German developments in high-velocity guns intended for use against armoured vehicles were not.

THE TAPERED-BORE GUNS

The earliest suggestion for a gun with a uniformly tapering barrel seems to have originated in Germany in about 1903 with a man named Karl Puff. He suggested using a projectile with a sleeve, which was compressed by the taper of the bore until it filled a

series of grooves in the body of the bullet. By that means, the velocity of the projectile was much increased, since its cross-sectional area had been diminished considerably while the pressure in the barrel remained constant (the velocity being a product of the two). Unfortunately for Puff, the complexities of manufacturing a rifled tapered bore were beyond the capability of German gunmakers, and nothing came of the idea, at least, not then.

In the 1930s, another German, a gunmaker named Hermann Gerlich, experimented with Puff's scheme, and was able to manufacture hunting rifles according to the principle. They proved to be excellent, with the all-important flat trajectory, but when he tried to interest the armed services of a number of countries in such a rifle, he was less successful, entirely, it seems, thanks to the projected cost of the weapon. However, the Springfield Arsenal, for one, certainly validated the concept, producing a version of the M1917 rifle with a muzzle velocity of over 2135m/s (7000ft/s) instead of the standard 855m/s (28QOft/s). Gerlich gave up trying to market the concept himself in 1933, and contacted Rheinmetall, who saw the possibility of incorporating the system into an anti-tank rifle, using a projectile with a tungsten carbide core and soft steel skirt. Eventually, it produced what became known as the Panzerbüchse (anti-tank rifle) 41, which fired a 20mm (it had started out at 28mm nominal diameter) round at a muzzle velocity of around 1400m/s (4600ft/s), and which could perforate (ie, pass completely through) 66mm (2.6in) of nickel-steel armour at a range of 500m (1640ft). Soon, Rheinmetall produced a more powerful version in 4.2cm nominal calibre, which squeezed its projectiles down to 29.4mm, and which could perforate that same thickness of armour plate at twice the distance. It entered service in 1941 as the 4.2cm Panzerabwehrkanone (anti-tank gun) 41, and proved to be very successful.

THE SQUEEZE-BORE GUN

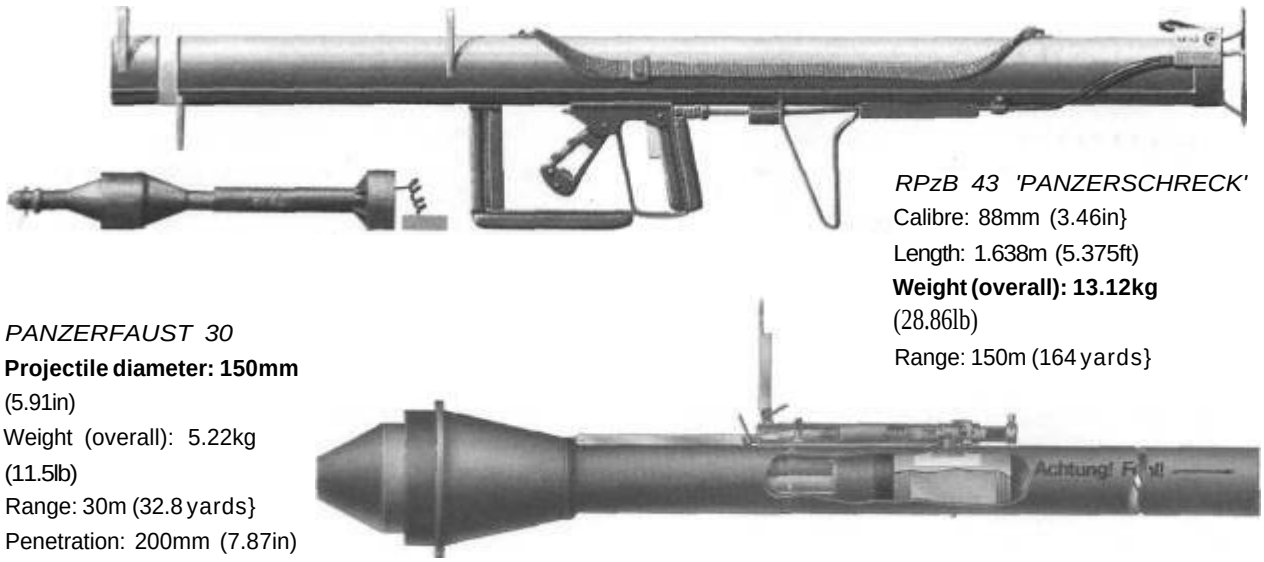
Two years earlier, Krupp had also begun to examine the possibilities of reducing the cross-sectional area of a projectile while it was in the barrel, and settled on a slightly simpler, but no less effective, method of carrying out the procedure. Instead of manufacturing a barrel with a uniformly tapered bore, Krupp added a smooth-bore, step-tapered section to the muzzle of a conventional gun. The (flanged) round entered the supplementary section at nominal diameter of 7.5cm and passed through two tapered sections which reduced it to 5.5cm. The advantage of this was chiefly

Above: The 8.8cm Raketenwerfer 43, usually called the 'Püppchen', was not a gun but a rocket launcher. It was superseded by the shoulder-held tube rocket launchers,

logistical; only the unrifled, tapered section became badly worn (that, of course, was the system's great drawback), and was attached to the main section of the barrel by a simple screw collar, which meant it could be replaced in the field without the need for special tools. The 7.5cm PaK 41, as the gun was known, fired a tungsten-cored shot weighing 2.6kg (5.71b) at a muzzle velocity of 1125m/s (3700ft/s) and could perforate 125mm (4.9in) of armour, more than any tank had, at a range of 2000m (6560ft). This gun was the weapon originally specified for the Tiger tank. The taper-bore and squeeze-bore guns were without question excellent battlefield weapons, but they needed tungsten for their bullet cores if they were to be effective, and that was a material in short supply in Germany at that time, being much in demand in the engineering industry as cutter bits for machine tools. Eventually, a choice had to be made, and the manufacturing industry won. The taper-bore and squeeze-bore guns were taken out of service and scrapped and few survived the war. Rheinmetall and Krupp offered conventional anti-tank guns in larger calibres instead, culminating in the 12.8cm PaK 44.

SHAPED AND HOLLOW CHARGES

The kinetic energy of a very hard object travelling at high speed (brute force, in other words) was one way to perforate armour, but there was another; the shaped



Above: The Panzerfaust 30 was the simplest of all German rocket-propelled grenade launchers. Its designation referred to its optimum range - 30m (32.8 yards).

Below: Appearances are not deceptive. The 'Panzerschreck' was developed from the US Bazooka, and was just as effective. Two versions were produced.

or hollow explosive charge, which incorporated a hollow cone or hemisphere of metal translated by the heat of the explosion behind it into a high-speed (around 7500m/s; 24,600ft/s) jet of molten material and gas. This was first produced, in Germany in 1939, as a demolition charge, and is reputed to have been first used in combat at the storming of the fortress of Eben-Emael in May 1940. By that time, however, its developers had moved on, and were on the verge of producing an artillery shell on the same principle.

The British and Americans had also made considerable progress independently, while the Soviets had achieved the same ends by the rather simpler means of copying captured or stolen German munitions. However, in this principle, there was a problem: the act of spinning the shell to maintain its accuracy in flight dispersed the molten jet and made it much less effective. One answer was to stabilise the round with fins instead, but that took some working out. Another answer was to emulate the pyrotechnic 'sky rocket' and fit the projectile with a long shaft for a tail. In the successful German development of this simple principle, the rod was surrounded by a tube upon which fins were mounted. The rod went down the barrel of a 3.7cm PaK 36 anti-tank gun, and the tube fitted around it, with the shaped-charge warhead, with its copper hemisphere and 2.4kg (5.31b) of TNT and hexogen sitting in front of the mu/zle. It was propelled by

RPzB 43 'PANZERSCHRECK'
Calibre: 88mm (3.46in}
Length: 1.638m (5.375ft)
Weight (overall): 13.12kg
(28.86lb)
Range: 150m (164 yards}

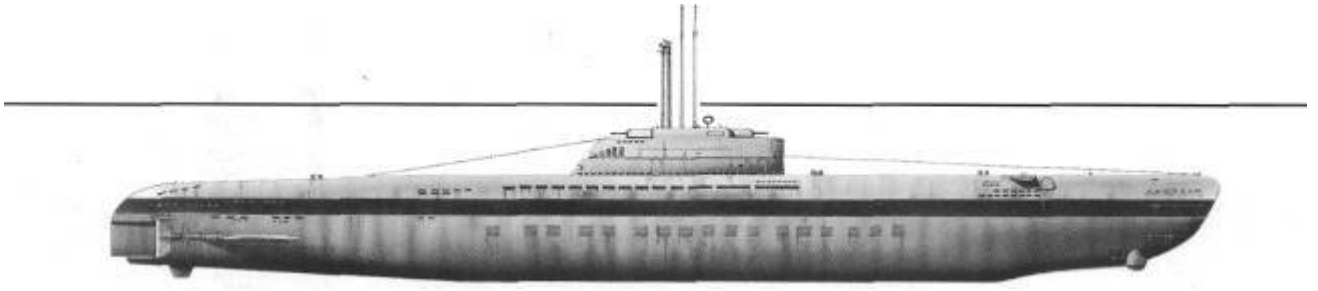
PANZERFAUST 30
Projectile diameter: 150mm
(5.91in)
Weight (overall): 5.22kg
(11.5lb)
Range: 30m (32.8 yards}
Penetration: 200mm (7.87in)

Above: The Raketenpanzerbüchse 43 'Panzerschreck' and the simpler Panzerfaust gave even individual infantrymen the means to kill tanks.

a special cartridge, loaded conventionally at the breech, and was reasonably accurate up to about 300m (985ft). Being independent of the kinetic energy of the round in flight (which diminished with distance, of course) the warhead was equally effective at all ranges, and could pierce 180mm (7.08in) of armour. The shaped-charge warhead was also to be mated with simple solid-fuel rocket 'motors' to produce early RPGs (rocket-propelled grenades), the Panzerfaust and the Raketenpanzerbüchse (also known as the 'Panzerschreck' - 'panzer terror'), which was a direct copy of the American Rocket Launcher M1, the celebrated Bazooka, using German 8.8cm rockets.

THE RUHRSTAHL X-7 'ROTTKÄPPCHEN'

An altogether more elegant solution to the problem of killing tanks on the battlefield at something greater than suicidally close quarters (the main problem with the Panzerfaust and 'Panzerschreck') was put forward by Ruhrstahl. We have already encountered this company as the producers of the 'Fritz-X' guided bomb and the X-4 air-to-air guided missile, in response to HWA's request in 1944. The X-7 'Rottkäppchen' ('Red Riding Hood') was essentially similar in nature to the X-4 AAM, with its conventional HE warhead exchanged for a 2.5kg (5.51b) shaped charge, and with its control system cunningly simplified. Like the X-4, the X-7 was winged (two wings only, in this case, with parabolic leading and trailing edges, with spools from which the control wire paid out located at their tips) and revolved slowly in flight, both pitch and yaw being controlled by a single spade-like vane or fin mounted at the end of a curved arm which, when the missile was launched, hung down and behind the body. As the missile rotated (once again, at a rate of about one complete turn per second), this was able to exercise control over both pitch and yaw, a gyroscopic switch transferring the signals to actuate the simple spoiler as it turned from the vertical to the horizontal plane and so on, an elegant solution indeed.



The X-7 was powered by two WASAG solid-fuel rockets whose diglycol propellant was in the form of two concentric tubes. The first charge gave a thrust of 68kg (1501b) for two and a half seconds to launch the missile into flight and get it up to its 360km/h (224 mph) operating speed; the second gave 5.5kg (121b) of thrust for eight seconds (which was actually longer by a considerable margin than the flight was likely to last) to sustain it. Maximum range was to have been around 1200m (1310 yards). It is thought that a total of a few hundred Ruhrstahl X-7s were manufactured, and that most were consumed in testing, but there is some evidence to suggest that some made it into the field, and were expended in combat on the Eastern Front during 1945. There are unconfirmed reports that the X-7 performed satisfactorily, and was able to deal even with the JS-1 'Stalin' heavy tank, which was impervious to virtually everything else at anything over short range.

CHAPTER ELEVEN

Submarines and their Weapons

By the time World War II was halfway through, Germany (and in particular the Führer himself) had largely given up on its surface navy, but the submarine arm was another matter entirely. U-boat veterans knew, however, that much still remained to be developed in the boats themselves, and a well-funded programme was put into effect. Yet again it proved to be just too late, however, for by the time the new-generation boats were coming off the ways, the war was already lost.

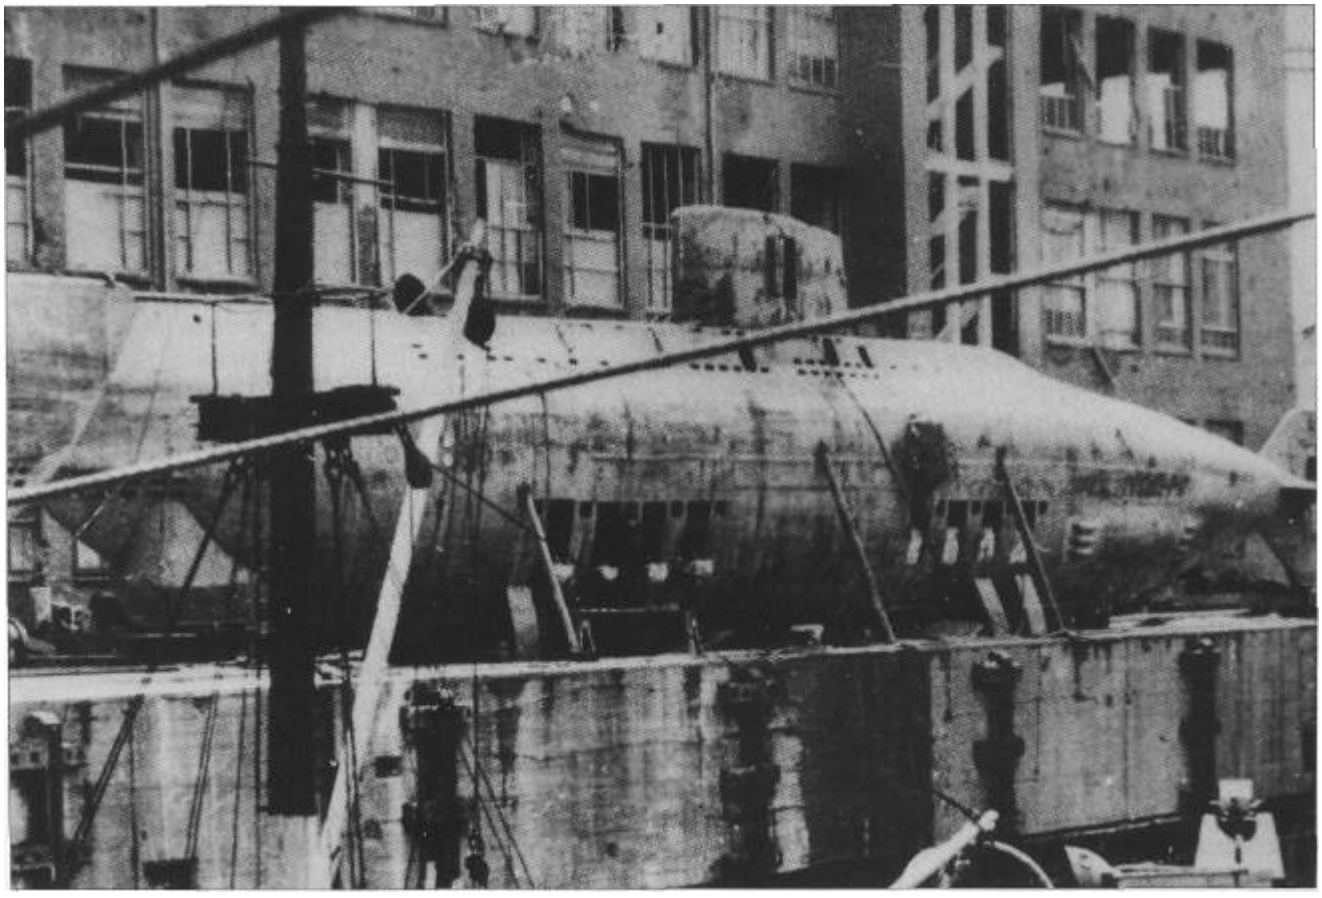
If the Luftwaffe was the Nazi Party favourite in pre-war and wartime Germany, the *Kriegsmarine* (Navy) was, for a variety of reasons, very definitely not. Some of the reasons were historical and political, and went back to the dark days of near civil war in the 1920s, but others were more recently rooted, and had to do exclusively with the poor performance of German capital ships. At one point, an enraged Hitler actually ordered all the surface fleet to be scrapped. The exception was the submarine service which, under the talented leadership of Karl Dönitz, had actually come close to cutting Britain's vital lifeline to the United States and to its colonies. Most of the few funds for development that did find their way to the *Kriegsmarine* were destined for the U-boat arm.

Above: The Type XXI U-boat was one of the most influential naval developments of the twentieth century.

Left: Germany also developed midget submarines, like this 'Biber' putting to sea from Rotterdam at Christmas 1944.

HOMING TORPEDOES AND MAGNETIC MINES

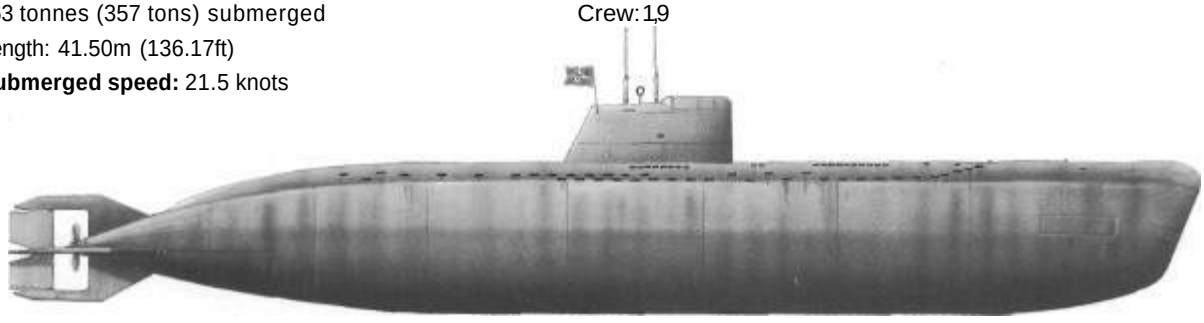
By the end of World War I, the submarine torpedo, the first really successful model of which had been produced by the Anglo-Italian Whitehead in 1868, had been developed to the point where it was a reliable, practical weapon. During that war it had been used to sink thousands of ships (German submarines alone accounted for 5556), and we can hazard a guess that the individual success rate (expressed as hits per torpedo) probably made it one of the most effective offensive weapons of the whole conflict. However, it was a relatively simple, unsophisticated weapon, and



that, combined with its effectiveness, surely meant that it could be improved. There was certainly the possibility of giving it much greater endurance and straight-line performance, but increasing the range always resulted in a lowering of the strike rate, since the torpedoes had no self-directive capability. There is reason to believe that scientists in Germany had actually perfected a passive acoustic homing device to steer a torpedo towards a submarine sound source by 1936, and that the new weapon had been kept back from production to preserve its secrecy.

FOXING THE 'FOXER'

The relatively simple first-generation devices, which were restricted to fairly low speeds, proved effective against slow-moving targets such as merchant ships, but less so against warships, which often simply outpaced them. Towed noise-makers (known as 'Foxers'; originally no more than two lengths of iron pipe, chained loosely together so that they constantly crashed into each other) could also dupe these devices, and it was September 1943 before German scientists perfected a means of outwitting them.



When a torpedo fitted with the second-generation T5 or 'Zaunkönig' ('Wren') passive acoustic seeker detected a sound source in a small arc ahead of it, a subsidiary circuit operated a simple solenoid switch to actuate the small rudder vane. This caused the torpedo to turn sharply to starboard and run in a circular path for a predetermined period (long enough, in fact, for it to describe a semi-circle) before turning sharply to starboard once more and setting off on its original track again. In this way, the torpedo skirted the noise-maker and homed in on the propeller noise of the ship towing it instead. Then, on encountering the noise of the ship dead ahead, the torpedo turned to perform the circling manoeuvre once more. The diameter of the semi-circular track the torpedo described being less than the length of the ship plus the distance the latter covered in the intervening period, it would strike the target from the beam. It has been estimated that 700 T5s were fired in anger, and that 77 (11 per cent) scored hits. The US Navy introduced the similarly

Below: *U14Q6,* one of the few operational Type XVII Walter-engined boats to be completed. She was scuttled in May 1945 but was salvaged and taken to the United States. A sister-boat, *U1407,* went to the UK.

TYPE XVIIB

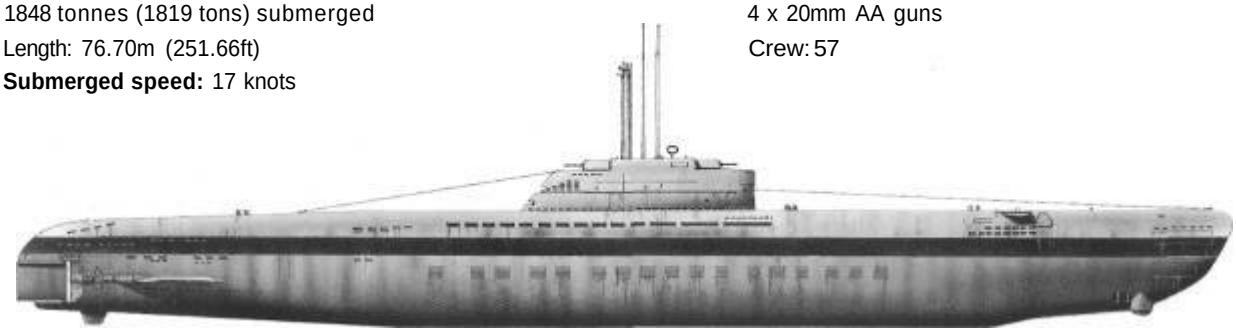
Type: Coastal submarine
Displacement: 317 tonnes (312 tons) surfaced; 363 tonnes (357 tons) submerged
Length: 41.50m (136.17ft)
Submerged speed: 21.5 knots
Submerged range: 210km (130 miles)
Armament: 2 x 533mm (21 in) torpedo tubes
Crew: 19

Above: The Type XVII boats had both conventional diesel engines and a single Walter closed-cycle engine. They were designed for coastal operations.

equipped Mark 27 torpedo in 1944, and in the last years of the war, 106 were fired in combat, scoring 33 hits (31 per cent).

Another approach was to fit a form of automatic pilot, which caused the torpedo to make a series of pre-programmed turns after it had run a preset distance, in the hope that a torpedo fired in the general direction of a convoy would turn and hit a ship purely by chance. Neither the success rate of the Federapparat-Torpedo, nor that of its more sophisticated successor, the Lagcnunabhangiger-Torpedo (which could be fired from depths of up to 50m; 164ft), seems to have been recorded. Later U-boats had their six forward-facing torpedo tubes organised into an array which covered 10 degrees of arc; firing all six in a salvo gave a much-improved chance of hitting the target. It is obvious that the same guidance system which was applied to the glider bombs and the guided missiles could also have been applied to torpedoes, even though keeping a precise track of the missile's course would naturally have been more difficult. It is inconceivable that an experimental programme, at least, was not initiated. Certainly, one of the *Kriegsmarine's* original submarine warfare instructors, Werner Fürbringer, suggested it.

A viable alternative to the torpedo was to lay mines in the path of the oncoming enemy (particularly if this was a slow-moving convoy), and a variety of submarine-launched mines were developed. The Torpedo-Ankertaumine (TMA) had a 215kg (4751b) explosive charge, and was attached to an anchor which allowed it to float at a predetermined height, while the Torpedo-Grundminen lay on the seabed in shallower water. They came in two sizes: the 500kg (llOOlb) TMB and the 1000kg (22001b) TMC. All three mines were dimensioned to allow them to be deployed through a standard 533mm (21in) torpedo tube and could be fitted with a variety of remotely actuated detonators, magnetic or acoustic.



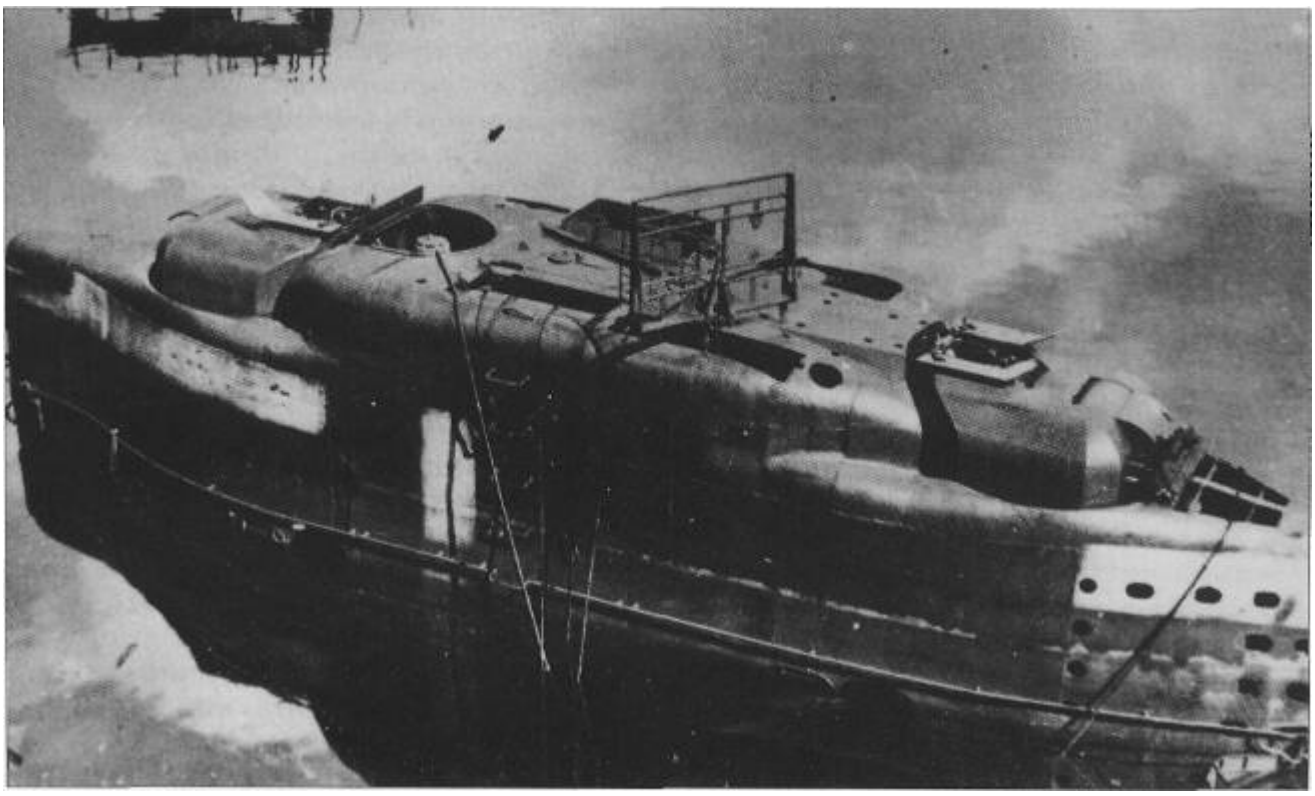
THE NEW GENERATION OF SUBMARINES

There was little development of the basic submarine in the inter-war period, except that the once-popular saddle-tank design, in which the buoyancy chambers were located outside the pressure hull, gave way more and more to the double hull, in which they enclosed it almost completely and were themselves contained within a light enclosure which could be shaped to improve sea-keeping and performance. In Germany, developments in the late 1930s were aimed only at increasing the size and endurance of existing types, not making any radical changes to their design. However, by 1941, experimental boats with a new type of powerplant which did not need atmospheric oxygen had been produced, and were proving to be quite remarkable. The powerplant in question was, once again, the creation of the prolific Professor Hellmuth Walter, whom we have already met.

Walter had constructed a small experimental boat, the *V30,* launched on 19 January 1940, which displaced just 73.8 tonnes (75 tons) submerged. He equipped it with a steam turbine, fed by a variant of the liquid-fuel motors which were to power the VI flying bomb's launch catapult, producing their steam by the chemical reaction of hydrogen peroxide with a catalyst. Walter soon discovered that his submarine could make almost 30 knots submerged - around three times the submerged speed of any conventional

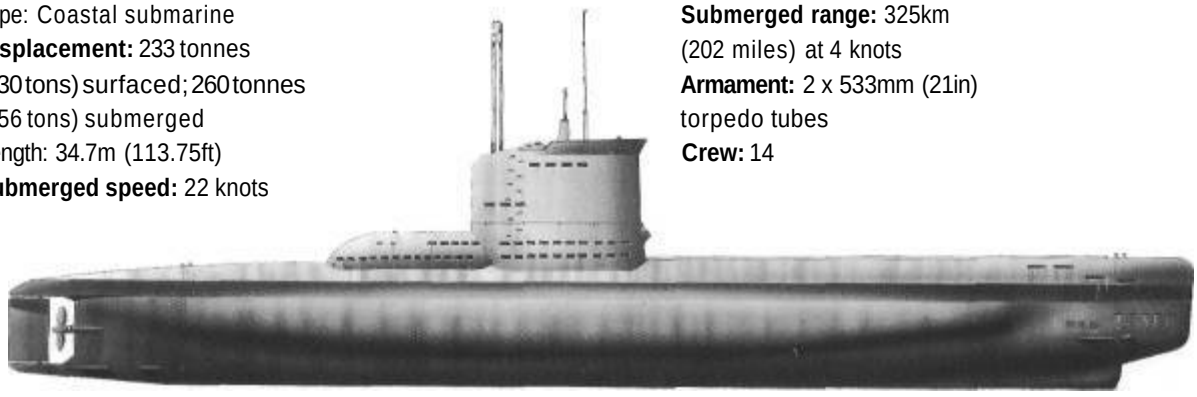
TYPE XXIA

Type: Ocean-going submarine
Displacement: 1620 tonnes (1595 tons) surfaced
1848 tonnes (1819 tons) submerged
Length: 76.70m (251.66ft)
Submerged speed: 17 knots
Submerged range: 525km (325 miles) at 6 knots
Armament: 6 x 533mm (21 in) torpedo tubes;
4 x 20mm AA guns
Crew: 57



Above: The Type XXIs were ocean-going submarines of over 1600 tonnes (1575 tons), the size of a small destroyer of the period. They could make 17 knots submerged.

submarine running on battery power - and that led him to suggest to the *Kriegsmarine* the construction of a fleet of similarly powered submarine warships. When asked where he proposed to store the large quantities of reagent and fuel that would be required, he produced a design for a two-decker submarine, in itself virtually two existing double hulls joined into a tigure '8', the bottom portion of which would serve exclusively as 'bunkerage'. Someone at this proposal meeting noted that it would be just as easy to fill that lower section with batteries.



THE'ELECTRO-BOATS'

Whatever the method adopted, as the war wore on, it was to become harder and harder for U-boat commanders to remain on the surface, even at night,

Below: The conning tower top of a (scuttled) Type XXI. Note the retractable radio antenna and the faired-in machine gun emplacements.

TYPE XXIII
Type: Coastal submarine
Displacement: 233 tonnes (230 tons) surfaced; 260 tonnes (256 tons) submerged
Length: 34.7m (113.75ft)
Submerged speed: 22 knots
Submerged range: 325km (202 miles) at 4 knots
Armament: 2 x 533mm (21in) torpedo tubes
Crew: 14

Above: The other 'Electro-boats' were the much smaller Type XXIIIs, intended for coastal operations. Even with a complement of just 14, they were cramped, much of the interior being given over to batteries.

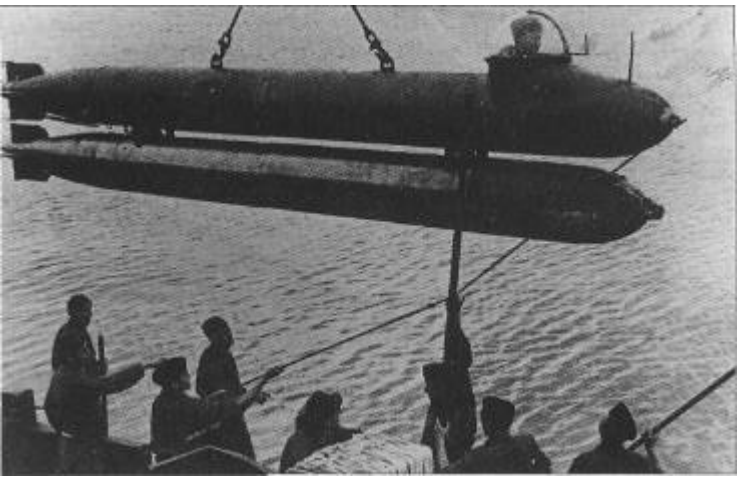
thanks to the increasingly effective airborne anti-submarine patrols mounted by the RAF and the USAAF. If they were to continue to wage war effectively, they would have to be provided with boats which could stay submerged for extended periods and perform more effectively under water, and it was along these lines that the bulk of research was carried out. More 'Walter' boats were built or at least were in the course of construction when the war ended. The two Type XVIIB boats which were successfully salvaged after having been scuttled in Hamburg harbour were later transferred to the US Navy and the Royal Navy, who operated them experimentally, but the powerplant required massive quantities of fairly exotic fuel and was most temperamental. It would perhaps become a valid solution in the fullness of time, but that was something the *Kriegsmarine* did not have, and it was essential to look at other suggestions.

THE TYPE XXI AND TYPE XXIII

The off-the-cuff remark to Walter about using the lower-deck space of his two-deck submarine for batteries was to have far-reaching consequences, and to lead to the construction of two classes of submarines which were actually faster submerged than they were on the surface: the ocean-going Type XXI; and the smaller, coastal Type XXIII. They were not the first to so perform; right at the end of World War I, the British constructed a class of 'hunter-killer' submarines, the 'R' class, with the 220-volt batteries taken from the much bigger T class, combined with a spindle-form hull from an earlier era, with a speed on the surface of 9.5 knots and 15 knots submerged. They proved to be difficult to control, and were stricken prematurely, though *R4* stayed in service until the early 1930s.

The two types of German combat submarines were quite different in character. The Type XXI11 was strictly for local deployment in coastal waters, if only by virtue of its size. It displaced 233 tonnes (230 tons) on the surface, was 34.7m (113.8ft) long and 3m (9.8ft) abeam, and had a crew of just 14. Its biggest weakness as a warship was that it carried just two 533mm (21 in) torpedoes, pre-loaded into two bow tubes, and no re-loads. Almost 500 were scheduled to be built at yards in Germany (Kiel and Hamburg), France (Toulon), Italy (Genoa and Montefalcone), and Russia (Nikolaev), but only the German yards of Deutsche Werft and Germaniawerft actually launched any boats, the German Army having been driven back out of occupied territory before any could be completed. The first boat, *U2321,* was launched at Hamburg on 17 April 1944 and a total of 63 had been completed by the time the war ended. However, problems of commissioning meant that only 10 operational patrols were made from March to May 1945; six merchant ships were sunk, two of them, by *U2336,* off Scotland on 7 May, being amongst the last sinkings of the war.

As its powerplant, the Type XXIII had a single 580bhp MWM diesel engine which drove two electric motors either directly or via the extensive batteries. The principal electric motor produced 580shp and could produce a submerged top speed of 22 knots; the secondary, 'creeping', motor produced just 35shp for a speed of 5 knots, but in almost complete silence. Using the secondary motor alone, the submarine could stay submerged, making a speed of 4 knots, for

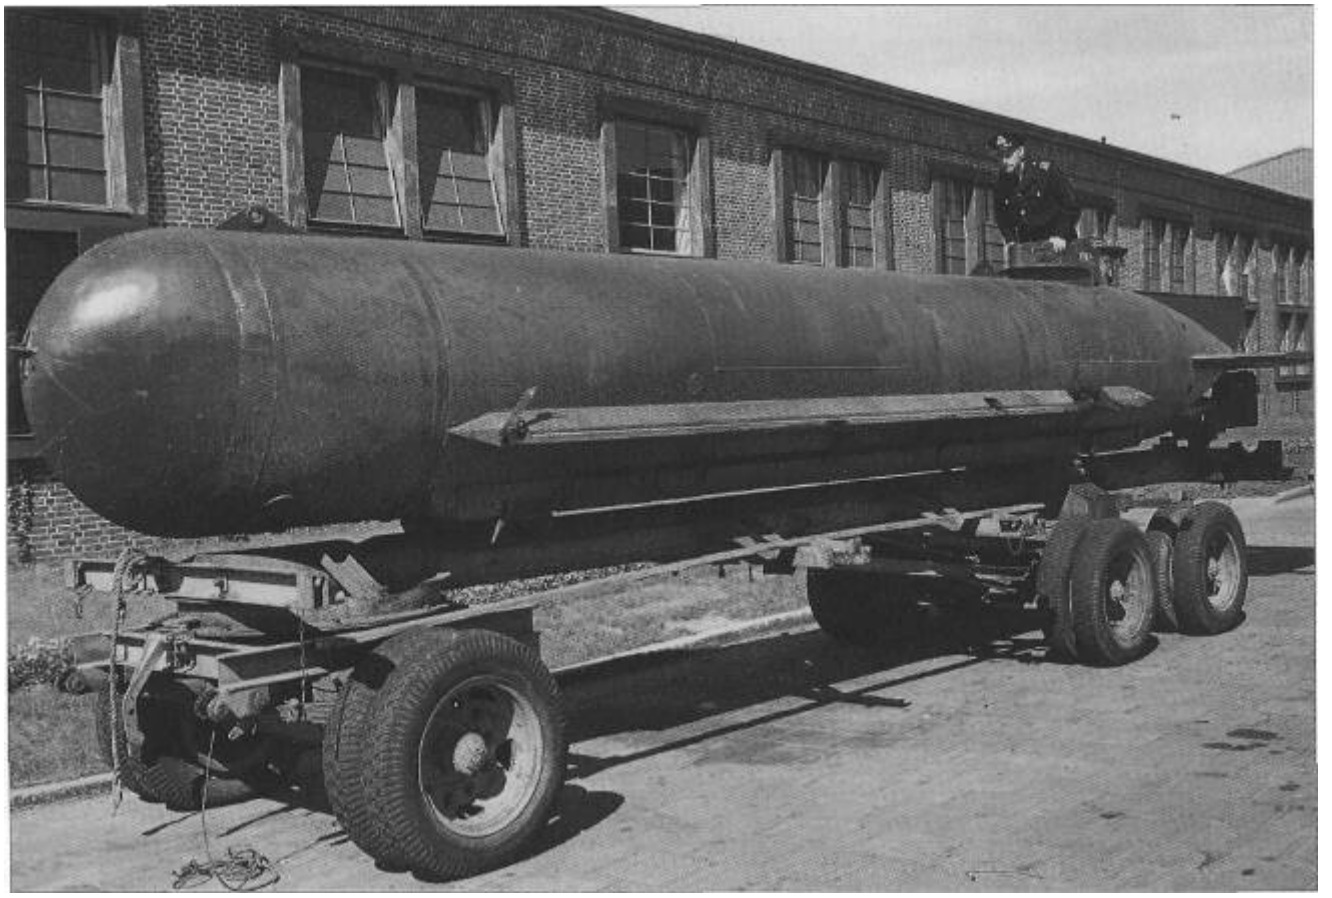


40 hours. Like the bigger, Type XXI boats, they were streamlined in appearance, with all external fittings either faired-in or removed.

The Type XXI was a more sophisticated boat than the Type XXIII; it was 76.7m (251.6ft) long and 6.6m (21.6ft) abeam, displacing 1620 tonnes (1595 tons) on the surface. Type XXIs were equipped with six torpedo tubes, all of them situated in the bow, and a total of 23 torpedoes (they were also to have carried four 30mm anti-aircraft cannon, but never did, a pair of 20mm cannon being substituted). Like the coastal boats, they were double-decked, the frames being fitted outside the pressure hulls, which suited the modular, prefabricated building method by then in use in Germany. Their powerplants were considerably more powerful, of course: they had two MAN diesels of lOOObhp each driving two propeller shafts via two 125()shp electric motors or two 57shp 'creeping[1] motors; on the surface they could make 15.5 knots and submerged, on main engines, over 17 knots, with 5 knots available from the auxiliary motors.

Almost 700 Type XXIs were scheduled to have been built by Blohm & Voss in Hamburg, Deschimag in Bremen, and Schichau in Danzig (Gdansk), but only 121 were actually commissioned. Many more were bombed on the slip prior to launching and a substantial number remained incomplete at the end of the war. Some of them - and some of the boats already in commission - were taken to the Soviet Union and completed there and formed the backbone of the Red Navy's submarine arm for many years. Indeed, so greedy were the Soviets for German submarines that they loaded the hangar decks of the incomplete hull of the aircraft carrier *Graf Zeppelin* with U-boat hull sections and proceeded to tow it the length of the Baltic to Leningrad, but it hit a mine in the Gulf of Finland and sank. Only two Type XXI boats ever left port on operational patrols and neither fired a shot in anger. The advance in submarine operations which the Type XXI and Type XXIII represented cannot be overstated. They altered the world's navies' perceptions of what could be expected of a submarine, and every design later produced, up to the modern 'teardrops', reflected that.

Left: The head of an extensible induction mast, or schnorkel tube. It took considerable ingenuity to produce a self-regulating valve system which was fast-enough acting to prevent large quantities of water being sucked into the submarine. The Dutch were the first to find a solution to the problem in about 1936.

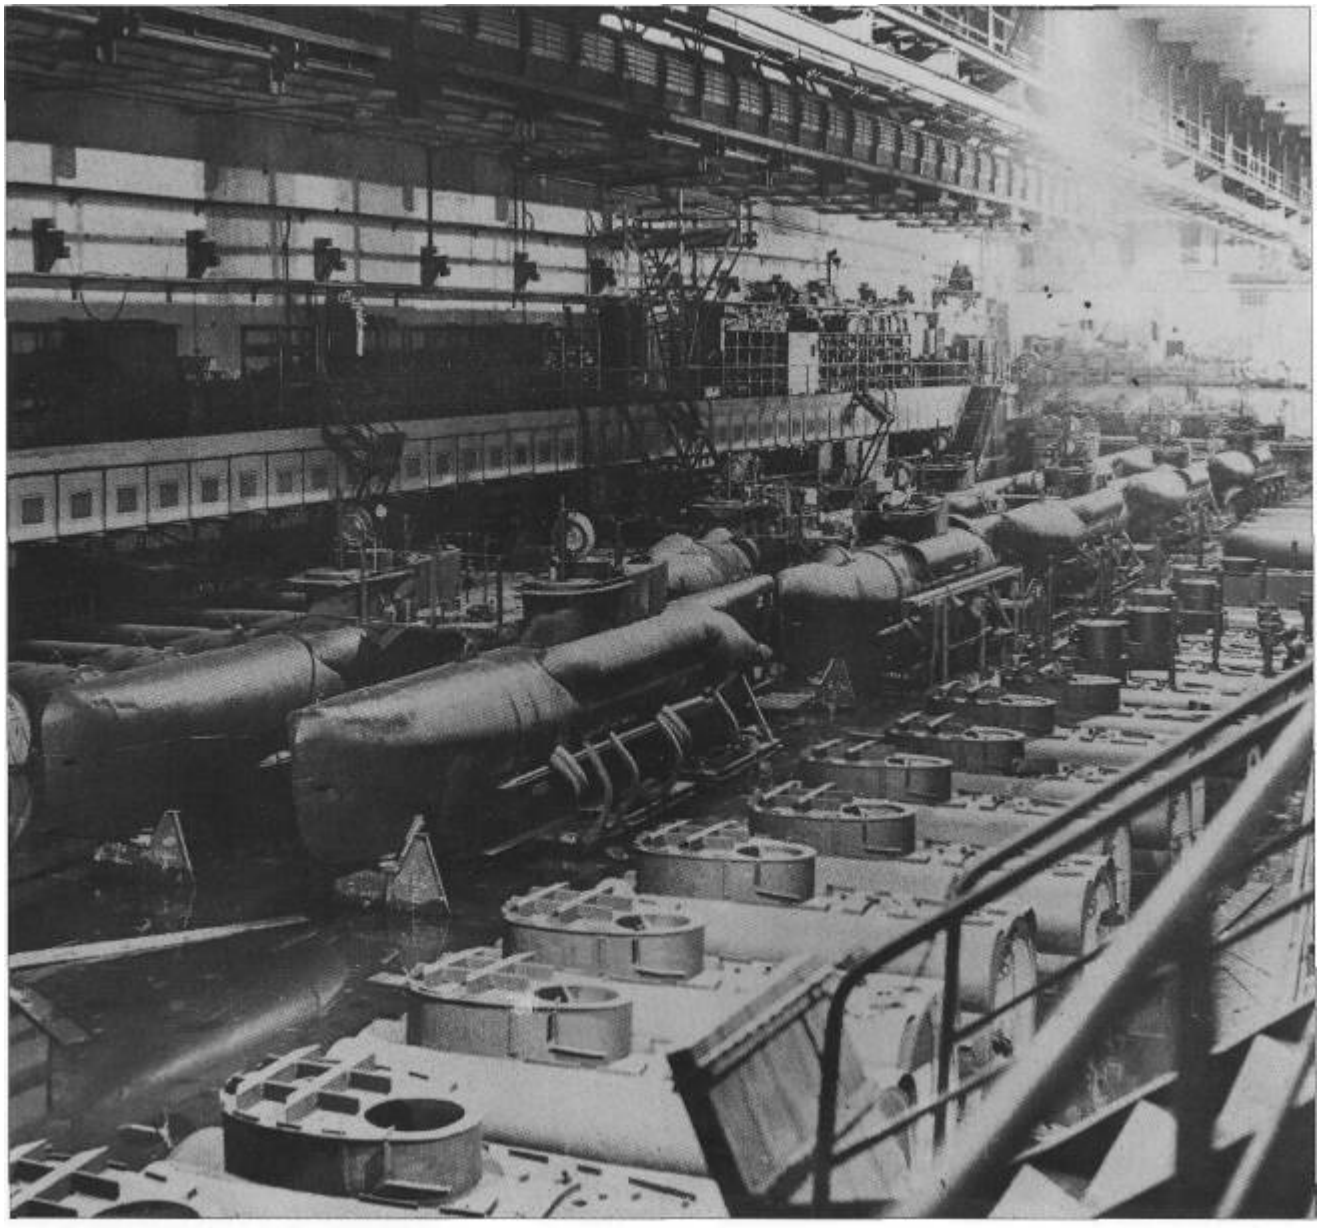


Above: A 'Marder' ('Marten') midget submarine being launched by crane. The nature of the craft-it was no more than a torpedo with a small crew compartment replacing the warhead - is obvious.

Below: The 'Molch' ('Salamander') was slightly more sophisticated than the 'Marder'. It carried two underslung torpedoes and around 400 were built The 'Molch' was used against Allied shipping in the Scheldt.

THE SCHNORKEL

There was one more way to keep the boat submerged with its engines running, of course: let it breathe through a tube. This may seem an obvious solution, and indeed, the very earliest submariners had adopted it, but in a large boat travelling even at only 5 or so knots, a breathing tube was very difficult indeed to maintain in operation in anything but a flat-calm sea. The practical problems were largely solved, however, by about 1936, and in a somewhat unlikely quarter: the Netherlands. When the German Army invaded in May 1940, examples of submarines with functional extensible induction masts (as the breathing tubes are properly known) were captured intact, but were never copied, and those fitted to Dutch submarines which the *Kriegsmarine* put into operation were removed. German submarine commanders[1] policy was to remain on the surface as much as possible, and only submerge to avoid escape or to make a particularly risky attack. As a result, U-boat commanders had no use for the snorting mast, at least, not until the dark days of 1943, when they were regularly being forced to dive by anti-submarine patrols, and when a research programme was put in hand to replicate the



results the Dutch had achieved. The first German submarine to have been fitted with a schnorkel seems to have been *U264*, and she was lost in February 1944 during her initial attempt to use it. Some experts maintain that the first-generation schnorkels caused as many problems as they solved, but they achieved their major objective of allowing the submarine to run submerged on its diesel engines, even if was a tricky business, and unpopular with the crew, who had been accustomed to a short watch on deck every now and then. Tt could also be very dangerous, as the loss of *U264* indicates, as it was all too easy to run the head-valve (a simple ball valve at the end of the U-shaped top section of the induction tube) under water, whereupon the diesels would begin to suck the air out of the boat's interior and would create a very considerable under-pressure before they stopped.

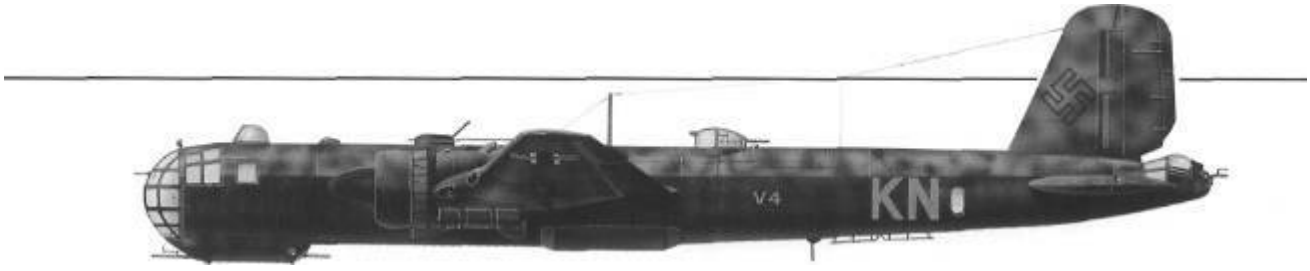
MIDGET SUBMARINES

Given their almost complete lack of success, it comes as something of a surprise to discover the extent of the German Navy's midget submarine programme. At least six different types of craft were produced in considerable numbers - certainly over 1500 in total - from 1943 (the programme was behind those of Britain, Italy, and especially Japan). The first types would more accurately be called semi-submersibles, for they all ran with their upper surfaces barely awash, the solitary crewman being able to see out through ports in the vestigial conning tower which enclosed his head. The first constructed was known as the 'Hecht' (Tike'); it was battery-powered and really little more than a manned torpedo with a detachable warhead. An improved model, the 'Neger' ('Negro') had a petrol engine, and carried an underslung torpedo. Tt worked well enough, but its solitary crewman had to breathe oxygen, and was thus restricted in what he could do. Two larger one-man types, the 'Molch' ('Salamander') and the 'Marder' ('Marten'), were slightly more practical, with recirculating air supplies. The former carried two underslung torpedoes, and was used with some success against Allied shipping in the Scheldt in late 1944 and 1945. The 'Marder' carried just one torpedo but could submerge completely in order to attack.

Below: The 'Biber' ('Beaver') was the third one-man midget submarine type. It could be transported by road or by specially equipped 'mother' submarines and proved to be quite successful in 1944-45.

Above: The best of all the German World War II midget submarines was the two-man 15.2-tonne (15-ton) 'Seehund' ('Seal'), the only type which was truly capable of operating independently.

The next step was to produce a true submersible, a proper submarine in miniature. The first attempt resulted in a single-seater experimental vehicle called the 'Hai' ('Shark'), powered by a petrol engine and batteries, which could make 20 knots for two hours on its electric motor. The 'Hai' was developed into the one-man 'Biber' ('Beaver'), which displaced 3.04 tonnes (3 tons) and carried two torpedoes slung beneath the hull; a later version of the 'Biber' was capable of carrying a second crewmember. Over 300 were built and used with a measure of success in the Scheldt Estuary and off Murmansk in the convoy assembly area. The 'Biber' could be transported by road or by air as well as by specially modified conventional submarines.



The most successful of the German midget submarines was the two-man 'Seehund' ('Seal'). This was much bigger at 15.2 tonnes (15 tons) displacement, and had jettisonable auxiliary fuel tanks, which gave it a range of around 800km (500 miles). It could make 8 knots on the surface and 6 knots submerged. The 'Seehund' also gained some success in the mouth of the Scheldt. Unconfirmed reports from German sources claim that it also operated against merchant shipping in the Thames estuary and off Margate.

CHAPTER TWELVE

Nuclear, Biological and Chemical Weapons

When war broke out in 1939, it was feared that poison gas would be used even more widely than it had been in World War I. To that fear was added the threat of biological agents, while physicists were struggling with the possibility of harnessing nuclear fission to produce a bomb the likes of which had never been seen.

In December 1938, German physicists Otto Hahn and Frit/ Strassman demonstrated the fission (splitting) of the uranium atom. This caused a stir in the scientific community, and ripples spread outside it, even as far as the HWA, to which several scientists wrote, suggesting that the phenomenon might conceivably be used in a bomb. The notion made slow progress, but by late 1939 a steering committee had been formed. It had just one item on its agenda: could a nuclear reactor to produce fissionable material be built? As a rider, subsidiary questions were posed about costs and timescale. A research programme was drawn up, and six university-based projects were established. By 1941, it had become clear that the notion was feasible, and the steering committee reported to HWA that a reactor could and should be built, and that it should use as its moderator, deutrium, also known as 'heavy water'. The entire project went downhill from there, but it would be a long while before that was to become obvious. By 1942, five different laboratories were experimenting with atomic piles, each one with a different theory of how

Above: The Heinkel He 177A-5; an He 177 was modified to carry the never-completed German atom bomb.

Left: A US serviceman is confronted by massed ranks of German mustard gas shells afterthe war.

it should be constructed, and each one in ignorance of what the others were (or were not) doing. At least one team - that led by Werner Heiscnberg, Nobel laureate and dean of the Gentian physics community, who had recently been appointed Director of the Kaiser Wilhelm Institute at Dahlem - is reported to have deliberately exploited the confusion which resulted to drag its feet. Convinced that a bomb could be contructed, Heisenberg set out to slow the process down, and make as little actual progress as possible towards its conclusion. Eventually, Albert Speer, Hitler's Minister for Munitions, lost patience, and demanded from Heisenberg a prediction of the length of time which would be required to actually manufacture a bomb. Heisenberg prevaricated still, but eventually said that he believed it might be possible by 1945.

Speer decided to set up a single research project charged with constructing a reactor. He assembled some of the best brains in the field and asked them to submit a budget. They requested 40,000 Rcichsmarks, less than the cost of a single PzKpfw IV tank, and this, more than anything, seems to have convinced him that the project had a very low likelihood of success. From then on, it seems, the nuclear research programme concentrated on producing a reactor suitable for power generation, rather than one to produce fissionable material for a bomb. Naturally, such a power station would inevitably produce small quantities of fissionable material as a by-product, but it would be a very long time before it would be possible to build a bomb, even if the reactor worked perfectly.

Two atomic piles were eventually built, one near Hechingen, the other near Erfurt, both using deutrium as their moderator. Neither actually achieved a chain reaction, largely because they were too small. By that time - late 1944 - the infrastructure of German industry was becoming increasingly chaotic. Such small supplies of uranium ore as were available - from a small field in Belgium and another in Bohemia - were running low, and thanks to a successful bombing raid by the RAE on the deutrium production plant in Norway, that was in short supply too. The programme was already dead in its infancy, and one might even say that it was stillborn.

There was perhaps a subsidiary use of uranium as a weapon of war under consideration. In 1943, HWA commissioned a report from a biological laboratory on the toxicity of radioactive material. From this it has been widely concluded that uranium dust was to have been employed as cargo in a conventional high-explosive bomb or rocket warhead, but there is no firm evidence to support this speculation and certainly no evidence to suggest that even the most basic experimentation ever took place outside the laboratory. One could just as well conclude that the project was aimed at improving worker safety.

BIOLOGICAL WEAPONS

Outside very special limits, suicidal attacks make little tactical sense, and a suicidal strategy makes none at all. Those truisms have always done more than pure ethics or morality to control the use of one of the most dreadful potential weapons known to man: disease. Indeed, in limited 'experiments', where the vectors of the disease in question could be completely controlled, man has shown himself willing to use biological agents of death. The US Army used it in the form of smallpox-infected blankets distributed to native Americans, and the Japanese did too in Manchuria in the 1930s. But as an everyday weapon of war, it had one enormous disadvantage: it was as likely to kill you, in the long run, as it was to kill your enemy. That is not to say that every country did not have its biological warfare research establishments, but more to suggest that much of the research carried out in them was aimed more at providing a defence against the agents of disease. There are persistent reports that tests of biological agents were carried out on unwill-

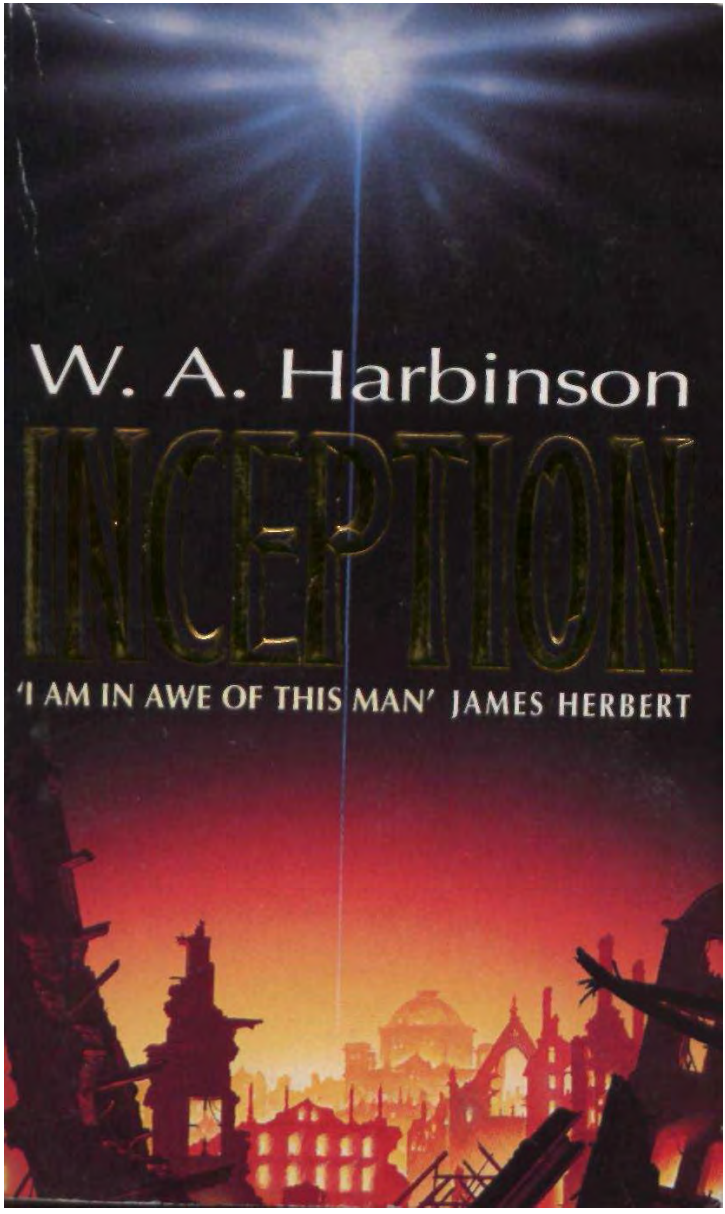
Left: Like all armies, the Wehrmacht took chemical weapons very seriously, as the protective clothing and warning signs on this locker indicate.

ing participants in concentration and extermination camps in Germany, and in the light of other undeniable findings from the people investigating the events in those places, we have to leave the question open.

CHEMICAL WEAPONS

More than half a century on, there is no lessening of the revulsion felt against the obscenities committed in the Nazi death camps or against the men and women who actually committed the acts, and that is as it should be. But besides the ethical and moral aspects, there is also the purely practical to be considered, for the destruction of six million or more people could only proceed on an industrial scale. The mass murders had to carried out under factory conditions. Very soon it became obvious that the only acceptable method would be by mass poisoning, the toxin to be delivered in the form of a gas. In the event, this murder of millions of helpless people was to be the only widespread use of chemical warfare during World War II. This is apart from Italian forces using phosgene in Abyssinia in 1938, the Japanese use of it in China from the mid-1930s to the end of 1941 in some 840 separate incidents, and reports that something described as 'toxic smoke' was used during the siege of Sebastopol.

German troops initiated the use of gas as a weapon of war in February 1915, when they fired shells filled with xylyl bromide (a lachrymogen, or tear gas) against Russian forces. The operation failed, for the gas was frozen solid in the shells, and dispersed only very slowly. Two months later, they used chlorine gas against British and Empire troops at Ypres with greater success, and from then on it became a recognised part of both sides' armouries. But it was not that effective; gas was responsible for only just over one per cent of battlefield deaths during the entire war. It was slightly more effective as a wounding agent - 5.69 per cent of all injuries were caused by gas - and from a military point of view, wounding is actually more desirable, since caring for wounded both on and off the battlefield eats into precious resources.



By 1919, there was a limited repertoire of gases available; chlorine, mustard gas, phosgene and a few others. By the time two decades had passed, there was a whole menu of more effective agents available, including some very exotic compounds which had been produced during research into insecticides and herbicides. These compounds were organo-phosphates, and were to become the basis for what we now call nerve gases. The original nerve gas, known as Tabun, was first synthesised in 1936 into a substance

Above: The sinister facade of a German mustard gas storage building, in which the agent was kept in huge concrete vats.

called ethyl-dimethyl-amido-phosphor-cyanidate. By 1942, a factory to produce it to the tune of 1016 tonnes f 1000 tons) per month had been established at Dyhernfurth in Silesia (now Brzeg Dolny in Poland). In 1938, a second and even more effective organo-phosphate, isopropyl methyl-phosphoro-fluoridate, was synthesised. Known as Sarin, it proved to be very much harder to manufacture on an industrial scale than Tabun, and even by 1945, only a small pilot plant had been set up. By that time, a still more dangerous derivative, pinacolyl methyl-phosphoro-fluoridate had been produced, under the name Soman, though little progress had been made with this by 1945.

It appears that until the factory producing Tabun was overrun by the Red Army in early 1945, the Allies knew nothing of these 'weapons', making their existence one of the best-kept German secrets of World War II. The first the British and Americans knew came from examining shells and bombs recovered from ammunition dumps (about half a million shells and 100,000 bombs, in all), and as the reality of the situation sank in, the researchers were horrified to discover that they were confronted by a lethal agent, and that there was no known cure or antidote from exposure to it. That last factor, it is argued by many, was the real reason that Germany did not employ nerve gas, even in the final days. The Wehrmacht and the SS could not be sure that the enemy did not also possess these simple and cheap weapons of mass destruction, and that the destruction which would result from their use would not be mutually assured.

W. A. Harbinson
INCEPTION
'I AM IN AWE OF THIS MAN' JAMES HERBERT

THE MOST TERRIFYING, AWESOME CONSPIRACY IN HUMAN HISTORY STARTS HERE...

The first wave of modern UFO sightings occurred nearly a hundred years ago. Fact. In 1908 a mysterious, nuclear-like explosion devastated a vast area of Siberia. Fact. Allied airmen flying over Germany in World War II were chased by eerie fireballs. Fact. During that same global conflict, the Nazis experimented desperately to try and create the world's first flying saucer. Fact.

These facts hold the key to the nightmarish secret of UFOs.

Based on previously concealed but carefully documented evidence, INCEPTION begins the epic Projekt Saucer series - a sequence of chilling revelations in the form of gripping fiction. Here is a unique, controversial and provocative work exposing cover-ups, conspiracies and terrible truths that have been hidden far, far too long . . .

'Harbinson's novels are never less than stupendous. I am in awe of this man'
JAMES HERBERT

Harbinson is a combination of H. G. Wells and Frederick Forsyth - audacious imagination combined with a precise and convincing realism'
COLIN WILSON

THE ULTIMATE CONSPIRACY

W. A. Harbinson started to uncover the nightmarish truth about Unidentified Flying Objects (UFOs) in the research for his international bestseller Genesis. Now he has taken that groundbreaking work and expanded it, going back decades to create another astounding epic. Inception is a terrifying story based on documented historical fact that reveals what is really known about UFOs while it holds readers spellbound with a breathtaking thriller about organized evil, global conspiracy - and the secret future of our world ...

INCEPTION: THE FIRST BOOK OF THE EPIC TERROR SERIES PROJEKT SAUCER

About the author

W. A. Harbinson has been a journalist, magazine editor and TV scriptwriter. Born in Belfast, Northern Ireland in 1941, he left school at fourteen, studied mechanical engineering, then joined the Royal Australian Air Force. While serving in the RAAF, he drafted his first novel, Instruments of Death. In 1980 he completed the classic Genesis, the epic novel of the world's most fearsome secret that became the inspiration for the Projekt Saucer tetralogy. (Inception is chronologically the first novel in this sequence.) Harbinson lives in north London with his wife and two children.

Inception

W. A. Harbinson

PROJEKT SAUCER: BOOK ONE

AUTHOR'S NOTE

In 1980 my 615-page novel, Genesis, based on a mass of research material, became a cult best-seller on both sides of the Atlantic. It remains in print to this day.

Reviewing the novel on its initial publication in the United States, Publishers Weekly said: 'Harbinson has drawn so heavily on factual material and integrated it so well into the text that the book begins to read like non-fiction ...' This conclusion was drawn by other reviewers, and over the years I received many letters from readers who obviously thought the same and begged me to tell them which parts of the book were fact and which were fiction. For the record, then, here are some facts.

Before writing Genesis, while researching a different novel altogether, I obtained through the Imperial War Museum, London, two short articles that attracted my attention. One was a routine war report by Marshall Yarrow, then the Reuters special correspondent to Supreme Headquarters in liberated Paris. The particular cutting I had was from the South Wales Argus of December 13, 1944. It stated: The Germans have produced a "secret" weapon in keeping with the Christmas season. The new device, which is apparently an air defence weapon, resembles the glass balls which adorn Christmas trees. They have been seen hanging in the air over German territory, sometimes singly, sometimes in clusters. They are coloured silver and are apparently transparent.' The second article, an Associated Press release published in the New York Herald Tribune of January 2, 1945, illuminated the subject even

more. It said: 'Now, it seems, the Nazis have thrown something new into the night skies over Germany. It is the weird, mysterious "Foo fighter" balls which race alongside the wings of Beaufighters flying intruder missions over Germany. Pilots have been encountering this eerie weapon for more than a month in their night flights. No one apparently knows what this sky weapon is. The "balls of fire" appear suddenly and accompany the planes for miles. They seem to be radio-controlled from the ground, so official intelligence reports reveal...'

Official 'Foo fighter' reports were submitted by pilots Henry Giblin and Walter Cleary, who stated that on the night of September 27, 1944, they had been harassed in the vicinity of Speyer by 'an enormous burning light' that was flying above their aircraft at about 250 miles per hour; then by Lieutenant Edward Schluter, a fighter pilot of the US 415th Night-Fighter Squadron based at Dijon, France, who, on the night of November 23, 1944, was harassed over the Rhine by 'ten small reddish balls of fire' flying in formation at immense speed. Further sightings were made by members of the same squadron on November 27, December 22, and December 24.

While no official designation of the Foo fighters was offered, most reports indicated that they appeared to be under some kind of control and were certainly not 'natural' phenomena. Indeed, according to a London Daily Telegraph report of January 2, 1945, RAF pilots were describing them as 'strange orange lights which follow their planes, sometimes flying in formation with them, and eventually peeling off and climbing (author's italics).

According to the Italian author Renato Vesco, in his book Intercept - But Don't Shoot (Grove Press, 1971), the Foo fighter was actually the German Feuerball, or Fireball, constructed at an aeronautical establishment at Wiener Neustadt It was a flat, circular flying machine, powered by a turbojet, and used during the closing stages of the war both as an antiradar device and a psychological weapon designed to disturb Allied pilots.

In any event, sightings of the Foo fighters tailed off and

ceased completely a few weeks before the end of the war.

The next wave of UFO sightings occurred in Western Europe and Scandinavia. From 1946 to 1947 many people, including airline pilots and radar operatives, reported seeing strange cigar- or disc-shaped objects in the skies. On June 21, 1947, Harold Dahl reported seeing saucer-shaped objects flying toward the Canadian border. Three days later Kenneth Arnold made his more famous sightings of saucer-shaped objects over the Cascades, also flying toward the Canadian border.

These and subsequent sightings led to speculation that both the Soviets and the Americans, utilizing the men and material captured in the secret research plants of Nazi Germany, including those at Peenemiinde and Nordhausen, were developing advanced saucer-shaped aircraft.

Were such speculations based on facts?

It would certainly seem so.

During the early 1950s, a former Luftwaffe engineer, Flugkapitan Rudolph Schriever, then resident at Hokerstrasse 28 in Bremerhaven-Lehe, West Germany, claimed that in 1941 he had designed the prototype for a 'flying top,' which was test-flown in June 1942. In the summer of 1944, with his colleagues Klaus Habermohl, Otto Miethe, and an Italian, Dr Giuseppe Belluzzo, he had constructed a larger version of his original prototype. Then, in the East Hall of the BMW plant near Prague, they redesigned the larger model, replacing its gas-turbine engines with an advanced form of jet propulsion.

An article about Projekt Saucer was later published in the indispensible volume, German Secret Weapons of the Second World War (English-language editions published by Neville Spearman, London, 1959, and the Philosophical Library, New York, 1959) by Major Rudulph Lusar. It included reproductions of Schriever and Miethe's flying-saucer drawings.

According to Lusar, the flying saucer consisted of a 'wide-surface ring which rotated round a fixed, cupola-shaped cockpit' The ring consisted of 'adjustable wing-discs which

could be brought into appropriate position for the take-off or horizontal flight, respectively.' Also developed was 'a discus-shaped plate of a diameter of 42 meters (138 feet), in which adjustable jets were inserted.' The completed machine had a height from base to canopy of 32 meters (105 feet).

Schriever claimed that his 'flying disc' had been ready for testing in early 1944, but with the advance of the Allies into Germany, the test had been canceled, the machine destroyed, and his designs either mislaid or stolen. His story was, however, contradicted by alleged eyewitness Georg Klein, who later stated to the German press that he had actually seen the test flight of the Schriever disc, or one similar, on February 14, 1945.

Doubt may be cast on Klein's date, because according to the War Diary of the 8th Air Fleet, February 14, 1945, was a day of low clouds, rain, snow, and generally poor visibility - hardly the conditions for the testing of a revolutionary new kind of aircraft. Nevertheless, according to author Renato Vesco, the test flight of a machine called the Kugelblitz, or Ball Lightning Fighter - which was rumored to be a revolutionary kind of supersonic aircraft - was conducted successfully over the underground complex of Kahla (near Nordhausen) sometime during February 1945.

Did the United States then become involved in flying saucer projects?

The short answer is: yes.

Evidence for US involvement surfaced with information about the US Navy's Flying Flapjack, or Flying Pancake. Designed by Charles H. Zimmerman and constructed in 1942 by the Chance-Voight Corporation, the Flying Flapjack, or V-173, was an experimental, vertical-rising, disc-shaped aircraft that used two 80-hp engines. A later, more advanced model, the XF5U-1, utilized two Pratt and Whitney R-2000-7 engines of 1,600 hp each. It was rumored to be over 100 feet (30 meters) in diameter and to have jet nozzles - resembling the 'glowing windows' seen on so many UFOs - arranged around its rim.

It was built in three layers, the central layer being slightly larger than the other two. As the saucer's velocity and maneuvering abilities were controlled by the power and tilt of the separate jet nozzles, there were no ailerons, rudders, or other protruding surfaces.

In appearance it was remarkably similar to those reported by so many UFO witnesses.

The US Navy claimed to have ceased working on the Flying Flapjack project in 1947 (the first version, the V-173, is stored with the Smithsonian Institution), but US involvement with saucer-shaped aircraft did not stop there.

The reports that started the modern UFO scare - the Dahl and Arnold sightings of 1947 - both stated that the saucers flew back toward the Canadian border. On February 11, 1953, the Toronto Star reported that a new flying saucer was being developed at the Avro-Canada plant in Malton, Ontario.

Both the US and Canadian governments vehemently denied involvement in any such project, but on February 16, after freelance photographer Jack Judges had taken an aerial photograph of a flying saucer resting outdoors in the Avro-Canada plant in Malton, the Minister for Defence Production admitted to the Canadian House of Commons that the firm was working on a 'mock-up model' of a flying saucer, capable of flying at 1,500 miles per hour (2,400 km/h) and ascending vertically. Shortly after this announcement, the president of Avro-Canada wrote in Avro News that the prototype being built was so revolutionary that it would make all other forms of supersonic aircraft obsolete.

The aircraft's official name was the Avro-Car.

According to official statements, the Avro-Car was tested in 1960 and subsequently abandoned as a failure. (The prototype is now on display for all to see at the Army Transportation Museum at Fort Eustis, Virginia.) However, while the Canadian and US governments have insisted that they are no longer involved with flying saucer construction projects, there are many who believe that they are lying and that the Canadian, British, US, and even Soviet governments

are continuing to work on highly advanced, saucer-shaped, supersonic aircraft based on the work done in Nazi Germany. Those who believe in this are often quick to point out that of the original Projekt Saucer team, Habermohl was captured by the Russians and taken back to the Soviet Union, along with over six thousand German technical specialists of all kinds, to work on similar projects; Miethe went to the United States with Wernher von Braun and other German rocket scientists and ended up working for Avro-Canada, in Malton; and Rudolph Schriever insisted right up to his death, in the late 1950s, that the Soviet Union and United States were both working on flying saucer construction projects based on material captured during the war.

For the purposes of my fiction, I have utilized many real-life people, including the mysterious John Wilson and the Nazi SS generals Artur Nebe and Hans Kammler.

The term 'real-life' is used in regard to John Wilson only in the sense that during the first modern UFO sightings - the Great Airship Scare of 1896-97 - when airships of unknown origin and advanced design were reportedly seen, and landed, all over the United States, the man whom most witnesses reportedly spoke to had introduced himself simply as "Wilson' and claimed that his airships had been constructed in Iowa and Illinois.

He was not seen or heard of after the great scare ended - though C. C. Akers, former sheriff of Zavalia County, Texas, to whom Wilson had referred when speaking to one of the witnesses, claimed that he had known a Wilson who was of 'a

mechanical turn of mind' and 'working on aerial navigation and something that would astonish the world.'

Regarding the SS general Artur Nebe: While he was placed on a Nazi 'death list' in 1944 and disappeared shortly after, his death was never confirmed. Many felt that he had simply fled for his life. As for General Hans Kammler, his history with the SS and the V-2 rocket program is well documented, but what became of him after he disappeared from Germany in April 1945 remains a mystery to this day.

These are some of the facts supporting the fiction of the original Genesis as well as Inception.

Ponder them wisely.

W. A. Harbinson London, 1990

CHAPTER ONE

The sun was still rising over the barren prairie near Roswell, New Mexico, when the Model T Ford, towing a trailer and churning up clouds of dust, approached the flat plain of Eden Valley, followed by a vintage black touring sedan.

Parked by the wooden shelter near the steel-webbed tower that soared sixty feet above the desert floor, with her knees propped up on the steering wheel of her car and her notebook resting on them, Gladys Kinder chewed on her pencil, watched the distant caravan approaching, then nodded thoughtfully and started to write. She began positively.

> Well, folks, what an era it has been! First the Civil War, then the Industrial Revolution, and now the Age of Science and Technology. And what advances have been made in the past few years! Michael Faraday explored electrical induction, Joseph Henry made startling advances in electromagnetism, Bell devised the telephone, Morse the telegraph, Edison the incandescent lamp, Heinrich Hertz detected radio waves, Marconi produced the wireless communicator, and other scientists are presently revolutionizing our concept of the essential elements of matter and the behavior of light-waves - all in the space of a few years!
>
> And this very day, just before we hail the bright and shiny New Year of 1931, our very own scientific genius, Robert H. Goddard, is about to launch his latest liquid-fueled, instrument-carrying, gyroscopically controlled rocket from the desolate plain known as Eden Valley.

Eden Valley! An appropriate name - since what is being created here could well lead to a world changed beyond our wildest imaginings.

A strange and terrible beauty is being born here in Roswell, New Mexico...

She studied what she had written, not pleased with its awkward mixture of the folksy and the academic, then looked up again as the caravan approached the steel-webbed launching tower and braked to a halt.

As the dust subsided around the vehicles, Gladys gazed around her to take in some background details, then hurriedly jotted down what she had seen:

From where I sit, which is close to the rocket's launching tower, the snowcapped El Capitdn Mountain rises from the foothills near the southwestern horizon. To the east are the sunlit slopes of the Caprock and, beyond them, the Staked Plains, where the Comanche Indians, Spanish explorers, and even Billy the Kid roamed not long ago...

Temporarily blocked and deciding to fill the rest in later, she put the notebook and pen back into her shoulder bag. As she looked up, five men stepped down from the two vehicles, casting long shadows on the desert floor.

She instantly recognized the forty-eight-year-old Goddard from his stooped walk and thin, tubercular body. He did not like journalists, did not approve of her being there, and so stared directly at her, his brown gaze intense over his mustache, before turning away to give instructions to his small group of mechanics and machinists.

Wilson wasn't among them.

Surprised, Gladys slid her knees off the steering wheel and looked south across the flat plain, hoping to see him driving toward her. Thwarted, she returned her gaze to the front in time to see the crew unwrapping the long bundle that had been covered with quilts and oilcloth and trussed down on the

back of the trailer towed by the Ford.

Once it had been unwrapped, the men lifted Robert H. Goddard's latest rocket out of the trailer bed.

It was a slender cylinder, about eleven feet long and nine inches in diameter, complicated with various tanks and tubing. One of its stabilizer vanes was painted bright red. The men carried it with considerable care to the sixty-foot launching tower, which had been guyed by cables and anchored in concrete.

Henry Sachs, the crew chief and instrument maker, and Al Kisk, Goddard's brother-in-law, climbed the tower and fastened cables to the striped rocket to hold it steady until its moment of release. Meanwhile, on the ground below, two of the mechanics, brothers Lawrence and Charles Mansur, reeled wire out from the tower to the control shelter that had been constructed about a thousand feet away from the launching tower and buttressed with sandbags. Then Lawrence headed out into the desert with his recording telescope and stopwatch while Charles walked up to Gladys and grinned nervously at her.

'No journalists are supposed to be here,' he said. 'Goddard's not pleased to see you.'

'Wilson told me I could come,' she replied.

'Oh, did he, indeed?'

'Yes.'

'So where's Wilson?'

'I was going to ask you that.'

'I don't know,' Mansur said. 'I don't know anything about that damned Wilson. No one does, Gladys - except maybe you.'

'And Goddard.'

'Goddard swears he's just an old friend.'

Then that's what he is.'

'He sure has a lot of priority for someone who's just an old friend and claims to know nothing about aeronautics.'

'So it goes,' Gladys said.

'You're a damned good journalist, Gladys. You've got eyes

and ears. You know damned well we resent him.'

'Why?'

'Why ask, since you know?'

'I only know what I'm told, so tell me.'

Mansur shook his head from side to side, grinning sardonically. 'All I can tell you is that I don't know a damned thing about Wilson. I don't, my brother doesn't, none of the other crew members do - and what Goddard knows, he's not about to discuss. In other words, Wilson is a mystery - he's just here as Goddard's friend.'

'Doing what? The cooking?'

'Very smart, Miss Kinder.'

'So, what?'

Mansur shrugged. 'Again, I don't know. All I know is that Wilson appeared out of nowhere about six months ago, that he's been tight as can be with Goddard since then, and that the two spend a lot of time in Goddard's workshop, doing God knows what According to Goddard, we're not supposed to talk about Wilson. As far as the public's concerned, Wilson doesn't exist. And as far as we're concerned - by which I mean Goddard's crew - Wilson has a mysterious hold on Goddard, with the master doing what the student bids. And he also has you in his bed - so what else do you want to know?'

Gladys smiled. 'Wilson's about sixty years old. Who the hell are you kidding?'

'Well, Gladys, you're thirty-five. And Wilson doesn't look like a sixty-year-old. He looks about your age.'

'Gee, thanks, Charlie!'

'Dammit, Gladys, you know what I mean.'

'Yes, Charlie, I do.'

What Charlie meant was that while Wilson was at least twenty years older than Goddard and claimed to be working for him, the general feeling among the crew was that he had somehow, surreptitiously, taken charge of the rocket project and was pulling all the strings behind the scenes. Charlie believed that because Gladys slept with Wilson, she must know more about him than anyone else; but she didn't

As a journalist for the Roswell Daily Record, as well as Wilson's mistress, she had been unable to resist asking him more than once about his past. She'd learned only that he had an aeronautical background, had never been married, and was the least emotional man she had ever known.

He was a mystery, all right - and most mysterious of all was the fact that although he worked constantly in Goddard's workshop, he had never once attended an actual rocket launching and had even insisted that if she, Gladys, wanted to keep seeing him, she had to ensure that his name was not mentioned in connection with Goddard's work.

And God knows, she did want to see him again. She needed to share his bed, was addicted, even against her better judgment, to what he could give her there. And what he gave her there was something that sometimes shamed her - a sexual heat in which love had no place because he could not conceive of it

He certainly wasn't a warm man, not impelled by finer feelings, but his very lack of emotion was what made him so good in bed, so patient and controlled, more exciting as a lover than most of those she had known.

And he was sixty years old...

'You're not really involved when you do it,' she'd once told him. 'You treat it as a functional endeavor, a mere form of release. You're not involved on any other level - least of all emotionally.'

'Count your blessings,' he'd replied with his familiar, slightly superior smile. 'It's because I'm not involved that I can control myself until you're satisfied.'

'You make me feel like an instrument of masturbation.'

'That's what sex is,' he said.

No, not an emotional man - certainly not a romantic one - yet it was true, as he had said, that his functional approach to the act of love was what made his loveless sex so exciting. He could keep going for hours - sometimes it seemed forever - and came to orgasm only when she begged him to do so.

Thus his coldness, while depriving her of affection, made the sex something special.

She had certainly needed it. He had come to town at the right time. Gladys had been born and raised right here in Roswell, the only child of farming parents, and had married too young to a man who, though decent in his way, had bored her to tears. The marriage had been a disaster, coming to grief on a bed of stone and producing no children. But when, five years ago, her husband had died of a heart attack, followed soon after by the death of both her parents, Gladys had felt that her life was falling to pieces and took refuge in drink.

The drink had dulled her pain and shock, but also released her from inhibitions, and she had taken up with a string of different men, most of whom disappointed her. She toughened up pretty fast, developed a pragmatic outlook, and charmed the proprietor of the Roswell Daily Record into trying her out as a journalist It was the best thing she'd ever done, giving her a sense of her own identity, and she'd buried the disappointments of her life in her work for the paper. She became a strong, independent woman easily bored, quick with her tongue, and discovered that a lot of men didn't like it and so shied away from her.

Not that she gave a damn - she didn't want to marry again. But then Wilson had come to town, looking to work with Goddard. Since, when Gladys met him through Goddard's assistant, Charlie Mansur, he'd made it perfectly obvious that he was intimidated by no one, she'd thought him a breath of fresh air and become involved with him.

It was not a romantic relationship, but it certainly had its moments, and she enjoyed the sex and found Wilson intriguing - a real mystery man. So, she was well pleased.

Returning to the present, Gladys looked away from Mansur as another car pulled up and Goddard's blond wife, Esther, climbed out with her camera and equipment. Henry Sachs filled the rocket's tanks with gasoline and 'lox,' or liquid oxygen, as Goddard greeted his wife. When Sachs had finished, Goddard checked the rocket's controls, connections,

pressure tanks, and aluminum-sheathed oxygen tank, waved to Larry Mansur in the distant observation post, then returned to the protected control shack with his wife and Sachs.

'Do I have to join them?' Gladys asked.

'No,' Charlie replied. 'You're far enough away to be safe, no matter what happens. But I have to join them.'

'You don't want me to get near Goddard, right?'

'Right, Gladys. Goddard's already mad that you're here, so I won't tempt the fates.'

Thanks, Charlie.'

'Okay, then.'

Charlie returned to the buttressed control shack as Esther Goddard put her camera on its tripod and pointed it through a hole in the shelter wall. Goddard looked at his watch and started counting off the seconds, letting the pressure-generating tanks build up to two hundred pounds, and eventually, after what seemed to Gladys to be an eternity, gave the order for the ignition to be fired.

Gladys knew he had done so when, from her vantage point well away from the launching tower, she heard a roaring noise and saw flames shooting out from the base of the rocket. The rocket shook violently as if about to blow about, lifted up slowly, reluctantly, then gained speed and suddenly shot out of the tower and soared toward the sky.

It climbed vertically, in a straight line, then veered south. It kept climbing as it headed south, at about a thousand feet, then ascended even higher, caught the sun as it leveled out at two thousand feet, then curved down again and raced toward earth. Its parachute didn't open, so it came down too fast, screeching and whistling, obviously out of control. It crashed into the sands of the desert about half a mile away, exploding in a great cloud of sand, its pieces scattering everywhere.

One of the men whooped with excitement, another bawled, The goddamned gyroscope!' and Henry Sachs had jumped into the touring sedan and was heading toward the scene of the crash even before the cloud of sand had settled down.

Gladys looked at Goddard, where he stood behind the

shelter, talking to his wife as she carefully checked her movie camera. The great scientist was actually smiling, which meant that most of the test had been successful - but then, when he glanced over his shoulder at Gladys, his mournful face registered disapproval that she was still there.

Not wanting to push her luck, and mystified by Wilson's absence, Gladys started her car and drove back across Eden Valley, heading south, toward Roswell.

Goddard's Mescalero Ranch was located on eight acres of land, three miles northeast of Roswell. As Gladys pulled up in front of the sprawling pueblo-style ranch house surrounded by scrubby trees and desert, she was struck again by the incongruity of Goddard and his rocket team being there, so close to the legendary Pecos River, where the men still wore blue jeans, high-heeled boots, and broad-brimmed hats, where the pioneer trails still cut through the nearby town to the borders of Mexico, and where the natives still talked about the exploits of Billy the Kid and other legendary, local desperadoes. She knew that Goddard had chosen this spot because he needed a relatively high region free from fog, and with a minimum of rain and snowfall - but even so, as she climbed down from her car and walked toward the house, the thought of rockets soaring over this barely modernized territory seemed slightly unreal to her.

She didn't actually go to the house, but instead went to the frame machine shop near it, where she guessed Wilson would be, as that's where he had slept during his stay here. After glancing automatically at the small static frame and concrete trough, called 'the bathtub,' located a hundred feet away and used for testing the rockets, she entered the unlocked machine shop and found Wilson kneeling on the floor by the cot he slept on.

He was packing his suitcase.

Shocked and confused, Gladys sucked in her breath - a sound loud enough to make Wilson stop what he was doing and look up at her.

His eyes were as blue as the sky above New Mexico, bright with an icy intelligence - and unnervingly steady.

'Hello, Gladys,' he said quietly.

'Hi,' she replied.

'You're back earlier than I'd expected.'

'So I see.'

He glanced down at his suitcase, smiled thinly, then closed the case and stood up to gaze steadily at her.

'I'm leaving,' he said.

Gladys closed her eyes, feeling sick to her stomach. Chilled by the flat tone of his voice, she knew he meant what he said.

'Open your eyes,' he said. 'Don't be childish. You always knew this would come. How did the test go?'

She opened her eyes and tried to see him for what he was. His hair was silvery, his face handsome but ascetic, and although he was sixty years old, he looked twenty years younger.

She only knew what he looked like.

'The test went okay,' she said. There was some problem with the gyroscopic controls, but otherwise it was fine... You were going to run away without telling me?'

'Yes,' he replied.

'Why?'

'Because I didn't want any arguments. I told you that someday I'd be going - and today is the day.'

'I didn't think you'd actually—'

'I'm not responsible for what you think - only for what I say. And I told you that one day I'd be leaving and going alone/

'God, Wilson, you're hard.'

You've known that since you've known me.'

'I think I'm going to have to sit down.'

'Help yourself,' Wilson said.

She took the chair at Goddard's old writing desk, next to his lathe and workbench, lit a cigarette, exhaled a stream of smoke, and squinted through it at Wilson. He was a tall man, as thin as his smile, and his blue gaze was steady.

'Okay,' she said, 'so you always told me you'd leave

someday. But I still didn't think you'd go this way - deliberately sending me out where I'm not wanted and then sneaking away.'

'I told you: I didn't want any arguments.'

'It's human to argue.'

To be human is to err.'

'We are lovers, Wilson. That must count for something.'

But he merely shook his head, arguing an academic point 'No,' he said, 'I'm afraid it doesn't. At least, not for me. The only thing that matters to me is my work - as I've told you repeatedly.'

'Yes, Wilson, you've told me repeatedly. I just happened to think you might not mean it.'

'I always mean what I say.'

Gladys's heart was racing and she felt desolated, but when she saw the icy glint in his eyes, she knew it wouldn't mean much to him. He would leave her as some people disown their pets - and he would never look back.

Accepting that, she was able to protect herself by becoming professional.

'You're a strange bird, Wilson.'

'You're free to think so.'

'I'm not the only one who thinks so. Goddard's men all think you're strange.'

Wilson smiled mockingly. 'What can I say to that? I'm not responsible for the thoughts of petty minds. What they think is irrelevant'

'They think you're the genius behind Goddard.'

'They're wrong: I was learning from him.'

'They think you know more about rockets than you let on - and that only Goddard knows how much you know.'

Wilson simply smiled again. 'I have to go now, Gladys.'

'Does Goddard know you're going?'

'No.'

'Is this how you say good-bye to him? To a genius with whom you've worked for six months? Is this how you thank him?'

'I thanked him by working for him for free. Now that I've

learned what I need to know, I've no reason to stay here.'

Shocked again at how truly cold Wilson was, Gladys blew another cloud of smoke and watched it spiraling in front of her.

'So what did you need to know?' she asked him.

'What Goddard could teach me.'

'About rockets?'

'Yes.'

'And what did you need to know that for?'

That's not your concern,' he said.

She looked intently at his blue eyes, trying to find what she had missed, but saw only a luminous intelligence, beyond rancor or warmth.

'If you're so concerned with rocket technology,' she said, 'why not stay with Goddard?'

'Because this country always betrays its great scientists -and will soon betray Goddard.'

'Does that mean you're going abroad?'

'Yes.'

'Where to?'

Wilson smiled. To where my own work will be appreciated.'

'And where's that?'

'I can't tell you.'

'I'm a journalist I can find out'

'It won't help you.'

'I can also find out just who you are.'

That won't help you either. Now I've got to be going.'

He picked up his suitcase, gazed down at her, smiled thinly, then walked out, not even kissing her good-bye. She had pride, but her heart betrayed her and she jumped out of Goddard's chair, then hurried to the doorway of the machine shop and looked into the morning sun.

Wilson climbed into his battered Ford, turned on the ignition, waved at her as if he were just going for a short trip, then drove toward the town of Roswell, with its pioneer trails and still-burning legends, to disappear into his unknown future and leave her all alone again.

'God damn you!' she whispered.

CHAPTER TWO

Ernst Stoll's heart was racing with anticipation when he saw his girlfriend, Ingrid, already seated at a table by a window in the Kranzier Cafe, Berlin. Feeling resplendent in his new SS uniform, almost like a movie star, he leaned over to kiss Ingrid's cheek, lightly stroked her short-cropped blond hair, then sat facing her and took hold of her hand.

You look lovely,' he said, meaning it. His excitement was raised by the pale beauty of her face, which was emphasized by her wide-brimmed black hat, black jumper, and string of pearls, all meant to match the new black coat she was wearing. 'And that coat suits you perfectly,' he added, 'Did you get it in Paris?'

'No,' she said with a gentle smile. 'Right here, in the Kurfurstendamm. Parisian fashions are frowned upon these days, so I made sure it was German. You look handsome in your brand-new uniform - black suits you as well - though I still wished you'd stayed with the Reichswehr, instead of joining the SS.'

'Let's have coffee and strudel,' he suggested, deliberately changing the subject, not wanting this particular day to be spoiled with even a small disagreement Yes?'

'Yes, Ernst.'

He called the waitress, gave her the order, then glanced out at the busy corner of the Unter den Linden and the Friedrichstrasse, its snow turned to slush by the many cars and pedestrians. When he returned his attention to Ingrid's green gaze, he was overcome by his love for her.

'You look excited,' she told him.

'It's seeing you,' he replied.

'No, Ernst, I don't think that's what it is. We both know what it is.'

He was grateful that she realized and didn't mind too much. Today was January 30, 1933. It would be a memorable day for Germany and already it was starting. Right now, Hitler and Goring were in the Chancellery with von Papen and Hindenburg, and the street between the Kaiserhof and the Chancellery was crowded with people. Before the day was out, Hitler would be the Chancellor of the Third Reich. A new era was dawning.

'I didn't expect to see you today,' Ingrid said. 'I was surprised to get your message. I thought you'd gone home for the fortnight'

'I couldn't miss this day,' he told her. 'And my parents understood. My father still doesn't approve, of course - he thinks I've betrayed my middle-class origins - but my mother recently joined the National Socialist Party, in secret, which I think is amusing.'

'I don't,' Ingrid said. 'A divided family isn't amusing. Your beloved National Socialist Party, which has already divided the country, is now dividing individual families. Do you think it's amusing?'

'I didn't mean it that way,' Ernst said, feeling a little embarrassed.

'No, I'm sure you didn't,' she said with soft sarcasm, then, perhaps realizing how she sounded, gently changed the subject. 'So, how is your family, Ernst?'

At that moment, the waitress returned with their coffee and strudel. They're fine,' Ernst said, pouring the coffee from the pot and thinking of his family home in Heidelberg, a grand house with fine gardens on the lower slopes of the majestic Odenwald. 'Father's sold his architectural firm and seems happy to have moved out of Mannheim - and Mother likes it as well.'

'I'm glad,' Ingrid said, 'though I'm also glad that I saw the

old house in Mannheim before it was sold - the house you were brought up in. There aren't many like that these days.'

Ernst knew what she meant. His father had been one of the most successful architects in Germany - his work conservatively based on neo-Renaissance and the 'safe' classicism of Ludwig Hoffmann - and his house in Mannheim, where he had spent most of his life, was a spacious residence built around an elaborate courtyard and guarded by wrought-iron gates. Within that imposing home, Ernst had been brought up to treat as perfectly natural enormous neo-Gothic rooms, French furniture, Empire upholstery, fireplaces faced with valuable Delft tiles, glittering chandeliers, maids with white caps, black dresses, and white aprons, and even butlers in purple livery with gilt buttons. Certainly, as Ingrid had noted, there weren't many houses like that these days - but the very opulence of the lifestyle is what had driven Ernst away from it and into the National Socialist Party, thus outraging his father as well as upsetting Ingrid.

He couldn't explain what attracted him to Hitler because he wasn't too sure what the appeal was. He only knew for certain that he'd been swept up in a tide of enthusiasm generated by his fellow students, first in the Institute of Technology in Munich, then in the University of Berlin, where he had been studying rocket technology under Professor Karl Emil Becker.

If he'd had any doubts at all about National Socialism they'd been swept away when, during his final semester at the university, he had attended an address that Hitler had delivered, in the Hasenheide Beer Hall, to the students of Berlin University and the Institute of Technology.

At first not impressed by the Charles Chaplin look-alike in a plain blue suit, who started speaking almost shyly in that dirty, gloomy beer hall, Ernst had soon been mesmerized by the rising passion of his rhetoric. He was astounded to find himself bawling and clapping with many other students in a spontaneous outburst of enthusiasm. A few days later, unable to forget that mesmeric performance, he had joined the

NSDAP; then, a few months after that, he dropped out of the university to join the army as a commissioned officer with the Weapons Office. When recently offered a transfer to the elite SS, he had been thrilled beyond measure.

'You're looking very thoughtful,' he said to Ingrid, who was staring straight at him in her disconcerting manner,

'I was thinking what a pity it is that you dropped out of university in order to look handsome in such a uniform. You wanted to be an engineer, Ernst, and now you're a policeman.'

'A soldier,' he corrected her, perhaps too firmly. The SS isn't the Gestapo. Please bear that in mind. The Gestapo is the Secret Police organization, run by Goring. SS stands for Schutz Staffel, or Guard Detachment, and the SS, created by Himmler, is Hitler's personal bodyguard - not a secret police force.'

Ingrid shrugged. 'It's still sad, Ernst. And I still don't understand why you did it, apart from naivete.'

He felt a flash of anger, but tried to conceal it. 'As I told you before, I joined the army because I wanted to be a rocket engineer, and the army is the best place to do that.'

That much I understand.' She brushed the blond hair from her green eyes, gazed out at the busy corner of the Unter den Linden and Friedrichstrasse, then returned her quizzical gaze to him. 'But I still don't understand why you then had to join the SS, which, whether a police force or Hitler's personal bodyguard, is not the place for a promising young engineer.'

'Because,' Ernst lied blatantly, 'it is the elite of the army and I only want to be in the best. It's as simple as that!'

In fact, what he couldn't explain to her was the bitterness he had felt ever since being rejected by the German amateur rocket society, the VfR, whose members included not amateurs, as the title implied, but most of the leading rocket experts of the day.

Also known as the Spaceship Travel Club, the VfR had come into being in 1927 when a group of brilliant space-travel enthusiasts had taken over an abandoned three-hundred-acre arsenal, which they called their Raketenflugplataz, or Rocket Flight Place, in the Berlin suburb of Reindickerdorf, from

where they actually shot some crude, liquid-fueled rockets skyward. Intrigued by the success of the VfR, which by 1930 included rocket experts Rudolf Nebel, Willy Ley, Hermann Oberth, and Klaus Riedel, the Ordnance Branch of the army's Ballistic and Weapons Office, headed by General Becker, had appointed Captain Walter Dornberger to create a rocket-development project at the army's firing range at Kummersdorf, about fifteen miles south of Berlin. It was now widely assumed by those involved with rocketry that as soon as Hitler came to power (which he almost certainly would today), the VfR would be disbanded by the Nazis and become part of the Kummersdorf program.

Ernst had desperately wanted to be part of the VfR, irrespective of who controlled it. After his rejection because of his lack of practical experience, his bitterness had been made more acute when Wernher von Braun, a fellow pupil at the university, had been accepted.

Thus, when Ernst was persuaded by a friend that working with the SS technical intelligence group would at least give him the opportunity to keep in touch with the rocket program and perhaps, in time, even give him authority over it, he had not been able to resist asking for the transfer.

'Listen,' he said to Ingrid, covering his anger with a broad smile and taking hold of her hand again, T can't wait any longer. Let's go and see what's happening at the Chancellery. There's bound to be a decision soon - and I want to be there when it's announced.'

Ingrid's smile, though still loving, was also slightly mocking. 'You want to be a part of history, Ernst?'

'Yes, Ingrid, I do.'

She acknowledged his enthusiasm with a defeated shrug of her shoulders. 'Then let's go, Ernst!'

As they hurried along the snow-covered Unter den Linden, past its elegant shops and many pedestrians and the noisy flow of traffic, Ernst glanced frequently at Ingrid's flushed face, its beauty now emphasized by the raised fur collar of her black overcoat and broad-brimmed hat He loved her dearly, though

they often disagreed, particularly when they talked about politics and general morality. They seemed opposites, then.

She came from a good family in the wealthy Berlin suburb of Wannsee - but she didn't believe, as he did, in the National Socialist Party. She was a liberal, like his father, believed in her own class, and could not be convinced that Hitler would create a new, better Germany. Even now, when they were supposed to be in love, she and Ernst fought a lot about the issue, which wounded him deeply.

As they approached the corner of Berlin's finest shopping street and heard the sudden roaring of the crowd that had filled the Wilhelmstrasse, Ernst knew that they had just missed the announcement he had wanted to hear. Nevertheless, he practically dragged Ingrid around the corner, into the Wilhelmstrasse, where, between the Kaiserhof and the Chancellery, the great crowd was tramping the snow to slush and roaring approval.

Stopping by the Ministry of Justice, facing the Presidential Residence, Ernst received confirmation from a jubilant fellow citizen that Hindenburg had resigned and Adolf Hitler had just been sworn in as Chancellor of Germany.

Ernst whooped with joy, swept Ingrid up in his arms, and spun her around on the pavement.

'Wunderbar?' he exclaimed.

Any doubts about love or compatibility were swept away in the fervor of the rest of that memorable day. Ernst had no sooner released Ingrid from his embrace than he saw Adolf Hitler standing upright in the back of his open-topped car as it crept slowly through the mass of people in the Wilhelmstrasse, taking him back to the Kaiserhof. Shouting himself hoarse like all the others, Ernst watched his hero being driven past, then embraced Ingrid again, kissed her passionately, and realized that the excitement was contagious and finally getting through to her.

Excited, they went for lunch, got drunk on beer and schnapps, then took a room in the Adlon Hotel, where their

faces were known. They made drunken, passionate love, uninhibited by doubts, and Ernst thought that he would die in Ingrid's body, with its smooth, burning skin, perfect breasts, and sublime, pale-white legs. They broke apart drenched in sweat, breathing harshly, exhausted, and he felt that he had died and been reborn and could never stop loving her.

'You're magnificent,' he told her.

Then he had to leave to take part in the torchlit parade that spelled the end of that great day.

Darkness was falling on the city when, with thousands of other troops, all in uniform and with many wearing their swastikas, Ernst started marching from the Tiergarten. Accompanied by the beating of drums and the blare of martial music, they passed under the Brandenburg Gate, and then continued down to Wilhelmstrasse, where hundreds of young men were hanging from the railings or perched like birds in the trees.

Raising his voice with those thousands of others in the 'Horst Wessel Lied' and other patriotic songs, Ernst soon found himself in the torchlit darkness outside the Presidential Palace, where a weary Hindenburg raised his hands in salute. Then the crowd moved to the Reichchancellery where, to Ernst's immense joy, Hitler appeared at a window to look down fondly on his men and acknowledge with a smile their triumphant chanting of 'Heil, Heil, Sieg Heil!'

Hitler smiled and raised his right hand and the massed troops roared acknowledgment. Then Hitler went back inside and Ernst lowered his gaze - away from that lighted window, from the fluttering red and black flags, from the torches that had formed a river of fire in the Wilhelmstrasse ... and saw Ingrid emerging from the crowd, her eyes bright with excitement, her arms outstretched as the drums continued pounding and the noise became deafening.

She threw herself into his arms and clung to him as he stroked her light-blond hair.

'Oh, Ingrid!' he said passionately. 'A great day! The future is ours! Let's get married at once!'

'Yes!' she whispered, clinging to him, part of him. 'Yes, Ernst, let's do it!'

Their hearts beat like the drums.

CHAPTER THREE

'Yes,' Mike Bradley said, thinking about Gladys Kinder instead of the facts as he gazed out the window of General Taylor's office at the other buildings being constructed on the sloping green fields of Langley Field, Virginia. 'I told him we were about to form a National Advisory Committee on Aeronautics and were considering a team that would include him and other aeronautical geniuses, such as Charles Lindbergh and Orville Wright - and the legendary Robert H. Goddard still showed no interest He just doesn't give a damn.'

'Why?' Taylor asked pragmatically.

'Because he doesn't trust anyone,' Bradley replied with a frustrated shrug of his broad shoulders, remembering the polite, suspicious voice he had heard over the telephone, when he had called from his office on Wall Street 'Reportedly he patents every damned thing he invents, is notoriously secretive and uncooperative with his fellow scientists, feels that many of his ideas have been stolen by them, notably those in Germany, and will take help only from organizations like the Smithsonian Institution, which lets him do whatever he wants. In fact, he's even refused the assistance of the California Institute of Technology Rocket Research Project and has been relying instead on the inadequate funding of Clark University in Worcester, where he teaches physics when he's not working on his rockets.'

Though according to Charles Lindbergh,' General Taylor pointed out, 'whom I met here just yesterday, Goddard has recently accepted some other help.'

'True enough,' Bradley said. With Lindbergh's recommendation he was recently able to get a Guggenheim Foundation grant for $2,500, which enabled him to leave Clark and return to Roswell, New Mexico.'

Where Gladys Kinder lives, he thought. He'd been unable to stop thinking about her since their brief meeting. It's ridiculous, he thought. You're being ridiculous. She's just a sharp-tongued lady from a cow town and you're imagining things. Though he couldn't help wondering...

'Is that where he was when you phoned him? Back in Roswell?'

'No,' Bradley said. 'He hadn't returned there yet He was still at Clark.'

'If what you say is true, he thinks that if he joins our proposed National Advisory Committee on Aeronautics, he'll have to share his precious ideas with us.'

'That's my bet,' Bradley said.

General Taylor smiled laconically. 'Sounds like a burgeoning crackpot,' he said.

'But a brilliant one, General - and one you could do with on your side. Since a major function of the committee will be to assess the military possibilities of aeronautical developments around the world, a man of Goddard's background and reputation would be invaluable to you - not only for his technical knowledge, but also as a public relations weapon.'

'Well, we'll just have to get along without him.'

'I guess so,' Bradley said.

The sound of hammering from outside momentarily distracted the general and made him glance out the window. Following his gaze, Bradley saw some men in coveralls kneeling on the roof of the adjoining building as they expertly nailed down some more beams. When these buildings were completed, they would house the new National Advisory Committee on Aeronautics as well as a branch of the too-informal army air force intelligence. General Taylor was currently the head and Bradley was an increasingly enthusiastic, but unofficial, agent of the intelligence unit.

'It's interesting that he should be so concerned with German rocket development,' the general said, returning his thoughtful gaze to Bradley, 'since that's also what we're concerned with right now.'

The Pentagon isn't,' Bradley replied. 'Since the White House has adopted an isolationist stance regarding Europe, there's no Pentagon interest in German weaponry.'

'I can't speak for the whole of the Pentagon, let alone the White House,' Taylor said, 'but I think I can say with confidence that we in military intelligence are concerned with the growing militarism of Germany - particularly since Hitler was elected chancellor. It's not our belief that America will be involved in European politics per se, but there's certainly been enough concern to cause the air force to informally gather information on aeronautical developments in Hitler's new Germany and, especially, on any further developments regarding the—' The general glanced down at the notes on his desk. The Verein fur Raumschiffart, or VfR,' he read, then looked up again

'Right,' Bradley said. The German amateur rocket society.'

'It's wonderful,' the general said with a slight, sardonic smile, 'how bright boys like you can bring back such interesting information from their vacations in Europe.'

Bradley knew what the general was getting at He had been a highly decorated pilot during the Great War who had left the service in the mistaken belief that he was becoming too old for it and needed a more settled life. So, he studied law, married Joan, had two kids, Mark and Miriam... As a successful lawyer, specializing in the drafting of complex agreements between government departments and civilian aeronautical research establishments, he had become increasingly bored with Wall Street and started calling his old military buddies to ask them for work, official or otherwise, that was more important and exciting.

Convinced that matters in Europe would eventually lead to another world war, he had used his Ivy League Wall Street friends to build up strong connections in Washington, DC, and

London. Eventually he managed to convince the army's chief of staff, General Douglas MacArthur, to let him embark on an unofficial intelligence-gathering trip to Europe, in the guise of studying international laws relating to aeronautics.

During that trip, in 1932, aided by some old friends who were now with the well-organized British Intelligence Service, he had traveled extensively and reported, in particular, on the growing militarism of Germany. What he had seen there had shocked him and made him fear for the free world. He no longer shared his own government's confidence that America could stay out of Europe - certainly not if the National Socialists, under Hitler, got what they wanted - and upon his return to the United States had insisted in his lengthy report that the country must prepare itself for inevitable involvement in another world war.

While his report had not been taken seriously by the White House, since then General Taylor had used him as an unofficial agent between Taylor's army air force intelligence branch and British intelligence, as well as a legal adviser, general administrator, and headhunter for the soon-to-be formed National Advisory Committee on Aeronautics - which is why Bradley had made his recent, unsuccessful trip to Robert H. Goddard in Roswell, New Mexico.

'But why would our air force be interested in a bunch of amateurs?' General Taylor now asked, after a thoughtful pause.

'Because they're not amateurs,' Bradley told him. 'The Verein fur Raumschiffart was founded in 1927 and soon included most of the rocket experts of the day, including Hermann Oberth, Max Valier, Rudolf Nebel, Willy Ley, and Klaus Riedel.'

The general gave a low whistle of respect. 'That's some bunch of scientists,' he said. 'What were they up to?'

'We know that a number of small liquid-fueled rockets were fired from their testing ground in the Berlin suburb of Reinickerdorf. Then, in April 1930, Captain Walter Dornberger was appointed to the Ordnance Branch of the German Army's

Ballistics and Weapons Office, headed by one General Becker. Dornberger was to work on rocket development at the army's Kummersdorf firing range, approximately fifteen miles south of Berlin. Two years later the VfR demonstrated one of their liquid-fueled rockets to Dornberger and other officers at Kummersdorf.'

'I'm surprised I haven't heard of this,' Taylor said, sounding slightly aggrieved.

'Maybe that's because recently, with Hitler's support, the Gestapo moved in and overnight the VfR ceased to exist as a civilian organization.'

'But it's now being used by the army.'

'Right. A lot of its members, including the reportedly up-and-coming Wernher von Braun, were taken under Dornberger's wing and began working at Kummersdorf in strict secrecy.'

'Ah,' the general said softly, 'so that's why our air force is concerned!'

'Damned right,' Bradley said. 'And if they knew what I just learned in Roswell, they'd be even more concerned.'

'And what was that, Mike?'

'Since Goddard was so damned suspicious and frosty over the phone,' Bradley explained, thinking again of Gladys Kinder and feeling distinctly guilty, 'I visited Roswell in order to interview those who had known him there - his engineers, the local townsfolk, and so forth. Anyway, over the week I spent there, I became increasingly concerned with the fact that Goddard, with so little assistance either financially or from fellow scientists, had managed to make such extraordinary advances in rocket research. Then, shortly after the final launch, I was introduced to a woman—'

'I won't tell your wife that,' the general interjected.

Bradley grinned, as if appreciating the joke, but immediately he was consumed by the guilt he had been trying to keep at bay ever since his meeting with Gladys Kinder.

The proprietor of the Roswell Daily Record had put him in touch with her. They'd met in the bar of his hotel. He was

instantly intrigued by her air of worldly cynicism. In the course of a conversation about Goddard's rocket team, he'd become uncomfortably attracted to her, which she had soon realized.

She had passed a few mischievous remarks to that effect and actually managed to make him blush.

She was tall and lean and had a head of short-cropped brown hair, which made her seem slightly mannish, and gray eyes that were disconcertingly steady over a full-lipped, sardonic smile. She had been wearing a long, belted dress, with high-heeled boots and a Stetson hat He, in his gray suit, portly and not too tall, in his mid-thirties and starting to show it - though thankfully he still had his hair - had felt soft and pampered in her attractively casual presence.

You didn't meet women like that in New York — and besides, he just liked her.

Now, when he recalled her and also thought of his attractive, good-humored wife, Joan, who lovingly looked after their home and children in Connecticut he felt as guilty as if he had had an affair, which he certainly had not done.

He had simply been tempted, that's all... So why should he feel guilty?

'The woman, Gladys Kinder,' he continued uneasily, Vas a journalist for one of the local papers, the Daily Record. When I said I'd spent the past week checking up on Goddard and his old launching grounds in Eden Valley, she told me that two years ago she'd had an affair with another physicist who'd stayed with Goddard for six months, spent most of that time working and sleeping in Goddard's machine shop, and was considered by most of Goddard's men to have been very influential on Goddard's work. Those facts were later confirmed in my discussions with some of the rocket team.'

Even now, as he spoke to the general, Bradley thought it odd that the mention of Gladys Kinder as Wilson's mistress should make him feel slightly resentful and, perhaps, even jealous. It was too ridiculous for words, but he couldn't deny the feeling; and when he recalled her sly smile in the hotel's gloomy bar, her droll mockery of his obvious confusion in her

sensual presence, he was irresistibly seduced by her image and wanted to see her again.

Crazy. Just crazy...

'What was this woman's name?' the general asked, picking up his pen and staring with what Bradley, in the guilty panic of his thoughts, imagined was accusing intensity.

'Kinder,' Bradley replied, feeling a helpless stab of desire and its bed partner, guilt 'Gladys Kinder.'

'Kinder,' the general murmured, writing the name down. 'Gladys Kinder,' he emphasized, as if deliberately tormenting Bradley. 'Mmmm...' he murmured, studying the name thoughtfully before putting his pen back down, looking up again, and saying 'So, what about him?'

'Pardon?'

The physicist that the Kinder woman told you about'

'Ah, yes...' Bradley gathered his thoughts together. 'Miss Kinder told me that when the physicist had left for good after the rocket launching of December 31, 1930, Goddard had confessed to her that his mysterious, temporary assistant was a, quote, genius, who had helped him develop many of his more notable innovations, including liquid-fueled, self-cooled motors, gyroscopes for guidance and control, lightweight fuel pumps, and reflector vanes to help stabilize and steer the rockets. The guy's name was John Wilson.'

'Interesting,' General Taylor said, writing that name down also, then popping some gum into his mouth and starting to chew, 'but I can't see what relevance all this has to Adolf Hitler's Germany.'

'Well, I can't be too sure of this,' Bradley replied, 'but I do have my worries there.'

'Don't tease me, Mike.'

'WelI, for a start this John Wilson's a complete mystery. No one at Roswell knew where he came from, Wilson wasn't about to tell them, and even Goddard swore he didn't know anything about him, other than the fact that he was extraordinarily knowledgeable about physics and aeronautics, just turned up at the ranch one day, showed Goddard some of his own

drawings, and then asked if he could help him with the rocket project. As for Wilson's journalist friend, Gladys Kinder—'

He couldn't avoid the name, and it brought back all his guilt.

'—even though she was his mistress during that six months, she learned only that he had an engineering background and loathed the US government for reasons that he never explained. She also learned, just before Wilson's abrupt departure, that he intended leaving the United States for good and going to a country where people like him and Goddard would be appreciated, instead of being treated as cranks.'

There was more loud hammering from outside and General Taylor, after wincing, said, 'I can't stand this goddamned noise, Mike. Do you fancy a walk?'

'Sure,' Bradley said, feeling trapped with his recollections of Gladys and glad to escape. 'Why not?'

They left the office and walked outside, where the noise of the workers was even louder and the sun shone over the flat green fields. Relieved to feel the fresh air, Bradley followed the general away from the skeletal buildings and their many workers, down toward the banks of the Potomac River.

'So where do you think your mysterious genius, this Mr Wilson, went?' General Taylor asked, striding across the grass and glancing keenly around him.

'A lot of the German engineers,' Bradley said, 'including Wernher von Braun, revere Goddard and are known to have based their work on his ideas. Our mysterious John Wilson would certainly have known that- and would also have known that while here, in the United States, Goddard's theories were being treated with contempt, Germany was spending fortunes on rocket research that was, by and large, based on his work.'

'So you think this Wilson went to Germany.'

'I don't think it - I know it I checked yesterday with the Immigration Department and learned that one John Wilson left this country on January 20, 1931, that he stayed in London for a few weeks in early March of that year, and that he applied for a German visa that same month. According to British immigration records, a US citizen called John Wilson left

England by a boat sailing for Bremen, Germany, on April 5, 1931. There's no other record of his movements.'

'You mean, you think he's still there, in Germany.'

'Yes.'

'Have you checked with the German authorities?'

'They deny all knowledge of him.'

'But you think they're lying.'

'Yes. I think he's still there - and if he is, and if he's working on rocket research, we should be concerned.'

They stopped by the edge of the river and looked across to the other side. The fields that stretched out on all sides were flat, densely forested, and sun-splattered. There were birds flying overhead.

You're my best man for intelligence gathering,' General Taylor reminded him, 'so perhaps you can track him down.'

'I'm not so sure,' Bradley said, feeling the itch of frustration. 'We're talking about Hitler's Third Reich. One man on his own can't do much with this kind of problem. That's why we need a central intelligence-gathering organization,' he continued, warming to his favorite theme. The goddamned Brits have an intelligence system that puts us to shame. The last thing we had that remotely resembled an intelligence agency was Herbert Yardley's Black Chamber - which was only a codebreaking unit - and since that was closed down in 1929, we haven't had a damned thing to replace it. Which is doubtless why Yardley wrote his best-selling book exposing our so-called secrets - and why New York federal marshals, the goddamned idiots, have just raided the offices of a perfectly respectable publisher to impound Yardley's second book.'

The general laughed heartily at that one, then said, The way you pronounce the word "idiots", Mike, reminds me that you're an Irish-American.'

'Ha ha,' Bradley responded, but warmly, without malice. He was proud of his background and not ashamed of what he had become, which is not what he should have been. Although his uneducated grandparents had emigrated from Ireland and he

had been raised as a Roman Catholic, Bradley had gone against convention by becoming a staunch member of the Republican party, instead of a Democrat, which most of the Irish were. He had also, after winning numerous awards for distinguished service in the battlefields of France in the Great War become a very successful lawyer, with his own law firm on Wall Street So, yes, he was proud of his background and achievements - and knew that General Taylor, his close friend, had great respect for him.

'Anyway,' the general said, wincing when the hammering on the distant buildings started again, 'you were starting to talk a blue streak, so don't let me stop you.'

This guy, Wilson,' Bradley continued, 'who is possibly an aeronautical genius, has gone off to sell his talents to a country whose whole interest in science is geared to its aggressive potential - in other words, Hitler's Third Reich.'

'So?' Taylor asked.

'So, since the Third Reich is devoted to war, we should be keeping tabs on Wilson - but we can't do it because we don't have the necessary intelligence-gathering organization.'

'But we do have that'

'No,' Bradley insisted, 'we don't. What we have is an uncoordinated collection of different intelligence agencies - Army Intelligence, or G2; the Office of Naval Intelligence; the FBI; the Secret Service; the State Department; the Customs and Immigration services; the Federal Communications System Service; and the Treasury's Foreign Funds Control Unit - not one of which deals with the others, let alone recognizing them.'

'So?'

'So what we need is a centralized, coordinated intelligence, like the British Secret Intelligence Service.'

'A sort of Central Intelligence Agency,' Taylor said.

'Right, General. You got it!'

'Ah!' the general exclaimed softly. 'So that's why you came all the way from New York to see me, instead of using the phone. You want to ride your favorite hobbyhorse again and

persuade me to include you in the formation of a proper, coordinated intelligence-gathering agency. Have I got it right, Mike?'

'Yeah, General, you have. I'm a highly successful, thirty-eight-year-old lawyer with a plush office in Manhattan, but the best time I ever had in my life was during the war.'

'So I gathered,' the general said. The Distinguished Service Cross, the Distinguished Service Medal, and the Medal of Honor...'

'Right,' Bradley interjected. 'Which proves that I'm a survivor - and that I'm willing to hang in when the chips are down.'

'No argument there,' the general murmured. 'Come on, let's head back.'

They started walking away from the river, back to where the men with the saws and hammers and nails were swarming like flies over the frames of buildings that would soon house a branch of army air force intelligence and the new National Advisory Committee on Aeronautics.

When Bradley thought of aeronautics, he thought of John Wilson; and when he thought of that mysterious genius, he also thought, with guilty, helpless longing, of Wilson's mistress - the middle-age, laconic, and undeniably attractive Gladys Kinder.

He just couldn't help himself.

'Anyway,' he said, 'my kids are growing up, they're both now away at college, and although I still have Joan, I'm bored with my legal work. I'm also, as you know, deeply convinced that America will, sooner or later, have to become involved with the outside world. I accepted your offer of unofficial intelligence gathering in Europe because I hoped that it would lead to stronger ties with the intelligence services already existing over there. And having been there, I'm more convinced than ever that we need a central intelligence-gathering agency - and I happen to know that you believe that also and have even discussed it'

'You know more than you should,' General Taylor said,

'which is, of course, why we should take you on on a more permanent basis.'

They skirted around the building site and stopped by Bradley's car, which was parked just outside General Taylor's office, gleaming in sunlight.

'Are you in the process of forming such an agency?' Bradley asked as he slipped into his car.

'Very early stages,' the general replied, 'but the short answer is yes.'

'And can I be part of it?'

'Yes - when the time comes. In the meantime, you better get on the trail of this John Wilson. If we can't yet find out what he's doing in Germany, you might at least find out where he came from and just who he is.'

'I will,' Bradley said.

He watched the general walk back into his office, then drove away, feeling a lot better, disturbed only when he thought of Gladys Kinder and her relationship with Wilson.

'Goddammit!' he whispered.

CHAPTER FOUR

The two men came for Wilson at the Zeppelin Works at Friedrichshafen at eight in the morning and escorted him out of the factory without a word. Both men were wearing the black uniforms of the SS, and not those of the Gestapo, which Wilson took for a good sign. He felt no fear and asked no questions when, outside the factory, they ordered him up into the back of a canvas-topped truck that already contained a collection of men and women, none of whom looked too happy and some of whom were actually in handcuffs. Wilson sat between a Frenchman who tugged nervously at his peaked cap and a Jewish woman whose dark eyes glowed with dread, then the truck growled into life and began its journey to Berlin.

Two armed soldiers sat at the end of the truck, to ensure that no one tried to escape.

Wilson, who did not wish to escape, merely smiled at the sight of them.

The journey began in the gray mist of morning and ended in the evening, with the streetlights illuminating the monolithic architecture of Berlin. In that long eight hours they had been driven a great distance, from Friedrichshafen on the north shore of Lake Constance to steely-gray Munich, from there to Nuremberg, still somber in the noonday sun, then across the majestic, forested hills of Thuringia, with the shadows of the trees lengthening in the deepening light of afternoon, then through Dessau as darkness was falling and eventually into Berlin.

Wilson had taken it all in from the back of the truck, every

glimpse he could get through the canvas flapping near the two soldiers, and had noticed, especially, the many troop trucks on the roads, the armed soldiers in even the smallest towns. He was reminded, beyond any shadow of doubt, that this country was set for war.

It was just what he needed.

Throughout the journey, the two guards had said little to the prisoners, other than ushering them in and out of the truck two or three times to enable them to eat or go to the toilet. They had done this in a distant but reasonably civilized manner, but now, as they kept their charges covered while escorting them from the truck into a large, official-looking building, they both became noticeably more tense and officious, barking their orders and even hitting some of the prisoners with the butts of their rifles when they failed to move quickly enough.

Once inside the building, which was gloomily lit and drearily institutional, the predominance of immaculate black uniforms, gleaming boots, and blond hair made it obvious that this was SS headquarters.

One of the female prisoners started weeping and a man crossed himself, but Wilson, as he had done that morning, took it as a good sign that he was in the hands of the SS, which he had wanted, and not the Gestapo.

The prisoners in handcuffs were led away. Wilson and the others were told to sit on the wooden benches lining the walls of a gloomy corridor. A golden-haired SS sergeant took their identity papers, disappeared through a door, and returned shortly after to lead Wilson away from where he had been sitting, between the dark-eyed Jewish woman and the unshaven Frenchman who had constantly murmured to God for deliverance. Glad to be rid of them, Wilson was even more pleased when he was escorted into an office and made to stop before the desk of a man he recognized from his many photographs in the newspapers - the head of the SS, Heinrich Himmler.

He did not raise his head when Wilson was escorted in, but

continued to study the papers on his desk. Wilson recognized his own handwriting and the technical sketches he had included with his lengthy letter, and smiled, feeling pleased with himself, until Himmler looked up at him.

Wilson immediately removed the smile from his face and looked deeply respectful.

Himmler sighed, as if weary. He had bland, decent features, a neatly trimmed mustache, and gray-blue eyes whose mildness was emphasized by his glistening pince-nez spectacles. He was a man without vanity or cruelty or lust - but Wilson knew, the minute he saw those eyes, that he was also quite mad.

It was what Wilson needed.

'So,' Himmler said, 'you are Wilson - John Wilson - an American citizen.'

'Yes, Herr Himmler,' Wilson replied in perfect German.

'Reichsfuhrer,' Himmler corrected him mildly.

'Sorry, Reichsfuhrer.'

'And you've been living in Germany, under an assumed name and with forged German identification papers, for the past three years. This is correct?'

'Yes, Reichsfuhrer.'

'And as this fictitious German citizen, you've been doing important research work on advanced gyroscopic controls with the subsonic windtunnel at the Zeppelin Works in Friedrichshafen.'

'Yes, sir.'

Himmler offered a slight, chilling smile. 'You realize, Hen-Wilson, that these are criminal offenses - that you could even be labeled as a spy and executed accordingly.'

'My purpose isn't spying, Reichsfuhrer, as the notes and drawings I sent you clearly prove.'

'Ah, yes... the notes and drawings.' Himmler adjusted the spectacles on his nose and glanced down at Wilson's papers. When he raised his eyes again, he was still smiling in that slight, chilling manner. 'What these notes prove, Mr Wilson, according to my aeronautical advisers, is that you are an

extraordinarily brilliant physicist and engineer. What they fail to prove is that you are not here on behalf of your government - in other words, as a spy.'

'I have no reason to love the American government - and my only interest in life is my work. That's why I'm here.'

Himmler stared steadily at him, with a cold curiosity, then smiled bleakly and indicated the chair in front of his desk. 'Please,' he said. Take a seat. Can I fetch you some tea?'

'No, thanks,' Wilson said as he sat down and studied the powerful, soft-faced lunatic across the desk. 'I drink as little as possible.'

'And hardly eat, so I've been told. Does that explain your remarkably youthful appearance?'

'It helps,' Wilson said, not forgetting for a moment that Himmler, former fertilizer salesman and chicken farmer, was quietly obsessed with all kinds of esoteric theories, including astrology and runes, the secret of the pyramids, the spirit of the eternal Wandervogel, Horbiger's world of ice and fire, and, of course, the magical properties of certain diets. 'I eat and drink only the bare minimum,' he clarified, 'though I find that the odd glass of white wine can be beneficial.'

'You speak flawless German,' Himmler said. 'When and where did you learn it?'

'I learned it here, in Germany, Reichsfuhrer.'

Himmler raised his eyebrows to display his scepticism. 'Here, Mr Wilson? In the Fatherland? In a mere three years? I would think that even an adolescent, let alone a man your age, would have trouble in being so fluent in our difficult tongue after such a short period.'

'I have a retentive memory,' Wilson explained, 'and I learned it in three years. We didn't even learn French in Iowa, let alone German. I've learned it since coming here.'

He was impatient with the question, since languages came easily to him. He had never experienced difficulty in learning anything, so could not abide ignorance. And languages, compared to mathematics or science, were merely child's play.

'Ah, yes,' Himmler said, forgetting the vexing question of

language. 'Iowa! The heartland of America. Which is where you came from.'

'Yes,' Wilson confirmed, remembering the rolling plains, the cold winters and long hot summers, his parents working in fields of corn between sunrise and sunset while he, who could never stand the place, searched the distant horizon.

He looked back with no emotion, simply recalling it from his mind, and retained no more feeling for that landscape than he did for his parents. He remembered them treating him kindly, but that didn't mean much to him.

The past was a dead place.

Himmler nodded judiciously, glanced down at Wilson's papers, picked some up and let them fall to the desk again, then spread the fingers of his delicate, almost feminine hands over them. 'Naturally we've checked the details you gave us about your background and found them to be exactly as you stated. You're a remarkable man, Mr Wilson, perhaps even extraordinary - which would only make you all the more dangerous, should you not be what you say you are.'

'I'm a scientist, Reichsfuhrer. I want to get on with my work. I can't do what I want to do in America, so I came here, to Germany, where I know that my particular kind of talent is much in demand. It's as simple as that'

'Nothing is as simple as that, Mr Wilson, as you and I both know. You're an American citizen, and no matter your grievances, you must still love the country you came from.'

'I do not, Reichsfuhrer. To me, it's just another country and one that can't help me.'

Himmler actually looked shocked, as if blasphemy had been spoken. 'Patriotism!' he exclaimed. 'You have no sense of that?'

'No.'

'I find that hard to believe.'

'Believe it.'

'If you were a German citizen, I'd have you shot for that attitude.'

'I'm not German, Reichsfuhrer.'

Himmler picked up a pencil, drummed it on the desk,

tapped it lightly against his teeth, then put it down again. He signed, almost sadly. 'Even though our country is not at war with yours, what you've done, in coming here to work for us, is virtually treason. Are you a traitor? Is that what you want to be?'

Wilson had to admire him for saying that The chicken farmer was no fool. He looked like a schoolteacher, perhaps even a monk, but mixed in with his lunatic ideas was a steely intelligence. Not a vast intelligence, but a sharp one, which meant that he had to be handled carefully and never taken for granted.

'A traitor?' Wilson said. 'I don't think in such terms. I was exploited by my government, then betrayed and cast aside, and now I wish to lend my talents to those who will use them.'

'Lend your talents?'

The question actually amused Wilson. 'How wise you are, Reichsfuhrer, to understand that a man of my ambition would not willingly do anything for free. Naturally, I came here for the most selfish reasons - because I live for my work and only someone like you would have the vision and courage to finance it. I'll work for you as long as you finance my research - which is why 1 wrote to you.'

'And you do not care to what ends your research is finally put?'

'A true scientist can't be concerned with such matters. My only concern is the pursuit of ultimate knowledge - and I know you agree with that. I'm just as much a soldier as you are - but what I fight for is science.'

'Are you as ruthless as a soldier, Herr Wilson?'

'Yes, Reichsfuhrer, I am.'

Himmler smiled, obviously pleased with this response, though his smile held no warmth.

'Why me?' he asked softly. 'Of all the people in the Third Reich, why did you write to me, rather than to some influential scientist or politician? You must have known you were taking a great chance - exposing yourself as an alien who used false identification papers in order to obtain a position in one of our most important research establishments - and that I could

have decided to have you shot as a spy. So why me, Herr Wilson?'

'Because you're a man of vision,' Wilson said, combining a lie with a certain amount of truth. He felt that Himmler was, indeed, a man of great dreams, if not vision, who would support any kind of research, no matter how esoteric or even mad. For that, if for very little else, he would certainly be useful. 'Because you believe in the limitless possibilities of the future, will back your beliefs with actions, and will not let petty human emotions stand in your way. You and I, Herr Himmler, if I may say so, are similar that way.'

'What you say may be true,' Himmler replied, unmoved by flattery, 'but it still doesn't explain why I should give you, a foreigner, my support, particularly since you wish to take part in our most vital, and therefore confidential, research.'

You should give me your support, Reichsfuhrer, because my papers have shown you what I can do - and what I can do is much more than anyone you have could do.'

'Some of my scientists would take offense at that remark.'

That wouldn't change its accuracy. My work is proof of my genius. More important, I'm engaged in a project similar to one you've already started: the creation of a revolutionary form of transport and extraordinary weapon.'

'You mean Projekt Saucer.'

'Yes, Reichsfuhrer.'

'And how did you know about that, Herr Wilson, since the project is under SS supervision?'

There are always whispers, Reichsfuhrer, particularly among scientists, and naturally I picked them up in Friedrichshafen. I was also puzzled to see certain, odd machine parts in the Zeppelin Works - but when combined with some of the experiments taking place in the wind tunnel, I realized they could only relate to the development of an aircraft shaped like a saucer - the kind of machine being researched with Projekt Saucer at Kummersdorf West.'

'What kind of experiments were you doing in the Zeppelin wind tunnel?'

'Tests relating to Prandtl's boundary layer.'

'The importance of which is?'

'If we can't solve the problem of the boundary layer, the speed and maneuverability of our aircraft will always be limited.'

'Please explain.'

The perfect flying machine will be one that requires no runway, since it will take off vertically, will be able to hover in midair, and will not be limited in flight by Prandtl's boundary layer.'

'I am not an engineer,' Himmler reminded him impatiently.

'According to Prandtl's theory of the boundary layer, the air sweeping in on an object in flight increases its resistance in direct proportion to the increasing speed of the flying object. Because of this, the speed of any flying object is finite. However, if some method can be found of removing the boundary layer, virtually limitless speed and maneuverability will be achieved.'

'And a disc shape is the best shape for this?'

'Potentially, yes. The buildup of the boundary layer is dramatically increased by the many surface protuberances of a normal aircraft - wings, tails, rudders, rotors, and so forth. If we could get rid of those - by somehow wrapping them together as part and parcel of the one, circular, smooth-surfaced flying wing - we would at least be on the road to the perfect flying machine.'

'And you think that we can accomplish this here in Germany?'

'I think you're the country with most interest in such developments and certainly the most advanced so far. Regarding vertical-rising aircraft, the Focke-Wulf Company has already announced that it has almost completed its FW 61 helicopter, which will be the first fully operational helicopter in existence. Regarding experimental tailless aircraft, or flying wings, devoid of vertical stabilizing or control surfaces, the Horten brothers of Bonn have already produced some successful prototypes. As for other

problems standing in the way of limitless speed and maneuverability, it was a German, Professor Ludwig Prandtl, who, at Gottingen in 1904, defined the nature of the boundary layer. Since then, many other German scientists have been experimenting with revolutionary new types of aircraft in the hope of finding a way of defeating that layer. A disc or saucer-shaped aircraft, without any surface protuberances, is the logical outcome of that research.'

Himmler's smile was as chilling as the gaze behind his small pince-nez. There are those who would say that such an aircraft cannot be built'

'The foolish always speak loudest.'

'And you think that you can help with such a project?'

'I can complete it, Reichsfuhrer. I have been working toward this goal all my life and have now almost reached it.'

Himmler glanced at Wilson's technical drawings, which had been done in black ink, then raised his eyes again as he spread his slim hands in a questioning manner.

'But are you close to reaching it?' he asked. 'My scientists often say the same thing - but so far they have failed.'

'Just look at my drawings, Reichsfiihrer.'

'I am not a scientist, Herr Wilson. Your drawings look impressive, but to me they are meaningless - though initial reports have certainly confirmed that your written work is extraordinary. These drawings will have to be studied further by people more knowledgeable than I. In the meantime, I have to consider what it is you want from me.'

'I've told you that, Reichsfiihrer. I wrote to you not only for the reasons we've just discussed, but also because I know that the SS is gradually taking over the security and management of the Third Reich's major scientific and research establishments, that soon it will be the most powerful organization in Germany, and that you, its Reichsfiihrer, are the only man in power with the vision to see what can be done in this particular field. Already you've implemented a disc-shaped aircraft project; only I can take that project to its completion - but I need your support.'

There was silence for a moment and Wilson waited patiently, neither excited nor frightened. He was fully in control as Himmler stared steadily at him. He did not flinch from the mild monster, but neither did he try to challenge him. Instead he let his gaze go slightly out of focus, as if gazing inward.

Which he did in a sense, thinking back upon America, remembering Goddard and how the Americans had mocked him while these clever Germans revered him. Well, Goddard was back in Roswell, struggling along on a mere pittance, while he, Wilson, if Himmler went as he thought he would, would soon have all the money and equipment he could possibly want.

Pleased, he focused again upon Himmler, whose mild gaze concealed madness.

'You do realize, Herr Wilson, that once I gave that support, you would be committed to working for the Third Reich for the rest of your days?'

'Yes, Reichsfuhrer.'

'And that if you betrayed us, or even tried to leave the country, I would personally have you executed?'

Tes, Reichsfuhrer, I realize that, also.'

Tou are therefore willing to commit yourself totally to the Third Reich and all it stands for?'

Tes, Reichsfuhrer,' Wilson said. He lied easily, as he was beyond morality, thinking only of his own plans for the future and ignoring all else. 'I'm willing to do that.'

Himmler stared steadily at him, his gaze searching, then he nodded, as if coming to a decision, though not without doubts.

'You must really despise your government,' he said, 'for what they did to you.'

'No, I don't,' Wilson said. 'Such emotions are redundant I'm here not because I want revenge, but because my government won't support me and I think you will. It's as simple as that'

'You are more than committed to your work,' Himmler observed. 'You are clearly fanatical.'

'I live only for my work - as you do - and that makes us superior men.'

'I think you really believe that, Herr Wilson.'

'I do, Reichsfuhrer. I do.'

Himmler smiled at the subtle flattery but was otherwise unmoved by it. He then glanced down at Wilson's drawings, scratched his nose while studying them, shook his head from side to side in wonder, and looked up again.

'I am going to have you placed in the custody of the Gestapo,' he said, 'in their headquarters in the Prinz Albrechtstrasse. You needn't worry. I do this merely for convenience. I wish to have these drawings examined in more detail - and to have you interrogated at length, regarding your past and present attitudes as well as your work. Naturally, you will be interrogated by one of my intelligence officers - but hopefully one with an engineering background. Should the results of our investigations prove positive, you will, as you request, be given work at the rocket research establishment at Kummersdorf West. On the other hand, if our findings are negative, you will be shot and buried as the German citizen whom these false identification papers say you are. Is that acceptable, Herr Wilson?'

'Yes, Reichsfuhrer - and thank you.'

Himmler nodded at the armed guard in the corner of the room, and Wilson was led out to begin his journey to Gestapo headquarters.

CHAPTER FIVE

Bradley met Robert H. Goddard on the porch of the latter's large frame house on a street shaded by horse chestnut trees in Worcester, Massachusetts, in the winter of 1933. The snow had not yet come, but the air was gray and cold, and the leaves were blowing around Bradley's feet when Goddard shook his hand and ushered him inside.

It was a pleasant, old-fashioned house, with its original furniture covered in relatively new slipcovers, its windows draped with chintz, and a wood fire burning in the large, open fireplace. Bradley knew that Goddard had lived here all his life, and it certainly suited him, being an unpretentious, comfortable place.

'Please take a seat,' Goddard said, his voice as formal as his appearance when he indicated the sofa by the fire. 'I'm sorry I can't offer you much - my wife's not home at the moment - but I can at least make a cup of coffee.'

That'd be fine,' Bradley said. 'I'll have it black, with no sugar.'

Goddard nodded solemnly and disappeared into the kitchen; he returned a couple of minutes later, carrying two cups of coffee. Bradley noticed his stooped walk, which, like his bald head, had been caused by tuberculosis in his youth. Goddard handed Bradley the black coffee, sipped at his own, then took the armchair facing the settee. His eyes were brown over a small mustache, his gaze slightly suspicious, and Bradley remembered that he wasn't keen on representatives of a government that had ignored his remarkable talents for too long.

'So,' Goddard said, 'you insisted on seeing me, even after I put you off on the phone when you called me at Clark. Have you come to make me an offer?'

Bradley grinned. 'No,' he said. 'I'm in neither science nor finance. I have heard that you've had trouble getting financed, but that's not what I'm here for.'

'If you're not part of the government's scientific community, why come to see me? The US government has never shown much interest in my work, so I'm naturally surprised that one of their representatives should turn up on my doorstep - more so since he hasn't come to offer me help.'

The National Advisory Committee for Aeronautics was recently formed to advise the government on every aspect of aeronautical development, political and scientific, both here and abroad. For that reason it was composed of those most respected in the aeronautical community. You were invited to join - and you rejected the offer.'

'With all due respect to Orville Wright and my good friend Charles Lindbergh, I don't consider such an offer to be of help. In making me such an offer, you were seeking my help - and what I need is government backing for my expensive research. That has never been offered.'

'I'm sorry.'

'I'm sure you are.'

Realizing that this was not going to be easy, Bradley decided to skip the formalities. 'In fact, perhaps to make matters worse, I'm asking for help again.'

'Obviously not scientific help.'

'No. I'm an intelligence officer for the US Army Air Force and I need information.'

'Information about my work?' Goddard asked suspiciously.

'No,' Bradley replied. 'I need to know about someone who worked with you - a man named John Wilson.'

Goddard straightened up, looking surprised, then collected himself by sipping some more coffee. When he lowered the cup and saucer to his lap, his eyes were masked.

'Ah, yes,' he said, 'Wilson. An odd bird. So why do you want to know about him?'

'Because I have to find him,' Bradley told him, 'and he hasn't left many tracks. Do you mind if I smoke?'

Goddard shook his head to say he didn't mind and Bradley, who smoked only when he didn't know what to do with his hands, lit a cigarette.

'Why do you have to find him? Has he committed an offense?'

'No,' Bradley said, exhaling a stream of smoke. 'And that's all I can say for now. But please accept that this man must be found - and you're our first lead.'

Goddard shrugged. 'I can't help you much, Mr Bradley. I doubt that I know any more about him than you do - I only worked with him.'

'With him? I thought he worked for you.'

'You mean as my assistant?'

'Yes.'

Goddard smiled for the first time - a slight, laconic smile. Well, he certainly was that - or was supposed to be that - but a man like Wilson doesn't work/or anybody. He was too bright for that.'

'How bright?'

'Brilliant. He was clearly a genius.'

As Goddard wasn't known for his generosity to fellow scientists, Bradley was surprised by this description.

'You're supposed to be a genius,' he said. 'Are you saying that—'

The word genius is used far too casually for my liking,' Goddard interjected, 'and so isn't one I'd normally use lightly. Yet I'd apply it without doubt to Wilson. The man was a genius.'

'How much did you learn about him?'

'Not much, Mr Bradley. He was guarded about his past, almost paranoid about remaining anonymous, and seemed to have few interests, other than space flight. Like me, he thought it possible to fly to the moon - and that's why he came to me.'

'When was that?'

'In 1930.'

Bradley saw a glass ashtray on a low table near the bookcase, so leaned sideways, picked it up, balanced it on one leg, and nicked some ash into it 'And how did he come to work with you? Did he initially write to you?'

'No. He simply turned up out of the blue, told me he was an aeronautical engineer who had designed airships—'

'Airships?'

'Correct.'

'Did he say he did that work in Europe or America?'

'He certainly didn't mention Europe. In fact, I got the impression that he had never been there in his life.'

'Yet that's where most of the airships have been constructed and flown.'

'That's where the first airships were constructed and flown,' Goddard corrected him. The first was built by Henri Giffard of France in 1852; powered by a 350-pound engine, it was successfully flown over the Paris Hippodrome at a speed of she miles an hour. An internal combustion engine fueled by hydrogen from the airship's bag was then used by the German, Paul Haenlein, for his even more successful flight in 1872. Albert and Gaston Tissandier of France successfully powered an airship with an electric motor in 1883, and the first rigid airship, with an aluminum-sheeting hull, was built in Germany in 1897. And I don't have to tell you that the Germans used a number of large Zeppelin airships to bomb Paris and London throughout the Great War.'

'All European airships,' Bradley reminded him.

'Yes, of course - they were the best known. But a few airships were constructed here in the 1920s, and more are being constructed right this minute - so there appears to be nothing remarkable in Wilson's assertion that he worked on airship designs.'

'Which must have been just before he came to work for you.'

'Probably,' Goddard said.

'What else did he tell you?' Bradley asked.

'He was obsessed with the possibilities of space flight - and

therefore with my rocket research. He said he had been inspired by the fact that I had managed to launch liquid-fueled, instrument-carrying rockets, and informed me that he wanted to work with me and learn from me.'

'I'm surprised you let him.'

Goddard didn't smile at all. 'As he was older than I,' he said, 'I was certainly initially uncomfortable with his suggestion, suspecting him to be someone simply desperate for work. However, he showed me his papers, which proved beyond doubt that he had attended MIT between 1888 and 1893 - before my time there - then Sibley College at Cornell University, in Ithaca, New York, where by 1895 he'd obtained his Bachelor of Science in aeronautics. He also proved, both verbally and with various papers he'd written and let me read, that he had an extraordinary - and I don't use the word lightly - an extraordinary grasp of aeronautics and physics. Naturally, Mr Bradley, after that, I couldn't turn him away.'

'He started working for you immediately?'

'Yes.'

'This was at your Guggenheim-financed experimental station in Roswell, New Mexico?'

'Yes.'

'For how long?'

'Approximately six months.'

'That doesn't seem too long.'

'No, but it was all he needed. During that period he helped me enormously - but he also learned everything I'd discovered so far about steering systems, gyroscopic controls, and various kinds of self-cooling combustion chambers. Those were the things he wanted to know about - and when he'd found what he needed, he left, with not even a good-bye note.'

'Not exactly showing gratitude,' Bradley said.

Goddard smiled for the second time. 'Wilson wasn't a man for gratitude - and I learned as much from him as he did from me, so I can't really complain.'

Whether or not Goddard felt the need to complain, Bradley certainly thought that Wilson's abrupt departure could only

be the act of an extraordinarily cold, thoughtless, self-centered man. When he also thought of how casually Wilson had dismissed and left his former mistress, the intriguing Gladys Kinder, he was even more convinced that the man he was trying to picture clearly was not the warmest, most sensitive soul on earth. Certainly he was a man who used people and casually cast them off- a man who didn't need love or friends.

A man completely alone.

'So what did you think about him as a person?' Bradley asked Goddard, desperately hoping to fit a human face to his shadowy quarry.

'I don't know what you mean,' Goddard said with scientific detachment.

Bradley blew a smoke ring and watched it grow larger and thinner before disappearing. Then, realizing what he was doing, he felt a little embarrassed. 'Did you become friends in any sense?' he asked.

Goddard shrugged, at least displaying his confusion, which made him more likable. 'I got on well with him,' he said, 'but in an academic way. We both lived for our work, we'd both had bad times with the government, and we agreed that the mind should rule the heart - not vice versa, as is commonly believed. Oddly enough, then, though there was little warmth between us, we had much in common.'

Bradley hardly heard the last remark, for his lawyer's instincts, always turned to the unusual, had honed in on something else.

'Did you say he'd had trouble with our government?' he asked, leaning forward, forgetting the ashtray, but managing to grab it before it fell off his leg.

'Yes,' Goddard said. 'Just like me.'

'You mean the trouble was related to his work?' Bradley asked as he rearranged the position of the ashtray.

'Yes,' Goddard confirmed. 'He didn't tell me much about himself, but he did say that he'd come from Iowa, worked on some airship projects, and come to me when those projects were first taken over by, then dropped by, the US government

Is that why you're interested, Mr Bradley? Were you involved in his problems?'

Feeling distinctly uneasy, Bradley was nevertheless able to answer honestly. 'No. I know nothing about them. It's interesting, though, that he should have said that What do you think?'

'I don't think I have to tell you, Mr Bradley, that for years I've felt neglected by the US government - and if Wilson was working on airships, or similar projects, and was then either dropped or blocked by the government, he would feel as bitter as I do - which is very bitter indeed.'

Bradley almost felt Goddard's bitterness. He was deeply embarrassed by it, but disguised it by drinking more coffee and then clearing his throat.

'Did he say or do anything to substantiate such bitterness?'

'Yes,' Goddard said without hesitation. 'Just before our rocket test flight of December 31, 1930, which Wilson should have attended, he told me that our government didn't appreciate its brightest minds, that it would eventually make things difficult for me, and that I should consider leaving the country for good and taking my talents where they'd be more appreciated.'

'And where did he suggest, Mr Goddard?'

'Germany,' Goddard said innocently. 'He reminded me that the German rocket scientists revered my work and that because of that I'd certainly get the financing there that I couldn't get here. Two days later, while we were testing our latest rocket, he packed up and disappeared.'

'Was your rocket test a success?' Bradley asked, thinking it wise to lighten the conversation.

'It was pleasing,' Goddard replied. The gyroscopic controls didn't work properly and the descent parachute didn't open, but the rocket reached a speed of 350 miles per hour and a height of nearly two miles.'

'That's impressive.'

'Yes, it's impressive - but not to your superiors.'

Feeling that he'd just been slapped on the face, and also

oddly haunted by the ghostly man he was pursuing, Bradley finished his coffee, stubbed his cigarette out, placed the ashtray on the table, and prepared to leave.

'Is there anything else you can give me that might help me?' he asked.

'No,' Goddard replied, standing up to show him to the door. What I've told you is all I can tell you. Apart from that, he's a mystery.'

Bradley sighed. Thanks anyway,' he said. 'I'd like to apologize for how the government's treated you, but—'

'It's not your place to do so.'

'Yeah,' Bradley said, grateful for the unexpected sensitivity. 'Right It's not my place. Thanks again, anyway, Dr Goddard - and the best of luck for the future.'

Goddard just smiled and nodded, led him to the door, remained on the porch till he drove away, then disappeared back into his attractive, old-fashioned house.

Bradley drove straight to MIT, flirted with the middle-age lady who worked in the records department, and soon learned that John Wilson had indeed attended the university before going on to Cornell in Ithaca. He was also able to ascertain from Wilson's old registration card that at the time of his enrollment, he had been living in Massachusetts with only his father, that before that he had lived with both his parents in Montezuma, Iowa, and that he had been born there on July 6, 1870.

Growing ever more intrigued by the fragmented trail of his brilliant, mysterious quarry, Bradley took the next train out of Massachusetts.

'Airships,' he muttered to himself as he sat in his reserved seat in a first-class car and lit a cigar. 'What next? I wonder.'

The train moved into darkness.

CHAPTER SIX

Ernst awakened at dawn, after a night of bad dreams, thinking he was in a cell in Stadelheim Prison, his heart pounding with fear. Then he saw his own bedroom, felt Ingrid beside him, and so heaved a sigh of relief and reached out to touch her.

She was naked beneath the sheets, her skin smooth and warm, and aroused, he rolled in against her, hoping to waken her.

She did not awaken immediately, which disappointed him again, and still caught in the web of his frightening dreams, he gazed through the windows. The curtains had not been drawn and he saw the dawn's dark-gray light, gradually illuminating the houses opposite, in the modest-priced Berlin suburb of Helensee. They had moved here a year ago, two weeks after they were married and had honeymooned in Paris - which, compared to Berlin, had been like heaven on earth. It seemed longer than a year ago (so much had happened in the turbulent period) and Ernst, now the father of a daughter, Ula, wondered where all the joy had gone.

Germany had changed dramatically in the fifteen months and he had changed with it

Not wishing to think about it, feeling the need for escape, he pressed himself against Ingrid's spine and ran his hands over her. He heard her breathing change, felt her stiffen and then relax, so he whispered her name into her ear and she sighed and turned into him. She gazed at him with sleepy, catlike green eyes, then kissed him sensually.

It was the dawn's sole reward, and he made love with

feeling, aware that it was not like it had been, but grateful to have her. Ingrid's body was still sublime, a soft retreat from harsh reality, and he slid along her belly, sucked and licked her breasts and neck, and moved inside her with the desperate need to obliterate what had recently been haunting him - the knowledge that he was losing her love as his pride was destroyed.

When he had finished and was hoping to rest on top of her, she slid out from under him.

'I'll get breakfast,' she said.

'Please, Ingrid, stay in bed a little longer.'

'No,' she said. 'You'll be late.'

Reminded by that remark of what the day might yet bring, Ernst felt a cold chill of dread slipping through him. He had forgotten that he had been ordered to report back to barracks unusually early in preparation for possible action against the SA, or Brownshirts, who were reported to be planning an armed rebellion under the leadership of Captain Ernst Roehm.

Another police duty, Ernst thought bitterly as Ingrid, in a dressing gown, padded from the room and he slid his legs out of the bed and went into the bathroom.

As he attended to his ablutions, he pondered the fact that even he was becoming confused by the sheer number of conflicting groups within the Third Reich's increasingly nightmarish police structure. Top of the list were the Gestapo, or Secret State Police. Originally under the command of the debauched Hermann Goring, recently it had been taken under the wing of Himmler, who was also head of the SS. The SS had been formed as Hitler's personal Guard Detachment but was fast becoming the most feared police force of all. Next came the SD, which acted as the long-range Intelligence and Security Service of the SS, under the control of the dreaded Reinhard Heydrich. Last of the major groups was the SA, originally formed as part of the SD and consisting of Ernst Roehm's brown-shirted Storm Troops, who represented the military arm of the Nazi Party and were used mainly to intimidate, beat up, or murder those openly opposed to it. Now

that degenerate madman, Roehm, was rumored to be planning a putsch, or armed revolt, against the Reichswehr... And today's police duty, Ernst suspected, had something to do with that situation.

He resented being involved in such duties - more so because Ingrid had frequently expressed her contempt for the SS, which she viewed as fascistic and brutal. He also resented them because what he had been promised, eighteen months ago, would be aeronautical intelligence gathering for the SS technical branch had in fact turned out to be secret service intelligence gathering against, and the arresting of, all those who opposed Hitler's National Socialist Party.

Ernst had escorted more unfortunate souls into Stadelheim prison and Gestapo headquarters than he cared to remember - and there were stories about both of those places that he preferred to forget.

Suddenly filled with the dry-throated nervousness that always gripped him when he thought of his SS duties, he had a quick bath, dressed even more urgently in his gleaming black SS uniform, looked fondly in on his nine-month-old daughter, where she was sleeping in her cot in her own brightly painted room, then went into the kitchen to have coffee with Ingrid.

She was sitting at the table, a steaming mug in her hands, her short-cropped blond hair attractively disheveled around her delicate features. Having Ula had not made her lose her figure, which remained slim and sensual; and Ernst, as he took the chair facing her, was grateful for that.

'I'd forgotten I had to be there so early,' he said, sipping his coffee. 'I also forgot to tell you that I may not be coming home tonight. It could be a long duty.'

What is it this time?' Ingrid asked him, her green gaze steady over her steaming mug.

'I don't know,' he lied, because he had been ordered to do so and did not dare do otherwise. They only said that it was some kind of police action that could take a long time.'

In fact, he had been told in confidence the previous day by Gruppenfuhrer Josef Dietrich, commander of Hitler's

elite SS bodyguard, the Leibstandarte - SS Adolf Hitler, that for months the SA, under the command of the notorious homosexual, Captain Roehm, had been in growing, increasingly open revolt against Hitler in particular and Himmler's SS in general, and now that conflict was coming to a head. According to Dietrich, Goring, SS chief Heinrich Himmler, and the dreaded SD chief Reinhard Heydrich had formed a secret alliance to get rid of Roehm and were going to act soon.

Ernst dreaded the form such an action might take, but tried to look unconcerned.

'Another police action,' Ingrid said, putting his previous thoughts into words and imbuing them with soft sarcasm. 'Before we married I said you'd become a policeman - and that's what you are.'

'I'm not a policeman,' he insisted too loudly, aware that he had had to do this too often. 'I'm not a member of the Gestapo. so stop suggesting I am.'

'You do the Gestapo's work,' Ingrid replied, not perturbed by his outrage, 'and that's just as bad.'

'I obey orders,' he said, 'and that's all I do. It's not the kind of work I wanted, it's certainly not what I expected, and although I don't always like what I'm told to do, I must obey orders.'

'You could try refusing.'

'That's nonsense, and you know it. I'm an SS officer, a German officer, and you know what that means.'

'It means you work as a policeman.'

'It means that if I don't do what I'm told, I'll be imprisoned myself - or possibly shot Is that what you want?'

Ingrid placed her cup on the table and gazed down at her coffee, perhaps trying to hide the blush he could see on her cheeks.

'I'm sorry,' she said. 'I know you're not really a policeman. I also know you don't like what you're doing and my attacks make it worse. I hate saying these things, but I can't help myself. I hate the SS - and I can't bear the thought that you,

who should have been an engineer, are doing their dirty work. It just makes me sick.'

'It sometimes makes me sick as well,' he said, 'but what else can I do? I am an officer in Heinrich Himmler's SS - and it's too late to get out'

Ingrid raised her head again. 'Are you sorry you joined?'

He shrugged. 'I'm not sure. Sometimes I feel betrayed - they said I would be in technical intelligence - but at other times, and I certainly can't deny it, I want to surrender my own feelings to the general good.'

'And you think that what's happening at present is for the general good?'

Ernst heard his own sigh like a soft wail of defeat. 'We can only hope,' he said. 'At the moment, things certainly look ugly, even shameful, but one hopes that the end will justify the means - and that's all one can hope for.'

Ingrid had just been about to take his hand, but she stopped, glanced at him, sat back, and glanced vaguely around her as if looking for exits.

'Everything's changed so quickly,' she said, shaking her head in bewilderment. 'Nothing's been the same since that night outside the Chancellery. It's only been fifteen months, yet now we live in a city filled with brown-shirted brutes, secret police, intimidation and fear. It's been like a bad dream.'

Ernst knew what she meant and rarely stopped thinking about it. He, too, remembered that wonderful moment in Wilhelmstrasse, when Hitler had appeared at the window of the Chancellery to smile down on his cheering men. It had been a great moment, a transcendental experience, one that had seemed to offer the promise of a magical future. A mere fifteen months ago...

And since then?

Ernst could not forget that he had been one of the truckloads of SS men, hastily sworn in as auxiliaries to the SA, who had, in March 1933, just a few days before he'd married Ingrid, swarmed through the city to round up known Reds and Social Democrats and take them into 'protective custody' - a

term that, even then, was rumored to mean imprisonment, torture, or execution.

Nor could he forget that he had been one of the many proud SS guards who sang the 'Horst Wessel' song in the Kroll Opera House, temporary site of the new Reichstag, the tumultuous night that Hitler, wearing his brown SA uniform and standing on a stage decorated with a huge swastika flag, made the speech that expunged democracy from the German parliament.

Nor could he forget that while the midnight calls and arrests increased, along with the whispers about torture and murder in SA and SS prison cells, he had been one of the many loyal 'policemen' who had seized union offices throughout the nation, arrested labor leaders, confiscated union files and bank accounts, shut down their newspapers, and in one awful day obliterated organized labor in the whole country.

Now the Fuhrer, Adolf Hitler, was ruling a totalitarian state known as the Third Reich - and he, Ernst Stoll, once a mere technical student, had aided his ruthless climb to power.

Naturally, Ingrid was right He had a lot to be ashamed of. But though he sometimes acknowledged this to himself, the shame and despair in which he writhed made him loathe her for saying it.

'I have to go now,' he said.

Feeling like someone being sucked into quicksand, and filled with the feeling that today would be a nightmare, he walked around the table, kissed Ingrid's cheek, and started out of the house.

'Don't do anything you'll be ashamed of,' Ingrid joked, trying to lighten the depression he was clearly showing.

'I'll try not to,' he replied with a smile and a wave, before stepping outside and closing the door behind him.

Waiting on the pavement in the morning's brightening light for the jeep that would transport him to Stadelheim Prison, he could not shake off his recollections of the past fifteen months and realized why he was losing Ingrid's love as his pride was destroyed. He had become a policeman, the emissary of

butchers, and as his resistance was eroded and his pride subtly destroyed, Ingrid's respect for him, the basis of her love, was also being eroded.

The Third Reich was driving a wedge between them, just as Ingrid had said it would.

The jeep that Ernst had been waiting for turned the corner at the bottom of the street, drove toward him, and pulled to the curb. As his fellow officers, Willi Brandt and Franck Ritter, both lieutenants, were taking up the rear seats, Ernst sat up front with the driver - not without noticing that the normally ebullient Brandt was looking gloomy while Franck was clearly excited.

'So,' Ernst said, as the jeep moved out into the almost deserted road and headed for the Prinz Albrechtstrasse, 'another early-morning call for the elite. It is so nice to be wanted.'

'It depends what they want us for,' the gloomy Brandt said, 'since that may not be nice.'

'I always like the early-morning calls,' Franck said, sounding excited. 'It usually means action.'

'I like action in the movies,' Brandt replied. 'I don't like to be part of it. Not when it involves arresting people and throwing them into that prison.'

They deserve what they get,' Franck said. 'If they didn't, we wouldn't arrest them. They are the dregs of society - drunks, illiterates, gypsies, communist traitors, and Jews - and what we do is for the good of the country, which is why I enjoy it.'

'You'd enjoy torturing or shooting them even more,' Brandt said in a remarkably careless outburst, 'but that doesn't make it right.'

Those are the words of a traitor!' Franck snapped. 'I could report you for that!'

'If it gets me off this duty,' Brandt responded, 'please be my guest.'

Unnerved by the conversation, Ernst told them both to shut up, then glanced at the awakening city through which they

were moving. It was a warm Saturday morning and already the news vendors were out, selling the propaganda to be found in the Illustrierte Beobachter and Frankfurter Zeitung while the Brownshirts took up their positions on the sidewalks, preparing for another day of insults, beard-tugging, and other carefully planned humiliations.

An average weekend in Berlin, 1934.

Ernst felt even worse when the jeep pulled up at the main entrance to the grim Gestapo headquarters in the Prinz Albrechtstrasse. He was startled by the number of SS jeeps and troop trucks lined up along the pavement, and even more startled when, inside the dreary, gloomy building, he found that it was packed with heavily armed SS troops.

This is no ordinary working day,' Brandt whispered, looking even more upset. "What the hell's going on, Ernst?'

'Something big!' Ritter exclaimed, his eyes gleaming with excitement. 'I knew it! I knew?

Even as he spoke, the door behind them opened again and more SS troops hurried in.

'They've arrested Roehm!' someone whispered.

'Hitler himself did it!' someone added.

'It's us or the SA,' another voice said. 'And today will decide it.'

Hardly able to believe what he was hearing, Ernst led his two comrades up the stairs and along some packed corridors, until he came to the office of his superior, Gruppenfuhrer Josef Dietrich. As Ernst stopped in the doorway, Dietrich barked orders to a group of SS officers. When the officers left, all looking anxious, Dietrich waved Ernst inside.

'Heil Hitler!' he snapped, then added more reasonably: 'Prepare yourselves, gentlemen. Operation Calibra has begun, You are in for a busy day.'

'I'm sorry, sir,' Ernst replied, 'but I'm not familiar with that code name.'

'No, Lieutenant, of course not. Only the most senior officers were informed. It had come to our attention that Roehm was planning a putsch and the ultimate destruction of the authority

of the army and SS. However, early this morning, our courageous Fuhrer, in the company of Goebbels, flew to Bad Wiessee and personally arrested that disgusting pervert and the nest of homosexual traitors he calls his stormtroopers, at the Pension Hanselbauer, near the Tegernsee. According to my reports, most of the pig's men were still in bed when the raid took place - many of them caught in flagrante delicto with fellow SA troops or local youths. One's stomach churns just to think of it.' Here the gruppenfuhrer shook his head in disgust. 'However,' he continued, 'they were all rounded up and are this very moment being transported back to Berlin to be incarcerated, with Roehm himself, in the Brown House, prior to being quickly tried and judged. Today, gentlemen, we will wield our long knives - so prepare to shed blood.' Ernst's soul plunged into despair - but he found no escape.

At ten o'clock that warm Saturday morning, he was informed that the cells of Stadelheim Prison were already packed with SA leaders. Those still in the Brown House, including Roehm, had demanded to see the Fiihrer, but were refused and, instead, transported to Stadelheim in an armored car. There Roehm was put in a solitary cell, not far from the one he had occupied after the Beer Hall putsch.

Shortly after learning of Roehm's incarceration, Ernst was called to the office of Gruppenfuhrer Dietrich, who told him that the purge was beginning.

'I personally,' Dietrich informed him proudly, 'have been put in charge of the executions of the SA men being held in Stadelheim Prison. Meanwhile, you are to go with Lieutenant Ritter to the home of General von Schleicher and once there, put him to death. You understand?'

'Yes, sir,' Ernst replied, burning hot and cold with shock and disbelief. He was being ordered to kill the former chancellor of Germany. 'I just think—'

'Don't think, lieutenant, just obey. And when you've done that, drive straight to Stadelheim to receive further orders. Now good luck and - Heil Hitler!'

Unable to believe his ears, but forced to accept that this was real, Ernst soon found himself seated beside the hated Franck Ritter in one of the many police cars that were careening through the streets of Berlin in the great roundup of enemies of the regime. As if in a dream that was becoming a nightmare, he saw one unit, the men all wearing steel helmets and armed with rifles and submachine guns, surrounding von Papen's office. There was the sound of gunshots, sudden and frightening as they passed. Ernst felt sick to his stomach, too hot, completely unreal; and closed and opened his eyes when they passed a similar unit as it surrounded Roehm's opulent residence on the Tiergartenstrasse.

Sirens wailed in the distance.

Too soon for Ernst's liking, he and Lieutenant Ritter were being ushered by an unsuspecting cook into the study of a comfortable house in a suburb of Berlin. While Ernst licked his dry lips and fought to stop himself from shaking, Ritter asked the distinguished-looking gentleman sitting at the desk if he was indeed General von Schleicher.

'Yes, of course,' the former chancellor replied, looking up in surprise, even as Ritter pulled his pistol from his holster, cocked the safety catch, and opened fire.

The noise was appalling in that confined space.

Fumbling in a state of nerves, having not killed before, Ernst fired in a daze even as Schleicher was falling - and, worse, just as Frau von Schleicher appeared out of nowhere, rushed toward her stricken husband, and was cut down by the bullets that Ernst and Ritter were still firing.

Two bodies lay on the floor in dark pools of spreading blood.

While Ernst stood there, too shocked to move, Ritter hurried over to the bloody bodies on the floor, examined them dispassionately, then looked up and said, 'This bastard's dead, but his wife's still alive. An ambulance is coming for them, dead or alive, so let's go. There's more work to do.'

Which was certainly true.

In the courtyard of Stadelheim Prison the slaughter was well under way, but Ernst, when he reported to Gruppenfuhrer

Dietrich, was told to make his way back to the Gestapo headquarters in the Prinz Albrechtstrasse where there was plenty of worthy work still to do. After driving there in traffic jammed up by the police roadblocks and SS trucks being used to raid other SA groups, he was ordered down to the cells. It was a hell of smoke and ricocheting gunfire, of aggressive bawling and piteous screaming, and Ernst didn't know what to do, didn't want to do anything, turned away to rush out again, but was pushed back by an officer. 'That bastard in there!' the officer bawled. That rat in his hole!'

Pushed forward by the officer, Ernst found himself beside the weeping Willi Brandt in a crowd of jostling SS troops, firing his pistol, as the others fired, into Cell 16. There Gregor Strasser, winner of the Iron Cross, first class, devoted National Socialist and once the Fuhrer's friend, dodged back and forth, his eyes astonishingly bright, trying to avoid the hail of bullets. Finally, jerking spasmodically, he collapsed in his own blood and was given the coup de grace.

The cells stank of cordite and piss and the rank sweat of terror.

There were no names after that - only bodies spurting blood. Ernst went with the others, losing control of himself, firing his pistol in dark prison cells, in the hot, sunlit court-yards, then driving across the city to execute others in their homes, then on to the Lichterfeld Barracks - here, there and everywhere, through the day, into the night - murdering SA troops and government ministers and policemen and politicians.

He fell asleep in darkness, awakened to the new day, took part in more executions at lichterfeld Barracks and Columbia House, an SS torture chamber, until, at approximately four o'clock the following morning, he was finally allowed to holster his pistol and wash the blood from his hands.

Like his good friend Willi Brandt, he wept and then dried his stinging eyes.

He remembered returning home and telling Ingrid what had happened. He remembered, also, that she did not show any sympathy for his exhaustion, any understanding of his feelings of shame and horror, but only reviled him for what he had done, said she would never forgive him, and told him never to touch her again, because he would simply revolt her.

That morning, as he lay on the sofa, he drew his strength from contempt for her.

He became a good Nazi.

CHAPTER SEVEN

Wearing a gray suit, plain white shirt, and tie, Bradley was feeling more like a full-time lawyer and less like a disappointed, part-time intelligence agent when he picked up the telephone in his office high above Wall Street.

'Miss Kinder?' he checked tentatively. 'The Miss Kinder, from Roswell, New Mexico?'

'That's right,' Gladys Kinder replied. 'You sound surprised, Mr Bradley.'

'Well, I certainly wasn't expecting to hear from you, so, you know, I was—'

She chuckled in a familiar, sensual manner. Well, here I am.'

'Where, exactly?'

'In the Algonquin Hotel. It's famous for its famous resident writers, so I wanted to stay here.'

What are you doing in New York?' he asked, feeling guilty at how glad he was to hear her voice. 'It's a long way from Roswell.'

'I'm on my way to Europe,' she replied, 'and I'm sailing from this fair city, so I thought I'd give you a call. I remembered that you'd taken a shine to me when we talked in your hotel, so I figured you'd at least buy me a drink.'

'I really don't think—' he began, taken aback by her insolence, embarrassed by her accuracy, and horrified that his secretary might be listening. 'I mean, I—'

She chuckled with throaty amusement 'Oh, stop worrying, Mr Bradley. I know you're not the playboy kind. I really called

because I've got some information that I think might intrigue you.'

'What information?' he asked carefully.

'Wilson. You remember John Wilson?'

'Yes,' he replied, sitting up straight in his chair, even as the mention of Wilson's name revived his feelings of bitter disappointment. 'Of course I do. He's the reason you and I met in the first place, so...'

'Still interested in him?'

'Well, not exactly. I mean...' He didn't quite know how to phrase it He didn't even want to think about it, since it made him mad and frustrated. That project's sort of cooled down,' he tried. 'It kinda got put on ice.'

'Ah-ha!'

'Right,' Bradley responded, already feeling too emotional just hearing her voice.

'So explain, Bradley. I thought you were hot for Wilson.'

'I was, Gladys, but various things got in the way. Basically, it was decided from above that what we had on Wilson wasn't enough to establish him as someone worth wasting good government money on. In short, I was taken off Wilson's case and given some others, so I haven't done anything about him for some time. I asked them to give me a few more days, but they cut me dead on the spot.'

'And when was that?'

'A couple of days after I'd visited MIT to check Wilson's background and education. Since he'd gone from there to Cornell, I was going to go there next, but when Taylor put a stop to the project... well, I was really disappointed and I kinda lost interest.'

'I've been to Cornell,' Gladys said. 'I went there to visit a friend before leaving for Europe; and since Wilson had once told me that that's where he'd been educated, I decided to check his records while I was there. I come cheap, so buy me lunch and I'll give it all to you.'

At once embarrassed and charmed by her unusual boldness, Bradley practically stuttered, Well, I don't know,

Gladys, I'm pretty busy here ... and what with the project being put on ice and all... Well, I don't...'

'You don't want to see me before I leave for Europe?'

'Well, yeah, I do, but...'

'Then don't make excuses. And believe me, Bradley, when vou have this information on Wilson, I don't think you'll have any problem at all in reviving the project - so you win on both counts. Now, do you want it or not?'

'I want it,' Bradley said, already excited. 'Where and when can we meet?'

'My ship leaves tomorrow, so can you meet me today? I've a prior engagement for tonight,' she said, sounding teasing, 'so how about lunch right here?'

'You can't make it any other time?'

'No.'

'Then lunch it is.'

'I'll be at a table in the restaurant. One o'clock?'

'Right,' he said. Thanks for calling.'

'My pleasure, Bradley.'

Feeling remarkably flustered, Bradley put the phone down just as Mark, his eighteen-year-old son, entered the office.

'Hi, Dad,' he said.

The young man was blessed with his mother's warm brown eyes and sensitive features, which no doubt helped, Bradley thought, with the many young ladies he dated in Manhattan during the weekends. In fact, Mark, though oddly shy, was a considerable ladies' man who kept one set of girlfriends in Manhattan, where he went to college, and another in Connecticut, where he lived with the family on weekends.

Bradley had always liked people who could surprise him and Mark could certainly do that.

'Hi, kid,' Bradley said, as his son took the chair at the other side of his desk. 'Is it lunchtime already?'

'Yep, it sure is. Don't tell me you were working too hard to notice. I don't fall for those tricks.'

Feeling guilty, Bradley grinned. 'Did I promise you lunch today?'

'Yeah,' Mark replied, 'but I'm letting you off the hook. Since my lecture's been canceled and I've got the afternoon free, I'm going to have lunch with Gail Mitchell, who looks sweeter than you.'

'Gail Mitchell? Do I know her?'

'I don't think so. She lives in Brooklyn Heights. I met her through a friend at college and she's rich and impossibly attractive and too tall for you.'

'I may be only five-foot-seven,' Bradley said, unburdened of his guilt, 'but what there is, is all man. Anyway, never mind. I was going to disappoint you. I'm having an unexpected business lunch today, so I'm glad you're fixed up.'

'Who are you lunching with?'

'Dave Marsh,' Bradley lied instinctively, impelled by the return of the guilt caused by the thought of Gladys Kinder and using the name of a friend he met often for lunch.

'You mean that other lawyer?'

'Right'

'I think I met him at home a few years ago.'

'You did. We once invited him for Thanksgiving. He got drunk and made a pass at your mother, which gave her a thrill. Anyway, since it's urgent, I had to cancel you and arrange to meet him instead.'

'Charming,' Mark retorted.

'Well, I knew you'd have a tall lady at hand, so I wasn't too worried. Come on, let's go.'

They left the office, took the elevator down to Wall Street, and stood outside on the busy, sunlit pavement.

'Are you having a long afternoon or just lunch with your Amazon?' Bradley asked.

'Just lunch.'

'Okay. Since it's Friday afternoon, why not meet on the platform of the station at three o'clock sharp and we'll go back together?'

'Sounds good,' Mark said.

'Okay, son, I'll see you.'

While Mark sauntered off along the crowded sidewalk,

Bradley grabbed a taxi to the Algonquin Hotel on 44th Street. He found Gladys Kinder already seated in a booth in the Rose Room, drinking bourbon and smoking a cigarette.

She certainly looked her age, which she had said was thirty-eight, but even in her old-fashioned clothes, which were doubtless the rage in Roswell, she had an undeniable attractiveness and, at least to him, an oddly opaque, provocative sensuality.

She made him feel slightly out of breath.

As he sat beside her in the banquette, wondering why she had chosen it instead of an open table, she held up her glass, grinned laconically, and said, 'I've been on the wagon since last night, but I couldn't resist this. We working journalists are all the same.'

'It looks almost empty,' Bradley observed. 'Shall I order another one?'

'Why not?' she responded.

'Shall we also order the food?'

'Sure,' she said. 'Why not?'

Instantly recalling her ability to hold her liquor, and also remembering that when drinking she could be impish, Bradley ordered two more bourbons. He went through the menu with her, ordered the food for both of them, then, when the aperitifs had arrived, raised his glass to her.

'Cheers,' he said.

'Cheers, Mr Bradley,' she replied, also raising her glass and smiling.

'Mike - just call me Mike.'

'That sounds really intimate, Mike - but what the hell, call me Gladys. Not the most romantic name in the world, but I have to live with it.'

He had to grin at that one. 'You said you were on your way to Europe. Did you really mean that?'

'Yep. Sure did, partner. I never quite recovered from the way Wilson left me, I didn't particularly like being a middle-age spinster in New Mexico, and so I wangled myself a job as foreign correspondent to the Roswell Daily Record, which I've

served so well so far. Those good ol' boys in Roswell always treated me fine, and when I told them I needed to get aways, this is what they came up with. It doesn't pay much, but I'll see Europe, and I've dreamed of that all my life.'

'Based anywhere in particular?'

'London. But I'm hoping to go to Spain. I think things are happening there.'

'Bad things.'

'I guess so.'

Over the meal, Bradley told her what he knew about Europe, which was considerable, and all the time he felt himself falling into her, as if in a dream. She wasn't like the women he knew - she was rough-edged and laconic - but that very difference, which seemed more pronounced here, in these sophisticated surroundings, made her even more attractive to him.

Talking about their first meeting in the Roswell hotel's gloomy lobby, she said, 'You had the East Coast written all over you and I thought that was cute.'

She also joked about how shocked he had seemed when, after informing her that he was in Roswell to interview the members of Goddard's rocket team, she responded by not only telling him she had been Wilson's mistress, but by elaborating in drunkenly mischievous, intimate detail just what she and her remarkably youthful sixty-year-old lover had done together in bed.

'You looked as shocked as a cheerleader trapped in a baseball team's shower room after a winning game. God, that was something!'

Finally she reminded him that he had found her attractive, that she had seen it in his face, and that his blushing response to her teasing had simply confirmed it.

'Yes,' he murmured, 'I guess it did.'

He had never had an affair before and certainly didn't plan to start one now, but when he thought of her going off to Europe, probably never to be seen again, he was filled with an unutterable sense of loss. It was an unexpected, inexplicable

feeling, and it left him bewildered.

So bewildered, in fact, that he almost forgot to ask her about Wilson - though eventually, over the coffee and brandy, he did get down to business.

'You said you'd been to Cornell,' he reminded her. 'Is that true or not?'

She became more serious then. 'Yeah,' she said, 'it's true.' Opening her handbag, she withdrew two sheets of typed notes, unfolded them, and spread them out on the table. She was briefly distracted by her brandy, but eventually, after imbibing and inhaling, she blew smoke and started reading from her neatly typed notes.

'Name: John Wilson. Born July 6, 1870, in Montezuma, Iowa, to Cass and Ira Wilson, both listed as farmers. Attended elementary school in Montezuma then high school in Des Moines. Stunning reports from both schools for his academic achievements - though all agreed that he seemed to have few friends and cared only for studying. In the fall of 1888, when he was eighteen years old, he signed on at MIT - apparently, shortly after his mother died and his father sold their farm in the Corn Belt and moved back to Worcester, Massachusetts, his hometown. At MIT, Wilson studied aerodynamics, with particular emphasis on the wind-tunnel experiments that took place in the Engineering A Department In 1893 - the same year his father died - Wilson's reports, in which every subject is listed as 'exemplary,' thus setting a college record, gained him entry to Sibley College, Cornell University, where he studied experimental engineering. By 1895 he'd obtained his bachelor of science degree in aeronautics and left Cornell. The university records don't say where he planned on going when he left - but they do reveal that between 1896 and 1897 he returned frequently to the university to attend the lectures of Octave Chanute.'

She stopped reading and raised her eyes from the notes.

'Anything else?' Bradley asked.

'No,' she replied. 'At least not until he turned up, in the fall of 1930, to work for six months with Robert H. Goddard, whom

we all know and love as the controversial rocket scientist and a later, if more renowned, MIT graduate.'

Bradley wrinkled his brow. 'Did you say 1930?'

'Yep.'

'You mean there's nothing on this guy from 1895 to 1930 -a period of approximately thirty-five years?'

'Not so far. He appears to have wiped his own tracks clean. We don't know what he did for a living following graduation, but we do know that he frequently returned informally to Cornell to attended Chanute's lectures, given throughout 1896 and 1897. Then, when Wilson was twenty-seven years old, he dropped out of sight completely - and he didn't reappear until 1930, when he worked for six months with Robert Goddard, before disappearing again, as completely as he'd done the first time.'

That's incredible,' Bradley said, blowing another cloud of smoke. 'A guy can't disappear that completely for thirty-five years, then suddenly turn up again at sixty years old!'

Gladys sighed. 'So far that appears to be the case. Wilson seems to be some kind of authentic genius. He obtained his BA in aeronautics when they were very rare indeed, he claimed to Goddard that he had designed airships - and yet we can't find a thing on what should have been the most productive thirty-five years of his life.'

Bradley gave a low whistle.

'Would that be possible in this day and age?' Gladys asked, but before Bradley could open his mouth to reply, she raised her index finger and asked, more emphatically: 'One: Would a man with that track record be capable of designing airships? And, two: If he was capable of doing so, could he have done it in total secrecy for so long?'

She glanced across the crowded restaurant at the group of people arguing noisily in a cloud of cigarette smoke at a table in the middle of the room. They included William Shawn, the associate editor of the New Yorker, an increasingly blind and visibly drunken cartoonist named James Thurber, a matinee idol theater reviewer, Robert Benchley, and the deceptively

sweet-faced satirical writer, Dorothy Parker. Grinning slightly and shaking her head, as if she didn't believe it, Gladys turned back to Bradley.

'I'd already checked out that possibility,' Bradley said, 'and in answer to your first question - yes, Wilson could have gone into airship design with that kind of background. Although there were no formal aeronautical courses at MIT when Wilson was there, there were plenty of informal courses on propulsion and the behavior of fluids - two subjects that Goddard later made his own. And certainly, by 1896, instructors and students at MIT had built a wind tunnel and were experimenting with it to get practical knowledge of aerodynamics. As for Sibley College, the experimental engineering courses that Wilson attended would have been conducted by professors Rolla Clinton Carpenter, George Burton Preston, Aldred Henry Eldredge, Charles Edwin Houghton, and Oliver Shantz - some of the greatest aeronautical thinkers of their day. Finally, Octave Chanute was the world-famous engineer who, in 1896, emulated the successful manned hang-glider experiments of the German, Otto Lilienthal, at an aerial experiment station on the Lake Michigan sand dunes near Miller, Indiana - so, again, Wilson learned from the very best'

'But what was the state of knowledge at the time?' Gladys asked, still skeptical about what he was telling her.

'Well,' Bradley replied, 'according to what I learned at MIT, it was certainly more advanced than is generally known. For instance, Cornell's courses at the time included mechanical and electrical engineering and machine design and construction. As for specific aeronautical texts of the time, they were surprisingly advanced and would have included the Smithsonian Institution's Experiments in Aerodynamics, published in 1891; the Lawrence Hargraves experiment reports of 1890 to 1894; the 1893 reports on Sir Hiram Maxim's experiments on engines, propellers, airplanes, and flying machines; and the Aeronautical Annual of 1895, 1896, and 1897, which contained original contributions from most of the

leading aeronautical scientists ... So assuming that Wilson was some kind of genius, he certainly could have attained the knowledge necessary to design airships.'

'Oh, boy!' Gladys exclaimed softly, obviously intrigued. 'And question two?'

'Could a man of such talents have worked in America for thirty-five years, possibly designing airships, without leaving any tracks behind?' Bradley nodded emphatically. 'Yes, Gladys, it's certainly odd, but I think it's possible. The period we're talking about was the greatest so far in the history of aviation - the first successful flight of S. P. Langley's flying machines; Santos-Dumont's flight in an airship from Saint Cloud to the Eiffel Tower; the Wright brothers' first successful heavier-than-air manned flight at Kitty Hawk, North Carolina; Goddard's first experiments in rocketry; Wilbur Wright's seventy-seven-mile flight in two hours and thirty minutes; then, only seven months later, in 1909, Louis Bleriot's flight across the English Channel; the dogfights and airship raids of the Great War of 1914, and the continuing advances made since then - so yes, Wilson could certainly have designed airships... or even more advanced forms of aircraft.'

'But could he have done so in secret?'

'Yes, it's possible. In fact, it was a time when financiers were in fierce competition with one another to sink money into experimental aeronautical projects - so most of those projects were wrapped in the strictest secrecy. Wilson could, therefore, have worked in almost total anonymity with the full support, even encouragement, of his financial backers. And the US government,' he continued, practically talking to himself, 'quietly backed more than one aeronautical project - particularly during the late 1930s - and usually insisted that such projects be kept secret They also occasionally took over civilian aeronautical projects and either ran them in strict secrecy or, for one reason or other, quietly aborted them.' He scratched his nose, coughed into his clenched fist, and spread his hands on the table. 'So,' he said, 'there it is.'

There was a moment's silence which seemed to last forever.

then Gladys said: 'Tell you what... I'll run a check on all the companies that were known to be working on such projects and see if Wilson's name pops up magically. It depends, I suppose, on whether or not he used his own name - but I'll certainly give it a try for you before I catch the boat - since the guy who obtained these notes for me, who works in the registrar's office at Cornell, is my date for this evening.'

Bradley, very much to his surprise, was upset to hear that, though he managed to hide the fact.

'Shall I call you at home tonight?' Gladys asked him.

'Sure,' he said, giving her his number, but feeling as guilty as a man arranging an assignation, 'that would be great. Now I have to go, Gladys. I'm meeting my son at Penn Station at three o'clock, to take the train home.'

He felt embarrassed saying it, but Gladys just smiled wickedly. 'Ah, yes,' she said, 'I remember. You told me all about your family. A lovely wife and a boy and girl, as I remember.'

That's right,' Bradley said. Though the boy and girl are older than you might think. In fact, Mark is eighteen.'

'A good age,' Gladys said.

Yet she seemed sad at that moment, or at least a little regretful, and when they left the hotel and faced each another on 44th Street, Bradley, not normally a romantic man, hardly knew what to say.

She had somehow sneaked up on him.

Well,' she said, offering her sunburned hand and a lopsided grin, 'it was nice to see you again, Mike Bradley. I'll give you that final call tonight, then it's au revoir, baby.'

Thanks,' he said. 'Au revoir.'

She just stood there as he climbed into a taxi and let it drive him away.

He was almost choked up.

CHAPTER EIGHT

Bradley met Mark at three o'clock at Penn Station and they took the train back to Bridgeport, Connecticut, unencumbered with the usual rush-hour crowd of fellow commuters. As Bradley had already phoned to say they would be early, his wife, Joan, was waiting for them in her car and drove them back to their relatively modest, ranch-style home, just ten minutes from the station and surrounded by expansive gardens and protective trees. There Bradley refreshed himself with a shower, dressed in casual slacks, shirt, and pullover, relaxed for an hour with the radio and another whiskey, then joined Joan and his two children for dinner in the oak-paneled dining room.

Modestly drunk from his lunch with Gladys Kinder and the additional whiskey, and still an Irish sentimentalist at heart, Bradley, after sharing a bottle of red wine with his family, found himself glancing from his wife to his daughter, quietly startled at how similar they looked in all but their age. Joan was thirty-eight, five days older than Bradley, and although their daughter, Miriam, was still only seventeen, she and her mother were almost like twins - sharing the same delicate features, dark hair, enchanting cafe-au-lait eyes, and a quietly mischievous sense of humor.

Bradley, usually sentimental but now guilty because of his guiltless passion for Gladys Kinder, was even more in love with both of them tonight than he was normally.

'How did school go today?' he asked Miriam.

'The same as always,' she replied. 'Clark Gable was teaching

math, Bette Davis taught history, and Errol Flynn discussed the things he knows best, then gave out his phone number That's why I love school, Dad.'

Bradley grinned. 'Well, school's certainly improved since my day - and the results are so wonderful.'

Miriam lowered her head and blushed.

'Gee,' Mark said, 'what a sweet kid! She makes me feel so mature, so protective, when she blushes like that.'

'Shut up, Mark,' Joan warned him.

'Sorry, Mom,' he replied.

'Who's taking you to the prom?' Bradley asked. 'Have you decided that yet?'

'Whoever asks her,' Mark informed him.

'Shut up, Mark,' Joan warned him.

'I told you,' Miriam replied, smiling sweetly. 'Errol Flynn gave me his number and a welcoming smile.'

'He's too old for you,' Joan said.

'A nice guy,' Mark said, 'but too old.'

'What about that kid who walks you home from school? At least he looks like Errol Flynn.'

'Looks aren't everything, Dad.'

'His father's rich,' Joan reminded her.

'Money's not everything, Mom.'

'It's nearly everything, Miriam.'

Will he be taking you?' Bradley asked.

Miriam sighed. 'He hasn't asked me.'

'When he asks, are you going to say yes?'

Miriam sighed. 'I suppose so.'

'A real lucky guy,' Mark said.

Yes, isn't he?' Miriam responded.

'Please finish your desserts,' Joan said to all of them, 'so I can clear this table and put up my feet.'

'Yes, ma'am!' they all exclaimed at once.

Joan did in fact put her feet up after dinner, stretching out on the sofa, while Bradley sat on the floor beside her, having a brandy and feeling deeply grateful for the good life he had. The kids had retired to their own rooms and he was about to

put on the radio, but Joan stopped him by taking hold of his wrist and pulling his hand onto her stomach, which still was as flat as an adolescent's, and seductively warm. 'No,' she said, 'I don't want to hear the radio. Let's just talk for a while.'

'Okay, dear. Sure. Anything special?'

'Nope,' she said with a lazy smile. 'Nothing special at all. flow did your day go?'

The same as always,' he replied. 'Clark Gable came by for a drink, Bette Davis dropped in for a smoke, and Errol Flynn called to discuss his marriage. That's why I love it at work.'

Joan chuckled softly, squeezed his hand, then lightly stroked his wrist 'So what did you really do?' she asked. 'Was it something exciting?'

'Mostly routine,' he replied. The best part of the day was lunch with Dave Marsh, who sends love and kisses.'

Joan's smile was quietly radiant. 'Ah, my boyfriend!' she said softly, oblivious to Bradley's shame. 'Was this just your usual monthly get-together or something special?'

'He's going to check someone out for me,' Bradley told her. 'A guy called John Wilson. A guy who's starting to intrigue me. A real mystery man...'

He told her all about Wilson, taking longer than he had expected, and then added that he was expecting a late-night call from one of Dave Marsh's friends: a lady named Gladys Kinder.

When he stopped talking, Joan rolled onto her hip, to stare directly, steadily at him with her lovely brown eyes.

'Be careful, Mike,' she told him. 'Don't let this become another obsession. You're easily bored, always searching for new adventures, and I know that you're looking at intelligence work to get you out of the office. But I repeat, please be careful. Don't become obsessed with this mystery man. We have a good marriage, but it's been through its troubles, and most of those troubles occurred when you became obsessed with your work. So please, Mike, no matter how intriguing this man is, don't let him threaten our marriage.'

'I promise I won't'

She went to bed shortly after and he promised to follow immediately, but instead sat on, thinking about what she had said and accepting the truth in it They did have a good marriage, but it had had its troubles, and in nearly every instance the problem had been caused by his obsession with some job or other and his subsequent neglect of home and hearth. He loved Joan and the children, appreciated what he had, and didn't want ever again to let work, or anything else, take him away from them.

And he was silently vowing not to let this happen when the telephone rang.

'I think I've found our man,' Gladys Kinder said. 'Our mysterious Mr Wilson. In 1895, the year Wilson left Cornell, a now-defunct New York financial company, Cohn and Goldman Incorporated, financed an aeronautical company, reportedly to research and, if possible, construct passenger-carrying airships. While Cohn and Goldman denied repeatedly that they were attempting to build commercial airships - as most speculators routinely did in those days - I have confirmation that they constructed their factories in Mount Pleasant, near the border of Iowa and Illinois... And according to the company records, the man put in charge of the whole project was a relatively unknown aeronautical scientist named John Wilson.'

Bradley was surprised to find himself releasing the breath he had been unwittingly holding in.

'Anything else?' he asked.

'No, Mike. Those are the only clippings I could find on either Wilson or the company Cohn and Goldman.'

'It's more than enough to go on,' Bradley said. Thanks a hell of a lot, Gladys.'

Excited and confused at once, he was just about to hang up, but Gladys spoke urgently enough to stop him. 'One more thing, Bradley... In checking the clippings, I was also reminded that the following two years - 1896 and 1897 - were notable for one phenomenon in particular: the great wave of

mystery airships. They called them UFOs - unidentified flying objects.'

'Why?'

'Because most of the reports indicated that the airships were more advanced than any known to have been constructed at the time. Also, they were reported to be carrying passengers, or crewmen. They landed frequently, usually to collect water for their engines, and at such times the crewmen talked freely to anyone who approached them... And the crewman who features most frequently in the reports is a man who called himself—'

'Wilson?'

'Right.' She chuckled and then went serious. 'I'm gonna arrange to have a friend send you the newspaper clippings about those sightings - and that's about it, Mike. After this, I'll be on my way to Europe. No more lunches. No phone calls...'

Her voice trailed off into a silence that spoke volumes and left Bradley grieving.

'Gladys, I don't know how...'

'What's domestic life like out there in Connecticut?'

'It's very nice.'

'Yeah, I thought so. Good-bye, Mike.'

'Good-bye, Gladys.'

The phone went dead. Bradley felt very emotional. He forgot to join Joan in bed, but instead went into his study and sat at his desk. He pulled out the notes he had collected on Wilson and started to ponder them.

The next morning, having not slept a wink, he rang General Taylor.

CHAPTER NINE

'I'm Lieutenant Ernst Stoll,' Wilson's new interrogator said when the cell door had closed behind the man and he took the hard wooden chair facing the bed upon which Wilson was seated. 'I am, as you can see, a member of the SS, not the Gestapo, and I work for the technical intelligence branch. Naturally,' he added, waving the papers in his right hand and offering what seemed like a shy smile, 'I know who you are, so shall we begin?'

'What if I say no?' Wilson asked.

'I would ignore you, of course.'

Wilson smiled. 'Let's begin, then. I take it, as you're from technical intelligence, that we've made a little progress - or at least finished with relatively unimportant matters.'

That's true,' Lieutenant Stoll said, mildly amused by Wilson's impertinence. 'Your background and motivation have been ascertained, so I'm here to talk about the work you have shown us and wish to do for us.'

'Good,' Wilson said, deliberately keeping his gaze steady, searching the lieutenant's face for what it was hiding, because all faces were masks. Lieutenant Ernst Stoll was young, perhaps in his middle twenties, and while he looked diabolically handsome in his gleaming black uniform, his face did not display a confidence to match. Indeed, he seemed a little haunted, a man divided within himself, and was obviously trying to cover his doubts with his dryly polite, distant manner.

'You have a technical background?' Wilson asked him.

'Yes,' Stoll replied with a flicker of pride. 'I studied

aeronautical engineering at the Institute of Technology in Munich, then rocket technology under Professor Becker at the Institute of Technology, Berlin University.'

'Ah!' Wilson exclaimed softly, with admiration. 'Becker! So were you a member of the German Amateur Rocket Society?'

'No,' Stoll said, briefly displaying hurt and resentment, then hiding it by changing the subject. 'I trust you found the previous interrogations civilized,' he asked, looking up from his papers.

'Yes,' Wilson said. 'Perfectly civilized. Surprisingly so.'

Lieutenant Stoll raised his eyebrows as if puzzled. 'Why surprisingly so? Is it not what you would have expected from German officers?'

'Given the sounds that have emanated from some of the other cells, I take it that not all German officers are so civilized when interrogating their prisoners.'

Ernst looked embarrassed, then smiled bleakly. 'Ah,' he said, 'that. Well, some prisoners are more troublesome than others, as I'm sure you agree. A little persuasion often goes a long way - though I hope that the noise from the other cells didn't make you lose too much sleep.'

Because he had been forced to listen, day and night, to the screaming of those being abused in the other cells or torture chambers of this Gestapo headquarters and prison, Wilson would certainly have lost a good deal of sleep had he been the kind to need a lot of it. As he was not, and as the fate of others did not concern him, he'd had a relatively comfortable time.

Nevertheless, hoping to find out more about the situation outside the prison, he said, 'Yes, I lost some sleep - particularly during that day and night two weeks ago, when this whole place turned into a madhouse of bawling and shooting.'

'You mean June 30?'

'Correct.'

The lieutenant's facade nearly crumbled, revealing revulsion mixed with shame, but he quickly regained his composure and smiled again, bleakly. 'Ah, yes, the Night of the Long Knives. That's what they call it now.'

'Is it true that the SS murdered over a hundred, maybe two hundred, SA officers and others in that one bloody purge?'

'No, it's not true,' the lieutenant replied with self-defensive anger. Those men weren't murdered, but executed, because they were traitors.'

'Executed without trial,' Wilson corrected him.

'You're impertinent, Herr Wilson. Count your blessings that you're American. Count them also because that purge, about which you are so sarcastic, has ensured that the SS, and not the SA, are now virtually ruling the Third Reich. The SS will therefore be in control of any research establishment in which you're likely to find yourself.'

'My request, then, is being seriously considered.'

'That's why I am here.'

Realizing that after weeks of interrogation in this prison cell, he was close to getting what he wanted, Wilson allowed himself the luxury of a feeling of triumph. When Lieutenant Ernst Stoll of SS Technical Intelligence lowered his head to study the papers on his knee, Wilson recognized his original drawings and notes, cunningly unfinished, for the kind of aircraft the Nazi's Projekt Saucer was trying, unsuccessfully, to create. It was also what he was trying to create, and with their help he would do it.

Lieutenant Stoll looked up from his notes and said, 'While I'm very impressed, I find it hard to believe that during the period you worked in secret - between 1895 and 1930 - you could have made the extraordinary technical advances indicated in these notes and drawings.'

'You've already tested my intellect and knowledge and know that both are remarkable - so why doubt my achievements?'

'We cannot check your actual engineering or scientific achievements until we get you into a research center; however, according to what we can gauge from these remarkable notes and drawings, your achievements were completely divorced from the general scientific achievements of the time. Those were very early days, and your achievements seem too advanced even to have sprung from that period.'

'It's a widely held misconception that those were early days,' Wilson replied, 'but they were in fact the most productive days in the history of science. As you've studied aeronautical engineering and rocketry, I needn't tell you about the extraordinary advances made in those fields during that period. However, I should remind you that by 1895 Rontgen had discovered X rays, Marconi had invented wireless telegraphy, Auguste and Louis Lumiere had invented the Cinematographe, the first main railway was electrified, and Ramsay had detected, by spectroscope, helium from a terrestrial source. By 1896 we had Rutherford's magnetic detection of electrical waves, the construction of an electrical submarine in France, and the first successful flights of S. P. Langley's flying machines. By 1897 numerous patents for flying machines had been registered, and J. J. Thomson's work on cathode rays had led to the evaluation of the electron. The rest I'm sure I don't have to tell you: From the successful test flights of Langley's flying machines in 1897 to the first cross-channel flight took only one decade - and in that decade Robert H. Goddard had already begun his experiments in rocketry. So, lieutenant, I was not too advanced for my own time - and indeed my work did spring from it and was nurtured by its achievements.'

Stoll smiled frostily, glanced down at Wilson's notes, then looked up again. 'Your work has been studied by our Projekt Saucer scientists and engineers at the German Rocket Research Institute at Kummersdorf, just outside Berlin. While it is agreed that your designs are remarkable, they remain incomplete and would not lead to a workable saucer-shaped aircraft. You claim that with our help you'd be able to complete this project, but why, since our own scientists have failed repeatedly to do so, should we place our faith in your undoubted talents?'

You know I can't answer that,' Wilson said carefully, 'but can only show you what I can do when I'm actually working.'

'I understand that, Herr Wilson, but perhaps you can at least give me some indication of the direction you'd be heading in.

For instance, what would separate your work from that which is already being done by our scientists at Kummersdorf? We agree that an aircraft shaped like a saucer would fly better than any other, but that shape also has its own problems, which so far we can't solve. How, then, would you approach this problem that has so far foiled us?'

Wilson had no intentions of telling them everything he had discovered, but he knew that he had to give them enough to whet their appetites and encourage them to let him work for them. He therefore leaned forward on the bed and chose his words carefully.

'Your scientists have been researching along conventional lines,' he said, 'but a saucer-shaped aircraft wouldn't respond to conventional laws of aerodynamics, so we have to look elsewhere.'

'I'm not sure I understand,' Stoll replied, though his gaze was steady and thoughtful.

'When I was working with the wind tunnel at Zeppelin in Friedrichshafen,' Wilson said, 'I helped test many of the experimental products coming from Kummersdorf - and it soon became clear to me that the Kummersdorf scientists were trying to construct some kind of saucer-shaped aircraft.'

'You've already told us you knew that,' Stoll said impatiently.

'I remind you of it,' Wilson replied, unperturbed, 'because I also ascertained that most of the Kummersdorf designs were based on the tailless, or "all-wing," aircraft, the Horten 1, which was designed and constructed by the Horten brothers, Walter and Riemer, for the German Air Ministry, at their factory in Bonn, from 1931 to 1932. That so-called all-wing aircraft, which in prototype was a glider, had a span of forty point seven feet, a wing area of two hundred and twenty-six square feet, and a wing-loading of two pounds per square foot. It had a flying weight of four hundred and forty pounds, a gliding angle of twenty-one degrees, and a flying life of approximately seven hours.'

'Your intelligence gathering is commendable,' Stoll said sarcastically, 'but what is the point of this?'

The Horten brothers were convinced that the most important form of aircraft would be the all-wing type, which is why there were no vertical stabilizing or control surfaces on their flying wing, the Horton 1, why it was virtually flat and crescent-shaped, like a boomerang, and why the pilot was placed in a prone position - to reduce cockpit size.'

'Yes, Herr Wilson, I know this, but—'

'That so-called flying wing certainly flew for seven hours - but it could never have been the basis of a flying saucer for one very good reason.'

'Yes?'

'It was still faced with the problem that's repeatedly foiled your scientists: the limitations imposed by the boundary layer.' He could see that he had Stoll's interest, though the German was trying to disguise it by showing little emotion. Amused, Wilson said, 'Have you heard of the boundary layer, Oberleutnant?'

Stoll just smiled at the sarcasm. 'Why don't you remind me, Herr Wilson? You talk so well about these things.'

'While being four or five thousand times less viscous than oil, air is still viscous,' Wilson said, enjoying himself. 'Because of this, the air sweeping in on the solid body of an aircraft forms imperceptible stratifications of resistance and consequently decreases the speed of the body in flight. These layers of air are therefore known as the boundary layer - and the boundary layer increases its resistance in direct proportion to the increasing speed of the flying object, thus imposing severe limitations on its speed and maneuverability.'

'And in layman's terms?' Stoll asked, clearly amused by Wilson's enthusiasm for lecturing.

'In layman's terms,' Wilson continued, drawing Stoll into his web, 'the major problem regarding supersonic flight is to somehow move this negative air as far to the rear of the aircraft as possible, thus minimizing the expenditure of energy required to propel it through the sky. Moreover, it's possible that a revolutionary type of aircraft could - by not only completely removing the boundary layer, but by somehow

rerouting it and utilizing it as an added propulsive force - fly through the skies using little other than the expelled air itself. Should this be accomplished, we would have an aircraft capable of remarkable speeds while using only the bare minimum of conventional fuel.'

'So you plan to devote all your energies to solving the problem of the boundary layer.'

'Yes,' Wilson said, playing his trump card, 'and Germany is the place for doing that.'

'I am flattered - but why Germany?'

'As I explained to your Reichsfuhrer, the boundary layer was introduced to the world of aerodynamics by the German professor, Ludwig Prandtl, at Gottingen in 1904. Throughout the following years, many other German scientists, including professors Betz, Flettner, and Junkers, experimented with specially equipped aircraft in attempts to reduce the boundary layer. Most of the experiments were based on the 'suction' method, in which the negative air is sucked into the wing itself, through tiny holes or slots, then expelled by means of a pump located in the fuselage. While this was a step in the right direction, the resulting aircraft still required heavy, obstructive engines - also the main problem with the flying wing jet fighter the Horten brothers envisaged - but it's my belief that in order to get rid of the boundary layer completely - and in order to make use of the "dead" air not only for acceleration, but for maneuvering as well - what we need is an aircraft devoid of all obstructing protuberances, such as wings, rudders, and even normal air intakes, and one not requiring a large, heavy engine. In other words, this revolutionary new aircraft should be the perfect 'flying wing' that offers the least possible resistance, sucks in the "dead" air of the boundary layer, and then uses that same air, expelling it at great force, to increase its own momentum.'

'And how do you propose creating such a machine?'

'By building the perfect flying wing - a circular wing that is, in a sense, wrapped around its suction pump, with the pump being part and parcel of the engine - a machine shaped like a

saucer - and by constructing it from a porous metal that will act like a sponge and remove the need for air intakes altogether. This would result in frictionless air flow during flight - an aircraft that slips through the air in the same way as a piece of wet soap slips through the fingers. Its speed and maneuvering capabilities would be literally limitless.'

Wilson felt excited merely thinking about it, and could see, in the sheltered gleam of Stoll's dark gaze, that he was feeling the same way. Nevertheless, the young oberleutnant was being careful about showing his feelings.

This sounds wonderful in theory,' he said, 'but practise is something else. I'm not sure that your so-called porous metal is a realistic proposal.'

'In fact, it's being worked on right now,' Wilson said, 'and right here in Germany. Among the many other experiments I helped run in the Zeppelin wind tunnel were those concerning different porous metals being created by the scientists of Gottingen and Volkenroda - a compound of magnesium and aluminum. The scientists are calling it Luftschwamm, or aerosponge... and I think it will work.'

He knew that he had won the instant he saw Lieutenant Stoll fold up his papers and slip them back into his briefcase. 'It's interesting,' the lieutenant said, pushing his chair back and standing up, 'that even the great Russian, Tsiolokovsky, evinced a strong interest in circular, hyperbolic, and spherical airframes.'

'I can see that you know more about this subject than you pretend, Oberleutnant,' Wilson replied, thus making the somber SS officer smile. 'And knowing that, you clearly also know that the extensive research into all-wing aircraft and rocketry that's been carried out in Germany during the past decade is directly due to German admiration for Tsiolokovsky's theories.'

'And due to admiration for the American, Robert H. Goddard, for whom you worked for six months.'

'I have to admit that although he's my junior, I learned a lot from Goddard about the problems of stabilization and

gyroscopic controls. That's why I wanted to work with him -it was my only weak area.'

The lieutenant smiled genuinely for the first time and said, 'Come, Herr Wilson, we are leaving. We are going to put you to work. We do not have much time, so don't bother with your possessions. This cell will be cleaned out as soon as we leave, and your possessions here, as well as those being kept by the Gestapo, will be forwarded to you this afternoon. So please, follow me now.'

Quietly exultant, Wilson was led out of the cell and up the stairs to the lobby near the front door of the building. There, while he adjusted to his sudden sense of space and movement (after weeks in his tiny cell, this lobby appeared to be immense and far too crowded), he was given an army greatcoat Then he was led out into the Prinz Albrechtstrasse and into a waiting police car.

Seated in the rear beside the notably more relaxed Oberleutnant Ernst Stoll, Wilson gazed out the window as the car pulled away from the curb and proceeded through Berlin. In the early afternoon's gray light, the city looked solid, busy, and perfectly normal, except for a notable increase in military personnel and vehicles, which seemed to be everywhere.

'This is a city preparing for war,' Wilson said.

'Yes,' the lieutenant replied. 'You are very observant.'

Intrigued by the handsome young lieutenant's oddly haunted look and reticence, Wilson said, taking a chance, 'Am I allowed to ask if you are involved with scientific work as distinct from intelligence?'

Lieutenant Stoll sighed. 'You may ask,' he said, 'and the answer is no. I am no longer involved in scientific research per se, but instead am forced to use my scientific knowledge for the gathering and analyzing of technical intelligence material.'

'Which is why you were sent to interview me, right?'

The oberleutnant sighed again, as if deeply depressed. 'Yes, Herr Wilson, that is the case. And now I will take you to Kummersdorf West, where you will work with men less

talented than I was. Such is life, I suppose.'

'You can't protest?'

'To be a member of the SS is to obey. I obey and take pride from that.'

Wilson doubted that Ernst Stoll was taking pride from his work and filed the knowledge away in his head for future reference.

The journey to Kummersdorf did not take long - it was only fifteen miles from Berlin - and the car soon slowed down at barbed-wire fences and a guarded gate. It was inspected by a particularly careful SS officer and eventually waved through, then stopped in front of an enormous hangar in a broad stretch of bare ground that ran out to more barbed wire and signs announcing that an army firing range lay beyond.

Puzzled to find only this enormous hangar and bare ground where he had expected to find a hive of activity, Wilson glanced questioningly at Stoll. The oberleutnant, as if reading his mind, smiled understandingly and said, 'Projekt Saucer has been separated from the Rocket Research Institute proper by that army firing range. Beyond the firing range are Wernher von Braun's more impressive research works, which is what you were, I assume, hoping to find.'

'Frankly, yes,' Wilson said, hearing the moaning of the wind and seeing only swaying, untended grass around that single, enormous hangar, under the leaden gray sky.

'Try not to be too disappointed,' Ernst said, as he led Wilson across the windblown grass, toward the already rusted, corrugated-iron hangar. Tou will be visiting the Research Institute on a regular basis, contributing your knowledge to their rocket projects, but most of your time will be spent here, in conditions of strict secrecy, where you will work more specifically on Projekt Saucer. Even those who work at the other side of the firing range do not know what we're doing here.'

The main hangar doors were closed and the small side door was guarded by armed SS troops who gave the Nazi salute when Stoll approached. After returning the salute in a

desultory manner, Stoll motioned Wilson into the hangar. Stepping inside, Wilson was temporarily blinded by the bright light. He adjusted to it as Stoll came in behind him and stood beside him, then saw an enormous open floor, surrounded by glassed-in offices and filled with machines and a few men in oily coveralls.

Raised about six feet off the concrete floor on a hydraulic platform was the skeletal prototype of a saucer-shaped craft, about forty feet in diameter and rising up to a central dome.

Its discus-shaped ribcage of steel covered what looked like two Hirth 80 hp engines.

'It'll never fly,' Wilson said.

Stoll smiled. 'No, it won't.'

Obviously pleased by Wilson's perception, he led him across the hangar floor to one of the larger offices. Stepping inside, he suddenly stiffened, gave the Nazi salute and said, 'Heil Hitler!' then stepped aside to introduce Wilson to a man who, even wearing his Reichsfuhrer's uniform, did not look like a soldier.

'So, Herr Wilson,' Heinrich Himmler said, 'we meet again, yes?'

'Yes, Reichsfuhrer - I'm glad to say.'

'I'm sure you are, Herr Wilson - since if we hadn't met again here, you would now be a dead man.'

Reminded by that remark that his assessment of Himmler was not amiss, Wilson glanced over the lunatic's shoulder at the men grouped behind him. As they were all wearing oily coveralls, they were either scientists or engineers.

'Would you care to inspect our flying saucer, Herr Wilson?'

'I do not have to inspect it, Reichsfuhrer,' Wilson replied, 'to know that it won't fly.'

Himmler simply smiled. 'How arrogant you are, Herr Wilson! But come,' he added, crooking a delicate index finger and indicating the men standing nervously behind him, 'please jet me introduce you to the rest of our team. This,' he said, indicating with a nod a young man with a lean and hungry look, 'is Flugkapitan Rudolph Schriever, who originally designed

this flying saucer, which you insist will not fly. And this,' he continued, when Wilson had shaken the hand of the solemn young designer, 'is the physicist Klaus Habermohl, and his associate, Otto Miethe. And this,' he ended, when Wilson had shaken the hands of Habermohl and Miethe, both of whom were middle age, 'is Dr Giuseppe Belluzzo who, though Italian, has become an invaluable member of our team. Gentlemen, I give you Herr Wilson, an American genius!'

Ignoring Himmler's quiet sarcasm and the resultant nervous chuckles, Wilson shook the hand of the small, plump balding Belluzzo and expressed his gratitude that he would soon be working with him. When the rest of the team had crowded around him to congratulate him on his work, which they had assessed for Ernst Stoll, Wilson said to Schriever, 'Few experiments work out the first time, and the fact that this particular saucer will not fly is of no great importance. What is important, Flugkapitan, is that you've already made such progress and that now, if we all work together, we can build successfully upon it. I therefore congratulate you, Flugkapitan, for building the first flying saucer.'

'Thank you, Herr Wilson.'

Schriever bowed stiffly, acknowledging Wilson's praise. Before anything else could be said, Himmler walked away from them and Oberleutnant Stoll urgently waved his hand, indicating that he and Wilson should follow.

Falling in beside Stoll, Wilson left the office and found himself standing in the great hangar, beside Himmler, who was facing Rudolph Schriever's skeletal flying saucer prototype and smiling in his mild, chilling way.

'You do not think it will work?' he asked.

'No, Reichsfuhrer,' Wilson replied.

'Then you are very diplomatic, Herr Wilson, which means you are cunning.' He then turned to Wilson, looked up through his glittering pince-nez, and said, 'Flugkapitan Schriever, for obvious reasons, is still in charge of this project, but you are the one from whom we expect results. Once a week you will visit Wernher von Braun at the Rocket Research Institute at

the other side of the firing range, and anything you have discovered that is of no use to this project but may be of use to von Braun, you will pass on to him, to be used as he sees fit.' 'I understand, Reichsfuhrer.'

'You understand also, I hope, that I will be kept informed of your progress, or lack thereof, by Oberleutnant Stoll here' - he indicated the nervous Ernst Stoll with a nod of his head— 'and that anything you wish to discuss, you must discuss with him - not with Flugkapitan Schriever.'

'Yes, Reichsfuhrer, I understand.'

'Good,' Himmler said. 'Now is there anything you want to know before I leave?'

Wilson glanced across the hangar, saw that mostly empty, valuable space, then returned his gaze to Himmler and said, 'My task is a large one, and apart from scientists and engineers, I am going to need hundreds of unskilled laborers. Where will I find them?'

Himmler adjusted the pince-nez on his nose, gazed across the vast hangar at the glittering skeleton of Schriever's saucer, then looked up at Wilson with a thin, icily controlled, deadly smile.

'The camps,' he said, almost whispering.

CHAPTER TEN

The administration buildings at Langley Field, Virginia, had been completed when Bradley made his next visit - officially as an advisor on aeronautical law, unofficially as one of General Dwight Taylor's intelligence agents - to attend a meeting of the recently formed National Advisory Committee for Aeronautics. Seated with him around the table in the main building were his old friend General Taylor, of the still too informal army air force intelligence branch, and the twelve members of the committee. Though most were Pentagon officers with technical backgrounds, also included were the aging yet still dapper Orville Wright who, in 1903, at Kitty Hawk, North Carolina, with his brother Wilbur, had made the first airplane flight in history; and Charles A Lindbergh, the handsome, aristocratic flyer who had won the nation's heart when, in 1927, he had made the first nonstop airplane flight between two continents in his now-legendary monoplane, The Spirit of St Louis, then won the sympathy of that same nation when, four years ago, his two-year-old son had been kidnapped and murdered.

Since its formation, the committee had been meeting once a month to discuss national and international aeronautical developments. This day should have been no different from any other... but most of those present were looking shocked.

'Eighteen years ago,' a radio announcer was saying, 'dejected German soldiers retreated from France across the Hohenzollern Bridge spanning the Rhine. Twenty-two days ago, at eleven-thirty a.m. on March 7, 1936, three of Adolf Hitler's battalions crossed that bridge again, this time marching back into the Rhineland.

Within hours twenty-five thousand German troops had occupied the Rhineland, with no retaliation from the French. Today, March 29, 1936, again without benefit of guns, ninety-eight point eight percent of the electorate voted for Adolf Hitler, thus making him the Fiihrer of all Germany. War in Europe is now virtually guaranteed...'

General Taylor turned the radio off, stared thoughtfully at it for a moment, then returned to take his seat at the head of the long committee table.

Well, gentlemen,' he said, 'there it is. Adolf Hitler's now the absolute dictator of the Third Reich - and he's not going to be satisfied with the Rhineland. As the man said, this clearly means war in Europe.'

War in Europe is not our concern,' said a silvery-haired gentleman from a cloud of cigar smoke at the end of the table.

'I think it is,' Taylor replied, 'to the degree that it affects Germany's interest in aeronautical research, which already is alarmingly advanced. Mike,' he added, turning to Bradley, Svhat do you think?'

'I'm seriously worried,' Bradley said. The Nazis are, as you say, already dangerously advanced in aeronautical research - and I think if s safe to say that most of that research will now be turned toward its potential for warfare.'

'It still doesn't affect us,' the dapper Orville Wright said, 'since America is taking an isolationist stance - and Europe's a long way away.'

'I don't believe we can cling to isolationism for too long,' Bradley said, 'and as long as there's even the faintest possibility that we'll be involved in war, sooner or later, we should be seriously concerned about technological advances anywhere in the world - but particularly in Nazi Germany.'

'Your concern seems extreme,' a technical advisor said, puffing on his pipe and pursing his lips to blow the smoke out. 'Have you reasons for this?'

'For the past couple of years,' General Taylor said, 'Bradley, in an unofficial intelligence capacity, has been trying to track down someone for us - a mysterious physicist and aeronautical

engineer called John Wilson, who once worked with Robert Goddard' - here the general glanced at Goddard's friend, Charles Lindbergh - 'before reportedly traveling to Germany to work for the Nazis, possibly under a false passport'

'Bradley's already asked me about this John Wilson,' Lindbergh pointed out, 'and I had to tell him, honestly, that I'd never heard of him in connection with Goddard until Bradley himself mentioned him. Obviously, as Bradley had already done, I then checked with Goddard and received confirmation that Wilson had indeed worked with him in 1930 for approximately six months.'

'So what's so worrying about this fellow?' Orville Wright asked impatiently.

'What worries me,' Bradley said, 'is that according to even Goddard, this Wilson was a scientific genius with a particular interest in rocketry and space flight He also appears to have been a completely unemotional, ruthless son of a bitch who didn't give a damn about anything other than his own work.'

'Sounds like your average scientist or politician,' someone said, thus encouraging a spasm of cynical laughter around the smoke-wreathed table.

When the laughter had died down, Bradley said patiently, What I'm trying to get across is that this mysterious Wilson, who's possibly a scientific genius and utterly ruthless, had reason enough, and is certainly fanatical enough, to contribute his genius to a foreign power, irrespective of its nature or motives. And it seems clear from the evidence that the country he's chosen is Nazi Germany.'

There was a long, uncomfortable pause until Charles Lindbergh said thoughtfully, 'Are you suggesting that this Wilson was actually more advanced in his thinking than Goddard?'

'Yes,' Bradley said without pause.

'I find that hard to credit,' Lindbergh said.

'So did I,' Bradley replied, 'but not any longer.' He pushed his chair back, stood up, and walked around the table, distributing to all the members of the committee typed copies of Wilson's curriculum vitae. While they were reading it he lit a cigarette,

smoked it, and gazed out the window, thinking of how far aeronautics had advanced since Samuel Pierpont Langley, American astronomer, secretary of the Smithsonian Institution, and aeronautical theorist (ironically also born, like Goddard and Wilson's father, in Massachusetts, where Wilson himself had attended MIT), had sent his quarter-scale, steam-powered 'aerodrome' into a flight over the Potomac River and these very fields, which had since been named in his honor. From those innocent beginnings, nearly forty years ago, a dark new age was dawning...

'Has everyone finished reading?' General Taylor asked, obviously impatient to continue.

Most of the heads, hazed in smoke, nodded affirmatively.

'If s certainly impressive,' Orville Wright said, 'but it doesn't prove that this man created anything out of the ordinary, in secret or otherwise.'

Aware of Wright's illustrious position in the history of aviation, that Charles Lindbergh had been forthright in his support of Robert H. Goddard, and that both men might therefore be more skeptical than most, Bradley said, 'While I can't confirm that Wilson worked on airships more advanced than those built officially, I think it's worth pointing out that during the period 1896 to 1897 - when Wilson had left Cornell University and disappeared completely to work, as we now know, on airship design and construction - America suffered what is now known as the Great Airship Scare.'

'I remember it well,' Orville Wright said. 'It lasted for months. There was a great wave of sightings of mysterious airships that were actually carrying passengers, or crew members, who reportedly spoke to the locals when they landed. At the time I put it down to mass hysteria'

'Well,' Bradley said, 'maybe it was and maybe it wasn't - but certainly most of the reports of contact between the airship crews and the witnesses mentioned a crew member who called himself Wilson. Please, gentlemen, bear with me.'

Bradley withdrew from his briefcase the press clippings that Gladys Kinder had sent him, spread them out on the table before

him, and talked while reading from them, one by one.

'As you all probably know,' he began, 'the first major UFO flap was indeed in 1896 - beginning about November of that year and continuing until May 1897. That was five years before the first experiments of Orville, here, and his brother, Wilbur; but there were, by that time, various airship designs on the drawing boards or in the Patent Office. For instance, according to my clippings here, on August 11, 1896, patent number 565805 was given to Charles Abbot Smith of San Francisco for an airship he intended having ready by the following year. And another patent, number 580941, was issued to Henry Heintz of Elkton, South Dakota, on April 20, 1897.'

'In all fairness,' Lindbergh said, 'you should point out that while many of the UFOs sighted were shaped roughly like the patented designs, there is no record of those airships having been built'

'Okay,' Bradley said, 'I concede that - but the fact that there's no record of them doesn't necessarily mean they weren't built'

'But the reported UFOs resembled the airships on the patented designs?' a disembodied voice asked from farther along the table.

Yes,' Orville Wright said. 'At that time the general belief was that aerial navigation would be solved through an airship, rather than a heavier-than-air flying machine - so most of the earlier designs looked like dirigibles with a passenger car on the bottom.'

'Cigar-shaped.'

'Right'

'Okay, Bradley,' General Taylor said. 'Please continue.'

What stands out in the 1896-97 sightings,' Bradley continued, 'is that the unidentified flying objects were mostly cigar-shaped, that they frequently landed, and that their occupants often talked to the witnesses, usually asking for water for their machines.'

'I remember that,' Orville Wright said, still proud of his memory.

'Now, the most intriguing of the numerous contactee stories,' Bradley went on doggedly, 'involved a man who called himself Wilson - he never gave his first name.'

Bradley's throat felt dry, so he swallowed, coughed into his fist, then started reading again from his notes and clippings.

The first incident occurred in Beaumont, Texas, on April 19, 1897, when one J. B. Ligon, the local agent for Magnolia Brewery, and his son, Charles, noticed lights in a pasture a few hundred yards away and went to investigate. They came upon four men standing beside a large, dark object that neither of the witnesses could see clearly. One of those men asked Ligon for a bucket of water, Ligon let him have it, and then the man introduced himself as Mr Wilson. He then told Iigon that he and his friends were traveling in a flying machine, that they had taken a trip out to the gulf - presumably the Gulf of Galveston, though no name was given - and that they were returning to the quiet Iowa town where the airship and four others like it had been constructed. When asked, Wilson explained that electricity powered the propellers and wings of his airship. Then he and his buddies got back into the airship and Ligon watched it ascending.'

'I get your drift,' Orville Wright said. 'That particular Wilson said he was returning to the quiet Iowa town where the airship and four others like it had been constructed - and your Wilson, the one in these notes, originally came from Iowa.'

Bradley just raised his hands in a questioning manner, then started reading again.
